|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| target_type  | Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"><li>DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent</li><li>DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option</li><li>DBMS_MGWADM.JOB_OPTION to set a propagation job option</li></ul> |
| target_name  | Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.                                                                                                                                                                                     |
| option_name  | Option name. This must not be NULL.                                                                                                                                                                                                                                                                                                 |
| option_value | Option value                                                                                                                                                                                                                                                                                                                        |
| encrypted    | Indicates whether the value should be stored as encrypted: <ul style="list-style-type: none"><li>TRUE if the value should be stored in an encrypted form</li><li>FALSE if the value should be stored in a cleartext form</li></ul>                                                                                                  |

### See Also:

[Table 113-10](#) regarding options for the option\_type parameter

## Usage Notes

### DBMS\_MGWADM.AGENT\_JAVA\_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target\_name specifies the name of the Messaging Gateway agent. DBMS\_MGWADM.DEFAULT\_AGENT can be used for the default agent.
- option\_name specifies the Java System property
- encrypted can be either TRUE or FALSE

### DBMS\_MGWADM.MSGLINK\_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS\_MGWADM.ALTER\_MSGSYSTEM\_LINK and using the options parameter to set an option.

The parameters are interpreted as follows:

- target\_name specifies the name of the message system link
- option\_name specifies the option to set
- encrypted must be FALSE

### DBMS\_MGWADM.JOB\_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

## 113.5.29 SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

### Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);

DBMS_MGWADM.SHUTDOWN (
    agent_name      IN VARCHAR2);
```

### Parameters

**Table 113-48 SHUTDOWN Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sdmode</code>     | The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress. |
| <code>agent_name</code> | Identifies the Messaging Gateway agent.<br><code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.                                                                                                         |

### Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

## 113.5.30 STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

### Syntax

```
DBMS_MGWADM.STARTUP (
    instance      IN BINARY_INTEGER DEFAULT 0,
    force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);

DBMS_MGWADM.STARTUP (
    agent_name    IN VARCHAR2);
```

## Parameters

**Table 113-49** STARTUP Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance   | Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.<br><b>Caution: This parameter has been deprecated.</b>                                                                           |
| force      | If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception.<br><b>Caution: This parameter has been deprecated.</b> |
| agent_name | Identifies the Messaging Gateway agent.<br>DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.                                                                                                                                                                                        |

## Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The `force` and `instance` parameters are no longer used and will be ignored. If the `instance` affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the `DBMS_MGWADM.ALTER_AGENT` procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the `DBMS_MGWADM.CREATE_AGENT` or `DBMS_MGWADM.ALTER_AGENT` subprograms.

## 113.5.31 UNREGISTER\_FOREIGN\_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

## Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE (  
    name           IN VARCHAR2,  
    linkname       IN VARCHAR2);
```

## Parameters

**Table 113-50** UNREGISTER\_FOREIGN\_QUEUE Procedure Parameters

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| name      | The queue name                                                   |
| linkname  | The link name for the messaging system on which the queue exists |

## Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

## 113.5.32 UNSCHEDULE\_PROPAGATION Procedure

This deprecated procedure removes a propagation schedule.

### Note:

This subprogram has been deprecated as a result of improved technology (see [REMOVE\\_JOB Procedure](#)), and is retained only for reasons of backward compatibility.

### Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (  
    schedule_id    IN VARCHAR2 );
```

### Parameters

**Table 113-51** UNSCHEDULE\_PROPAGATION Procedure Parameters

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| schedule_id | Identifies the propagation schedule to be removed |

# DBMS\_MGWMSG

DBMS\_MGWMSG provides object types used by the canonical message types to convert message bodies, and methods, constants, and subprograms for working with Messaging Gateway message types.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Summary of DBMS\\_MGWMSG Subprograms](#)

## See Also:

[DBMS\\_MGWADM](#) which describes the Messaging Gateway administrative interface, [DBMS\\_MGWADM](#)

## 114.1 DBMS\_MGWMSG Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS\_MGWMSG package as well as the canonical types. The DBMS\_MGWMSG packages and object types are owned by SYS.

## Note:

You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Database Advanced Queuing User's Guide* for information on loading database objects and using DBMS\_MGWMSG.

## 114.2 DBMS\_MGWMSG Constants

The DBMS\_MGWMSG package defines constants for specifying various parameter values.

**Table 114-1 DBMS\_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW\_NAME\_VALUE\_T Object**

| Value         | Constant                     |
|---------------|------------------------------|
| TEXT_VALUE    | CONSTANT BINARY_INTEGER := 1 |
| RAW_VALUE     | CONSTANT BINARY_INTEGER := 2 |
| BOOLEAN_VALUE | CONSTANT BINARY_INTEGER := 3 |

**Table 114-1 (Cont.) DBMS\_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW\_NAME\_VALUE\_T Object**

| Value         | Constant                      |
|---------------|-------------------------------|
| BYTE_VALUE    | CONSTANT BINARY_INTEGER := 4  |
| SHORT_VALUE   | CONSTANT BINARY_INTEGER := 5  |
| INTEGER_VALUE | CONSTANT BINARY_INTEGER := 6  |
| LONG_VALUE    | CONSTANT BINARY_INTEGER := 7  |
| FLOAT_VALUE   | CONSTANT BINARY_INTEGER := 8  |
| DOUBLE_VALUE  | CONSTANT BINARY_INTEGER := 9  |
| DATE_VALUE    | CONSTANT BINARY_INTEGER := 10 |

**Table 114-2 DBMS\_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value**

| Value         | Constant                     |
|---------------|------------------------------|
| BOOLEAN_FALSE | CONSTANT BINARY_INTEGER := 0 |
| BOOLEAN_TRUE  | CONSTANT BINARY_INTEGER := 1 |

**Table 114-3 DBMS\_MGWMSG Constants: Case Comparisons**

| Value            | Constant                     |
|------------------|------------------------------|
| CASE_SENSITIVE   | CONSTANT BINARY_INTEGER := 0 |
| CASE_INSENSITIVE | CONSTANT BINARY_INTEGER := 1 |

**Table 114-4 Constants for the TIB/Rendezvous field type**

| Value             | Constant               |
|-------------------|------------------------|
| TIBRVMSG_BOOL     | CONSTANT INTEGER := 1  |
| TIBRVMSG_F32      | CONSTANT INTEGER := 2  |
| TIBRVMSG_F64      | CONSTANT INTEGER := 3  |
| TIBRVMSG_I8       | CONSTANT INTEGER := 4  |
| TIBRVMSG_I16      | CONSTANT INTEGER := 5  |
| TIBRVMSG_I32      | CONSTANT INTEGER := 6  |
| TIBRVMSG_I64      | CONSTANT INTEGER := 7  |
| TIBRVMSG_IPADDR32 | CONSTANT INTEGER := 8  |
| TIBRVMSG_IPPORT16 | CONSTANT INTEGER := 9  |
| TIBRVMSG_DATETIME | CONSTANT INTEGER := 10 |
| TIBRVMSG_F32ARRAY | CONSTANT INTEGER := 11 |
| TIBRVMSG_F64ARRAY | CONSTANT INTEGER := 12 |
| TIBRVMSG_I8ARRAY  | CONSTANT INTEGER := 13 |

**Table 114-4 (Cont.) Constants for the TIB/Rendezvous field type**

| Value             | Constant               |
|-------------------|------------------------|
| TIBRVMSG_I16ARRAY | CONSTANT INTEGER := 14 |
| TIBRVMSG_I32ARRAY | CONSTANT INTEGER := 15 |
| TIBRVMSG_I64ARRAY | CONSTANT INTEGER := 16 |
| TIBRVMSG_OPAQUE   | CONSTANT INTEGER := 17 |
| TIBRVMSG_STRING   | CONSTANT INTEGER := 18 |
| TIBRVMSG_XML      | CONSTANT INTEGER := 19 |

## 114.3 DBMS\_MGWMSG Types

DBMS\_MGWMSG uses types to specify certain information.

- [SYS.MGW\\_NAME\\_VALUE\\_T Type](#)
- [SYS.MGW\\_NAME\\_VALUE\\_T Type-Attribute Mapping](#)
- [SYS.MGW\\_NAME\\_TYPE\\_ARRAY\\_T Type](#)
- [SYS.MGW\\_TEXT\\_VALUE\\_T Type](#)
- [SYS.MGW\\_RAW\\_VALUE\\_T Type](#)
- [SYS.MGW\\_BASIC\\_MSG\\_T Type](#)
- [SYS.MGW\\_NUMBER\\_ARRAY\\_T Type](#)
- [SYS.MGW\\_TIBRV\\_FIELD\\_T Type](#)
- [SYS.MGW\\_TIBRV\\_MSG\\_T Type](#)

### 114.3.1 DBMS\_MGWMSG SYS.MGW\_NAME\_VALUE\_T Type

This type specifies a named value.

The name attribute, type attribute, and one of the <>\_value attributes are typically not NULL.

#### Syntax

```

TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
    name          VARCHAR2(250),
    type          INTEGER,
    integer_value  INTEGER,
    number_value   NUMBER,
    text_value     VARCHAR2(4000),
    raw_value      RAW(2000),
    date_value     DATE,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_BOOLEAN (
        name  IN VARCHAR2,
        value IN INTEGER )
    RETURN SYS.MGW_NAME_VALUE_T,

```

```

STATIC FUNCTION CONSTRUCT_BYTE (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
    name    IN VARCHAR2,
    value   IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name    IN VARCHAR2,
    value   IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name    IN VARCHAR2,
    value   IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name    IN VARCHAR2,
    value   IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name    IN VARCHAR2,
    value   IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

## Attributes

**Table 114-5 SYS.MGW\_NAME\_VALUE\_T Attributes**

| Attribute     | Description                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name          | Name associated with the value                                                                                                                                                                                           |
| type          | Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in <a href="#">Table 114-1</a> . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value. |
| integer_value | Stores a numeric integer value                                                                                                                                                                                           |
| number_value  | Stores a numeric float or large integer value                                                                                                                                                                            |

**Table 114-5 (Cont.) SYS.MGW\_NAME\_VALUE\_T Attributes**

| Attribute  | Description                |
|------------|----------------------------|
| text_value | Stores a text value        |
| raw_value  | Stores a RAW (bytes) value |
| date_value | Stores a date value        |

**SYS.MGW\_NAME\_VALUE\_T Type-Attribute Mapping**

[Table 114-6](#) shows the mapping between the value type and the attribute used to store the value.

**Table 114-6 SYS.MGW\_NAME\_VALUE\_T Type Attribute Mapping**

| Type                      | Value Stored in Attribute |
|---------------------------|---------------------------|
| DBMS_MGWMSG.TEXT_VALUE    | text_value                |
| DBMS_MGWMSG.RAW_VALUE     | raw_value                 |
| DBMS_MGWMSG.BOOLEAN_VALUE | integer_value             |
| DBMS_MGWMSG.BYTE_VALUE    | integer_value             |
| DBMS_MGWMSG.SHORT_VALUE   | integer_value             |
| DBMS_MGWMSG.INTEGER_VALUE | integer_value             |
| DBMS_MGWMSG.LONG_VALUE    | number_value              |
| DBMS_MGWMSG.FLOAT_VALUE   | number_value              |
| DBMS_MGWMSG.DOUBLE_VALUE  | number_value              |
| DBMS_MGWMSG.DATE_VALUE    | date_value                |

**CONSTRUCT Method**

This method constructs a new `SYS.MGW_NAME_VALUE_T` instance. All attributes are assigned a value of `NULL`.

**Syntax**

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

**CONSTRUCT\_TYPE Methods**

These methods construct a new `SYS.MGW_NAME_VALUE_T` instance initialized with the value of a specific type. Each method sets the `name` and `type` attributes and one of the `<>_value` attributes, as shown in the mappings in [Table 114-6](#).

**Syntax**

```
STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
    value   IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

**Usage Notes**

The `construct_boolean` method sets the value to either `DBMS_MGWMSG.BOOLEAN_TRUE` or `DBMS_MGWMSG.BOOLEAN_FALSE`.

### 114.3.2 DBMS\_MGWMSG SYS.MGW\_NAME\_TYPE\_ARRAY\_T Type

This type specifies an array of name-value pairs. An object of `SYS.MGW_NAME_VALUE_ARRAY_T` type can have up to 1024 elements.

#### Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
  AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

### 114.3.3 DBMS\_MGWMSG SYS.MGW\_TEXT\_VALUE\_T Type

This type specifies a `TEXT` value. It can store a large value as a `CLOB` or a smaller value (size  $\leq 4000$ ) as `VARCHAR2`. Only one of the `< >_value` attributes should be set.

#### Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
  small_value VARCHAR2(4000),
  large_value CLOB,

  -- Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_TEXT_VALUE_T);
```

#### Attributes

**Table 114-7** SYS.MGW\_TEXT\_VALUE\_T Attributes

| Attribute                | Description                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------|
| <code>small_value</code> | Small <code>TEXT</code> value. Used for values $\leq 4000$ .                                                |
| <code>large_value</code> | Large <code>TEXT</code> value. Used when the value is too large for the <code>small_value</code> attribute. |

#### CONSTRUCT Method

This method constructs a new `SYS.MGW_TEXT_VALUE_T` instance. All attributes are assigned a value of `NULL`.

#### Syntax

```
STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_TEXT_VALUE_T;
```

### 114.3.4 DBMS\_MGWMSG SYS.MGW\_RAW\_VALUE\_T Type

This type specifies a `RAW` value. This type can store a large value as a `BLOB` or a smaller value (size  $\leq 2000$ ) as `RAW`. You must set no more than one of the `< >_value` attributes.

#### Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
  small_value RAW(2000),
```

```
    large_value BLOB,  
  
--Methods  
STATIC FUNCTION CONSTRUCT  
RETURN SYS.MGW_RAW_VALUE_T);
```

### Attributes

**Table 114-8** SYS.MGW\_RAW\_VALUE\_T Attributes

| Attribute   | Description                                                                      |
|-------------|----------------------------------------------------------------------------------|
| small_value | Small RAW (bytes) value <= 2000                                                  |
| large_value | Large RAW value. Used when the value is too large for the small_value attribute. |

### CONSTRUCT Method

This method constructs a new SYS.MGW\_RAW\_VALUE\_T instance. All attributes are assigned a value of NULL.

### Syntax

```
STATIC FUNCTION CONSTRUCT  
RETURN SYS.MGW_RAW_VALUE_T;
```

## 114.3.5 DBMS\_MGWMSG SYS.MGW\_BASIC\_MSG\_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

### Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(  
    header      SYS.MGW_NAME_VALUE_ARRAY_T,  
    text_body   SYS.MGW_TEXT_VALUE_T,  
    raw_body    SYS.MGW_RAW_VALUE_T,  
  
--Methods  
STATIC FUNCTION CONSTRUCT  
RETURN SYS.MGW_BASIC_MSG_T);
```

### Attributes

**Table 114-9** SYS.MGW\_BASIC\_MSG\_T Attributes

| Attribute | Description                                                |
|-----------|------------------------------------------------------------|
| header    | Message header information as an array of name-value pairs |
| text_body | Message body for a TEXT message                            |
| raw_body  | Message body for a RAW (bytes) message                     |

### CONSTRUCT Method

This method constructs a new SYS.MGW\_BASIC\_MSG\_T instance. All attributes are assigned a value of NULL.

### Syntax

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;

```

## 114.3.6 DBMS\_MGWMSG SYS.MGW\_NUMBER\_ARRAY\_T Type

A type that specifies an array of numbers.

### Syntax

```

TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;

```

## 114.3.7 DBMS\_MGWMSG SYS.MGW\_TIBRV\_FIELD\_T Type

This type represents a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW\_TIBRV\_MSG\_T instance.

### Syntax

```

TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
    field_name      VARCHAR2(256),
    field_id        INTEGER,
    field_type      INTEGER,
    number_value    NUMBER,
    number_array_value SYS.MGW_NUMBER_ARRAY_T,
    text_value      VARCHAR2(4000),
    raw_value       RAW(2000),
    date_value      DATE,
    clob_value      CLOB,
    blob_value      BLOB);

```

### Attributes

**Table 114-10** SYS.MGW\_TIBRV\_FIELD\_T Attributes

| Attribute          | Description                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| field_name         | Field name. This will be NULL if the field has no name.                                                                                                                                                               |
| field_id           | Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message. |
| field_type         | Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.             |
| number_value       | Used to store a numeric value                                                                                                                                                                                         |
| number_array_value | Used to store a numeric array value                                                                                                                                                                                   |
| text_value         | Used to store a small text value                                                                                                                                                                                      |
| raw_value          | Used to store a small raw value                                                                                                                                                                                       |
| date_value         | Used to store a date value                                                                                                                                                                                            |
| clob_value         | Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.                                                                                 |
| blob_value         | Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.                                                                                    |

**SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

Table 114-11 describes the mapping in type SYS.MGW\_TIBRV\_FIELD\_T between the field type and attribute used to store the value.

**Table 114-11 SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

| Field Type (DBMS_MGWMSG constant) | Value Stored in Attribute |
|-----------------------------------|---------------------------|
| TIBRVMSG_BOOL                     | number_value              |
| TIBRVMSG_F32                      | number_value              |
| TIBRVMSG_F64                      | number_value              |
| TIBRVMSG_I8                       | number_value              |
| TIBRVMSG_I16                      | number_value              |
| TIBRVMSG_I32                      | number_value              |
| TIBRVMSG_I64                      | number_value              |
| TIBRVMSG_IPADDR32                 | text_value                |
| TIBRVMSG_IPPORT16                 | number_value              |
| TIBRVMSG_DATETIME                 | date_value                |
| TIBRVMSG_F32ARRAY                 | number_array_value        |
| TIBRVMSG_F64ARRAY                 | number_array_value        |
| TIBRVMSG_I8ARRAY                  | number_array_value        |
| TIBRVMSG_I16ARRAY                 | number_array_value        |
| TIBRVMSG_I32ARRAY                 | number_array_value        |
| TIBRVMSG_I64ARRAY                 | number_array_value        |
| TIBRVMSG_OPAQUE                   | raw_value or blob_value   |
| TIBRVMSG_STRING                   | text_value or clob_value  |
| TIBRVMSG_XML                      | raw_value or blob_value   |

**114.3.8 DBMS\_MGWMSG SYS.MGW\_TIBRV\_MSG\_T Type**

This type represents a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

**Syntax**

```
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
```

```
        blob_data3      BLOB,

    STATIC FUNCTION construct
    RETURN SYS.MGW_TIBRV_MSG_T,

### Attributes

**Table 114-12** SYS.MGW\_TIBRV\_MSG\_T Type Attributes

| Attribute       | Description                            |
|-----------------|----------------------------------------|
| send_subject    | Send subject name                      |
| reply_subject   | Reply subject name                     |
| cm_time_limit   | Time limit for a certified message     |
| cm_sender_name  | Sender name of a certified message     |
| cm_sequence_num | Sequence number of a certified message |

**Table 114-12 (Cont.) SYS.MGW\_TIBRV\_MSG\_T Type Attributes**

| Attribute  | Description                      |
|------------|----------------------------------|
| fields     | Collection of message fields     |
| clob_data1 | Used to store a large text value |
| clob_data2 | Used to store a large text value |
| clob_data3 | Used to store a large text value |
| blob_data1 | Used to store a large raw value  |
| blob_data2 | Used to store a large raw value  |
| blob_data3 | Used to store a large raw value  |

**Construct Method**

Constructs a new SYS.MGW\_TIBRV\_MSG\_T instance. All attributes are set to NULL.

**Syntax**

```
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;
```

**ADD\_<> Methods**

Adds a new field to the message.

**Syntax**

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

**Parameters****Table 114-13 SYS.MGW\_TIBRV\_MSG\_T ADD\_<> Method Parameters**

| Parameter | Description      |
|-----------|------------------|
| name      | Field name       |
| id        | Field identifier |
| value     | Field data       |

[Table 114-14](#) shows, for each add method, the field type that will be assigned and valid values for the field data.

**Table 114-14 MGW\_TIBRV\_MSG\_T Add Method Field Types**

| Method Name | Field Type Assigned | Comment                           |
|-------------|---------------------|-----------------------------------|
| add_bool    | TIBRVMSG_BOOL       | Valid values: 0 (false), 1 (true) |
| add_f32     | TIBRVMSG_F32        | n/a                               |
| add_f64     | TIBRVMSG_F64        | n/a                               |
| add_i8      | TIBRVMSG_I8         | Valid range: -128...127           |

**Table 114-14 (Cont.) MGW\_TIBRV\_MSG\_T Add Method Field Types**

| Method Name  | Field Type Assigned | Comment                                                                    |
|--------------|---------------------|----------------------------------------------------------------------------|
| add_i16      | TIBRVMSG_I16        | Valid range: -32768...32767                                                |
| add_i32      | TIBRVMSG_I32        | Valid range: -2147483648...<br>2147483647                                  |
| add_i64      | TIBRVMSG_I64        | n/a                                                                        |
| add_ipaddr32 | TIBRVMSG_IPADDR32   | n/a                                                                        |
| add_ipport16 | TIBRVMSG_IPPORT16   | n/a                                                                        |
| add_datetime | TIBRVMSG_DATETIME   | n/a                                                                        |
| add_f32array | TIBRVMSG_F32ARRAY   | n/a                                                                        |
| add_f64array | TIBRVMSG_F64ARRAY   | n/a                                                                        |
| add_i8array  | TIBRVMSG_I8ARRAY    | Valid range: -128...127                                                    |
| add_i16array | TIBRVMSG_I16ARRAY   | Valid range: -32768...32767                                                |
| add_i32array | TIBRVMSG_I32ARRAY   | Valid range: -2147483648...<br>2147483647                                  |
| add_i64array | TIBRVMSG_I64ARRAY   | n/a                                                                        |
| add_opaque   | TIBRVMSG_OPAQUE     | Value stored as RAW if size < 2000;<br>otherwise value stored in BLOB      |
| add_string   | TIBRVMSG_STRING     | Value stored as VARCHAR2 if size <<br>4000; otherwise value stored in CLOB |
| add_xml      | TIBRVMSG_XML        | Value stored as RAW if size < 2000;<br>otherwise value stored in BLOB      |

**SET\_<> Methods**

Accessor methods to set an instance attribute to a specific value.

**Syntax**

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

**Parameters****Table 114-15 SYS.MGW\_TIBRV\_MSG\_T SET\_<> Method Parameters**

| Parameter | Description          |
|-----------|----------------------|
| value     | Value to be assigned |

**GET\_<> Methods**

Accessor methods to retrieve the value for an instance attribute.

**Syntax**

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

**Parameters**

None

#### Return Values

Returns the attribute value.

#### GET\_FIELD\_COUNT Function

Gets the number of message fields.

#### Syntax

```
MEMBER PROCEDURE get_field_count  
RETURN INTEGER;
```

#### Parameters

None

#### Return Values

Returns the number of fields, or zero (0) if there are none.

#### GET\_FIELD Function

Retrieves field information for the field having a given field collection index. This method should only be called if the `GET_FIELD_COUNT` Function returns a nonzero value and `idx` must specify a valid collection index; that is, `1<=idx<=get_field_count()`.

#### Syntax

```
MEMBER PROCEDURE get_field (  
    idx    IN    INTEGER )  
RETURN SYS.MGW_TIBRV_FIELD_T;
```

#### Parameters

**Table 114-16** SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD Function Parameters

| Parameter        | Description                                                           |
|------------------|-----------------------------------------------------------------------|
| <code>idx</code> | Specifies the 1-based field collection index of the field to retrieve |

#### Note:

A 1-based index begins at one (1) instead of zero (0).

#### Return Values

Returns the field information.

#### GET\_FIELD\_BY\_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

#### Syntax

```
MEMBER PROCEDURE get_field_by_name (  
    name IN VARCHAR2 )  
RETURN SYS.MGW_TIBRV_FIELD_T;
```

#### Parameters

**Table 114-17 SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_NAME Function Parameters**

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| name      | Specifies the field name to search for. This can be NULL to find the first field that does not have a field name. |

#### Return Values

Returns the field information, or NULL if no match was found.

#### GET\_FIELD\_BY\_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

#### Syntax

```
MEMBER PROCEDURE get_field_by_id (  
    id IN INTEGER )  
RETURN SYS.MGW_TIBRV_FIELD_T;
```

#### Parameters

**Table 114-18 SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_ID Function Parameters**

| Parameter | Description                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| id        | Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier. |

#### Return Values

Returns the field information, or NULL if no match was found.

#### FIND\_FIELD\_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

#### Syntax

```
MEMBER PROCEDURE find_field_name (  
    name IN VARCHAR2,  
    start_idx IN INTEGER )  
RETURN INTEGER;
```

#### Parameters

**Table 114-19 SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_NAME Function Parameters**

| Parameter | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| name      | Specifies the field name to search for. This can be NULL to search for a field that does not have a field name. |
| start_idx | Specifies the 1-based field collection index from which the search should start.                                |

**Return Values**

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

**FIND\_FIELD\_ID Function**

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

**Syntax**

```
MEMBER PROCEDURE find_field_id (  
    id          IN  INTEGER,  
    start_idx IN INTEGER )  
RETURN        INTEGER;
```

**Parameters****Table 114-20 SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_ID Function Parameters**

| Parameter | Description                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------|
| id        | Specifies the field identifier to search for. This can be zero (0) or NULL to find a field that does not have an identifier. |
| start_idx | Specifies the 1-based field collection index from which the search should start.                                             |

**Return Values**

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

## 114.4 Summary of DBMS\_MGWMSG Subprograms

This table lists the DBMS\_MGWMSG subprograms and briefly describes them.

**Table 114-21 DBMS\_MGWMSG Package Subprograms**

| Subprogram                                 | Description                                                                                                                      |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LCR_TO_XML Function</a>        | Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object |
| <a href="#">NVARRAY_ADD Procedure</a>      | Appends a name-value element to the end of a name-value array                                                                    |
| <a href="#">NVARRAY_FIND_NAME Function</a> | Searches a name-value array for the element with the name you specify in p_name                                                  |

**Table 114-21 (Cont.) DBMS\_MGWMSG Package Subprograms**

| Subprogram                                        | Description                                                                                                                                                                              |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">NVARARRAY_FIND_NAME_TYPE Function</a> | Searches a name-value array for an element with the name and value type you specify                                                                                                      |
| <a href="#">NVARARRAY_GET Function</a>            | Gets the name-value element of the name you specify in <code>p_name</code> from a name-value array                                                                                       |
| <a href="#">NVARARRAY_GET_BOOLEAN Function</a>    | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>BOOLEAN_VALUE</code> value type                                                |
| <a href="#">NVARARRAY_GET_BYTE Function</a>       | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>BYTE_VALUE</code> value type                                                   |
| <a href="#">NVARARRAY_GET_DATE Function</a>       | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>DATE_VALUE</code> value type                                                   |
| <a href="#">NVARARRAY_GET_DOUBLE Function</a>     | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>DOUBLE_VALUE</code> value type                                                 |
| <a href="#">NVARARRAY_GET_FLOAT Function</a>      | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>FLOAT_VALUE</code> value type                                                  |
| <a href="#">NVARARRAY_GET_INTEGER Function</a>    | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>INTEGER_VALUE</code> value type                                                |
| <a href="#">NVARARRAY_GET_LONG Function</a>       | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>LONG_VALUE</code> value type                                                   |
| <a href="#">NVARARRAY_GET_RAW Function</a>        | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>RAW_VALUE</code> value type                                                    |
| <a href="#">NVARARRAY_GET_SHORT Function</a>      | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>SHORT_VALUE</code> value type                                                  |
| <a href="#">NVARARRAY_GET_TEXT Function</a>       | Gets the value of the name-value array element that you specify in <code>p_name</code> and with the <code>TEXT_VALUE</code> value type                                                   |
| <a href="#">XML_TO_LCR Function</a>               | Converts a <code>SYS.XMLTYPE</code> object to a <code>SYS.ANYDATA</code> object encapsulating a row LCR ( <code>LCR\$_ROW_RECORD</code> ) or a DDL LCR ( <code>LCR\$_DDL_RECORD</code> ) |

## 114.4.1 LCR\_TO\_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

### See Also:

[XML\\_TO\\_LCR Function](#)

### Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
    p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

## Parameters

**Table 114-22 LCR\_TO\_XML Function Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| p_anydata | An ANYDATA object to be converted |

## Return Values

Returns a SYS.XMLTYPE object.

## Usage Notes

An exception is raised if the encapsulated type p\_anydata is not an LCR.

## 114.4.2 NVARRAY\_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (  
    p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_value IN      SYS.MGW_NAME_VALUE_T );
```

## Parameters

**Table 114-23 NVARRAY\_ADD Procedure Parameters**

| Parameter | Description                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| p_array   | On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance. |
| p_value   | The value to add. If NULL, then p_array is not changed.                                                                                     |

## 114.4.3 NVARRAY\_FIND\_NAME Function

This function searches a name-value array for the element with the name you specify in p\_name.

### Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (  
    p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name IN VARCHAR2,  
    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

## Parameters

**Table 114-24 NVARRAY\_FIND\_NAME Function Parameters**

| Parameters | Description                                                             |
|------------|-------------------------------------------------------------------------|
| p_array    | The name-value array to search                                          |
| p_name     | The name to find                                                        |
| p_compare  | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

## Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

## 114.4.4 NVARRAY\_FIND\_NAME\_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

## Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_type     IN BINARY_INTEGER  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

## Parameters

**Table 114-25 NVARRAY\_FIND\_NAME\_TYPE Function Parameters**

| Parameter | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| p_array   | The name-value array to search                                                     |
| p_name    | The name to find                                                                   |
| p_type    | The value type. Refer to the value type constants in <a href="#">Table 114-1</a> . |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.            |

## Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

## 114.4.5 NVARRAY\_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

### Parameters

**Table 114-26 NVARRAY\_GET Function Parameters**

| Parameter              | Description                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------|
| <code>p_array</code>   | The name-value array                                                                               |
| <code>p_name</code>    | The value name                                                                                     |
| <code>p_compare</code> | Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> . |

### Return Values

Returns the matching element, or `NULL` if the specified name is not found.

## 114.4.6 NVARRAY\_GET\_BOOLEAN Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BOOLEAN_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

### Parameters

**Table 114-27 NVARRAY\_GET\_BOOLEAN Function Parameters**

| Parameter              | Description                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------|
| <code>p_array</code>   | The name-value array                                                                               |
| <code>p_name</code>    | The value name                                                                                     |
| <code>p_compare</code> | Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> . |

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

**114.4.7 NVARRAY\_GET\_BYTE Function**

This function gets the value of the name-value array element that you specify in `p_name` and with the `BYTE_VALUE` value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

**Parameters**

**Table 114-28 NVARRAY\_GET\_BYTE Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

**114.4.8 NVARRAY\_GET\_DATE Function**

This function gets the value of the name-value array element that you specify in `p_name` and with the `DATE_VALUE` value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

**Parameters**

**Table 114-29 NVARRAY\_GET\_DATE Function Parameters**

| Parameters | Description          |
|------------|----------------------|
| p_array    | The name-value array |
| p_name     | The value name       |

**Table 114-29 (Cont.) NVARRAY\_GET\_DATE Function Parameters**

| Parameters | Description                                                             |
|------------|-------------------------------------------------------------------------|
| p_compare  | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.9 NVARRAY\_GET\_DOUBLE Function

This function gets the value of the name-value array element that you specify in p\_name and with the DOUBLE\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

**Parameters****Table 114-30 NVARRAY\_GET\_DOUBLE Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.10 NVARRAY\_GET\_FLOAT Function

This function gets the value of the name-value array element that you specify in p\_name and with the FLOAT\_VALUE value type.

**Syntax**

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

## Parameters

**Table 114-31 NVARRAY\_GET\_FLOAT Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

## Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.11 NVARRAY\_GET\_INTEGER Function

This function gets the value of the name-value array element that you specify in p\_name and with the INTEGER\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

## Parameters

**Table 114-32 NVARRAY\_GET\_INTEGER Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

## Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.12 NVARRAY\_GET\_LONG Function

This function gets the value of the name-value array element that you specify in p\_name and with the LONG\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
```

```
p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN NUMBER;
```

### Parameters

**Table 114-33 NVARRAY\_GET\_LONG Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.13 NVARRAY\_GET\_RAW Function

This function gets the value of the name-value array element that you specify in p\_name and with the RAW\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN RAW;
```

### Parameters

**Table 114-34 NVARRAY\_GET\_RAW Function Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.14 NVARRAY\_GET\_SHORT Function

This function gets the value of the name-value array element that you specify in p\_name and with the SHORT\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
```

```
    p_name      IN VARCHAR2,  
    p_compare   IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;
```

### Parameters

**Table 114-35** NVARRAY\_GET\_SHORT Function Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## 114.4.15 NVARRAY\_GET\_TEXT Function

This function gets the value of the name-value array element that you specify in p\_name and with the TEXT\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (  
    p_array      IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name       IN VARCHAR2,  
    p_compare    IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN VARCHAR2;
```

### Parameters

**Table 114-36** NVARRAY\_GET\_TEXT Function Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| p_array   | The name-value array                                                    |
| p_name    | The value name                                                          |
| p_compare | Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE. |

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

# 114.4.16 XML\_TO\_LCR Function

This function converts a `SYS.XMLTYPE` object to a `SYS.ANYDATA` object encapsulating a row LCR (`LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`).

 **See Also:**  
[LCR\\_TO\\_XML Function](#)

## Syntax

```
DBMS_MGWMSG.XML_TO_LCR (
    p_xmldata IN SYS.XMLTYPE )
RETURN SYS.ANYDATA;
```

## Parameters

**Table 114-37 XML\_TO\_LCR Function Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| p_xmldata | An <code>XMLTYPE</code> object representing an LCR |

## Return Values

Returns a `SYS.ANYDATA` object.

## Usage Notes

An exception is raised if `p_xmldata` cannot be converted to an LCR.

# DBMS\_MONITOR

The `DBMS_MONITOR` package enables you to use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS\\_MONITOR Subprograms](#)

## 115.1 Summary of DBMS\_MONITOR Subprograms

This table lists the `DBMS_MONITOR` subprograms and briefly describes them.

**Table 115-1 DBMS\_MONITOR Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                         |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLIENT_ID_STAT_DISABLE Procedure</a>     | Disables statistic gathering previously enabled for a given Client Identifier                                                                                       |
| <a href="#">CLIENT_ID_STAT_ENABLE Procedure</a>      | Enables statistic gathering for a given Client Identifier                                                                                                           |
| <a href="#">CLIENT_ID_TRACE_DISABLE Procedure</a>    | Disables the trace previously enabled for a given Client Identifier globally for the database                                                                       |
| <a href="#">CLIENT_ID_TRACE_ENABLE Procedure</a>     | Enables the trace for a given Client Identifier globally for the database                                                                                           |
| <a href="#">DATABASE_TRACE_DISABLE Procedure</a>     | Disables SQL trace for the whole database or a specific instance                                                                                                    |
| <a href="#">DATABASE_TRACE_ENABLE Procedure</a>      | Enables SQL trace for the whole database or a specific instance                                                                                                     |
| <a href="#">SERV_MOD_ACT_STAT_DISABLE Procedure</a>  | Disables statistic gathering enabled for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code>                                           |
| <a href="#">SERV_MOD_ACT_STAT_ENABLE Procedure</a>   | Enables statistic gathering for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code>                                                    |
| <a href="#">SERV_MOD_ACT_TRACE_DISABLE Procedure</a> | Disables the trace for <code>ALL</code> enabled instances for a or a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> name globally   |
| <a href="#">SERV_MOD_ACT_TRACE_ENABLE Procedure</a>  | Enables SQL tracing for a given combination of Service Name, <code>MODULE</code> and <code>ACTION</code> globally unless an <code>instance_name</code> is specified |
| <a href="#">SESSION_TRACE_DISABLE Procedure</a>      | Disables the previously enabled trace for a given database session identifier (SID) on the local instance                                                           |
| <a href="#">SESSION_TRACE_ENABLE Procedure</a>       | Enables the trace for a given database session identifier (SID) on the local instance                                                                               |

## 115.1.1 CLIENT\_ID\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT\_STATS view enabled by the CLIENT\_ID\_STAT\_ENABLE Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN   VARCHAR2);
```

### Parameters

**Table 115-2** CLIENT\_ID\_STAT\_DISABLE Procedure Parameters

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| client_id | Client Identifier for which statistic aggregation is disabled |

### Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

## 115.1.2 CLIENT\_ID\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier.

Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT\_STATS views.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN   VARCHAR2);
```

### Parameters

**Table 115-3** CLIENT\_ID\_STAT\_ENABLE Procedure Parameters

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| client_id | Client Identifier for which statistic aggregation is enabled |

### Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

## 115.1.3 CLIENT\_ID\_TRACE\_DISABLE Procedure

This procedure will disable tracing enabled by the `CLIENT_ID_TRACE_ENABLE` Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(  
  client_id    IN  VARCHAR2);
```

### Parameters

**Table 115-4** CLIENT\_ID\_TRACE\_DISABLE Procedure Parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| client_id | Client Identifier for which SQL tracing is disabled |

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

## 115.1.4 CLIENT\_ID\_TRACE\_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(  
  client_id    IN  VARCHAR2,  
  waits        IN  BOOLEAN DEFAULT TRUE,  
  binds        IN  BOOLEAN DEFAULT FALSE,  
  plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-5** CLIENT\_ID\_TRACE\_ENABLE Procedure Parameters

| Parameter | Description                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| client_id | Database Session Identifier for which SQL tracing is enabled                                                                           |
| waits     | If TRUE, wait information is present in the trace                                                                                      |
| binds     | If TRUE, bind information is present in the trace                                                                                      |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

### Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,  
FALSE);
```

## 115.1.5 DATABASE\_TRACE\_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(  
    instance_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-6 DATABASE\_TRACE\_DISABLE Procedure Parameters**

| Parameter     | Description                             |
|---------------|-----------------------------------------|
| instance_name | Disables tracing for the named instance |

## 115.1.6 DATABASE\_TRACE\_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(  
    waits          IN BOOLEAN DEFAULT TRUE,  
    binds          IN BOOLEAN DEFAULT FALSE,  
    instance_name  IN VARCHAR2 DEFAULT NULL,  
    plan_stat      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-7 DATABASE\_TRACE\_ENABLE Procedure Parameters**

| Parameter     | Description                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| waits         | If TRUE, wait information will be present in the trace                                                                                 |
| binds         | If TRUE, bind information will be present in the trace                                                                                 |
| instance_name | If set, restricts tracing to the named instance                                                                                        |
| plan_stat     | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

## 115.1.7 SERV\_MOD\_ACT\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV\_MOD\_ACT\_STATS view.

Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(  
    service_name  IN VARCHAR2,  
    module_name   IN VARCHAR2,  
    action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

### Parameters

**Table 115-8 SERV\_MOD\_ACT\_STAT\_DISABLE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name | Name of the service for which statistic aggregation is disabled                                                                                                                                                                                                                         |
| module_name  | Name of the MODULE. An additional qualifier for the service. It is a required parameter.                                                                                                                                                                                                |
| action_name  | Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level. |

### Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

## 115.1.8 SERV\_MOD\_ACT\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION.

Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V\$SERV\_MOD\_ACT\_STATS view.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(  
    service_name  IN VARCHAR2,  
    module_name   IN VARCHAR2,  
    action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

## Parameters

**Table 115-9 SERV\_MOD\_ACT\_STAT\_ENABLE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name | Name of the service for which statistic aggregation is enabled                                                                                                                                                                                                                          |
| module_name  | Name of the MODULE. An additional qualifier for the service. It is a required parameter.                                                                                                                                                                                                |
| action_name  | Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level. |

## Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL\_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

## Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE  
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1', 'GLEDGER', 'DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT\_ENTRY Action within the GLEDGER Module.

## 115.1.9 SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(  
    service_name    IN  VARCHAR2,  
    module_name     IN  VARCHAR2,  
    action_name     IN  VARCHAR2 DEFAULT ALL_ACTIONS,  
    instance_name   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-10** SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure Parameters

| Parameter     | Description                                                                  |
|---------------|------------------------------------------------------------------------------|
| service_name  | Name of the service for which tracing is disabled.                           |
| module_name   | Name of the MODULE. An additional qualifier for the service                  |
| action_name   | Name of the ACTION. An additional qualifier for the Service and MODULE name. |
| instance_name | If set, this restricts tracing to the named instance_name                    |

### Usage Notes

Specifying NULL for the module\_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

### Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',  
        DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,  
        FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',  
        DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
```

## 115.1.10 SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an `instance_name` is specified.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(  
    service_name    IN VARCHAR2,  
    module_name     IN VARCHAR2 DEFAULT ANY_MODULE,  
    action_name     IN VARCHAR2 DEFAULT ANY_ACTION,  
    waits           IN BOOLEAN DEFAULT TRUE,  
    binds           IN BOOLEAN DEFAULT FALSE,  
    instance_name   IN VARCHAR2 DEFAULT NULL,  
    plan_stat       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-11** SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure Parameters

| Parameter                  | Description                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>service_name</code>  | Name of the service for which SQL trace is enabled                                                                                                                                       |
| <code>module_name</code>   | Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled for all modules and actions in a given service.    |
| <code>action_name</code>   | Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module. |
| <code>waits</code>         | If TRUE, wait information is present in the trace                                                                                                                                        |
| <code>binds</code>         | If TRUE, bind information is present in the trace                                                                                                                                        |
| <code>instance_name</code> | If set, this restricts tracing to the named <code>instance_name</code>                                                                                                                   |
| <code>plan_stat</code>     | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.                                                   |

### Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL\_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The `instance_name` parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the `trcsess` tool to collect it into a single file.

- Specifying NULL for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

### Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
        DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
        FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
        DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

## 115.1.11 SESSION\_TRACE\_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
    session_id    IN    BINARY_INTEGER DEFAULT NULL,
    serial_num    IN    BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 115-12** SESSION\_TRACE\_DISABLE Procedure Parameters

| Parameter               | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| <code>session_id</code> | Database Session Identifier for which SQL trace is disabled |
| <code>serial_num</code> | Serial number for this session                              |

### Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

## 115.1.12 SESSION\_TRACE\_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(  
    session_id  IN  BINARY_INTEGER DEFAULT NULL,  
    serial_num  IN  BINARY_INTEGER DEFAULT NULL,  
    waits       IN  BOOLEAN DEFAULT TRUE,  
    binds       IN  BOOLEAN DEFAULT FALSE,  
    plan_stat   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 115-13** SESSION\_TRACE\_ENABLE Procedure Parameters

| Parameter  | Description                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------|
| session_id | Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.                             |
| serial_num | Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.                              |
| waits      | If TRUE, wait information is present in the trace                                                                                      |
| binds      | If TRUE, bind information is present in the trace                                                                                      |
| plan_stat  | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

### Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

# DBMS\_MVIEW

`DBMS_MVIEW` enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

**Note:**

`DBMS_MVIEW` is a synonym for `DBMS_SNAPSHOT`.

**See Also:**

*Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- [Operational Notes](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_MVIEW Subprograms](#)

## 116.1 DBMS\_MVIEW Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL\*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

## 116.2 DBMS\_MVIEW Security Model

The `DBMS_MVIEW` package consists of a number of materialized view-related subprograms, each of which has different functionality and privilege requirements.

The privilege model is generally based on the invoker's right. Each package subprogram is executed by first checking the privileges against the invoker. If all the required privileges are met, the subprogram will be executed. Otherwise, an insufficient privileges error will be thrown.

## 116.3 DBMS\_MVIEW Rules and Limits

The `DBMS_MVIEW.EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `DBMS_MVIEW.EXPLAIN_MVIEW` procedure.

## 116.4 Summary of DBMS\_MVIEW Subprograms

This table lists the DBMS\_MVIEW subprograms and briefly describes them.

**Table 116-1 DBMS\_MVIEW Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                             |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BEGIN_TABLE_REORGANIZATION Procedure</a> | Performs a process to preserve materialized view data needed for refresh                                                                                                |
| <a href="#">END_TABLE_REORGANIZATION Procedure</a>   | Ensures that the materialized view data for the master table is valid and that the master table is in the proper state                                                  |
| <a href="#">ESTIMATE_MVIEW_SIZE Procedure</a>        | Estimates the size of a materialized view that you might create, in bytes and rows                                                                                      |
| <a href="#">EXPLAIN_MVIEW Procedure</a>              | Explains what is possible with a materialized view or potential materialized view                                                                                       |
| <a href="#">EXPLAIN_REWRITE Procedure</a>            | Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views                          |
| <a href="#">I_AM_A_REFRESH Function</a>              | Returns the value of the I_AM_REFRESH package state                                                                                                                     |
| <a href="#">PMARKER Function</a>                     | Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)                                                                                |
| <a href="#">PURGE_DIRECT_LOAD_LOG Procedure</a>      | Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)                                           |
| <a href="#">PURGE_LOG Procedure</a>                  | Purges rows from the materialized view log                                                                                                                              |
| <a href="#">PURGE_MVIEW_FROM_LOG Procedure</a>       | Purges rows from the materialized view log                                                                                                                              |
| <a href="#">REFRESH Procedures</a>                   | Refreshes one or more materialized views that are not members of the same refresh group                                                                                 |
| <a href="#">REFRESH_ALL_MVIEWS Procedure</a>         | Refreshes all materialized views that do not reflect changes to their master table or master materialized view                                                          |
| <a href="#">REFRESH_DEPENDENT Procedures</a>         | Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views |
| <a href="#">REGISTER_MVIEW Procedure</a>             | Enables the administration of individual materialized views                                                                                                             |
| <a href="#">UNREGISTER_MVIEW Procedure</a>           | Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view            |

### 116.4.1 BEGIN\_TABLE\_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

#### Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
    tabowner    IN    VARCHAR2,
    tabname     IN    VARCHAR2);
```

## Parameters

**Table 116-2 BEGIN\_TABLE\_REORGANIZATION Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| tabowner  | Owner of the table being reorganized |
| tabname   | Name of the table being reorganized  |

## 116.4.2 END\_TABLE\_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

### Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (  
    tabowner    IN   VARCHAR2,  
    tabname     IN   VARCHAR2);
```

## Parameters

**Table 116-3 END\_TABLE\_REORGANIZATION Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| tabowner  | Owner of the table being reorganized |
| tabname   | Name of the table being reorganized  |

## 116.4.3 ESTIMATE\_MVIEW\_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

### Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (  
    stmt_id      IN   VARCHAR2,  
    select_clause IN   VARCHAR2,  
    num_rows     OUT  NUMBER,  
    num_bytes    OUT  NUMBER);
```

## Parameters

**Table 116-4 ESTIMATE\_MVIEW\_SIZE Procedure Parameters**

| Parameter     | Description                                                        |
|---------------|--------------------------------------------------------------------|
| stmt_id       | Arbitrary string used to identify the statement in an EXPLAIN PLAN |
| select_clause | The SELECT statement to be analyzed                                |
| num_rows      | Estimated cardinality                                              |
| num_bytes     | Estimated number of bytes                                          |

# 116.4.4 EXPLAIN\_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

## Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    statement_id IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
    mv          IN VARCHAR2,
    msg_array   OUT SYS.ExplainMVArrayType);
```

## Parameters

Table 116-5 EXPLAIN\_MVIEW Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mv           | The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a <code>SELECT</code> statement or a <code>CREATE MATERIALIZED VIEW</code> statement for a potential materialized view. |
| statement_id | A client-supplied unique identifier to associate output rows with specific invocations of <code>EXPLAIN_MVIEW</code>                                                                                                               |
| msg_array    | The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_MVIEW</code> 's output to a PL/SQL <code>VARRAY</code> rather than <code>MV_CAPABILITIES_TABLE</code> .                        |

## Usage Notes

You must run the `utlxmlv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a `VARRAY`. The script is found in the `ADMIN` directory.

## 116.4.5 EXPLAIN\_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used.

Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the `EXPLAIN_REWRITE` statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from `EXPLAIN_REWRITE`.

### Syntax

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a `VARRAY`. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          VARCHAR2,
    mv             VARCHAR2(30),
    statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utlrxw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a `VARRAY` instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          [VARCHAR2 | CLOB],
    mv             VARCHAR2(30),
    output_array    SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from SQL\*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN... END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

## Parameters

**Table 116-6 EXPLAIN\_REWRITE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| query        | SQL <code>SELECT</code> statement to be explained                                                                                                                                   |
| mv           | The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names. |
| statement_id | A client-supplied unique identifier to distinguish output messages                                                                                                                  |
| msg_array    | The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> .                      |

## Usage Notes

To obtain the output into a table, you must run the `utlxrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

## 116.4.6 I\_AM\_A\_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

### Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH  
    RETURN BOOLEAN;
```

### Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

## 116.4.7 PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

### Syntax

```
DBMS_MVIEW.PMARKER(  
    rid IN ROWID)  
    RETURN NUMBER;
```

## Parameters

**Table 116-7 PMARKER Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| rid       | The rowid of a row entry in a master table |

## 116.4.8 PURGE\_DIRECT\_LOAD\_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

### Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

## 116.4.9 PURGE\_LOG Procedure

This procedure purges rows from the materialized view log.

### Syntax

```
DBMS_MVIEW.PURGE_LOG (
    master      IN   VARCHAR2,
    num         IN   BINARY_INTEGER := 1,
    flag        IN   VARCHAR2      := 'NOP');
```

### Parameters

**Table 116-8 PURGE\_LOG Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| master    | Name of the master table or master materialized view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| num       | <p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p> |
| flag      | <p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</pre>                                                                                                                                                                                                                                                                                                                                                                                                   |

## 116.4.10 PURGE\_MVIEW\_FROM\_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the

specified materialized view identified by `mview_id` or the combination of `mviewowner`, `mviewname`, and `mviewsite`.

If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

### Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
    mview_id      IN    BINARY_INTEGER);

DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
    mviewowner    IN    VARCHAR2,
    mviewname     IN    VARCHAR2,
    mviewsite     IN    VARCHAR2);
```

#### Note:

This procedure is overloaded. The parameter `mview_id` is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

### Parameters

**Table 116-9 PURGE\_MVIEW\_FROM\_LOG Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mview_id</code>   | If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs.<br><br>Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views ( <code>DBA_REGISTERED_MVIEWS</code> ). |
| <code>mviewowner</code> | If you do not specify an <code>mview_id</code> , enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners.                                                                                                                                                                                                                                                                           |
| <code>mviewname</code>  | If you do not specify an <code>mview_id</code> , enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names.                                                                                                                                                                                                                                                                              |
| <code>mviewsite</code>  | If you do not specify an <code>mview_id</code> , enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites.                                                                                                                                                                                                                                                                              |

### Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

## 116.4.11 REFRESH Procedures

This procedure refreshes a list of materialized views.

### Syntax

```
DBMS_MVIEW.REFRESH (
  { list          IN      VARCHAR2,
    | tab         IN      DBMS_UTILITY.UNCL_ARRAY, }
  method         IN      VARCHAR2      := NULL,
  rollback_seg   IN      VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN      := true,
  refresh_after_errors IN    BOOLEAN    := false,
  purge_option    IN      BINARY_INTEGER := 1,
  parallelism     IN      BINARY_INTEGER := 0,
  heap_size       IN      BINARY_INTEGER := 0,
  atomic_refresh  IN      BOOLEAN      := true,
  nested          IN      BOOLEAN      := false,
  out_of_place    IN      BOOLEAN      := false,
  skip_ext_data   IN      BOOLEAN      := false);
```

### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

### Parameters

**Table 116-10 REFRESH Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>list   tab</code> | <p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>method</code>     | <p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following <code>EXECUTE</code> statement within <code>SQL*Plus</code>:</p> <pre>DBMS_MVIEW.REFRESH ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p> |

**Table 116-10 (Cont.) REFRESH Procedure Parameters**

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rollback_seg</code>         | Name of the materialized view site rollback segment to use while refreshing materialized views                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>push_deferred_rpc</code>    | Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>refresh_after_errors</code> | If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.                                                                                                                                                                                                                                            |
| <code>purge_option</code>         | If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue.                                                                     |
| <code>parallelism</code>          | 0 specifies serial propagation.<br>$n > 1$ specifies parallel propagation with $n$ parallel processes.<br>1 specifies parallel propagation using only one parallel process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>heap_size</code>            | Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.<br><br>Note: Do not set this parameter unless directed to do so by Oracle Support Services.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>atomic_refresh</code>       | If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.<br><br>If this parameter is set to <code>false</code> , then each of the materialized views is refreshed non-atomically in separate transactions.<br><br>As part of complete refresh, if <code>truncate</code> is used (non-atomic refresh), unique index rebuild is executed. <code>INDEX REBUILD</code> automatically computes statistics. Thus, statistics are updated for truncated tables. |
| <code>nested</code>               | If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.                                                                                                                                                                                                                                                                                                                                                |
| <code>out_of_place</code>         | If <code>true</code> , then it performs an out-of-place refresh. The default is <code>false</code> .<br><br>This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and <code>out_of_place = true</code> , then an out-of-place fast refresh will be attempted. Similarly, if you specify P and <code>out_of_place = true</code> , then out-of-place PCT refresh will be attempted.                                                                                                                                                                                                                                                                                  |
| <code>skip_ext_data</code>        | Provides you an option to skip the MV data refresh corresponding to the external partitions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# 116.4.12 REFRESH\_ALL\_MVIEWS Procedure

This procedure refreshes all materialized views that have certain properties

All materialized views with the following properties are refreshed:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA\_MVIEWS.

This procedure is intended for use with data warehouses.

## Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
    number_of_failures    OUT    BINARY_INTEGER,
    method                IN     VARCHAR2          := NULL,
    rollback_seg          IN     VARCHAR2          := NULL,
    refresh_after_errors  IN     BOOLEAN           := false,
    atomic_refresh        IN     BOOLEAN           := true,
    out_of_place          IN     BOOLEAN           := false);
```

## Parameters

**Table 116-11 REFRESH\_ALL\_MVIEWS Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| number_of_failures   | Returns the number of failures that occurred during processing                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| method               | A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. |
| rollback_seg         | Name of the materialized view site rollback segment to use while refreshing materialized views                                                                                                                                                                                                                                                                                                                                                                                                        |
| refresh_after_errors | If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.                                                                                                        |
| atomic_refresh       | If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.<br><br>If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions.                                                                 |

**Table 116-11 (Cont.) REFRESH\_ALL\_MVIEWS Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| out_of_place | If true, then it performs an out-of-place refresh. The default is false.<br><br>This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted. |

## 116.4.13 REFRESH\_DEPENDENT Procedures

This procedure refreshes all materialized views that have certain properties.

Materialized views with the following properties are refreshed:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA\_MVIEWS.

This procedure is intended for use with data warehouses.

### Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
    number_of_failures    OUT    BINARY_INTEGER,
    { list                IN     VARCHAR2,
      | tab               IN     DBMS_UTILITY.UNCL_ARRAY, }
    method               IN     VARCHAR2      := NULL,
    rollback_seg         IN     VARCHAR2      := NULL,
    refresh_after_errors IN     BOOLEAN       := false,
    atomic_refresh       IN     BOOLEAN       := true,
    nested               IN     BOOLEAN       := false,
    out_of_place         IN     BOOLEAN       := false);
```

### Note:

This procedure is overloaded. The list and tab parameters are mutually exclusive.

### Parameters

**Table 116-12 REFRESH\_DEPENDENT Procedure Parameters**

| Parameter          | Description                                                    |
|--------------------|----------------------------------------------------------------|
| number_of_failures | Returns the number of failures that occurred during processing |

**Table 116-12 (Cont.) REFRESH\_DEPENDENT Procedure Parameters**

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>list   tab</code>           | <p>Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>method</code>               | <p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. <code>F</code> or <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following <code>EXECUTE</code> statement within <code>SQL*Plus</code>:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT ('employees,deptartments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the <code>employees</code> table, a fast refresh of the materialized views that depend on the <code>departments</code> table, and a default refresh of the materialized views that depend on the <code>hr.regions</code> table.</p> |
| <code>rollback_seg</code>         | Name of the materialized view site rollback segment to use while refreshing materialized views                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>refresh_after_errors</code> | If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>atomic_refresh</code>       | <p>If this parameter is set to <code>true</code>, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to <code>false</code>, then each of the materialized views is refreshed non-atomically in separate transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>nested</code>               | If <code>true</code> , then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>out_of_place</code>         | <p>If <code>true</code>, then it performs an out-of-place refresh. The default is <code>false</code>.</p> <p>This parameter uses the four methods of refresh (<code>F</code>, <code>P</code>, <code>C</code>, <code>?</code>). So, for example, if you specify <code>F</code> and <code>out_of_place = true</code>, then an out-of-place fast refresh will be attempted. Similarly, if you specify <code>P</code> and <code>out_of_place = true</code>, then out-of-place PCT refresh will be attempted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# 116.4.14 REGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

## Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner  IN   VARCHAR2,
  mviewname   IN   VARCHAR2,
  mviewsite   IN   VARCHAR2,
  mview_id    IN   DATE | BINARY_INTEGER,
  flag        IN   BINARY_INTEGER,
  qry_txt     IN   VARCHAR2,
  rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

## Parameters

**Table 116-13 REGISTER\_MVIEW Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mviewowner | Owner of the materialized view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| mviewname  | Name of the materialized view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| mviewsite  | Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| mview_id   | The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a <code>BINARY_INTEGER</code> . Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a <code>DATE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| flag       | <p>A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following:</p> <p><code>DBMS_MVIEW.REG_ROWID_MVIEW</code> for a rowid materialized view</p> <p><code>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW</code> for a primary key materialized view</p> <p><code>DBMS_MVIEW.REG_OBJECT_ID_MVIEW</code> for an object id materialized view</p> <p><code>DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW</code> for a materialized view that can be fast refreshed</p> <p><code>DBMS_MVIEW.REG_UPDATABLE_MVIEW</code> for a materialized view that is updatable</p> <p>A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter:</p> <p><code>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW +</code><br/><code>DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW</code></p> <p>You can determine the properties of a materialized view by querying the <code>ALL_MVIEWS</code> data dictionary view.</p> |
| qry_txt    | The first 32,000 bytes of the materialized view definition query.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 116-13 (Cont.) REGISTER\_MVIEW Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rep_type  | Version of the materialized view. Valid constants that can be assigned include the following:<br><br>DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site<br><ul style="list-style-type: none"><li>DBMS_MVIEW.REG_V8_SNAPSHOT</li></ul><br>reg_repapi_snapshot if the materialized view is at an Oracle database version 8.x or higher site<br><br>DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site |

#### Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER\_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview\_id, flag, and qry\_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry\_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview\_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

## 116.4.15 UNREGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

#### Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (  
    mviewowner      IN   VARCHAR2,  
    mviewname       IN   VARCHAR2,  
    mviewsite       IN   VARCHAR2);
```

#### Parameters

**Table 116-14 UNREGISTER\_MVIEW Procedure Parameters**

| Parameters | Description                        |
|------------|------------------------------------|
| mviewowner | Owner of the materialized view     |
| mviewname  | Name of the materialized view      |
| mviewsite  | Name of the materialized view site |

# DBMS\_MVIEW\_STATS

`DBMS_MVIEW_STATS` package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.

## See Also:

*Oracle Database Data Warehousing Guide* for information about managing and using materialized view refresh statistics

This chapter contains the following topics:

- [DBMS\\_MVIEW\\_STATS Overview](#)
- [DBMS\\_MVIEW\\_STATS Security Model](#)
- [Summary of DBMS\\_MVIEW\\_STATS Subprograms](#)

## 117.1 DBMS\_MVIEW\_STATS Overview

You can use the procedures contained in the `DBMS_MVIEW_STATS` package to manage the collection and retention of statistics for materialized view refresh operations. This includes the level and granularity at which these statistics are collected and the duration for which they are retained in the database.

You can also set database level system defaults for the parameters that control statistics collection.

## 117.2 DBMS\_MVIEW\_STATS Security Model

Refer to the Usage Notes section in each subprogram for information about the privileges required to use the subprogram.

## 117.3 Summary of DBMS\_MVIEW\_STATS Subprograms

This table lists the `DBMS_MVIEW_STATS` subprograms and briefly describes them.

**Table 117-1 DBMS\_MVIEW\_STATS Package Subprograms**

| Subprogram                                    | Description                                                                                                       |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <a href="#">PURGE_REFRESH_STATS Procedure</a> | Purges the statistics of materialized view refresh operations that are older than the specified retention period. |

Table 117-1 (Cont.) DBMS\_MVIEW\_STATS Package Subprograms

| Subprogram                                       | Description                                                                                                                                                                                                             |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_MVREF_STATS_PARAMS Procedure</a> | Sets the values of parameters that define the collection level and retention period for materialized view refresh statistics. You can set the values either at the database level or for individual materialized views. |
| <a href="#">SET_SYSTEM_DEFAULT Procedure</a>     | Sets the system default value of a refresh statistics parameter. The two refresh statistics parameters are collection level and the retention period.                                                                   |

### 117.3.1 PURGE\_REFRESH\_STATS Procedure

This procedure purges refresh statistics that are older than the specified retention period for the specified materialized views.

This procedure forces a purge of refresh statistics without altering the retention period defined for the specified materialized views.

#### Syntax

```
DBMS_MVIEW_STATS.PURGE_REFRESH_STATISTICS (  
    mv_list           IN      VARCHAR2,  
    retention_period  IN      NUMBER);
```

#### Parameters

Table 117-2 PURGE\_REFRESH\_STATS Procedure Parameters

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mv_list</code>          | <p>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views.</p> <p>Specify <code>NULL</code> to purge materialized view refresh statistics for all materialized views in the database.</p>                                                                                                                                                                                                                                                                              |
| <code>retention_period</code> | <p>The number of days for which refresh statistics must be preserved in the data dictionary. Statistics for materialized view refresh operations that are older than the retention period are purged from the data dictionary.</p> <p>The retention period specified in this procedure overrides the retention period that may have been set previously either at the database level or for specified materialized views.</p> <p>Specify <code>NULL</code> to use the purging policy defined by the automatic statistics purge. Specify <code>-1</code> to purge all refresh statistics.</p> |

#### Usage Notes

To invoke this procedure, you need either the `SYSDBA` privilege or privileges on every materialized view that is specified in `mv_list`.

## 117.3.2 SET\_MVREF\_STATS\_PARAMS Procedure

This procedure sets the collection level and retention period for materialized view refresh statistics. You can set these properties either for individual materialized views or for all materialized views in the database.

### Syntax

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (
    mv_list          IN    VARCHAR2,
    collection_level IN    VARCHAR2 DEFAULT NULL,
    retention_period IN    NUMBER DEFAULT NULL);
```

### Parameters

**Table 117-3 SET\_MVREF\_STATS\_PARAMS Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mv_list</code>          | <p>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views.</p> <p>Specify <code>NULL</code> to set properties for all existing materialized views in the database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>collection_level</code> | <p>Specifies the level of detail used when collecting refresh statistics for the materialized views specified in <code>mv_list</code>.</p> <p>Set one of the following values for <code>collection_level</code>:</p> <ul style="list-style-type: none"> <li><code>NONE</code>: No materialized view refresh statistics are collected.</li> <li><code>TYPICAL</code>: Only basic refresh statistics are collected and stored for the materialized views specified in <code>mv_list</code>.</li> <li><code>ADVANCED</code>: Detailed refresh statistics are collected and stored for materialized view specified in <code>mv_list</code>.</li> </ul> <p>If this parameter is set to <code>NULL</code>, then the system default value for <code>collection_level</code> (set using <code>SET_SYSTEM_DEFAULT</code>) is used.</p> |
| <code>retention_period</code> | <p>Specifies the retention period, in days, for the refresh statistics of the materialized views specified in <code>mv_list</code>. Statistics that are older than the retention period are automatically purged from the data dictionary.</p> <p>Valid values are between 1 and 1365000.</p> <p>If this parameter is set to <code>NULL</code>, then the system default value for <code>retention_period</code> (set using <code>SET_SYSTEM_DEAFULT</code>) is used.</p> <p>Set <code>retention_period</code> to <code>-1</code> to specify that refresh statistics for the materialized views in <code>mv_list</code> must never be purged.</p>                                                                                                                                                                              |

### Usage Notes

To set the collection level or retention period of one or more materialized views, you must have privileges on those materialized views. To set the collection level or retention period for all materialized views in the database, you must have either the `SYSDBA` privilege or privileges on every materialized view in the database.

To set the system-level default values for statistics collection level and retention period, use the `SET_SYSTEM_DEAFULT` procedure.

Use the `DBA_MVREF_STATS_PARAMS` view to determine the currently-set retention period and collection level for materialized view statistics collection.

To disable refresh statistics collection for all materialized views in the database, use the following:

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (NULL, 'NONE', NULL);
```

Note that the parameters set using `SET_MVREF_STATS_PARAMS` only affect materialized views that exist in the database at the time the procedure is run. Any new materialized views created after this procedure is run will use the system default values for `collection_level` and `retention_period`.

### 117.3.3 SET\_SYSTEM\_DEFAULT Procedure

This procedure sets system-wide defaults that manage the collection and retention of materialized view refresh statistics. All newly-created materialized views use these defaults until the parameters are reset explicitly using the `SET_MVREF_STATS_PARAMS` procedure.

#### Syntax

```
DBMS_MVIEW_STATS.SET_SYSTEM_DEFAULT (
    parameter_name      IN   VARCHAR2,
    value               IN   VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 117-4 SET\_SYSTEM\_DEFAULT Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>parameter_name</code> | <p>The name of the materialized view refresh statistics parameter whose system default value is being set.</p> <p>The parameters that can be set are:</p> <ul style="list-style-type: none"> <li><code>COLLECTION_LEVEL</code>: Specifies the level of detail for collecting materialized view refresh statistics.</li> <li><code>RETENTION_PERIOD</code>: Specifies the duration, in days, for which refresh statistics are retained in the data dictionary</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>value</code>          | <p>The value of the materialized view refresh statistics parameter.</p> <p>The valid values for <code>COLLECTION_LEVEL</code> are:</p> <ul style="list-style-type: none"> <li><code>NONE</code>: No refresh statistics are collected for the refresh operation.</li> <li><code>TYPICAL</code>: Only basic refresh statistics are collected for the refresh operation. This is the default setting.</li> <li><code>ADVANCED</code>: Detailed refresh statistics are collected for the refresh operation.</li> </ul> <p>The valid values for <code>RETENTION_PERIOD</code> are:</p> <ul style="list-style-type: none"> <li><code>-1</code></li> <li>Numbers between 1 and 1365000</li> </ul> <p>The default value for <code>retention_period</code> is 31.</p> <p>If you specify <code>NULL</code> for any of the parameters, then the system default setting for that parameter is used.</p> |

#### Usage Notes

You must have `SYSDBA` privilege to invoke this procedure.

Use the `DBA_MVREF_STATS_SYS_DEFAULTS` view to display the current default settings for materialized view refresh statistics collection.

# DBMS\_NETWORK\_ACL\_ADMIN

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network Access Control List (ACL).

The chapter contains the following topics:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_NETWORK\\_ACL\\_ADMIN Subprograms](#)

## See Also:

For more information, see "Managing Fine-grained Access to External Network Services" in *Oracle Database Security Guide*

## 118.1 DBMS\_NETWORK\_ACL\_ADMIN Overview

The `DBMS_NETWORK_ACL_ADMIN` package provides the interface to administer the network access control lists (ACL).

ACLs are used to control access by users to external network services and resources from the database through PL/SQL network utility packages including [UTL\\_TCP](#) , [UTL\\_HTTP](#) , [UTL\\_SMTP](#) and [UTL\\_INADDR](#) .

## 118.2 DBMS\_NETWORK\_ACL\_ADMIN Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Oracle Database 12c:

- [ADD\\_PRIVILEGE Procedure](#)
- [ASSIGN\\_ACL Procedure](#)
- [ASSIGN\\_WALLET\\_ACL Procedure](#)
- [CHECK\\_PRIVILEGE Function](#)
- [CHECK\\_PRIVILEGE\\_ACLID Function](#)

- [CREATE\\_ACL Procedure](#)
- [DELETE\\_PRIVILEGE Procedure](#)
- [DROP\\_ACL Procedure](#)
- [UNASSIGN\\_ACL Procedure](#)
- [UNASSIGN\\_WALLET\\_ACL Procedure](#)

## 118.3 DBMS\_NETWORK\_ACL\_ADMIN Security Model

The `EXECUTE` privilege on the `DBMS_NETWORK_ACL_ADMIN` package is granted to the `DBA` role and to the `EXECUTE_CATALOG_ROLE` by default.

## 118.4 DBMS\_NETWORK\_ACL\_ADMIN Constants

The `DBMS_NETWORK_ACL_ADMIN` package defines constants to use specifying parameter values. These are shown in the following table.

**Table 118-1 DBMS\_NETWORK\_ACL\_ADMIN Constants**

| Constant                    | Type                      | Value                                             | Description                                      |
|-----------------------------|---------------------------|---------------------------------------------------|--------------------------------------------------|
| <code>IP_ADDR_MASK</code>   | <code>VARCHAR2(80)</code> | <code>'([[:digit:]]+\.){3}[[:digit:]]+'</code>    | IP address mask:<br><code>xxx.xxx.xxx.xxx</code> |
| <code>IP_SUBNET_MASK</code> | <code>VARCHAR2(80)</code> | <code>'([[:digit:]]+\.){0,3}\*'</code>            | IP subnet mask:<br><code>xxx.xxx...*</code>      |
| <code>HOSTNAME_MASK</code>  | <code>VARCHAR2(80)</code> | <code>'[^\.\.:\/\*]+\(\. [^\.\.:\/\*]+\)*'</code> | Hostname<br>mask: <code>???...???...???</code>   |
| <code>DOMAIN_MASK</code>    | <code>VARCHAR2(80)</code> | <code>"\*(\.[^\.:\/\*]+)*"</code>                 | Domain mask:<br><code>*.???...???</code>         |

## 118.5 DBMS\_NETWORK\_ACL\_ADMIN Exceptions

The following table lists the exceptions raised by the `DBMS_NETWORK_ACL_ADMIN` package.

**Table 118-2 DBMS\_NETWORK\_ACL\_ADMIN Exceptions**

| Exception                        | Error Code | Description         |
|----------------------------------|------------|---------------------|
| <code>ACE_ALREADY_EXISTS</code>  | 24243      | ACE already exists  |
| <code>EMPTY_ACL</code>           | 24246      | Empty ACL           |
| <code>ACL_NOT_FOUND</code>       | 46114      | ACL not found       |
| <code>ACL_ALREADY_EXISTS</code>  | 46212      | ACL already exists  |
| <code>INVALID_ACL_PATH</code>    | 46059      | Invalid ACL path    |
| <code>INVALID_HOST</code>        | 24244      | Invalid host        |
| <code>INVALID_PRIVILEGE</code>   | 24245      | Invalid privilege   |
| <code>INVALID_WALLET_PATH</code> | 29248      | Invalid wallet path |
| <code>BAD_ARGUMENT</code>        | 29261      | Bad argument        |

**Table 118-2 (Cont.) DBMS\_NETWORK\_ACL\_ADMIN Exceptions**

| Exception             | Error Code | Description           |
|-----------------------|------------|-----------------------|
| UNRESOLVED_PRINCIPAL  | 46238      | Unresolved principal  |
| PRIVILEGE_NOT_GRANTED | 01927      | Privilege not granted |

## 118.6 DBMS\_NETWORK\_ACL\_ADMIN Examples

Grant the connect and resolve privileges for host `www.us.example.com` to SCOTT.

### Example 1

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('connect', 'resolve'),
    principal_name => 'scott',
    principal_type => xs_acl.ptype_db));
```

### Example 2

Revoke the resolve privilege for host `www.us.example.com` from SCOTT.

```
dbms_network_acl_admin.remove_host_ace(
  host => 'www.us.example.com',
  ace => xs$ace_type(privilege_list => xs$name_list('resolve'),
    principal_name => 'scott',
    principal_type => xs_acl.ptype_db));
```

### Example 3

Grant the use\_client\_certificates and use\_passwords privileges for wallet `file:/example/wallets/hr_wallet` to SCOTT.

```
dbms_network_acl_admin.append_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list => xs$name_list('use_client_certificates',
    'use_passwords'),
    principal_name => 'scott',
    principal_type => xs_acl.ptype_db));
```

### Example 4

Revoke the use\_passwords privilege for wallet `file:/example/wallets/hr_wallet` from SCOTT.

```
dbms_network_acl_admin.remove_wallet_ace(
  wallet_path => 'file:/example/wallets/hr_wallet',
  ace => xs$ace_type(privilege_list => xs$name_list('use_passwords'),
    principal_name => 'scott',
    principal_type => xs_acl.ptype_db));
```

### Example 5

The `CONTAINS_HOST` in the `DBMS_NETWORK_ACL_UTILITY` package determines if a host is contained in a domain. It can be used in conjunction with the `DBA_HOST_ACE` view to determine the users and their privilege assignments to access a network host. For example, for access to `www.us.example.com`:

```

SELECT HOST, LOWER_PORT, UPPER_PORT,
       ACE_ORDER, PRINCIPAL, PRINCIPAL_TYPE,
       GRANT_TYPE, INVERTED_PRINCIPAL, PRIVILEGE,
       START_DATE, END_DATE
  FROM (SELECT ACES.*,
        DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                HOST) PRECEDENCE
        FROM DBA_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
        LOWER_PORT NULLS LAST,
        UPPER_PORT NULLS LAST,
        ACE_ORDER;

```

| HOST               | LOWER_PORT | UPPER_PORT | ACE_ORDER | PRINCIPAL | PRINCIPAL_TYPE | GRANT_TYPE |
|--------------------|------------|------------|-----------|-----------|----------------|------------|
| INVERTED_PRINCIPAL | PRIVILEGE  | START_DATE | END_DATE  |           |                |            |
| www.us.example.com | 80         | 80         | 1         | SCOTT     | DATABASE USER  | GRANT      |
| NO                 | HTTP       |            |           |           |                |            |
| www.us.example.com | 80         | 80         | 2         | ADAMS     | DATABASE USER  | GRANT      |
| NO                 | HTTP       |            |           |           |                |            |
| *                  |            |            | 1         | HQ_DBA    | DATABASE USER  | GRANT      |
| NO                 | CONNECT    |            |           |           |                |            |
| *                  |            |            | 1         | HQ_DBA    | DATABASE USER  | GRANT      |
| NO                 | RESOLVE    |            |           |           |                |            |

### Example 6

For example, for HQ\_DBA's own permission to access to www.us.example.com:

```

SELECT HOST, LOWER_PORT, UPPER_PORT, PRIVILEGE, STATUS
  FROM (SELECT ACES.*,
        DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.us.example.com',
                                                HOST) PRECEDENCE
        FROM USER_HOST_ACES ACES)
 WHERE PRECEDENCE IS NOT NULL
 ORDER BY PRECEDENCE DESC,
        LOWER_PORT NULLS LAST,
        UPPER_PORT NULLS LAST;

```

| HOST | LOWER_PORT | UPPER_PORT | PRIVILEGE | STATUS  |
|------|------------|------------|-----------|---------|
| *    |            |            | CONNECT   | GRANTED |
| *    |            |            | RESOLVE   | GRANTED |

## 118.7 Summary of DBMS\_NETWORK\_ACL\_ADMIN Subprograms

This table lists and briefly describes the DBMS\_NETWORK\_ACL\_ADMIN package subprograms.

**Table 118-3 DBMS\_NETWORK\_ACL\_ADMIN Package Subprograms**

| Subprogram                              | Description                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_PRIVILEGE Procedure</a> | [DEPRECATED] Adds a privilege to grant or deny the network access to the user in an access control list (ACL) |

**Table 118-3 (Cont.) DBMS\_NETWORK\_ACL\_ADMIN Package Subprograms**

| Subprogram                                     | Description                                                                                                                               |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">APPEND_HOST_ACE Procedure</a>      | Appends an access control entry (ACE) to the access control list (ACL) of a network host.                                                 |
| <a href="#">APPEND_HOST_ACL Procedure</a>      | Appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host                                         |
| <a href="#">APPEND_WALLET_ACE Procedure</a>    | Appends an access control entry (ACE) to the access control list (ACL) of a wallet                                                        |
| <a href="#">APPEND_WALLET_ACL Procedure</a>    | Appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet                                               |
| <a href="#">ASSIGN_ACL Procedure</a>           | [DEPRECATED] Assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.         |
| <a href="#">ASSIGN_WALLET_ACL Procedure</a>    | [DEPRECATED] Assigns an access control list (ACL) to a wallet                                                                             |
| <a href="#">CHECK_PRIVILEGE Function</a>       | [DEPRECATED] Checks if a privilege is granted or denied the user in an access control list (ACL)                                          |
| <a href="#">CHECK_PRIVILEGE_ACLID Function</a> | [DEPRECATED] Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list |
| <a href="#">CREATE_ACL Procedure</a>           | [DEPRECATED] Creates an access control list (ACL) with an initial privilege setting                                                       |
| <a href="#">DELETE_PRIVILEGE Procedure</a>     | [DEPRECATED] Deletes a privilege in an access control list (ACL)                                                                          |
| <a href="#">DROP_ACL Procedure</a>             | [DEPRECATED] Drops an access control list (ACL)                                                                                           |
| <a href="#">REMOVE_HOST_ACE Procedure</a>      | Removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE            |
| <a href="#">REMOVE_WALLET_ACE Procedure</a>    | Removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE                  |
| <a href="#">SET_HOST_ACL Procedure</a>         | Sets the access control list (ACL) of a network host which controls access to the host from the database                                  |
| <a href="#">SET_WALLET_ACL Procedure</a>       | Sets the access control list (ACL) of a wallet which controls access to the wallet from the database                                      |
| <a href="#">UNASSIGN_ACL Procedure</a>         | [DEPRECATED] Unassigns the access control list (ACL) currently assigned to a network host                                                 |
| <a href="#">UNASSIGN_WALLET_ACL Procedure</a>  | [DEPRECATED] Unassigns the access control list (ACL) currently assigned to a wallet                                                       |

## 118.7.1 ADD\_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
    acl          IN VARCHAR2,
    principal    IN VARCHAR2,
    is_grant     IN BOOLEAN,
    privilege    IN VARCHAR2,
    position     IN PLS_INTEGER DEFAULT NULL,
    start_date   IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
    end_date     IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

### Parameters

**Table 118-4 ADD\_PRIVILEGE Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl        | Name of the ACL. Relative path will be relative to "/sys/acls"                                                                                                                                                                                                                                                                                                                                                 |
| principal  | Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.                                                                                                                                                                                                                                                                                                                  |
| is_grant   | Privilege is granted or denied.                                                                                                                                                                                                                                                                                                                                                                                |
| privilege  | Network privilege to be granted or denied                                                                                                                                                                                                                                                                                                                                                                      |
| position   | Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same is_grant (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the is_grant if one exists, or to the end of the ACL if the matching ACE does not exist. |
| start_date | Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The start_date will be ignored if the privilege is added to an existing ACE.                                                                                                                                                                                                         |
| end_date   | End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date. The end_date will be ignored if the privilege is added to an existing ACE.                                                                                                                                                                 |

### Usage Notes

To remove the permission, use the [DELETE\\_PRIVILEGE Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'us-example-com-permissions.xml',
    principal    => 'ST_USERS',
    is_grant     => TRUE,
    privilege    => 'connect')
END;
```

## 118.7.2 APPEND\_HOST\_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a network host. The ACL controls access to the given host from the database and the ACE specifies the privileges granted to or denied from the specified principal.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  ace           IN XS$ACE_TYPE);
```

### Parameters

**Table 118-5 APPEND\_HOST\_ACE Function Parameters**

| Parameter  | Description                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host       | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range                                                                                                                              |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed.                                                                                             |
| ace        | The ACE                                                                                                                                                                |

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the [REMOVE\\_HOST\\_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
  - `www.us.example.com`
  - `*.us.example.com`
  - `*.example.com`
  - `*.com`
  - `*`
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say `192.168.0.100`, the following subnets are listed in decreasing precedence:

- 192.168.0.100
  - 192.168.0.\*
  - 192.168.\*
  - 192.\*
  - \*
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
  - When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
  - When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.
  - If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

#### See Also:

*Oracle Database Real Application Security Administrator's and Developer's Guide* for more information about the `XS$ACE_TYPE` object type

## 118.7.3 APPEND\_HOST\_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACL (
  host          IN VARCHAR2,
  lower_port    IN PLS_INTEGER DEFAULT NULL,
  upper_port    IN PLS_INTEGER DEFAULT NULL,
  acl           IN VARCHAR2);
```

### Parameters

**Table 118-6 APPEND\_HOST\_ACL Function Parameters**

| Parameter  | Description                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host       | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range                                                                                                                              |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed.                                                                                             |
| acl        | The ACL from which to append                                                                                                                                           |

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.

- To remove the ACE, use the [REMOVE\\_HOST\\_ACE Procedure](#).
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
  - `www.us.example.com`
  - `*.us.example.com`
  - `*.example.com`
  - `*.com`
  - `*`
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say `192.168.0.100`, the following subnets are listed in decreasing precedence:
  - `192.168.0.100`
  - `192.168.0.*`
  - `192.168.*`
  - `192.*`
  - `*`
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

## 118.7.4 APPEND\_WALLET\_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a wallet. The ACL controls access to the given wallet from the database and the ACE specifies the privileges granted to or denied from the specified principal.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACE (
    wallet_path    IN VARCHAR2,
    ace            IN XS$ACE_TYPE);
```

### Parameters

**Table 118-7 APPEND\_WALLET\_ACE Function Parameters**

| Parameter   | Description                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> . |
| ace         | The ACE                                                                                                   |

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.

- To remove the ACE, use the [REMOVE\\_WALLET\\_ACE Procedure](#).
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

#### See Also:

*Oracle Database Real Application Security Administrator's and Developer's Guide* for more information about the `XS$ACE_TYPE` object type

## 118.7.5 APPEND\_WALLET\_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACL (
    wallet_path    IN VARCHAR2,
    acl            IN VARCHAR2);
```

### Parameters

**Table 118-8 APPEND\_WALLET\_ACL Function Parameters**

| Parameter   | Description                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code> . |
| ace         | The ACL from which to append                                                                              |

### Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use `REMOVE_WALLET_ACE`.
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 118.7.6 ASSIGN\_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

#### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
    acl          IN VARCHAR2,
    host         IN VARCHAR2,
    lower_port   IN PLS_INTEGER DEFAULT NULL,
    upper_port   IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 118-9** ASSIGN\_ACL Function Parameters

| Parameter  | Description                                                                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl        | Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> .                                                                                                                            |
| host       | Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of a TCP port range if not <code>NULL</code>                                                                                                                                                 |
| upper_port | Upper bound of a TCP port range. If <code>NULL</code> , <code>lower_port</code> is assumed.                                                                                                              |

## Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the [DROP\\_ACL Procedure](#). To remove an access control list assignment, use the [UNASSIGN\\_ACL Procedure](#).
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.example.com", the following domains are listed in decreasing precedences:

- www.us.example.com
- \*.us.example.com
- \*.example.com
- \*.com
- \*

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:

- 192.168.0.100
- 192.168.0.\*
- 192.168.\*
- 192.\*
- \*

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.  
For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.
- When specifying a TCP port range, both `lower_port` and `upper_port` must not be NULL and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.
- To remove the assignment, use [UNASSIGN\\_ACL Procedure](#).

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
    acl          => 'us-example-com-permissions.xml',
    host         => '*.us.example.com',
    lower_port   => 80);
END;
```

## 118.7.7 ASSIGN\_WALLET\_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

### Syntax

```
UTL_HTTP.ASSIGN_WALLET_ACL (
  acl          IN  VARCHAR2,
  wallet_path  IN  VARCHAR2);
```

### Parameters

**Table 118-10** ASSIGN\_WALLET\_ACL Procedure Parameters

| Parameter                | Description                                                                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>acl</code>         | Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code>                                                                      |
| <code>wallet_path</code> | Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format <code>file:directory-path</code> . |

### Usage Notes

To remove the assignment, use the [UNASSIGN\\_WALLET\\_ACL Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal    => 'SCOTT',
    is_grant     => TRUE,
    privilege    => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'wallet-acl.xml',
    principal    => 'SCOTT',
    is_grant     => TRUE,
    privilege    => 'use-passwords');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
    acl          => 'wallet-acl.xml',
    wallet_path => 'file:/example/wallets/test_wallet');
END;
```

## 118.7.8 CHECK\_PRIVILEGE Function

This function checks if a privilege is granted or denied the user in an ACL.

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
  acl          IN VARCHAR2,
  user         IN VARCHAR2,
  privilege    IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 118-11** CHECK\_PRIVILEGE Function Parameters

| Parameter | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| acl       | Name of the ACL. Relative path will be relative to "/sys/acls".                                                                                     |
| user      | User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view. |
| privilege | Network privilege to check                                                                                                                          |

## Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

## Examples

```
SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
    'us-example-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

## 118.7.9 CHECK\_PRIVILEGE\_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
  aclid          IN RAW,
  user           IN VARCHAR2 DEFAULT NULL)
  privilege      IN VARCHAR2,
RETURN NUMBER;
```

## Parameters

**Table 118-12 CHECK\_PRIVILEGE\_ACLID Function Parameters**

| Parameter | Description                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aclid     | Object ID of the ACL                                                                                                                                                                        |
| user      | User to check against. If the user is <code>NULL</code> , the invoker is assumed. The username is case-sensitive as in the <code>USERNAME</code> column of the <code>ALL_USERS</code> view. |
| privilege | Network privilege to check                                                                                                                                                                  |

## Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

## 118.7.10 CREATE\_ACL Procedure

This deprecated procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [APPEND\\_HOST\\_ACE Procedure](#) and the [APPEND\\_WALLET\\_ACE Procedure](#).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
    acl             IN VARCHAR2,
    description     IN VARCHAR2,
    principal       IN VARCHAR2,
    is_grant        IN BOOLEAN,
    privilege       IN VARCHAR2,
    start_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    end_date        IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

### Parameters

**Table 118-13 CREATE\_ACL Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl         | Name of the ACL. Relative path will be relative to "/sys/acls".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| description | Description attribute in the ACL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| principal   | Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| is_grant    | Privilege is granted or not (denied)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| privilege   | Network privilege to be granted or denied - 'connect   resolve' (case sensitive). A database user needs the <code>connect</code> privilege to an external network host computer if he or she is connecting using the <code>UTL_TCP</code> , <code>UTL_HTTP</code> , <code>UTL_SMTP</code> , and <code>UTL_MAIL</code> utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the <code>UTL_INADDR</code> package, grant the database user the <code>resolve</code> privilege. |
| start_date  | Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| end_date    | End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The <code>end_date</code> must be greater than or equal to the <code>start_date</code> .                                                                                                                                                                                                                                                                                                                                                       |

### Usage Notes

To drop the access control list, use the [DROP\\_ACL Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'us-example-com-permissions.xml',
    description  => 'Network permissions for *.us.example.com',
    principal    => 'SCOTT',
    is_grant     => TRUE,
    privilege    => 'connect');
END;
```

## 118.7.11 DELETE\_PRIVILEGE Procedure

This deprecated procedure deletes a privilege in an access control list.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

## Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN DEFAULT NULL,
  privilege    IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 118-14** DELETE\_PRIVILEGE Function Parameters

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| acl       | Name of the ACL. Relative path will be relative to "/sys/acls".                                                                  |
| principal | Principal (database user or role) for whom all the ACE will be deleted                                                           |
| is_grant  | Privilege is granted or not (denied). If a NULL value is given, the deletion is applicable to both granted or denied privileges. |
| privilege | Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges.                         |

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
    acl          => 'us-example-com-permissions.xml',
    principal    => 'ST_USERS')
END;
```

## 118.7.12 DROP\_ACL Procedure

This **deprecated procedure** drops an access control list (ACL).

### Note:

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
    acl          IN VARCHAR2);
```

### Parameters

**Table 118-15 DROP\_ACL Procedure Parameters**

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| acl       | Name of the ACL. Relative path will be relative to "/sys/acls". |

### Examples

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
        acl => 'us-example-com-permissions.xml');
END;
```

## 118.7.13 REMOVE\_HOST\_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_HOST_ACE (
    host          IN VARCHAR2,
    lower_port     IN PLS_INTEGER DEFAULT NULL,
    upper_port     IN PLS_INTEGER DEFAULT NULL,
    ace           IN XS$ACE_TYPE,
    remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 118-16 REMOVE\_HOST\_ACE Function Parameters**

| Parameter  | Description                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host       | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range                                                                                                                              |

**Table 118-16 (Cont.) REMOVE\_HOST\_ACE Function Parameters**

| Parameter        | Description                                                                |
|------------------|----------------------------------------------------------------------------|
| upper_port       | Upper bound of an optional TCP port range. If NULL, lower_port is assumed. |
| ace              | The ACE                                                                    |
| remove_empty_acl | Whether to remove the ACL when it becomes empty when the ACE is removed    |

#### Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 118.7.14 REMOVE\_WALLET\_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE.

#### Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_WALLET_ACE (
    wallet_path      IN VARCHAR2,
    ace              IN XS$ACE_TYPE,
    remove_empty_acl IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

**Table 118-17 REMOVE\_WALLET\_ACE Function Parameters**

| Parameter        | Description                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------|
| wallet_path      | Directory path of the wallet. The path is case-sensitive of the format <i>file:directory-path</i> . |
| ace              | The ACE                                                                                             |
| remove_empty_acl | Whether to remove the ACL when it becomes empty when the ACE is removed                             |

#### Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

## 118.7.15 SET\_HOST\_ACL Procedure

This procedure sets the access control list (ACL) of a network host which controls access to the host from the database.

#### Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_HOST_ACL (
    host      IN VARCHAR2,
    lower_port IN PLS_INTEGER DEFAULT NULL,
```

```
upper_port    IN PLS_INTEGER DEFAULT NULL,  
acl           IN VARCHAR2);
```

### Parameters

**Table 118-18 SET\_HOST\_ACL Function Parameters**

| Parameter  | Description                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host       | The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive. |
| lower_port | Lower bound of an optional TCP port range                                                                                                                              |
| upper_port | Upper bound of an optional TCP port range. If NULL, lower_port is assumed.                                                                                             |
| acl        | The ACL. NULL to unset the host's ACL.                                                                                                                                 |

### Usage Notes

A host's ACL is created and set on-demand when an access control entry (ACE) is appended to the host's ACL. Users are discouraged from setting a host's ACL manually.

## 118.7.16 SET\_WALLET\_ACL Procedure

This procedure sets the access control list (ACL) of a wallet which controls access to the wallet from the database.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_WALLET_ACL (  
    wallet_path    IN VARCHAR2,  
    acl           IN VARCHAR2);
```

### Parameters

**Table 118-19 SET\_WALLET\_ACL Function Parameters**

| Parameter   | Description                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------|
| wallet_path | Directory path of the wallet. The path is case-sensitive of the format <i>file:directory-path</i> . |
| acl         | The ACL. NULL to unset the host's ACL.                                                              |

### Usage Notes

A wallet's ACL is created and set on-demand when an access control entry (ACE) is appended to the wallet's ACL. Users are discouraged from setting a wallet's ACL manually.

## 118.7.17 UNASSIGN\_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a network host.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
  acl          IN VARCHAR2 DEFAULT NULL,
  host         IN VARCHAR2 DEFAULT NULL,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 118-20 UNASSIGN\_ACL Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl        | Name of the ACL. Relative path will be relative to "/sys/acls". If ACL is NULL, any ACL assigned to the host is unassigned.                                                                                                                                                                                                                        |
| host       | Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is NULL, the ACL will be unassigned from any host. If both host and acl are NULL, all ACLs assigned to any hosts are unassigned. |
| lower_port | Lower bound of a TCP port range if not NULL                                                                                                                                                                                                                                                                                                        |
| upper_port | Upper bound of a TCP port range. If NULL, lower_port is assumed.                                                                                                                                                                                                                                                                                   |

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host      => '*.us.example.com',
    lower_port => 80);
END;
```

## 118.7.18 UNASSIGN\_WALLET\_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a wallet.

### Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the [REMOVE\\_HOST\\_ACE Procedure](#) and the [REMOVE\\_WALLET\\_ACE Procedure](#).

### Syntax

```
UTL_HTTP.UNASSIGN_WALLET_ACL (
    acl          IN  VARCHAR2 DEFAULT NULL,
    wallet_path  IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 118-21 UNASSIGN\_WALLET\_ACL Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| acl         | Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> . If <code>acl</code> is <code>NULL</code> , any ACL assigned to the wallet is unassigned                                                                                                     |
| wallet_path | Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format <code>file:directory-path</code> . If both <code>acl</code> and <code>wallet_path</code> are <code>NULL</code> , all ACLs assigned to any wallets are unassigned. |

### Examples

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(
        acl          => 'wallet-acl.xml',
        wallet_path => 'file:/example/wallets/test_wallet');
END;
```

# DBMS\_NETWORK\_ACL\_UTILITY

The `DBMS_NETWORK_ACL_UTILITY` package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

For more information, see ["Managing Fine-grained Access to External Network Services"](#) in *Oracle Database Security Guide*

The chapter contains the following topics:

- [Security Model](#)
- [Examples](#)
- [Summary of DBMS\\_NETWORK\\_ACL\\_UTILITY Subprograms](#)

## 119.1 DBMS\_NETWORK\_ACL\_UTILITY Security Model

`EXECUTE` on the `DBMS_NETWORK_ACL_UTILITY` package is granted to `PUBLIC`.

## 119.2 DBMS\_NETWORK\_ACL\_UTILITY Examples

The `CONTAINS_HOST` Function in this package indicates if a domain or subnet contains a given host or IP address.

It can be used in conjunction with the [CHECK\\_PRIVILEGE\\_ACLID Function](#) in the `DBMS_NETWORK_ACL_ADMIN` package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the `CONTAINS_HOST` Function in can also be used to order the ACL assignments by their precedence.

### Example 1

For example, for SCOTT's permission to connect to `www.hr.example.com`:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
  FROM (SELECT host, acl, aclid, lower_port, upper_port,
               DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
               precedence
        FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC, lower_port nulls LAST;
```

HOST

LOWER\_PORT UPPER\_PORT ACL

PRIVILEGE

|                    |      |      |                   |         |
|--------------------|------|------|-------------------|---------|
| www.hr.example.com | 80   | 80   | /sys/acls/www.xml | GRANTED |
| www.hr.example.com | 3000 | 3999 | /sys/acls/www.xml | GRANTED |
| www.hr.example.com |      |      | /sys/acls/www.xml | GRANTED |
| *.hr.example.com   |      |      | /sys/acls/all.xml |         |
| *.example.com      |      |      | /sys/acls/all.xml |         |

## Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
FROM (SELECT host, acl, aclid,
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
             precedence
      FROM dba_network_acls
      WHERE lower_port IS NULL AND upper_port IS NULL)
WHERE precedence > 0
ORDER BY precedence DESC;
```

| HOST               | ACL                       | PRIVILEGE |
|--------------------|---------------------------|-----------|
| www.hr.example.com | /sys/acls/hr-www.xml      | GRANTED   |
| *.hr.example.com   | /sys/acls/hr-domain.xml   |           |
| *.example.com      | /sys/acls/corp-domain.xml |           |

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when lower\_port and upper\_port are NULL). For this reason, the example does not include lower\_port and upper\_port columns in the query.

## Related Topics

- [CONTAINS\\_HOST Function](#)  
This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

# 119.3 Summary of DBMS\_NETWORK\_ACL\_UTILITY Subprograms

This table lists and briefly describes the DBMS\_NETWORK\_ACL\_UTILITY package subprograms.

**Table 119-1 DBMS\_NETWORK\_ACL\_UTILITY Package Subprograms**

| Subprogram                             | Description                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------|
| <a href="#">CONTAINS_HOST Function</a> | Determines if the given host is equal to or contained in the given host, domain, or subnet |
| <a href="#">DOMAIN_LEVEL Function</a>  | Returns the domain level of the given host name, domain, or subnet                         |

**Table 119-1 (Cont.) DBMS\_NETWORK\_ACL\_UTILITY Package Subprograms**

| Subprogram                           | Description                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DOMAINS Function</a>     | For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not. |
| <a href="#">EQUALS_HOST Function</a> | Determines if the two given hosts, domains, or subnets are equal                                                                                         |

## 119.3.1 CONTAINS\_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (  
    host      IN    VARCHAR2,  
    domain    IN    VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 119-2 CONTAINS\_HOST Function Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| host      | Network host                    |
| domain    | Network host, domain, or subnet |

### Return Values

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If domain is a hostname, returns the level of its domain + 1
- If domain is a domain name, returns the domain level
- If domain is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If domain is the wildcard "\*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.

### Examples

```
SELECT host, acl, precedence  
FROM (select host, acl,  
             DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('192.0.2.3', host)  
             precedence  
FROM dba_network_acls)
```

```
WHERE precedence > 0
ORDER BY precedence DESC;
```

| HOST                 | ACL                       | PRECEDENCE |
|----------------------|---------------------------|------------|
| 192.0.2.3            | /sys/acls/hr-www.xml      | 32         |
| ::ffff:192.0.2.0/120 | /sys/acls/hr-domain.xml   | 24         |
| ::ffff:192.0.0.0/104 | /sys/acls/corp-domain.xml | 8          |

## 119.3.2 DOMAIN\_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (
    host IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 119-3 DOMAIN\_LEVEL Function Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| host      | Network host, domain, or subnet |

### Return Values

The domain level of the given host, domain, or subnet.

### Usage Notes

Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.

### Examples

```
SELECT host, acl, domain_level
FROM (select host, acl,
            DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) domain_level
      FROM dba_network_acls)
order by domain_level desc;
```

| HOST               | ACL                       | DOMAIN_LEVEL |
|--------------------|---------------------------|--------------|
| www.hr.example.com | /sys/acls/hr-www.xml      | 4            |
| *.hr.example.com   | /sys/acls/hr-domain.xml   | 3            |
| *.example.com      | /sys/acls/corp-domain.xml | 2            |

## 119.3.3 DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (  
    host IN VARCHAR2)  
    RETURN DOMAIN_TABLE PIPELINED;
```

### Parameters

**Table 119-4** DOMAINS Function Parameters

| Parameter | Description  |
|-----------|--------------|
| host      | Network host |

### Return Values

The domains or subnets for the given host.

### Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

### Examples

```
select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));
```

```
DOMAINS  
-----  
www.hr.example.com  
*.hr.example.com  
*.example.com  
*.com  
*
```

## 119.3.4 EQUALS\_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4- native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST (  
    host1 IN VARCHAR2,  
    host2 IN VARCHAR2)  
    RETURN NUMBER;
```

## Parameters

**Table 119-5 EQUALS\_HOST Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| host1     | Network host, domain, or subnet to compare |
| host2     | Network host, domain, or subnet to compare |

## Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

## Examples

```
SELECT host, acl
   FROM dba_network_acls
  WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;
```

| HOST                 | ACL                     |
|----------------------|-------------------------|
| -----                | -----                   |
| ::ffff:192.0.2.0/120 | /sys/acls/hr-domain.xml |

DBMS\_ODCI package contains a single user function related to the use of Data Cartridges.

This chapter contains the following topic:

- [Summary of DBMS\\_ODCI Subprograms](#)

 **See Also:**

- *Oracle Database Data Cartridge Developer's Guide*

## 120.1 Summary of DBMS\_ODCI Subprograms

The DBMS\_ODCI package has one subprogram, the ESTIMATE\_CPU\_UNITS function.

**Table 120-1** DBMS\_ODCI Package Subprograms

| Subprogram                                  | Description                                                                                                               |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ESTIMATE_CPU_UNITS Function</a> | Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds) |

### 120.1.1 ESTIMATE\_CPU\_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE\_CPU\_UNITS considers the speed of a single processor.

**Syntax**

```
DBMS_ODCI.estimate_cpu_units(  
    elapsed_time    NUMBER)  
    RETURN NUMBER;
```

**Parameters**

| Parameter    | Description                                                      |
|--------------|------------------------------------------------------------------|
| elapsed_time | The elapsed time in seconds that it takes to execute a function. |

### Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

# DBMS\_OPTIM\_BUNDLE

The `DBMS_OPTIM_BUNDLE` package is used to manage the installed but disabled module bug fixes which cause an execution plan change.

This chapter contains the following topics:

- [DBMS\\_OPTIM\\_BUNDLE Security Model](#)
- [Summary of DBMS\\_OPTIM\\_BUNDLE Subprograms](#)

## 121.1 DBMS\_OPTIM\_BUNDLE Security Model

The `DBMS_OPTIM_BUNDLE` package runs with the privileges of the user starting the package. DBA role is required to run this package.

## 121.2 Summary of DBMS\_OPTIM\_BUNDLE Subprograms

This table lists the `DBMS_OPTIM_BUNDLE` subprograms and briefly describes them.

**Table 121-1 DBMS\_OPTIM\_BUNDLE Package Subprograms**

| Subprogram                                       | Description                                                                                                     |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">ENABLE_OPTIM_FIXES Procedure</a>     | This procedure enables or disables fixes with plan changes up to the latest installed release update.           |
| <a href="#">GETBUGSFORBUNDLE Procedure</a>       | This procedure displays execution plan bug fixes applied as part of release updates.                            |
| <a href="#">LISTBUNDLESWITHFCFIXES Procedure</a> | This procedure lists the release update names and release update IDs of release updates with fix control fixes. |
| <a href="#">SET_FIX_CONTROLS Procedure</a>       | This procedure enables or disables a list of fixes with <code>_fix_controls</code> .                            |

### 121.2.1 ENABLE\_OPTIM\_FIXES Procedure

The `DBMS_OPTIM_BUNDLE` subprogram, `ENABLE_OPTIM_FIXES` procedure enables or disables fixes with plan changes up to the latest installed release update.

#### Syntax

```
DBMS_OPTIM_BUNDLE.ENABLE_OPTIM_FIXES (
  action          IN VARCHAR2 DEFAULT 'OFF',
  scope          IN VARCHAR2 DEFAULT 'MEMORY',
  current_setting_precedence IN VARCHAR2 DEFAULT 'YES');
```

## Parameters

**Table 121-2** ENABLE\_OPTIM\_FIXES Procedure Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action                     | <p>Enables or disables all of the installed but disabled execution plan bug fixes up to and including the current release update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"><li>• ON-enables the bundle fixes.</li><li>• OFF-disables bundle fixes by setting the <code>_fix_controls</code> to the value 0. It will not remove <code>_fix_control</code> entries from SPFILE.</li></ul> <p>The default value is OFF.</p>                                                                                                                                                                                                                                         |
| scope                      | <p>The scope of enabling or disabling the installed but disabled execution plan bug fixes.</p> <p>The possible values are:</p> <ul style="list-style-type: none"><li>• MEMORY</li><li>• SPFILE</li><li>• BOTH</li><li>• INITORA</li></ul> <p>MEMORY/SPFILE/BOTH: These three input values enables or disables the fixes in a given scope.</p> <p>INITORA: This input value will just display manual command syntax that the user needs to manually enter into the database's <code>init.ora</code> file in order to enable or disable execution plan bug fixes. When using <code>SCOPE=INITORA</code> in this way, the <code>current_setting_precedence</code> field has no significance.</p> |
| current_setting_precedence | <p>Sets the precedence of environment settings or release update settings, where these settings are in conflict.</p> <p>The possible values are:</p> <ul style="list-style-type: none"><li>• YES-the current environment settings take precedence in case of conflict</li><li>• NO-release update settings take precedence in case of conflict</li></ul> <p>The default value is YES.</p>                                                                                                                                                                                                                                                                                                     |

## Examples

To enable all of the installed but disabled execution plan bug fixes up to and including those from the current release update:

```
SQL> execute dbms_optim_bundle.enable_optim_fixes('ON','BOTH', 'YES');
```

This instruction would enable all fixes, in both `MEMORY` and in the persistent `SPFILE`, with a precedence of current setting.

## Exceptions

The following exceptions are raised by the `ENABLE_OPTIM_FIXES` Procedure:

- ORA-20001: Bad input value
- ORA-20002: Internal or other errors

## 121.2.2 GETBUGSFORBUNDLE Procedure

The `DBMS_OPTIM_BUNDLE` subprogram, `GETBUGSFORBUNDLE` procedure displays execution plan bug fixes applied as part of release updates.

### Syntax

```
DBMS_OPTIM_BUNDLE.GETBUGSFORBUNDLE (  
    bundleid          IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 121-3** GETBUGSFORBUNDLE Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bundleid  | The release update ID.<br>If NULL, the execution plan bug fixes from the latest bundle is displayed. If a bundle ID is specified, then the execution plan bug fixes up to the specified bundle is displayed.<br>The default value is NULL. |

### Examples

To view a listing of the installed but disabled execution plan bug fixes from the most recent release update applied:

```
SQL> set serveroutput on;  
SQL> execute dbms_optim_bundle.getbugsforbundle;  
  
19.8.0.0.200714DBRU:  
  Bug: 29304314, fix_controls: 29304314  
  Bug: 29930457, fix_controls: 29930457
```

The above example lists the installed but disabled execution plan bug fixes from the 19.8.0.0.200714DBRU release.

To view a listing of the installed but disabled execution plan bug fixes from release updates up to and including release update 171017:

```
SQL> execute dbms_optim_bundle.getbugsforbundle(171017);
```

### Exceptions

The following exceptions are raised by the `GETBUGSFORBUNDLE` Procedure:

- `ORA-20001: Bad input value`
- `ORA-20002: Internal or other errors`

## 121.2.3 LISTBUNDLESWITHFCFIXES Procedure

The `DBMS_OPTIM_BUNDLE` subprogram, `LISTBUNDLESWITHFCFIXES` procedure lists the release update names and release update IDs of release updates with fix control fixes.

### Syntax

```
DBMS_OPTIM_BUNDLE.LISTBUNDLESWITHFCFIXES ( );
```

## Examples

To view the release update names and release update IDs:

```
SQL> set serveroutput on
SQL> exec dbms_optim_bundle.listBundlesWithFCFixes;
bundleId: 190719, bundleName: 19.4.0.0.190719DBRU
bundleId: 191015, bundleName: 19.5.0.0.191015DBRU

```

PL/SQL procedure successfully completed.

## Exceptions

The following exception is raised by the LISTBUNDLESWITHFCFIXES Procedure:

ORA-20002: Internal or other errors

## 121.2.4 SET\_FIX\_CONTROLS Procedure

The DBMS\_OPTIM\_BUNDLE subprogram, SET\_FIX\_CONTROLS procedure enables or disables a list of fixes with `_fix_controls`. The fixes can be present in a base version, in a release update, or in a one-off release. This procedure appends the new fix control settings to the existing ones.

### Syntax

```
DBMS_OPTIM_BUNDLE.SET_FIX_CONTROLS (
    fix_control_string      IN  VARCHAR2,
    sid                    IN  VARCHAR2  DEFAULT '*',
    scope                  IN  VARCHAR2  DEFAULT 'MEMORY',
    current_setting_precedence IN  VARCHAR2  DEFAULT 'YES');
```

### Parameters

**Table 121-4 SET\_FIX\_CONTROLS Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>fix_control_string</code> | Comma separated list of <code>fix_control:value</code> pair. For example:<br>'13329748:0,20355502:4, 27060221:1'                                                                                                                        |
| <code>sid</code>                | The name of the instance on which <code>fix_control</code> setting need to be made.<br>Acceptable values are * or valid <code>instance_name</code> from <code>sys.gv\$instance</code> .<br>The default value is *.                      |
| <code>scope</code>              | The scope of enabling or disabling the installed but disabled execution plan bug fixes.<br>The possible values are: <ul style="list-style-type: none"> <li>MEMORY</li> <li>SPFILE</li> <li>BOTH</li> </ul> The default value is MEMORY. |

**Table 121-4 (Cont.) SET\_FIX\_CONTROLS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| current_setting_precedence | <p>Precedence of current setting over user supplied setting.</p> <p>The possible values are:</p> <ul style="list-style-type: none"><li>• YES—the current environment settings take precedence in case of conflict</li><li>• NO—input settings take precedence in case of conflict</li></ul> <p>The default value is YES.</p> |

### Exceptions

The following exceptions are raised by the SET\_FIX\_CONTROLS Procedure:

- ORA-20001: Bad input value
- ORA-20002: Internal or other errors

# DBMS\_OUTLN

The `DBMS_OUTLN` package, synonymous with `OUTLN_PKG`, contains the functional interface for subprograms associated with the management of stored outlines.

## See Also:

For more information about using the `DBMS_OUTLN` package, see *Oracle Database SQL Tuning Guide*.

## Note:

Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or [LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_OUTLN Subprograms](#)

## 122.1 DBMS\_OUTLN Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or the [LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

## 122.2 DBMS\_OUTLN Security Model

DBMS\_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

## 122.3 Summary of DBMS\_OUTLN Subprograms

This table lists the DBMS\_OUTLN subprograms and briefly describes them.

**Table 122-1 DBMS\_OUTLN Package Subprograms**

| Subprogram                                      | Description                                                                         |
|-------------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">CLEAR_USED Procedure</a>            | Clears the outline 'used' flag                                                      |
| <a href="#">CREATE_OUTLINE Procedure</a>        | Generates outlines from the shared cursor identified by hash value and child number |
| <a href="#">DROP_BY_CAT Procedure</a>           | Drops outlines that belong to a specified category                                  |
| <a href="#">DROP_UNUSED Procedure</a>           | Drops outlines that have never been applied in the compilation of a SQL statement   |
| <a href="#">EXACT_TEXT_SIGNATURES Procedure</a> | Updates outline signatures to those that compute based on exact text matching       |
| <a href="#">UPDATE_BY_CAT Procedure</a>         | Changes the category of outlines in one category to a new category                  |
| <a href="#">UPDATE_SIGNATURES Procedure</a>     | Updates outline signatures to the current version's signature                       |

### 122.3.1 CLEAR\_USED Procedure

This procedure clears the outline 'used' flag.

#### Syntax

```
DBMS_OUTLN.CLEAR_USED (  
    name      IN      VARCHAR2);
```

#### Parameters

**Table 122-2 CLEAR\_USED Procedure Parameters**

| Parameter | Description          |
|-----------|----------------------|
| name      | Name of the outline. |

## 122.3.2 CREATE\_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

### Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (  
    hash_value    IN NUMBER,  
    child_number  IN NUMBER,  
    category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Parameters

**Table 122-3 CREATE\_OUTLINE Procedure Parameters**

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| hash_value   | Hash value identifying the target shared cursor. |
| child_number | Child number of the target shared cursor.        |
| category     | Category in which to create outline (optional).  |

## 122.3.3 DROP\_BY\_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

### Syntax

```
DBMS_OUTLN.DROP_BY_CAT (  
    cat VARCHAR2);
```

### Parameters

**Table 122-4 DROP\_BY\_CAT Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| cat       | Category of outlines to drop. |

### Usage Notes

This procedure purges a category of outlines in a single call.

### Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

## 122.3.4 DROP\_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

### Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

### Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

## 122.3.5 EXACT\_TEXT\_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

### Syntax

```
DBMS_OUTLN.EXACT_TEXT_SIGNATURES;
```

### Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

## 122.3.6 UPDATE\_BY\_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

### Syntax

```
DBMS_OUTLN.UPDATE_BY_CAT (  
    oldcat    VARCHAR2 default 'DEFAULT',  
    newcat    VARCHAR2 default 'DEFAULT');
```

### Parameters

**Table 122-5** UPDATE\_BY\_CAT Procedure Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| oldcat    | The current category of outlines. |
| newcat    | The new category of outlines.     |

## 122.3.7 UPDATE\_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

### Syntax

```
DBMS_OUTLN.UPDATE_SIGNATURES;
```

### Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

# DBMS\_OUTPUT

The `DBMS_OUTPUT` package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_OUTPUT Subprograms](#)

## 123.1 DBMS\_OUTPUT Overview

The package is typically used for debugging, or for displaying messages and reports to SQL\*DBA or SQL\*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The [PUT Procedure](#) and [PUT\\_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET\\_LINE Procedure](#) and [GET\\_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

## 123.2 DBMS\_OUTPUT Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

## 123.3 DBMS\_OUTPUT Operational Notes

The following operational notes apply to `DBMS_OUTPUT`.

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL\*Plus, the buffered messages are ignored.
- SQL\*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL\*Plus has the effect of invoking

```
DBMS_OUTPUT.ENABLE (buffer_size => NULL);
```

with no limit on the output.

- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL\*Plus to control whether or not to display output.

**Note:**

Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

## 123.4 DBMS\_OUTPUT Exceptions

`DBMS_OUTPUT` subprograms raise the application error `ORA-20000` and return errors.

The output procedures can return the following errors:

**Table 123-1 DBMS\_OUTPUT Errors**

| Error      | Description          |
|------------|----------------------|
| ORU-10027: | Buffer overflow      |
| ORU-10028: | Line length overflow |

## 123.5 DBMS\_OUTPUT Rules and Limits

The following are limits on `DBMS_OUTPUT` line and buffer size.

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

## 123.6 DBMS\_OUTPUT Examples

This topic contains three examples of using `DBMS_OUTPUT`.

### Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the `DBMS_OUTPUT` package, then the text produced by this `PUT_LINE` would be buffered, and you could, after executing the statement (presumably some `INSERT`, `DELETE`, or `UPDATE` that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
  DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to `GET_LINE` until `status` comes back as nonzero. For better performance, you should use calls to [GET\\_LINES Procedure](#) which can return an array of lines.

### Example 2: Debugging Stored Procedures and Triggers

The `DBMS_OUTPUT` package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in "[Example 3: Retrieving Information About an Object](#)".

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the `PUT_LINE` procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages    NUMBER(11, 2) := 0;
  counter        NUMBER(10) := 1;
BEGIN

  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
      + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
      '; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
    TO_CHAR(total_wages));
  RETURN total_wages;

END dept_salary;
```

Assume the `EMP` table contains the following rows:

| EMPNO | SAL  | COMM | DEPT |
|-------|------|------|------|
| 1002  | 1500 | 500  | 20   |
| 1203  | 1000 |      | 30   |
| 1289  | 1000 |      | 10   |
| 1347  | 1000 | 250  | 20   |

Assume the user executes the following statements in SQL\*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
```

PL/SQL procedure successfully executed.

### Example 3: Retrieving Information About an Object

In this example, the user has used the `EXPLAIN PLAN` command to retrieve information about the execution plan for a statement and has stored it in `PLAN_TABLE`. The user has also assigned a statement ID to this statement. The example `EXPLAIN_OUT` procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```

/*****
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
*****/
CREATE OR REPLACE PROCEDURE explain_out
  (statement_id IN VARCHAR2) AS

  -- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

  CURSOR explain_rows IS
    SELECT level, id, position, operation, options,
           object_name
    FROM plan_table
    WHERE statement_id = explain_out.statement_id
    CONNECT BY PRIOR id = parent_id
    AND statement_id = explain_out.statement_id
    START WITH id = 0
    ORDER BY id;

BEGIN

  -- Loop through information retrieved from PLAN_TABLE:

  FOR line IN explain_rows LOOP

    -- At start of output, include heading with estimated cost.

    IF line.id = 0 THEN
      DBMS_OUTPUT.PUT_LINE ('Plan for statement '
        || statement_id
        || ', estimated cost = ' || line.position);
    END IF;

    -- Output formatted information. LEVEL determines indentation level.

    DBMS_OUTPUT.PUT_LINE (lpad(' ', 2*(line.level-1)) ||
      line.operation || ' ' || line.options || ' ' ||
      line.object_name);
  END LOOP;

END;
```

## 123.7 DBMS\_OUTPUT Data Structures

The DBMS\_OUTPUT package declares 2 collection types for use with the GET\_LINES Procedure.

### TABLE Types

[CHARARR Table Type](#)

### OBJECT Types

[DBMSOUTPUT\\_LINESARRAY Object Type](#)

### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.

### 123.7.1 CHARARR Table Type

This package type is to be used with the GET\_LINES Procedure to obtain text submitted through the PUT Procedure and PUT\_LINE Procedure.

#### Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

#### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.
- [PUT Procedure](#)  
This procedure places a partial line in the buffer.
- [PUT\\_LINE Procedure](#)  
This procedure places a line in the buffer.

### 123.7.2 DBMS\_OUTPUT DBMSOUTPUT\_LINESARRAY Object Type

This type, defined outside the package, is to be used with the GET\_LINES Procedure to obtain text submitted through the PUT Procedure and PUT\_LINE Procedure.

#### Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY(2147483647) OF VARCHAR2(32767);
```

#### Related Topics

- [GET\\_LINES Procedure](#)  
This procedure retrieves an array of lines from the buffer.
- [PUT Procedure](#)  
This procedure places a partial line in the buffer.
- [PUT\\_LINE Procedure](#)  
This procedure places a line in the buffer.

## 123.8 Summary of DBMS\_OUTPUT Subprograms

This table lists the DBMS\_OUTPUT subprograms and briefly describes them.

**Table 123-2 DBMS\_OUTPUT Package Subprograms**

| Subprogram                          | Description                             |
|-------------------------------------|-----------------------------------------|
| <a href="#">DISABLE Procedure</a>   | Disables message output                 |
| <a href="#">ENABLE Procedure</a>    | Enables message output                  |
| <a href="#">GET_LINE Procedure</a>  | Retrieves one line from buffer          |
| <a href="#">GET_LINES Procedure</a> | Retrieves an array of lines from buffer |
| <a href="#">NEW_LINE Procedure</a>  | Terminates a line created with PUT      |
| <a href="#">PUT Procedure</a>       | Places a partial line in the buffer     |
| <a href="#">PUT_LINE Procedure</a>  | Places line in buffer                   |

### Note:

The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

### 123.8.1 DISABLE Procedure

This procedure disables calls to PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES, and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the SERVEROUTPUT option of SQL\*Plus.

#### Syntax

```
DBMS_OUTPUT.DISABLE;
```

#### Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

### 123.8.2 ENABLE Procedure

This procedure enables calls to PUT, PUT\_LINE, NEW\_LINE, GET\_LINE, and GET\_LINES.

Calls to these procedures are ignored if the DBMS\_OUTPUT package is not activated.

#### Syntax

```
DBMS_OUTPUT.ENABLE (  
    buffer_size IN INTEGER DEFAULT 20000);
```

#### Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

## Parameters

**Table 123-3** ENABLE Procedure Parameters

| Parameter   | Description                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| buffer_size | Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit. |

## Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL\*Plus.
- If there are multiple calls to ENABLE, then buffer\_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer\_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

## 123.8.3 GET\_LINE Procedure

This procedure retrieves a single line of buffered information.

## Syntax

```
DBMS_OUTPUT.GET_LINE (  
    line    OUT VARCHAR2,  
    status  OUT INTEGER);
```

## Parameters

**Table 123-4** GET\_LINE Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| line      | Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small". |
| status    | If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.                                                                                                                             |

## Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET\_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET\_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET\_LINE or GET\_LINES, any lines not retrieved before the next call to PUT, PUT\_LINE, or NEW\_LINE are discarded to avoid confusing them with the next message.

## 123.8.4 GET\_LINES Procedure

This procedure retrieves an array of lines from the buffer.

### Syntax

```
DBMS_OUTPUT.GET_LINES (
    lines      OUT   CHARARR,
    numlines   IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
    lines      OUT   DBMSOUTPUT_LINESARRAY,
    numlines   IN OUT INTEGER);
```

### Parameters

**Table 123-5 GET\_LINES Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lines     | Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the VARRAY overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.                      |
| numlines  | Number of lines you want to retrieve from the buffer.<br>After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer. |

### Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

## 123.8.5 NEW\_LINE Procedure

This procedure puts an end-of-line marker.

The [GET\\_LINE Procedure](#) and the [GET\\_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT\\_LINE Procedure](#) or [NEW\\_LINE Procedure](#) generates a line that is returned by `GET_LINE(S)`.

### Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

## 123.8.6 PUT Procedure

This procedure places a partial line in the buffer.

### Note:

The `PUT` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

### Syntax

```
DBMS_OUTPUT.PUT (  
    item IN VARCHAR2);
```

### Parameters

**Table 123-6** PUT Procedure Parameters

| Parameter | Description     |
|-----------|-----------------|
| item      | Item to buffer. |

### Exceptions

**Table 123-7** PUT Procedure Exceptions

| Error                    | Description                                               |
|--------------------------|-----------------------------------------------------------|
| ORA-20000,<br>ORU-10027: | Buffer overflow, limit of <buf_limit> bytes.              |
| ORA-20000,<br>ORU-10028: | Line length overflow, limit of 32767 bytes for each line. |

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.
- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON  
SQL> BEGIN
```

```
2 DBMS_OUTPUT.PUT_LINE ('hello');
3 DBMS_LOCK.SLEEP (10);
4 END;
```

## 123.8.7 PUT\_LINE Procedure

This procedure places a line in the buffer.

### Note:

The `PUT_LINE` procedure that takes a `NUMBER` is obsolete and, while currently supported, is included in this release for legacy reasons only.

### Syntax

```
DBMS_OUTPUT.PUT_LINE (  
    item IN VARCHAR2);
```

### Parameters

**Table 123-8 PUT\_LINE Procedure Parameters**

| Parameter | Description     |
|-----------|-----------------|
| item      | Item to buffer. |

### Exceptions

**Table 123-9 PUT\_LINE Procedure Exceptions**

| Error                    | Description                                               |
|--------------------------|-----------------------------------------------------------|
| ORA-20000,<br>ORU-10027: | Buffer overflow, limit of <buf_limit> bytes.              |
| ORA-20000,<br>ORU-10028: | Line length overflow, limit of 32767 bytes for each line. |

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.
- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2 DBMS_OUTPUT.PUT_LINE ('hello');
  3 DBMS_LOCK.SLEEP (10);
  4 END;
```

# DBMS\_PARALLEL\_EXECUTE

The `DBMS_PARALLEL_EXECUTE` package enables incremental update of table data in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_PARALLEL\\_EXECUTE Subprograms](#)

## See Also:

- *Oracle Database Development Guide*
- *Oracle Database Reference*

## 124.1 DBMS\_PARALLEL\_EXECUTE Overview

This package lets you incrementally update table data in parallel, in two high-level steps.

1. Group sets of rows in the table into smaller-sized chunks.
2. Run a user-specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of *parallel execution task*. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the [GENERATE\\_TASK\\_NAME Function](#) and the [TASK\\_STATUS Procedure](#)) perform a commit.

## 124.2 DBMS\_PARALLEL\_EXECUTE Security Model

`DBMS_PARALLEL_EXECUTE` is a SYS-owned package which is granted to PUBLIC.

Users who have the `ADM_PARALLEL_EXECUTE_TASK` role can perform administrative routines (qualified by the prefix `ADM_`) and access the DBA view.

Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, you must have `CREATE JOB` system privilege.

The `CHUNK_BY_SQL`, `RUN_TASK`, and `RESUME_TASK` subprograms require a query, and are executed using `DBMS_SQL`. Invokers of the `DBMS_SQL` interface must ensure that no query contains SQL injection.

## 124.3 DBMS\_PARALLEL\_EXECUTE Constants

The `DBMS_PARALLEL_EXECUTE` package uses the constants described in these two tables.

**Table 124-1 DBMS\_PARALLEL\_EXECUTE Constants - Chunk Status Value**

| Constant             | Type   | Value | Description                                                       |
|----------------------|--------|-------|-------------------------------------------------------------------|
| ASSIGNED             | NUMBER | 1     | Chunk has been assigned for processing                            |
| PROCESSED            | NUMBER | 2     | Chunk has been processed successfully                             |
| PROCESSED_WITH_ERROR | NUMBER | 3     | Chunk has been processed, but an error occurred during processing |
| UNASSIGNED           | NUMBER | 0     | Chunk is unassigned                                               |

**Table 124-2 DBMS\_PARALLEL\_EXECUTE Constants - Task Status Value**

| Constant            | Type   | Value | Description                                                                                                                                                                                                           |
|---------------------|--------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHUNKED             | NUMBER | 5     | Table associated with the task has been chunked, but none of the chunk has been assigned for processing                                                                                                               |
| CHUNKING            | NUMBER | 2     | Table associated with the task is being chunked                                                                                                                                                                       |
| CHUNKING_FAILED     | NUMBER | 3     | Chunking failed                                                                                                                                                                                                       |
| CRASHED             | NUMBER | 9     | Only applicable if parallel execution is used, this occurs if a job slave crashes or if the database crashes during <code>EXECUTE</code> , leaving a chunk in <code>ASSIGNED</code> or <code>UNASSIGNED</code> state. |
| CREATED             | NUMBER | 1     | The task has been created by the <a href="#">CREATE_TASK Procedure</a>                                                                                                                                                |
| FINISHED            | NUMBER | 7     | All chunks processed without error                                                                                                                                                                                    |
| FINISHED_WITH_ERROR | NUMBER | 8     | All chunks processed, but with errors in some cases                                                                                                                                                                   |
| NO_CHUNKS           | NUMBER | 4     | Table associated with the task has no chunks created                                                                                                                                                                  |
| PROCESSING          | NUMBER | 6     | Part of the chunk assigned for processing, or which has been processed                                                                                                                                                |

**Note:**

Use constants instead of absolute values, because absolute values might change in future.

## 124.4 DBMS\_PARALLEL\_EXECUTE Views

The `DBMS_PARALLEL_EXECUTE` package uses the following views.

- `DBA_PARALLEL_EXECUTE_CHUNKS`
- `DBA_PARALLEL_EXECUTE_TASKS`
- `USER_PARALLEL_EXECUTE_CHUNKS`
- `USER_PARALLEL_EXECUTE_TASKS`

## 124.5 DBMS\_PARALLEL\_EXECUTE Exceptions

The following table lists the exceptions raised by `DBMS_PARALLEL_EXECUTE`.

**Table 124-3 Exceptions Raised by DBMS\_PARALLEL\_EXECUTE**

| Exception                                   | Error Code | Description                                                                                                         |
|---------------------------------------------|------------|---------------------------------------------------------------------------------------------------------------------|
| <code>CHUNK_NOT_FOUND</code>                | 29499      | Specified chunk does not exist                                                                                      |
| <code>DUPLICATE_TASK_NAME</code>            | 29497      | Same task name has been used by an existing task                                                                    |
| <code>INVALID_STATE_FOR_CHUNK</code>        | 29492      | Attempts to chunk a table that is not in <code>CREATED</code> or <code>CHUNKING_FAILED</code> state                 |
| <code>INVALID_STATE_FOR_REDSU<br/>ME</code> | 29495      | Attempts to resume execution, but the task is not in <code>FINISHED_WITH_ERROR</code> or <code>CRASHED</code> state |
| <code>INVALID_STATE_FOR_RUN</code>          | 29494      | Attempts to execute the task that is not in <code>CHUNKED</code> state                                              |
| <code>INVALID_STATUS</code>                 | 29493      | Attempts to set an invalid value to the chunk status                                                                |
| <code>INVALID_TABLE</code>                  | 29491      | Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT      |
| <code>MISSING_ROLE</code>                   | 29490      | User does not have the necessary <code>ADM_PARALLEL_EXECUTE</code> role                                             |
| <code>TASK_NOT_FOUND</code>                 | 29498      | Specified <code>task_name</code> does not exist                                                                     |

## 124.6 DBMS\_PARALLEL\_EXECUTE Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. They requires that the HR schema be created with the `JOB SYSTEM` privilege.

### Chunk by ROWID

This example shows the most common usage of this package. After calling the [RUN\\_TASK Procedure](#), it checks for errors and reruns in the case of error.

```
DECLARE
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
```

```

-- Chunk the table by ROWID
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true, 100);

-- Execute the DML in parallel
l_sql_stmt := 'update EMPLOYEES e
              SET e.salary = e.salary + 10
              WHERE rowid BETWEEN :start_id AND :end_id';
DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                               parallel_level => 10);

-- If there is an error, RESUME it for at most 2 times.
L_try := 0;
L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
LOOP
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
END LOOP;

-- Done with processing; drop the task
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/

```

### Chunk by User-Provided SQL

A user can specify a chunk algorithm by using the [CREATE\\_CHUNKS\\_BY\\_SQL Procedure](#). This example shows that rows with the same `manager_id` are grouped together and processed in one chunk.

```

DECLARE
    l_chunk_sql VARCHAR2(1000);
    l_sql_stmt VARCHAR2(1000);
    l_try NUMBER;
    l_status NUMBER;
BEGIN
    -- Create the TASK
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

    -- Chunk the table by MANAGER_ID
    l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);

    -- Execute the DML in parallel
    -- the WHERE clause contain a condition on manager_id, which is the chunk
    -- column. In this case, grouping rows is by manager_id.
    l_sql_stmt := 'update EMPLOYEES e
                  SET e.salary = e.salary + 10
                  WHERE manager_id between :start_id and :end_id';
    DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                                   parallel_level => 10);

    -- If there is error, RESUME it for at most 2 times.
    L_try := 0;
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
    Loop
        L_try := l_try + 1;
        DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    End Loop;
END;

```

```

        l_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    END LOOP;

    -- Done with processing; drop the task
    DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

end;
/

```

### Executing Chunks in an User-defined Framework

You can execute chunks in a self-defined framework without using the [RUN\\_TASK Procedure](#). This example shows how to use [GET\\_ROWID\\_CHUNK Procedure](#), [EXECUTE IMMEDIATE](#), [SET\\_CHUNK\\_STATUS Procedure](#) to execute the chunks.

```

DECLARE
    l_sql_stmt varchar2(1000);
    l_try number;
    l_status number;
    l_chunk_id number;
    l_start_rowid rowid;
    l_end_rowid rowid;
    l_any_rows boolean;
    CURSOR c1 IS SELECT chunk_id
                  FROM user_parallel_execute_chunks
                  WHERE task_name = 'mytask'
                     AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
                                     DBMS_PARALLEL_EXECUTE.ASSIGNED);
BEGIN

    -- Create the Objects, task, and chunk by ROWID
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true, 100);

    l_sql_stmt := 'update EMPLOYEES e
                  SET e.salary = e.salary + 10
                  WHERE rowid BETWEEN :start_id AND :end_id';

    -- Execute the DML in his own framework
    --
    -- Process each chunk and commit.
    -- After processing one chunk, repeat this process until
    -- all the chunks are processed.
    --
    <<main_processing>>
    LOOP
        --
        -- Get a chunk to process; if there is nothing to process, then exit the
        -- loop;
        --
        DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',

## 124.7 Summary of DBMS\_PARALLEL\_EXECUTE Subprograms

This table lists the DBMS\_PARALLEL\_EXECUTE subprograms and briefly describes them.

**Table 124-4 DBMS\_PARALLEL\_EXECUTE Package Subprograms**

| Subprogram                                            | Description                                                                                                                           |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADM_DROP_CHUNKS Procedure</a>             | Drops all chunks of the specified task owned by the specified owner                                                                   |
| <a href="#">ADM_DROP_TASK Procedure</a>               | Drops the task of the given user and all related chunks                                                                               |
| <a href="#">ADM_TASK_STATUS Function</a>              | Returns the task status                                                                                                               |
| <a href="#">ADM_STOP_TASK Procedure</a>               | Stops the task of the given owner and related job slaves                                                                              |
| <a href="#">CREATE_TASK Procedure</a>                 | Creates a task for the current user                                                                                                   |
| <a href="#">CREATE_CHUNKS_BY_NUMBER_COL Procedure</a> | Chunks the table associated with the given task by the specified column.                                                              |
| <a href="#">CREATE_CHUNKS_BY_ROWID Procedure</a>      | Chunks the table associated with the given task by ROWID                                                                              |
| <a href="#">CREATE_CHUNKS_BY_SQL Procedure</a>        | Chunks the table associated with the given task by means of a user-provided SELECT statement                                          |
| <a href="#">DROP_TASK Procedure</a>                   | Drops the task and all related chunks                                                                                                 |
| <a href="#">DROP_CHUNKS Procedure</a>                 | Drops the task's chunks                                                                                                               |
| <a href="#">GENERATE_TASK_NAME Function</a>           | Returns a unique name for a task                                                                                                      |
| <a href="#">GET_NUMBER_COL_CHUNK Procedure</a>        | Picks an unassigned NUMBER chunk and changes it to ASSIGNED                                                                           |
| <a href="#">GET_ROWID_CHUNK Procedure</a>             | Picks an unassigned ROWID chunk and changes it to ASSIGNED                                                                            |
| <a href="#">PURGE_PROCESSED_CHUNKS Procedure</a>      | Deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR                                                    |
| <a href="#">RESUME_TASK Procedures</a>                | Retries the given the task if the <a href="#">RUN_TASK Procedure</a> finished with an error, or resumes the task if a crash occurred. |
| <a href="#">RUN_TASK Procedure</a>                    | Executes the specified SQL statement on the chunks in parallel                                                                        |

**Table 124-4 (Cont.) DBMS\_PARALLEL\_EXECUTE Package Subprograms**

| Subprogram                                 | Description                           |
|--------------------------------------------|---------------------------------------|
| <a href="#">SET_CHUNK_STATUS Procedure</a> | Sets the status of the chunk          |
| <a href="#">STOP_TASK Procedure</a>        | Stops the task and related job slaves |
| <a href="#">TASK_STATUS Procedure</a>      | Returns the task status               |

## 124.7.1 ADM\_DROP\_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2);
```

### Parameters

**Table 124-5 ADM\_DROP\_CHUNKS Procedure Parameters**

| Parameter  | Description       |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name  | Name of the task  |

## 124.7.2 ADM\_DROP\_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2);
```

### Parameters

**Table 124-6 ADM\_DROP\_TASK Procedure Parameters**

| Parameter  | Description       |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name  | Name of the task  |

## 124.7.3 ADM\_TASK\_STATUS Function

This function returns the task status.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 124-7** ADM\_TASK\_STATUS Function Parameters

| Parameter  | Description       |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name  | Name of the task  |

## 124.7.4 ADM\_STOP\_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2);
```

### Parameters

**Table 124-8** ADM\_STOP\_TASK Procedure Parameters

| Parameter  | Description       |
|------------|-------------------|
| task_owner | Owner of the task |
| task_name  | Name of the task  |

## 124.7.5 CREATE\_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_TASK (  
    task_name      IN  VARCHAR2,  
    comment        IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 124-9 CREATE\_TASK Procedure Parameters**

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the task. The task_name can be any string in which related length must be less than or equal to 128 bytes. |
| comment   | Comment field. The comment must be less than 4000 bytes.                                                           |

## 124.7.6 CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a `NUMBER` column. This procedure takes the `MIN` and `MAX` value of the column, and then divides the range evenly according to `chunk_size`.

The chunks are:

| START_ID                | END_ID                    |
|-------------------------|---------------------------|
| -----                   | -----                     |
| min_id_val              | min_id_val+1*chunk_size-1 |
| min_id_val+1*chunk_size | min_id_val+2*chunk_size-1 |
| ...                     | ...                       |
| min_id_val+i*chunk_size | max_id_val                |

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (  
    task_name      IN  VARCHAR2,  
    table_owner    IN  VARCHAR2,  
    table_name     IN  VARCHAR2,  
    table_column   IN  VARCHAR2,  
    chunk_size     IN  NUMBER);
```

## Parameters

**Table 124-10 CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure Parameters**

| Parameter    | Description                            |
|--------------|----------------------------------------|
| task_name    | Name of the task                       |
| table_owner  | Owner of the table                     |
| table_name   | Name of the table                      |
| table_column | Name of the <code>NUMBER</code> column |
| chunk_size   | Range of each chunk                    |

## 124.7.7 CREATE\_CHUNKS\_BY\_ROWID Procedure

This procedure chunks the table (associated with the specified task) by `ROWID`.

`num_row` and `num_block` are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical `ROWID` having views and table functions. Index-organized tables are not allowed.

## Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (
    task_name      IN  VARCHAR2,
    table_owner    IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    by_row         IN  BOOLEAN,
    chunk_size     IN  NUMBER);
```

## Parameters

**Table 124-11 CREATE\_CHUNKS\_BY\_ROWID Procedure Parameters**

| Parameter   | Description                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------|
| task_name   | Name of the task                                                                                      |
| table_owner | Owner of the table                                                                                    |
| table_name  | Name of the table                                                                                     |
| by_row      | TRUE if chunk_size refers to the number of rows, otherwise, chunk_size refers to the number of blocks |
| chunk_size  | Approximate number of rows/blocks to process for each commit cycle                                    |

## 124.7.8 CREATE\_CHUNKS\_BY\_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided `SELECT` statement.

The `SELECT` statement that returns the range of each chunk must have two columns: `start_id` and `end_id`. If the task is to chunk by `ROWID`, then the two columns must be of `ROWID` type. If the task is to chunk the table by `NUMBER` column, then the two columns must be of `NUMBER` type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

## Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (
    task_name      IN  VARCHAR2,
    sql_stmt       IN  CLOB,
    by_rowid       IN  BOOLEAN);
```

## Parameters

**Table 124-12 CREATE\_CHUNKS\_BY\_SQL Procedure Parameters**

| Parameter | Description                            |
|-----------|----------------------------------------|
| task_name | Name of the task                       |
| sql_stmt  | SQL that returns the chunk ranges      |
| by_rowid  | TRUE if the table is chunked by rowids |

## 124.7.9 DROP\_TASK Procedure

This procedure drops the task and all related chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (
    task_name      IN VARCHAR2);
```

### Parameters

**Table 124-13 DROP\_TASK Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

## 124.7.10 DROP\_CHUNKS Procedure

This procedure drops the task's chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (
    task_name      IN VARCHAR2);
```

### Parameters

**Table 124-14 DROP\_CHUNKS Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

## 124.7.11 GENERATE\_TASK\_NAME Function

This function returns a unique name for a task.

The name is of the form *prefixN* where N is a number from a sequence. If no prefix is specified, the generated name is, by default, TASK\$\_1, TASK\$\_2, TASK\$\_3, and so on. If 'SCOTT' is specified as the prefix, the name is SCOTT1, SCOTT2, and so on.

### Syntax

```
DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (
    prefix      IN      VARCHAR2 DEFAULT 'TASK$_')
RETURN VARCHAR2;
```

### Parameters

**Table 124-15 GENERATE\_TASK\_NAME Function Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| prefix    | The prefix to use when generating the task name |

## 124.7.12 GET\_NUMBER\_COL\_CHUNK Procedure

This procedure picks an unassigned `NUMBER` chunk and changes it to `ASSIGNED`. If there are no more chunks to assign, `any_rows` is set to `FALSE`. Otherwise, the `chunk_id`, `start`, and `end_id` of the chunk are returned as `OUT` parameters.

The chunk information in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: `STATUS` becomes `ASSIGNED`; `START_TIMESTAMP` records the current time; `END_TIMESTAMP` is cleared.

**See Also:**

[Views](#)

### Syntax

```
DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_rowid    OUT ROWID,
    end_id         OUT ROWID,
    any_rows       OUT BOOLEAN);
```

### Parameters

**Table 124-16 GET\_NUMBER\_COL\_CHUNK Procedure Parameters**

| Parameter                | Description                                                   |
|--------------------------|---------------------------------------------------------------|
| <code>task_name</code>   | Name of the task                                              |
| <code>chunk_id</code>    | Chunk_id of the chunk                                         |
| <code>start_rowid</code> | Start rowid in the returned range                             |
| <code>end_id</code>      | End rowid in the returned range                               |
| <code>any_rows</code>    | Indicating if there could be any rows to process in the range |

### Usage Notes

If the task is chunked by `ROWID`, then use `get_rowid_range`. If the task is chunked by `NUMBER` column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` have valid values but `start_id` and `end_id` are `NULL`.

## 124.7.13 GET\_ROWID\_CHUNK Procedure

This procedure picks an unassigned `ROWID` chunk and changes it to `ASSIGNED`.

If there are no more chunks to assign, `any_rows` is set to `FALSE`. Otherwise, the `chunk_id`, `start`, and `end_id` of the chunk are returned as `OUT` parameters. The chunk info in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: `STATUS` becomes `ASSIGNED`; `START_TIMESTAMP` records the current time; `END_TIMESTAMP` is cleared.

**See Also:**[Views](#)**Syntax**

```
DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (  
    task_name          IN VARCHAR2,  
    chunk_id           OUT NUMBER,  
    start_rowid        OUT ROWID,  
    end_id             OUT ROWID,  
    any_rows           OUT BOOLEAN);
```

**Parameters****Table 124-17 GET\_ROWID\_CHUNK Procedure Parameters**

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| task_name   | Name of the task                                       |
| chunk_id    | Chunk_id of the chunk                                  |
| start_rowid | Start rowid in the returned range                      |
| end_id      | End rowid in the returned range                        |
| any_rows    | Indicates that the range could include rows to process |

**Usage Notes**

If the task is chunked by ROWID, then use `get_rowid_range`. If the task is chunked by NUMBER column, then use `get_number_col_range`. If you make the wrong function call, the returning `chunk_id` and `any_rows` will still have valid values but `start_id` and `end_id` are NULL.

## 124.7.14 PURGE\_PROCESSED\_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is `PROCESSED` or `PROCESSED_WITH_ERROR`.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (  
    task_name          IN VARCHAR2);
```

**Parameters****Table 124-18 PURGE\_PROCESSED\_CHUNKS Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

## 124.7.15 RESUME\_TASK Procedures

This procedure retries the specified task if the RUN\_TASK Procedure finished with an error, or resumes the task if a crash occurred.

You can only invoke this procedure if the task is in a `CRASHED` or `FINISHED_WITH_ERROR` state.

For a crashed serial execution, the state remains in `PROCESSING`. The `FORCE` option allows you to resume any task in `PROCESSING` state. However, it is your responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in `PROCESSED_WITH_ERROR` or `ASSIGNED` (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the [RUN\\_TASK Procedure](#). The overload which takes `task_name` as the only input argument re-uses the arguments provided in the previous invoking of the [RUN\\_TASK Procedure](#) or [RESUME\\_TASK Procedures](#).

**See Also:**

[Table 124-2](#)

### Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    sql_stmt           IN  CLOB,
    language_flag      IN  NUMBER,
    edition            IN  VARCHAR2  DEFAULT NULL,
    apply_crossedition_trigger IN  VARCHAR2  DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN   DEFAULT TRUE,
    parallel_level     IN  NUMBER   DEFAULT 0,
    job_class          IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS',
    force              IN  BOOLEAN   DEFAULT FALSE);
```

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    force              IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 124-19 RESUME\_TASK Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>     | Name of the task                                                                                                                                                                                                                                                                                                                                    |
| <code>sql_stmt</code>      | SQL statement; must have <code>:start_id</code> and <code>:end_id</code> placeholders                                                                                                                                                                                                                                                               |
| <code>language_flag</code> | Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li>V6 (or 0) specifies version 6 behavior</li> <li>NATIVE (or 1) specifies normal behavior for the database to which the program is connected</li> <li>V7 (or 2) specifies Oracle database version 7 behavior</li> </ul> |

**Table 124-19 (Cont.) RESUME\_TASK Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| edition                    | Specifies the edition in which to run the statement. Default is the current edition.                                                                                                                                                                                                       |
| apply_crossedition_trigger | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement. |
| fire_apply_trigger         | Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only to used as be a guide in selecting other triggers                                                                                                                                             |
| parallel_level             | Number of parallel jobs; zero if run in serial; NULL uses the default parallelism                                                                                                                                                                                                          |
| job_class                  | If running in parallel, the jobs all belong to the specified job class                                                                                                                                                                                                                     |
| force                      | If TRUE, do not raise an error if the status is PROCESSING.                                                                                                                                                                                                                                |

### Examples

Suppose the chunk table contains the following chunk ranges:

| START_ID | END_ID |
|----------|--------|
| -----    | -----  |
| 1        | 10     |
| 11       | 20     |
| 21       | 30     |

And the specified SQL statement is:

```
UPDATE employees
  SET salary = salary + 10
  WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
  SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;

UPDATE employees
  SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;

UPDATE employees
  SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

### Related Topics

- [RUN\\_TASK Procedure](#)  
This procedure executes the specified statement (sql\_stmt) on the chunks in parallel.

## 124.7.16 RUN\_TASK Procedure

This procedure executes the specified statement (`sql_stmt`) on the chunks in parallel.

It commits after processing each chunk.

The specified statement must have two placeholders called `start_id` and `end_id`, respectively, which represent the range of the chunk to be processed. The type of each placeholder must be `ROWID` where `ROWID`-based chunking was used, or `NUMBER` where `NUMBER`-based chunking was used.

### Syntax

```
DBMS_PARALLEL_EXECUTE.RUN_TASK (
    task_name          IN  VARCHAR2,
    sql_stmt           IN  CLOB,
    language_flag      IN  NUMBER,
    edition            IN  VARCHAR2  DEFAULT NULL,
    apply_crossedition_trigger IN VARCHAR2  DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN   DEFAULT TRUE,
    parallel_level     IN  NUMBER    DEFAULT 0,
    job_class          IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS');
```

### Parameters

**Table 124-20 RUN\_TASK Procedure Parameters**

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>                  | Name of the task                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>sql_stmt</code>                   | SQL statement; must have <code>:start_id</code> and <code>:end_id</code> placeholders                                                                                                                                                                                                                                                                                                                                             |
| <code>language_flag</code>              | Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li><code>V6</code> (or <code>0</code>) specifies version 6 behavior</li> <li><code>NATIVE</code> (or <code>1</code>) specifies normal behavior for the database to which the program is connected</li> <li><code>V7</code> (or <code>2</code>) specifies Oracle database version 7 behavior</li> </ul> |
| <code>edition</code>                    | Specifies the edition in which to run the statement. Default is the current edition.                                                                                                                                                                                                                                                                                                                                              |
| <code>apply_crossedition_trigger</code> | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the <code>edition</code> and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user executes the statement.                                                                                                                  |
| <code>fire_apply_trigger</code>         | Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or only a guide to be used in selecting other triggers.                                                                                                                                                                                                                                                                         |
| <code>parallel_level</code>             | Number of parallel jobs; zero if run in serial; <code>NULL</code> uses the default parallelism.                                                                                                                                                                                                                                                                                                                                   |
| <code>job_class</code>                  | If running in parallel, the jobs belong to the specified job class                                                                                                                                                                                                                                                                                                                                                                |

### Usage Notes

- The SQL statement is executed as the current user.

- Since this subprogram is subject to reexecution on error, you need to take great care in submitting a statement to `RUN_TASK` that is not idempotent.
- Chunks can be executed in parallel by `DBMS_SCHEDULER` job slaves. Therefore, parallel execution requires `CREATE JOB` system privilege. The job slaves is created under the current user. The default number of job slaves is computed as the product of Oracle parameters `cpu_count` and `parallel_threads_per_cpu`. On a Real Application Clusters installation, the number of job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the job slaves finished.

### Examples

Suppose the chunk table contains the following chunk ranges:

| START_ID | END_ID |
|----------|--------|
| 1        | 10     |
| 11       | 20     |
| 21       | 30     |

And the specified SQL statement is:

```
UPDATE employees
  SET salary = salary + 10
  WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
  SET salary = salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;

UPDATE employees
  SET salary = salary + 10 WHERE employee_id between 11 and 20;
COMMIT;

UPDATE employees
  SET salary = salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

## 124.7.17 SET\_CHUNK\_STATUS Procedure

This procedure sets the status of the chunk.

The `START_TIMESTAMP` and `END_TIMESTAMP` of the chunk is updated according to the new status:

| Value of the new Status           | Side Effect                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------|
| UNASSIGNED                        | <code>START_TIMESTAMP</code> and <code>END_TIMESTAMP</code> will be cleared                           |
| ASSIGNED                          | <code>START_TIMESTAMP</code> will be the current time and <code>END_TIMESTAMP</code> will be cleared. |
| PROCESSED or PROCESSED_WITH_ERROR | The current time will be recorded in <code>END_TIMESTAMP</code>                                       |

**See Also:**[Views](#)**Syntax**

```
DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS (  
    task_name      IN VARCHAR2,  
    chunk_id       OUT NUMBER,  
    status         IN  NUMBER,  
    err_num        IN  NUMBER  DEFAULT NULL,  
    err_msg        IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 124-21 SET\_CHUNK\_STATUS Procedure Parameters**

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| task_name | Name of the task                                                             |
| chunk_id  | Chunk_id of the chunk                                                        |
| status    | Status of the chunk: UNASSIGNED, ASSIGNED, PROCESSED<br>PROCESSED_WITH_ERROR |
| err_num   | Error code returned during the processing of the chunk                       |
| err_msg   | Error message returned during the processing of the chunk                    |

## 124.7.18 STOP\_TASK Procedure

This procedure stops the task and related job slaves.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.STOP_TASK (  
    task_name      IN VARCHAR2);
```

**Parameters****Table 124-22 STOP\_TASK Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

## 124.7.19 TASK\_STATUS Procedure

This procedure returns the task status.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.TASK_STATUS (  
    task_name      IN VARCHAR2);
```

## Parameters

**Table 124-23 TASK\_STATUS Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

# DBMS\_PART

The `DBMS_PART` package provides an interface for maintenance and management operations on partitioned objects.

 **See Also:**

- Oracle Database Reference* for related views

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_PART Subprograms](#)

## 125.1 DBMS\_PART Security Model

`DBMS_PART` is an invoker's rights package, running with the privileges of the user.

## 125.2 DBMS\_PART Operational Notes

The following operational notes apply to `DBMS_PART`.

- `DBMS_PART` ignores all the errors that it runs into during the cleanup process.
- To display the message `PL/SQL procedure executed successfully` requires at least one cleanup operation to be successful.

## 125.3 Summary of DBMS\_PART Subprograms

This table briefly describes the subprograms of `DBMS_PART` package.

**Table 125-1 DBMS\_PART Package Subprograms**

| Subprogram                                  | Description                                                                                                                                                          |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLEANUP_GIDX Procedure</a>      | Gathers the list of global indexes where optimized asynchronous index maintenance has taken place to clean up entries pointing to data segments that no longer exist |
| <a href="#">CLEANUP_GIDX_JOB Procedure</a>  |                                                                                                                                                                      |
| <a href="#">CLEANUP_ONLINE_OP Procedure</a> | Cleans up failed online move operations                                                                                                                              |

## 125.3.1 CLEANUP\_GIDX Procedure

As a consequence of prior partition maintenance operations with asynchronous global index maintenance, global indexes can contain entries pointing to data segments that no longer exist. These stale index rows will not cause any correctness issues or corruptions during any operation on the table or index, whether these are queries, DMLs, DDLs or analyze. This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

### Syntax

```
DBMS_PART.CLEANUP_GIDX (
    schema_name_in    IN    VARCHAR2 DEFAULT NULL,
    table_name_in     IN    VARCHAR2 DEFAULT NULL,
    parallel           IN    VARCHAR2 DEFAULT NULL,
    options             IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 125-2 CLEANUP\_GIDX Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name_in | Non-NULL processes only indexes on tables in the given schema                                                                                                                                                                |
| table_name_in  | Non-NULL processes only indexes on the given table in the given schema (schema_name_in must be non-NULL if table_name_in is non-NULL)                                                                                        |
| parallel       | The parallel degree to use for the ALTER INDEX DDLs.                                                                                                                                                                         |
| options        | The following options are supported: <ul style="list-style-type: none"> <li>CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used.</li> <li>COALESCE: implies that 'coalesce cleanup' mechanism is used.</li> </ul> |

## 125.3.2 CLEANUP\_GIDX\_JOB Procedure

This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

### Syntax

```
DBMS_PART.CLEANUP_GIDX_JOB (
    parallel           IN    VARCHAR2 DEFAULT NULL,
    options             IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 125-3 CLEANUP\_GIDX\_JOB Function Parameters**

| Parameter | Description                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parallel  | The parallel degree to use for the ALTER INDEX DDLs.                                                                                                                                                                       |
| options   | The following options are supported: <ul style="list-style-type: none"> <li>CLEANUP_ORPHANS: implies that 'cleanup only' mechanism is used.</li> <li>COALESCE: implies that coalesce cleanup mechanism is used.</li> </ul> |

## 125.3.3 CLEANUP\_ONLINE\_OP Procedure

There are many possible points of failure when performing `ALTER TABLE ... MOVE PARTITION ... ONLINE` operations. This procedure pro-actively cleans up such failed online move operations instead of waiting for the background process (SMON) to do so.

### Syntax

```
DBMS_PART.CLEANUP_ONLINE_OP (  
    schema_name      IN   VARCHAR2 DEFAULT NULL,  
    table_name       IN   VARCHAR2 DEFAULT NULL,  
    partition_name   IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 125-4 CLEANUP\_ONLINE\_OP Function Parameters**

| Parameter      | Description       |
|----------------|-------------------|
| schema_name    | Name of schema    |
| table_name     | Name of schema    |
| partition_name | Name of partition |

### Usage Notes

- If `schema_name`, `table_name` and `partition_name` are specified, this cleans up the failed online move operation for the specified partition.
- If `schema_name` and `table_name` are specified, this cleans up all failed online move operations for all the partitions of the specified table.
- If only `schema_name` is specified, this cleans up all failed online move operations in the schema.
- If no arguments are provided, we cleans up all the failed online move operations in the system.
- All other cases raise `ORA-20000` to inform the user of invalid inputs as arguments.

# DBMS\_PCLXUTIL

The `DBMS_PCLXUTIL` package provides intra-partition parallelism for creating partition-wise local indexes. `DBMS_PCLXUTIL` circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one parallel execution server process for each partition is used.

## See Also:

There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_PCLXUTIL Subprograms](#)

## 126.1 DBMS\_PCLXUTIL Overview

`DBMS_PCLXUTIL` uses the `DBMS_JOB` package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with `DBMS_SCHEDULER`), in combination with intra-partition parallelism using the parallel execution server.

`DBMS_PCLXUTIL` works with both range and range-hash composite partitioning.

The `DBMS_PCLXUTIL` package can be used during the following DBA tasks:

### 1. Local index creation

The procedure `BUILD_PART_INDEX` assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the `UNUSABLE` option.

```
CREATE INDEX <idx_name> on <tab_name>(...) local(...) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure `BUILD_PART_INDEX` causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

## 2. Local index maintenance

By marking desired partitions usable or unusable, the `BUILD_PART_INDEX` procedure also enables selective rebuilding of local indexes. The `force_opt` parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(...) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using `force_opt = TRUE`:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the `DBMS_OUTPUT` package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

## 126.2 DBMS\_PCLXUTIL Security Model

This utility can be run only as table owner, and not as any other user.

## 126.3 DBMS\_PCLXUTIL Operational Notes

`DBMS_PCLXUTIL` submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the `INIT.ORA` parameter `JOB_QUEUE_PROCESSES` correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

## 126.4 DBMS\_PCLXUTIL Rules and Limits

Because `DBMS_PCLXUTIL` uses the `DBMS_JOB` package, you must be aware of the following limitations pertaining to `DBMS_JOB`:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:  

```
job_queue_processes=n    #the number of background processes = n
```
- Failure conditions are reported only in the trace files (a `DBMS_JOB` limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

### Note:

For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8i.

## 126.5 Summary of DBMS\_PCLXUTIL Subprograms

The DBMS\_PCLXUTIL package has one subprogram, the BUILD\_PART\_INDEX procedure.

**Table 126-1 DBMS\_PCLXUTIL Package Subprograms**

| Subprogram                                 | Description                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------|
| <a href="#">BUILD_PART_INDEX Procedure</a> | Provides intra-partition parallelism for creating partition-wise local indexes |

### 126.5.1 BUILD\_PART\_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

#### Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (  
    jobs_per_batch  IN NUMBER    DEFAULT 1,  
    procs_per_job   IN NUMBER    DEFAULT 1,  
    tab_name        IN VARCHAR2  DEFAULT NULL,  
    idx_name        IN VARCHAR2  DEFAULT NULL,  
    force_opt       IN BOOLEAN   DEFAULT FALSE);
```

#### Parameters

**Table 126-2 BUILD\_PART\_INDEX Procedure Parameters**

| Parameter      | Description                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------|
| jobs_per_batch | The number of concurrent partition-wise "local index builds".                                                          |
| procs_per_job  | The number of parallel execution servers to be utilized for each local index build (1 <= procs_per_job <= max_slaves). |
| tab_name       | The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).             |
| idx_name       | The name given to the local index (an exception is raised if a local index is not created on the table tab_name).      |
| force_opt      | If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.      |

#### Usage Notes

This utility can be run only as table owner, and not as any other user.

#### Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD\_PART\_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);  
Statement processed.
```

INFO: Job #21 created for partition PROJ002 with 4 slaves  
INFO: Job #22 created for partition PROJ001 with 4 slaves

# DBMS\_PDB

The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface that specifies which database objects are application common objects. You can migrate a PDB from one CDB to another CDB. After the migration is complete, all backups of the PDB before the migration are available and usable in the destination CDB.

## See Also:

- *Oracle Database Administrator's Guide* for information about creating and managing PDBs and CDBs
- *Oracle XML DB Developer's Guide* for information about configuring protocol ports and DNS mappings
- *Oracle Database SQL Language Reference* for information about creating PDBs
- *Oracle Database Security Guide* regarding how to create audit policies in a multitenant environment

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PDB Subprograms](#)

## 127.1 DBMS\_PDB Overview

A multitenant container database (CDB) is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs). The `DBMS_PDB` package provides an interface to examine and manipulate data about pluggable databases (PDBs). The subprograms in this package can also set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

 **See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 127.2 DBMS\_PDB Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_PDB` package.

## 127.3 Summary of DBMS\_PDB Subprograms

This table lists and describes `DBMS_PDB` package subprograms.

 **Note:**

A multitenant container database is the only supported architecture in Oracle Database 21c and later releases. While the documentation is being revised, legacy terminology may persist. In most cases, "database" and "non-CDB" refer to a CDB or PDB, depending on context. In some contexts, such as upgrades, "non-CDB" refers to a non-CDB from a previous release.

**Table 127-1 DBMS\_PDB Package Subprograms**

| Subprogram                                        | Description                                                                                                                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CHECK_PLUG_COMPATIBILITY Function</a> | Uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).                                    |
| <a href="#">DESCRIBE Procedure</a>                | Generates an XML file describing the specified pluggable database (PDB).                                                                                                            |
| <a href="#">EXPORTMANBACKUP Procedure</a>         | Needs to be called only when a non-CDB is migrated as PDB. This procedure needs to be executed in non-CDB database. For PDB relocation, it is automatically called during unplugin. |
| <a href="#">RECOVER Procedure</a>                 | Generates an XML file describing a pluggable database by using data files belonging to the pluggable database (PDB).                                                                |
| <a href="#">SET_DATA_LINKED Procedure</a>         | Sets a database object to a data-linked application common object                                                                                                                   |
| <a href="#">SET_EXT_DATA_LINKED Procedure</a>     | Sets a database object to an extended data-linked application common object.                                                                                                        |

**Table 127-1 (Cont.) DBMS\_PDB Package Subprograms**

| Subprogram                                     | Description                                                                                 |
|------------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">SET_METADATA_LINKED Procedure</a>  | Sets a database object to a metadata-linked application common object.                      |
| <a href="#">SET_PROFILE_EXPLICIT Procedure</a> | Sets a profile as an application common profile in an application container.                |
| <a href="#">SET_ROLE_EXPLICIT Procedure</a>    | Sets a role as an application common role in an application container.                      |
| <a href="#">SET_USER_EXPLICIT Procedure</a>    | This procedure sets a local user as an application common user in an application container. |

## 127.3.1 CHECK\_PLUG\_COMPATIBILITY Function

This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

### Syntax

```
DBMS_PDB.CHECK_PLUG_COMPATIBILITY (  
    pdb_descr_file    IN    VARCHAR2,  
    pdb_name          IN    VARCHAR2 DEFAULT NULL)  
RETURN BOOLEAN;
```

### Parameters

**Table 127-2 CHECK\_PLUG\_COMPATIBILITY Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pdb_descr_file</code> | Path of the XML file that will contain description of a PDB                                                                                                                                   |
| <code>pdb_name</code>       | Name which will be given to the PDB represented by <code>pdb_descr_file</code> when plugged into a given CDB. If not specified, the name will be extracted from <code>pdb_descr_file</code> . |

### Return Values

TRUE if the PDB described by `pdb_descr_file` is compatible with the given CDB, FALSE otherwise. If this function returns FALSE, then query the `PDB_PLUG_IN_VIOLATIONS` data dictionary view to find information about the errors that are found.

#### See Also:

*Oracle Database Reference* for information about the `PDB_PLUG_IN_VIOLATIONS` view

## 127.3.2 DESCRIBE Procedure

This procedure generates an XML file describing the specified pluggable database (PDB). This file can then be passed to the `CHECK_PLUG_COMPATIBILITY` Function to determine if the

PDB described by the XML file may be plugged into a given multitenant container database (CDB).

### Syntax

```
DBMS_PDB.DESCRIBE (
    pdb_descr_file    IN    VARCHAR2,
    pdb_name          IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 127-3** *DESCRIBE Procedure Parameters*

| Parameter                   | Description                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------|
| <code>pdb_descr_file</code> | Path of the XML file that will contain description of a PDB                         |
| <code>pdb_name</code>       | Name of a PDB to be described. A remote database is specified by including @dblink. |

### Usage Notes

- If `pdb_name` is omitted, the PDB to which the session is connected will be described.
- If `pdb_name` is omitted, and the session is connected to the Root, an error will be returned.

### Related Topics

- [CHECK\\_PLUG\\_COMPATIBILITY Function](#)  
This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

## 127.3.3 EXPORTRMANBACKUP Procedure

This procedure exports the RMAN backup information that belongs to a pluggable database to its dictionary before unplug so that pre-plugin backups can be used. This procedure needs to be called only for non-CDB to PDB migration. For PDB relocation, this procedure need not be called.

### Syntax

```
DBMS_PDB.EXPORTRMANBACKUP (
    pdb_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 127-4** *EXPORTRMANBACKUP Procedure Parameters*

| Parameter             | Description                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pdb_name</code> | Name of a pluggable database whose backup information needs to be exported.<br><br>Omit this parameter if you are connected to a pluggable database or a non-cdb. |

### Usage Notes

- The PDB must be opened in read/write mode.

- If the database is non-CDB, then `pdb_name` must be omitted.
- If the `pdb_name` is omitted, then the pluggable database to which the session is connected is exported.
- If the `pdb_name` is omitted and the session is connected to the `root`, an error is returned.

## 127.3.4 RECOVER Procedure

This procedure generates an XML file describing a pluggable database by using data files belonging to the pluggable database. This XML file can then be used to plug the pluggable database into a multitenant container database (CDB) using the `CREATE PLUGGABLE DATABASE` statement.

Use this procedure when an XML file describing a pluggable database is corrupted or lost.

### Syntax

```
DBMS_PDB.RECOVER (  
    pdb_descr_file    IN    VARCHAR2,  
    pdb_name          IN    VARCHAR2,  
    filenames         IN    VARCHAR2);
```

### Parameters

**Table 127-5** *RECOVER Procedure Parameters*

| Parameter                   | Description                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| <code>pdb_descr_file</code> | Path of the XML file that contains description of a pluggable database                                    |
| <code>pdb_name</code>       | Name of a pluggable database                                                                              |
| <code>filenames</code>      | Comma-separated list of datafile paths and/or directories containing datafiles for the pluggable database |

## 127.3.5 SET\_DATA\_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_DATA_LINKED (  
    schema_name    IN VARCHAR2,  
    object_name    IN VARCHAR2,  
    namespace      IN NUMBER,  
    edition_name   IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 127-6** *SET\_DATA\_LINKED Procedure Parameters*

| Parameter    | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema that owns the database object.                                                                   |
| object_name  | The name of the database object.                                                                                        |
| namespace    | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object.                                                                        |

### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 127.3.6 SET\_EXT\_DATA\_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_EXT_DATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 127-7** *SET\_EXT\_DATA\_LINKED Procedure Parameters*

| Parameter   | Description                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name | The name of the schema that owns the database object.                                                                   |
| object_name | The name of the database object.                                                                                        |
| namespace   | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |

**Table 127-7 (Cont.) SET\_EXT\_DATA\_LINKED Procedure Parameters**

| Parameter    | Description                                      |
|--------------|--------------------------------------------------|
| edition_name | The name of the edition for the database object. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 127.3.7 SET\_METADATA\_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB.SET_METADATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 127-8 SET\_METADATA\_LINKED Procedure Parameters**

| Parameter    | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema that owns the database object.                                                                   |
| object_name  | The name of the database object.                                                                                        |
| namespace    | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object.                                                                        |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 127.3.8 SET\_PROFILE\_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_PROFILE_EXPLICIT (  
    profile_name IN VARCHAR2);
```

### Parameters

**Table 127-9** *SET\_PROFILE\_EXPLICIT Procedure Parameters*

| Parameter    | Description              |
|--------------|--------------------------|
| profile_name | The name of the profile. |

### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 127.3.9 SET\_ROLE\_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_ROLE_EXPLICIT (  
    role_name IN VARCHAR2);
```

### Parameters

**Table 127-10** *SET\_ROLE\_EXPLICIT Procedure Parameters*

| Parameter | Description           |
|-----------|-----------------------|
| role_name | The name of the role. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 127.3.10 SET\_USER\_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

### Syntax

```
DBMS_PDB.SET_USER_EXPLICIT (  
    user_name IN VARCHAR2);
```

### Parameters

**Table 127-11** *SET\_USER\_EXPLICIT Procedure Parameters*

| Parameter | Description           |
|-----------|-----------------------|
| user_name | The name of the user. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## DBMS\_PDB\_ALTER\_SHARING

In an application container with a pre-installed application, the `DBMS_PDB_ALTER_SHARING` package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.

### Note:

This package provides a subset of the subprograms in the `DBMS_PDB` package. Users who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

This chapter contains the following topics:

- [DBMS\\_PDB\\_ALTER\\_SHARING Overview](#)
- [DBMS\\_PDB\\_ALTER\\_SHARING Security Model](#)
- [Summary of DBMS\\_PDB\\_ALTER\\_SHARING Subprograms](#)

## 128.1 DBMS\_PDB\_ALTER\_SHARING Overview

The subprograms in this package can set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

You can use the subprograms in this package when you

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

#### See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container

## 128.2 DBMS\_PDB\_ALTER\_SHARING Security Model

This package provides a subset of the subprograms in the `DBMS_PDB` package. User who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

Security on this package can be controlled in either of the following ways:

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

## 128.3 Summary of DBMS\_PDB\_ALTER\_SHARING Subprograms

This table lists and briefly describes `DBMS_PDB_ALTER_SHARING` package subprograms.

**Table 128-1 DBMS\_PDB\_ALTER\_SHARING Subprograms**

| Subprogram                                     | Description                                                                  |
|------------------------------------------------|------------------------------------------------------------------------------|
| <a href="#">SET_DATA_LINKED Procedure</a>      | Sets a database object to a data-linked application common object            |
| <a href="#">SET_EXT_DATA_LINKED Procedure</a>  | Sets a database object to an extended data-linked application common object  |
| <a href="#">SET_METADATA_LINKED Procedure</a>  | Sets a database object to a metadata-linked application common object        |
| <a href="#">SET_PROFILE_EXPLICIT Procedure</a> | Sets a profile as an application common profile in an application container. |

**Table 128-1 (Cont.) DBMS\_PDB\_ALTER\_SHARING Subprograms**

| Subprogram                                  | Description                                                                  |
|---------------------------------------------|------------------------------------------------------------------------------|
| <a href="#">SET_ROLE_EXPLICIT Procedure</a> | Sets a role as an application common role in an application container.       |
| <a href="#">SET_USER_EXPLICIT Procedure</a> | Sets a local user as an application common user in an application container. |

## 128.3.1 SET\_DATA\_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_DATA_LINKED (  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2,  
    namespace   IN NUMBER,  
    edition_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128-2 SET\_DATA\_LINKED Procedure Parameters**

| Parameter    | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema that owns the database object.                                                                   |
| object_name  | The name of the database object.                                                                                        |
| namespace    | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object.                                                                        |

### See Also:

## 128.3.2 SET\_EXT\_DATA\_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

### Syntax

```
DBMS_PDB_ALTER_SHARING.SET_EXT_DATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 128-3** *SET\_EXT\_DATA\_LINKED Procedure Parameters*

| Parameter    | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema that owns the database object.                                                                   |
| object_name  | The name of the database object.                                                                                        |
| namespace    | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object.                                                                        |

## 128.3.3 SET\_METADATA\_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

## Syntax

```
DBMS_PDB_ALTER_SHARING.SET_METADATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 128-4** *SET\_METADATA\_LINKED Procedure Parameters*

| Parameter    | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| schema_name  | The name of the schema that owns the database object.                                                                   |
| object_name  | The name of the database object.                                                                                        |
| namespace    | The namespace of the database object.<br>The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object. |
| edition_name | The name of the edition for the database object.                                                                        |

## 128.3.4 SET\_PROFILE\_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

## Syntax

```
DBMS_PDB_ALTER_SHARING.SET_PROFILE_EXPLICIT (  
    profile_name IN VARCHAR2);
```

## Parameters

**Table 128-5** *SET\_PROFILE\_EXPLICIT Procedure Parameters*

| Parameter    | Description              |
|--------------|--------------------------|
| profile_name | The name of the profile. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 128.3.5 SET\_ROLE\_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

**Syntax**

```
DBMS_PDB_ALTER_SHARING.SET_ROLE_EXPLICIT (  
    role_name IN VARCHAR2);
```

**Parameters**

**Table 128-6** *SET\_ROLE\_EXPLICIT Procedure Parameters*

| Parameter | Description           |
|-----------|-----------------------|
| role_name | The name of the role. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

## 128.3.6 SET\_USER\_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

**Syntax**

```
DBMS_PDB_ALTER_SHARING.SET_USER_EXPLICIT (  
    user_name IN VARCHAR2);
```

**Parameters**

**Table 128-7** *SET\_USER\_EXPLICIT Procedure Parameters*

| Parameter | Description           |
|-----------|-----------------------|
| user_name | The name of the user. |

**See Also:**

*Oracle Database Administrator's Guide* for information about migrating an application to an application container.

# DBMS\_PERF

The DBMS\_PERF package provides an interface to generate active reports for monitoring database performance

 **See Also:**

*Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PERF Subprograms](#)

## 129.1 DBMS\_PERF Overview

The DBMS\_PERF package provides an interface for generating database performance reports. All subprograms return an active report and these reports can be generated at the system level, session level or at SQL level.

## 129.2 DBMS\_PERF Security Model

The DBMS\_PERF package requires the DBA role.

## 129.3 Summary of DBMS\_PERF Subprograms

This table lists the DBMS\_PERF subprograms and briefly describes them.

**Table 129-1 DBMS\_PERF Package Subprograms**

| Subprogram                              | Description                                                                                                                                                             |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_PERFHUB Function</a> | Generates a composite active performance report of the entire database system for a specified time period                                                               |
| <a href="#">REPORT_SESSION Function</a> | Generates a performance report for a specific database session where a session is identified by <code>inst_id</code> , <code>sid</code> , and <code>serial_num</code> . |
| <a href="#">REPORT_SQL Function</a>     | Generates an active performance report for a particular SQL statement identified by its <code>sql_id</code> .                                                           |

## 129.3.1 REPORT\_PERFHUB Function

This function generates a composite active performance report of the entire database system for a specified time period.

### Syntax

```
DBMS_PERF.REPORT_PERFHUB (
    is_realtime          IN NUMBER    DEFAULT NULL,
    outer_start_time     IN DATE      DEFAULT NULL,
    outer_end_time       IN DATE      DEFAULT NULL,
    selected_start_time  IN DATE      DEFAULT NULL,
    selected_end_time    IN DATE      DEFAULT NULL,
    inst_id              IN NUMBER    DEFAULT NULL,
    dbid                 IN NUMBER    DEFAULT NULL,
    monitor_list_detail  IN NUMBER    DEFAULT NULL,
    workload_sql_detail  IN NUMBER    DEFAULT NULL,
    addm_task_detail     IN NUMBER    DEFAULT NULL,
    report_reference     IN VARCHAR2  DEFAULT NULL,
    report_level         IN VARCHAR2  DEFAULT NULL,
    type                 IN VARCHAR2  DEFAULT 'ACTIVE',
    base_path            IN VARCHAR2  DEFAULT NULL);
RETURN CLOB;
```

### Parameters

**Table 129-2** *REPORT\_PERFHUB Function Parameters*

| Parameter           | Description                                                                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_realtime         | If 1, then real-time. If NULL (default) or 0, then historical mode.                                                                                                                                                                                                                                            |
| outer_start_time    | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>                                  |
| outer_end_time      | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul> |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then 1 hour before selected_end_time</li> <li>If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>                                                                                  |
| selected_end_time   | End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then latest AWR snapshot</li> <li>If is_realtime=1, then current time</li> </ul>                                                                                                                      |
| inst_id             | Instance ID to for which to retrieve data <ul style="list-style-type: none"> <li>If -1, then current instance</li> <li>If number is specified, then for that instance</li> <li>If NULL (default), then all instances</li> </ul>                                                                                |

**Table 129-2 (Cont.) *REPORT\_PERFHUB* Function Parameters**

| Parameter                        | Description                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dbid</code>                | DBID to query. <ul style="list-style-type: none"> <li>If <code>NULL</code>, then current DBID.</li> <li>If <code>is_realtime=1</code>, then DBID must be the local DBID.</li> </ul>                                                |
| <code>monitor_list_detail</code> | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If <code>NULL</code> (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul> |
| <code>workload_sql_detail</code> | Top N in Workload Top SQL list to retrieve monitor details, <ul style="list-style-type: none"> <li>If <code>NULL</code> (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>          |
| <code>addm_task_detail</code>    | Maximum N latest ADDM tasks to retrieve <ul style="list-style-type: none"> <li>If <code>NULL</code> (default), retrieves available data but no more than N</li> <li>If 0, then retrieves no ADDM task details</li> </ul>           |
| <code>report_reference</code>    | Must be <code>NULL</code> when used from SQL*Plus.                                                                                                                                                                                 |
| <code>report_level</code>        | 'typical' will get all tabs in performance hub                                                                                                                                                                                     |
| <code>type</code>                | Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>                                                                                                                       |
| <code>base_path</code>           | URL path for HTML resources since flex HTML requires access to external files. This is only valid for <code>type='ACTIVE'</code> and is typically not used. Default value will retrieve the required files from OTN.               |

**Usage Notes**

- Once a time period is selected, the performance information is collected and presented based on performance subject areas.
- The time period can be real-time or historical.
- When real-time data is selected, more granular data is presented because data points are available every minute.
- When historical data is selected, more detailed data (broken down by different metrics) is presented, but the data points are averaged out to the Automatic Workload Repository (AWR) interval (usually an hour).
- Different tabs are available in the Performance Hub, depending on whether `is_real-time` is 1 for real time mode or 0 for historical mode.

## 129.3.2 *REPORT\_SESSION* Function

This function produces a performance report for a specific database session where a session is identified by `inst_id`, `sid`, and `serial_num`.

If any of those parameters are missing, then the report is for the current session.

The session-level performance report contains the following tabs:

- Summary** - This tab contains key identifiers and attributes of the session along with a summary of its activity data. It also contains a list of SQLs, PLSQL blocks and Database

Operations (DBOP) executed by that session that were monitored by Real-time SQL Monitoring.

- **Activity** - This tab shows activity broken down by wait classes for this session. The data used for this chart is fetched from Active Session History (ASH).
- **Metrics** - This tab shows charts for certain key metrics for the selected session over time and is only available in historical mode. Some of the metrics shown are CPU usage, PGA usage, IO Throughput and IO Requests.

### Syntax

```
DBMS_PERF.REPORT_SESSION (
    inst_id          IN NUMBER    DEFAULT NULL,
    sid              IN NUMBER    DEFAULT NULL,
    serial           IN NUMBER    DEFAULT NULL,
    is_realtime       IN NUMBER    DEFAULT NULL,
    outer_start_time  IN DATE      DEFAULT NULL,
    outer_end_time    IN DATE      DEFAULT NULL,
    selected_start_time IN DATE    DEFAULT NULL,
    selected_end_time IN DATE    DEFAULT NULL,
    dbid             IN NUMBER    DEFAULT NULL,
    monitor_list_detail IN NUMBER  DEFAULT NULL,
    report_reference  IN VARCHAR2 DEFAULT NULL,
    report_level      IN VARCHAR2 DEFAULT NULL,
    type             IN VARCHAR2 DEFAULT 'ACTIVE',
    base_path         IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 129-3** *REPORT\_SESSION Function Parameters*

| Parameter           | Description                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inst_id             | Instance ID to for which to retrieve data. If NULL (default), then instance of current session.                                                                                                                                                                                                                    |
| sid                 | Session ID for which to retrieve performance. If NULL, uses current session.                                                                                                                                                                                                                                       |
| serial              | Serial# of session. If NULL, then the serial# of the specified sid is used provided the session is connected.                                                                                                                                                                                                      |
| is_realtime         | If 1, then real-time. If NULL (default) or 0, then historical mode.                                                                                                                                                                                                                                                |
| outer_start_time    | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>• If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>• If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>                                  |
| outer_end_time      | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>• If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>• If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul> |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>• If is_realtime=0, then 1 hour before selected_end_time</li> <li>• If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>                                                                                  |

**Table 129-3 (Cont.) *REPORT\_SESSION* Function Parameters**

| Parameter                        | Description                                                                                                                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>selected_end_time</code>   | End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If <code>is_realtime=0</code>, then latest AWR snapshot</li> <li>If <code>is_realtime=1</code>, then current time</li> </ul>   |
| <code>dbid</code>                | DBID to query. <ul style="list-style-type: none"> <li>If NULL, then current DBID.</li> <li>If <code>is_realtime=1</code>, then DBID must be the local DBID.</li> </ul>                                                |
| <code>monitor_list_detail</code> | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul> |
| <code>report_reference</code>    | Must be NULL when used from SQL*Plus.                                                                                                                                                                                 |
| <code>report_level</code>        | 'typical' will get all tabs in the session hub (or session details)                                                                                                                                                   |
| <code>type</code>                | Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>                                                                                                          |
| <code>base_path</code>           | URL path for HTML resources since flex HTML requires access to external files                                                                                                                                         |

### 129.3.3 REPORT\_SQL Function

This function generates an active performance report for a particular SQL statement identified by its `sql_id`.

The SQL-level performance report contains the following tabs:

- Summary - This tab contains an overview of the SQL statement with key attributes like the SQL text, user name, sessions executing it, and related information. It also contains a Plans tab which shows statistics and activity for each distinct plan for this SQL statement found in memory and in the AWR.
- Activity - This tab shows activity broken down by wait classes for this SQL statement. The data used for this chart is fetched from Active Session History (ASH).
- Execution Statistics - This tab shows statistics and activity for each distinct plan for this statement along with a graphical and tabular representation of the plan.
- Monitored SQL - All executions of this SQL statement that were monitored by Real-time SQL Monitoring are listed in this tab.
- Plan Control - This tab shows information about SQL Profiles and SQL Plan Baselines if they exist for this SQL statement.
- Historical Statistics - This tab is available only in Historical mode. It contains statistics, such as number of executions, number of I/Os, rows processed, and other information produced over time for different execution plans. This information is retrieved from AWR.

#### Syntax

```
DBMS_PERF.REPORT_SQL (
    sql_id          IN varchar2 default null,
    is_realtime     IN number   default null,
    outer_start_time IN date     default null,
```

```

        outer_end_time      IN date      default null,
        selected_start_time IN date      default null,
        selected_end_time   IN date      default null,
        inst_id             IN number    default null,
        dbid                IN number    default null,
        monitor_list_detail IN number    default null,
        report_reference     IN varchar2  default null,
        report_level        IN varchar2  default null,      type          IN varchar2
default 'ACTIVE',
        base_path           IN varchar2  default null);
RETURN CLOB;

```

## Parameters

**Table 129-4** *REPORT\_SQL Function Parameters*

| Parameter           | Description                                                                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id              | SQL_ID for which to retrieve performance. If NULL, gets SQL details for the last executed SQL statement.                                                                                                                                                                                                       |
| is_realtime         | If 1, then real-time. If NULL (default) or 0, then historical mode.                                                                                                                                                                                                                                            |
| outer_start_time    | Start time of outer period shown in the time selector. If NULL (default): <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then 24 hours before outer_end_time.</li> <li>If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.</li> </ul>                                  |
| outer_end_time      | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot. <ul style="list-style-type: none"> <li>If is_realtime=0 (historical), then the latest AWR snapshot</li> <li>If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)</li> </ul> |
| selected_start_time | Start time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then 1 hour before selected_end_time</li> <li>If is_realtime=1, then 5 minutes before selected_end_time</li> </ul>                                                                                  |
| selected_end_time   | End time period of selection. If NULL (default) <ul style="list-style-type: none"> <li>If is_realtime=0, then latest AWR snapshot</li> <li>If is_realtime=1, then current time</li> </ul>                                                                                                                      |
| inst_id             | Instance ID to for which to retrieve data. If NULL (default), then instance of current session.                                                                                                                                                                                                                |
| dbid                | DBID to query. <ul style="list-style-type: none"> <li>If NULL, then current DBID.</li> <li>If is_realtime=1, then DBID must be the local DBID.</li> </ul>                                                                                                                                                      |
| monitor_list_detail | Top N in SQL monitor list for which to retrieve SQL monitor details. <ul style="list-style-type: none"> <li>If NULL (default), then retrieves top 10</li> <li>If 0, then retrieves no monitor list details</li> </ul>                                                                                          |
| report_reference    | Must be NULL when used from SQL*Plus.                                                                                                                                                                                                                                                                          |
| report_level        | 'typical' will get all tabs in performance hub                                                                                                                                                                                                                                                                 |
| type                | Report type: <ul style="list-style-type: none"> <li>'ACTIVE' (default)</li> <li>'xml' returns XML</li> </ul>                                                                                                                                                                                                   |
| base_path           | URL path for HTML resources since flex HTML requires access to external files                                                                                                                                                                                                                                  |

## DBMS\_PIPE

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_PIPE Subprograms](#)

### 130.1 DBMS\_PIPE Overview

Pipe functionality has several potential applications: external service interface, independent transactions, alerters (non-transactional), debugging, and concentrator.

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

## 130.2 DBMS\_PIPE Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either public pipes or private pipes, which are described in [DBMS\\_PIPE Operational Notes](#).

## 130.3 DBMS\_PIPE Constants

This is the maximum time to wait attempting to send or receive a message.

```
maxwait    constant integer := 86400000; /* 1000 days */
```

## 130.4 DBMS\_PIPE Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

### WARNING:

Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of `DBMS_PIPE` is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

### Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

### Reading and Writing Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The

information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

### Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

## 130.5 DBMS\_PIPE Exceptions

DBMS\_PIPE package subprograms can return the errors listed in the following table.

**Table 130-1 DBMS\_PIPE Errors**

| Error      | Description                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-23321: | Pipename may not be null. This can be returned by the <code>CREATE_PIPE</code> function, or any subprogram that takes a pipe name as a parameter. |
| ORA-23322: | Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.               |

## 130.6 DBMS\_PIPE Examples

These examples show use of DBMS\_PIPE in debugging PL/SQL, debugging Pro\*C, executing system commands, and an external service interface.

### Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```

CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;

```

## Example 2: Debugging - Pro\*C

The following Pro\*C code receives messages from the PLSQL\_DEBUG pipe in the previous example, and displays the messages. If the Pro\*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```

#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int      status;
    int      msg_length;
    char      retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "HR/<password>");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)
    {
        EXEC SQL EXECUTE
            DECLARE
                len INTEGER;
                typ INTEGER;
                sta INTEGER;
                chr VARCHAR2(2000);
            BEGIN
                chr := '';
                sta := dbms_pipe.receive_message('plsql_debug');
                IF sta = 0 THEN
                    DBMS_PIPE.UNPACK_MESSAGE(len);
                    DBMS_PIPE.UNPACK_MESSAGE(chr);
                END IF;
                :status := sta;
                :retval := chr;
            END;
    }
}

```

```

        IF len IS NOT NULL THEN
            :msg_length := len;
        ELSE
            :msg_length := 2000;
        END IF;
    END;
END-EXEC;
IF (status == 0)
    printf("\n%.s\n", msg_length, retval);
ELSE
    printf("abnormal status, value is %d\n", status);
}
}

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.s\n", rlen, msg);
    exit(1);
}

```

### Example 3: Execute System Commands

This example shows PL/SQL and Pro\*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro\*C program that is listening for them.

The Pro\*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro\*C program processes it, carrying out the required action, such as executing a UNIX command through the *system()* call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS\_PIPE package to send and receive message to and from the Pro\*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro\*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL\*Plus or Enterprise Manager. For example:

```

SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');

```

On a UNIX system, this causes the Pro\*C daemon to execute the command *system('ls -la')*.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL\*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS\_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```

CREATE OR REPLACE PACKAGE daemon AS
    FUNCTION execute_sql(command VARCHAR2,
        timeout NUMBER DEFAULT 10)

```

```
        RETURN NUMBER;

    FUNCTION execute_system(command VARCHAR2,
                           timeout NUMBER DEFAULT 10)
        RETURN NUMBER;

    PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

    FUNCTION execute_system(command VARCHAR2,
                           timeout NUMBER DEFAULT 10)
    RETURN NUMBER IS

        status      NUMBER;
        result       VARCHAR2(20);
        command_code NUMBER;
        pipe_name    VARCHAR2(30);
    BEGIN
        pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

        DBMS_PIPE.PACK_MESSAGE('SYSTEM');
        DBMS_PIPE.PACK_MESSAGE(pipe_name);
        DBMS_PIPE.PACK_MESSAGE(command);
        status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
        IF status <> 0 THEN
            RAISE_APPLICATION_ERROR(-20010,
                'Execute_system: Error while sending. Status = ' ||
                status);
        END IF;

        status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
        IF status <> 0 THEN
            RAISE_APPLICATION_ERROR(-20011,
                'Execute_system: Error while receiving.
                Status = ' || status);
        END IF;

        DBMS_PIPE.UNPACK_MESSAGE(result);
        IF result <> 'done' THEN
            RAISE_APPLICATION_ERROR(-20012,
                'Execute_system: Done not received.');
```

```
        END IF;

        DBMS_PIPE.UNPACK_MESSAGE(command_code);
        DBMS_OUTPUT.PUT_LINE('System command executed. result = ' ||
                             command_code);

        RETURN command_code;
    END execute_system;

    FUNCTION execute_sql(command VARCHAR2,
                        timeout NUMBER DEFAULT 10)
    RETURN NUMBER IS

        status      NUMBER;
        result       VARCHAR2(20);
        command_code NUMBER;
        pipe_name    VARCHAR2(30);
    BEGIN
        pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;
```

```

DBMS_PIPE.PACK_MESSAGE('SQL');
DBMS_PIPE.PACK_MESSAGE(pipe_name);
DBMS_PIPE.PACK_MESSAGE(command);
status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20020,
        'Execute_sql: Error while sending. Status = ' || status);
END IF;

status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20021,
        'execute_sql: Error while receiving.
        Status = ' || status);
END IF;

DBMS_PIPE.UNPACK_MESSAGE(result);
IF result <> 'done' THEN

END daemon;

```

daemon.pc Example. This is the code for the Pro\*C daemon. You must precompile this using the Pro\*C Precompiler, Version 1.5.x or later. You must also specify the `USERID` and `SQLCHECK` options, as the example contains embedded PL/SQL code.

#### Note:

To use a `VARCHAR` output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=HR/<password> sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>
```

```
EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "HR/<password>";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%.s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()

    }
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

#### Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

|                  |                      |                         |
|------------------|----------------------|-------------------------|
| protocol_version | VARCHAR2             | - '1', 10 bytes or less |
| returnpipe       | VARCHAR2             | - 30 bytes or less      |
| service          | VARCHAR2             | - 30 bytes or less      |
| arg1             | VARCHAR2/NUMBER/DATE |                         |
| ...              |                      |                         |
| argn             | VARCHAR2/NUMBER/DATE |                         |

The recommended format for returning the result is:

|         |                      |                                               |
|---------|----------------------|-----------------------------------------------|
| success | VARCHAR2             | - 'SUCCESS' if OK,<br>otherwise error message |
| arg1    | VARCHAR2/NUMBER/DATE |                                               |
| ...     |                      |                                               |
| argn    | VARCHAR2/NUMBER/DATE |                                               |

The "stock price request server" would do, using OCI or PRO\* (in pseudo-code):

```

<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;
  <figure out price based on stocksymbol (probably from some radio
    signal), set error if can't find such a stock>
  BEGIN dbms_stock_server.return_price(:error, :price); END;

```

A client would do:

```

BEGIN :price := stock_request('YOURCOMPANY'); end;

```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```

CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe  VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS

```

```

        s INTEGER;
BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
        raise_application_error(-20000, 'Error:' || to_char(s) ||
            ' sending on pipe');
    END IF;
END;

PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                INTEGER;
    service          VARCHAR2(30);
BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
        raise_application_error(-20000, 'Error:' || to_char(s) ||
            'reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
        raise_application_error(-20000, 'Bad protocol: ' ||
            protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
        returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
END;

PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
BEGIN
    IF errormsg is NULL THEN
        dbms_pipe.pack_message('SUCCESS');
        dbms_pipe.pack_message(price);
    ELSE
        dbms_pipe.pack_message(errormsg);
    END IF;
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
        raise_application_error(-20000, 'Error:' || to_char(s) ||
            ' sending on pipe');
    END IF;
END;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
    s                INTEGER;
    price            VARCHAR2(20);
    errormsg         VARCHAR2(512);
BEGIN
    dbms_pipe.pack_message('1'); -- protocol version
    dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
    dbms_pipe.pack_message('getprice');

```

```

dbms_pipe.pack_message(symbol);
s := dbms_pipe.send_message('stock_service');
IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
END IF;
s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
        ' receiving on pipe');
END IF;
dbms_pipe.unpack_message(errormsg);
IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
END IF;
dbms_pipe.unpack_message(price);
RETURN price;
END;

```

You would typically only GRANT EXECUTE on DBMS\_STOCK\_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock\_request to those users allowed to use the service.

## 130.7 Summary of DBMS\_PIPE Subprograms

This table lists the DBMS\_PIPE subprograms and briefly describes them.

**Table 130-2 DBMS\_PIPE Package Subprograms**

| Subprogram                                   | Description                                                                                         |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_PIPE Function</a>         | Creates a pipe (necessary for private pipes)                                                        |
| <a href="#">NEXT_ITEM_TYPE Function</a>      | Returns datatype of next item in buffer                                                             |
| <a href="#">PACK_MESSAGE Procedures</a>      | Builds message in local buffer                                                                      |
| <a href="#">PURGE Procedure</a>              | Purges contents of named pipe                                                                       |
| <a href="#">RECEIVE_MESSAGE Function</a>     | Copies message from named pipe into local buffer                                                    |
| <a href="#">REMOVE_PIPE Function</a>         | Removes the named pipe                                                                              |
| <a href="#">RESET_BUFFER Procedure</a>       | Purges contents of local buffer                                                                     |
| <a href="#">SEND_MESSAGE Function</a>        | Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist |
| <a href="#">UNIQUE_SESSION_NAME Function</a> | Returns unique session name                                                                         |
| <a href="#">UNPACK_MESSAGE Procedures</a>    | Accesses next item in buffer                                                                        |

## 130.7.1 CREATE\_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

### Syntax

```
DBMS_PIPE.CREATE_PIPE (  
    pipename      IN VARCHAR2,  
    maxpipesize   IN INTEGER DEFAULT 8192,  
    private       IN BOOLEAN DEFAULT TRUE)  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

### Parameters

**Table 130-3 CREATE\_PIPE Function Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pipename</code>    | <p>Name of the pipe you are creating.</p> <p>You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code>. This name must be unique across the instance.</p> <p>Caution: Do not use pipe names beginning with <code>ORA\$</code>. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</p>                                                                                |
| <code>maxpipesize</code> | <p>The maximum size allowed for the pipe, in bytes.</p> <p>The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default <code>maxpipesize</code> is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value use the existing, larger value.</p> |
| <code>private</code>     | <p>Uses the default, <code>TRUE</code>, to create a private pipe.</p> <p>Public pipes can be implicitly created when you call <code>SEND_MESSAGE</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |

## Return Values

**Table 130-4 CREATE\_PIPE Function Return Values**

| Return    | Description                                                                                                                                                                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0         | Successful.<br><br>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.<br><br>If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged. |
| ORA-23322 | Failure due to naming conflict.<br><br>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.                                                                                                                                                            |

## Exceptions

**Table 130-5 CREATE\_PIPE Function Exception**

| Exception      | Description                                                                                  |
|----------------|----------------------------------------------------------------------------------------------|
| Null pipe name | Permission error: Pipe with the same name already exists, and you are not allowed to use it. |

## 130.7.2 NEXT\_ITEM\_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `NEXT_ITEM_TYPE`.

### Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

## Return Values

**Table 130-6 NEXT\_ITEM\_TYPE Function Return Values**

| Return | Description   |
|--------|---------------|
| 0      | No more items |
| 6      | NUMBER        |
| 9      | VARCHAR2      |
| 11     | ROWID         |
| 12     | DATE          |
| 23     | RAW           |

## 130.7.3 PACK\_MESSAGE Procedures

This procedure builds your message in the local message buffer.

To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

### Syntax

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);
```

```
DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);
```

```
DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

### Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

### Parameters

**Table 130-7 PACK\_MESSAGE Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| item      | Item to pack into the local message buffer. |

### Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

## Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

## 130.7.4 PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

## Syntax

```
DBMS_PIPE.PURGE (
    pipename IN VARCHAR2);
```

## Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```

## Parameters

**Table 130-8 PURGE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pipename</code> | Name of pipe from which to remove all messages.<br>The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive. |

## Usage Notes

Because `PURGE` calls `RECEIVE_MESSAGE`, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

## Exceptions

Permission error if pipe belongs to another user.

## 130.7.5 RECEIVE\_MESSAGE Function

This function copies the message into the local message buffer.

## Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

## Pragmas

```
pragma restrict_references(receive_message,WNDS,RNDS);
```

## Parameters

**Table 130-9 RECEIVE\_MESSAGE Function Parameters**

| Parameter | Description                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pipename  | Name of the pipe on which you want to receive a message.<br>Names beginning with ORA\$ are reserved for use by Oracle                                                          |
| timeout   | Time to wait for a message, in seconds.<br>The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking. |

## Return Values

**Table 130-10 RECEIVE\_MESSAGE Function Return Values**

| Return    | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| 0         | Success                                                                         |
| 1         | Timed out. If the pipe was implicitly-created and is empty, then it is removed. |
| 2         | Record in the pipe is too large for the buffer. (This should not happen.)       |
| 3         | An interrupt occurred.                                                          |
| ORA-23322 | User has insufficient privileges to read from the pipe.                         |

## Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is overloaded to unpack items of type `DATE`, `NUMBER`, `VARCHAR2`, and there are two additional procedures to unpack `RAW` and `ROWID` items. If you do not know the type of data that you are attempting to unpack, then call `NEXT_ITEM_TYPE` to determine the type of the next item in the buffer.

## Exceptions

**Table 130-11 RECEIVE\_MESSAGE Function Exceptions**

| Exception      | Description                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------|
| Null pipe name | Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else. |

## 130.7.6 RESET\_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

### Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

### Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

## 130.7.7 REMOVE\_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

### Syntax

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

### Parameters

**Table 130-12 REMOVE\_PIPE Function Parameters**

| Parameter             | Description                           |
|-----------------------|---------------------------------------|
| <code>pipename</code> | Name of pipe that you want to remove. |

### Return Values

**Table 130-13 REMOVE\_PIPE Function Return Values**

| Return | Description                                                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0      | Success<br>If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed. |

**Table 130-13 (Cont.) REMOVE\_PIPE Function Return Values**

| Return    | Description                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-23322 | Insufficient privileges.<br>If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges. |

### Exceptions

**Table 130-14 REMOVE\_PIPE Function Exception**

| Exception      | Description                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------|
| Null pipe name | Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else. |

## 130.7.8 SEND\_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

### Syntax

```
DBMS_PIPE.SEND_MESSAGE (  
    pipename      IN VARCHAR2,  
    timeout       IN INTEGER DEFAULT MAXWAIT,  
    maxpipesize   IN INTEGER DEFAULT 8192)  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

### Parameters

**Table 130-15 SEND\_MESSAGE Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pipename  | Name of the pipe on which you want to place the message.<br>If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code> .<br><br>Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters. |
| timeout   | Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant <code>MAXWAIT</code> , which is defined as 86400000 (1000 days).                                                                                                                                                                                                                                                                                         |

**Table 130-15 (Cont.) SEND\_MESSAGE Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxpipesize | <p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.</p> |

#### Return Values

**Table 130-16 SEND\_MESSAGE Function Return Values**

| Return    | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0         | <p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p> |
| 1         | <p>Timed out.</p> <p>This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</p>                                                                                                                          |
| 3         | <p>An interrupt occurred.</p> <p>If the pipe was implicitly created and is empty, then it is removed.</p>                                                                                                                                                                                                                                           |
| ORA-23322 | <p>Insufficient privileges.</p> <p>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</p>                                                                                                                                                                |

#### Exceptions

**Table 130-17 SEND\_MESSAGE Function Exception**

| Exception      | Description                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------|
| Null pipe name | Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else. |

## 130.7.9 UNIQUE\_SESSION\_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the PIPENAME parameter for your SEND\_MESSAGE and RECEIVE\_MESSAGE calls.

### Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

### Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

## 130.7.10 UNPACK\_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE\_MESSAGE to place pipe information in a local buffer, call UNPACK\_MESSAGE.

### Note:

The UNPACK\_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

### Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (  
    item OUT VARCHAR2);  
  
DBMS_PIPE.UNPACK_MESSAGE (  
    item OUT NCHAR);  
  
DBMS_PIPE.UNPACK_MESSAGE (  
    item OUT NUMBER);  
  
DBMS_PIPE.UNPACK_MESSAGE (  
    item OUT DATE);  
  
DBMS_PIPE.UNPACK_MESSAGE_RAW (  
    item OUT RAW);  
  
DBMS_PIPE.UNPACK_MESSAGE_ROWID (  
    item OUT ROWID);
```

## Pragmas

```
pragma restrict_references(unpack_message,WNDS,RNDS);
pragma restrict_references(unpack_message_raw,WNDS,RNDS);
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);
```

## Parameters

**Table 130-18 UNPACK\_MESSAGE Procedure Parameters**

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| item      | Argument to receive the next unpacked item from the local message buffer. |

## Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

# DBMS\_PLSQL\_CODE\_COVERAGE

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.

This chapter contains the following topics:

- [DBMS\\_PLSQL\\_CODE\\_COVERAGE Overview](#)
- [DBMS\\_PLSQL\\_CODE\\_COVERAGE Security Model](#)
- [Summary of DBMS\\_PLSQL\\_CODE\\_COVERAGE Subprograms](#)

## 131.1 DBMS\_PLSQL\_CODE\_COVERAGE Overview

The `DBMS_PLSQL_CODE_COVERAGE` package provides an interface for collecting code coverage information at the basic block level of PL/SQL applications. A basic block refers to a single entry single exit block of PL/SQL code. PL/SQL developers want to know how well their test infrastructure exercised their code. The coverage tables are created using the `CREATE_COVERAGE_TABLES` procedure.

A typical code coverage run in a session involves calls to :

- `START_COVERAGE`
- Run PL/SQL code
- `STOP_COVERAGE`

### See Also:

- *Oracle Database Development Guide* for more information about using PL/SQL basic block coverage to maintain quality
- *Oracle Database PL/SQL Language Reference* for the `COVERAGE PRAGMA` syntax and semantics
- *Oracle Database PL/SQL Language Reference* for more information about the `PLSQL_OPTIMIZE_LEVEL` compilation parameter

## 131.2 DBMS\_PLSQL\_CODE\_COVERAGE Security Model

The user must have `EXECUTE` privilege on the `DBMS_PLSQL_CODE_COVERAGE` package.

The user must have `CREATE` privilege on the unit to collect coverage information about this unit.

Coverage information is not collected for wrapped units.

## 131.3 Summary of DBMS\_PLSQL\_CODE\_COVERAGE Subprograms

This table lists the DBMS\_PLSQL\_CODE\_COVERAGE subprograms and briefly describes them.

**Table 131-1 DBMS\_PLSQL\_CODE\_COVERAGE Package Subprograms**

| Subprogram                                       | Description                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------|
| <a href="#">CREATE_COVERAGE_TABLES Procedure</a> | Creates coverage tables                                                          |
| <a href="#">START_COVERAGE Function</a>          | Starts the coverage data collection in the user's session and returns the RUN_ID |
| <a href="#">STOP_COVERAGE Procedure</a>          | Ends the current coverage run                                                    |

### 131.3.1 CREATE\_COVERAGE\_TABLES Procedure

This procedure creates the tables used for coverage data collection.

#### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.CREATE_COVERAGE_TABLES (
    FORCE_IT      IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FORCE_IT  | The default is to raise an error if the coverage tables already exists. If set to TRUE, the tables are dropped silently if the tables already exist, and new tables are created. |

#### Exceptions

**Table 131-2 CREATE\_COVERAGE\_TABLES Exceptions**

| Exception      | Description                                                   |
|----------------|---------------------------------------------------------------|
| COVERAGE_ERROR | The FORCE_IT parameter is FALSE and the tables already exist. |

### 131.3.2 START\_COVERAGE Function

This function starts the coverage data collection in the user's session and returns a unique identifier RUN\_ID for the run.

#### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.START_COVERAGE (
    run_comment  IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

| Parameter                | Description                                          |
|--------------------------|------------------------------------------------------|
| <code>run_comment</code> | Allows the user to name a run and identify the test. |

## 131.3.3 STOP\_COVERAGE Procedure

This procedure ends the current coverage run.

### Syntax

```
DBMS_PLSQL_CODE_COVERAGE.STOP_COVERAGE;
```

### Exceptions

**Table 131-3 STOP\_COVERAGE Exceptions**

| Exception                   | Description                                             |
|-----------------------------|---------------------------------------------------------|
| <code>COVERAGE_ERROR</code> | An error is raised if the coverage tables do not exist. |

## DBMS\_PREDICTIVE\_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PREDICTIVE\\_ANALYTICS Subprograms](#)

### 132.1 DBMS\_PREDICTIVE\_ANALYTICS Overview

`DBMS_PREDICTIVE_ANALYTICS` automates parts of the data mining process.

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

### 132.2 DBMS\_PREDICTIVE\_ANALYTICS Security Model

The `DBMS_PREDICTIVE_ANALYTICS` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_PREDICTIVE_ANALYTICS` package exposes APIs which are leveraged by the Oracle Data Mining option. Users who wish to invoke procedures in this package require the `CREATE MINING MODEL` system privilege (as well as the `CREATE TABLE` and `CREATE VIEW` system privilege).

## 132.3 Summary of DBMS\_PREDICTIVE\_ANALYTICS Subprograms

This table lists and briefly describes the DBMS\_PREDICTIVE\_ANALYTICS package subprograms.

**Table 132-1 DBMS\_PREDICTIVE\_ANALYTICS Package Subprograms**

| Subprogram                        | Purpose                                                                    |
|-----------------------------------|----------------------------------------------------------------------------|
| <a href="#">EXPLAIN Procedure</a> | Ranks attributes in order of influence in explaining a target column.      |
| <a href="#">PREDICT Procedure</a> | Predicts the value of a target column based on values in the input data.   |
| <a href="#">PROFILE Procedure</a> | Generates rules that identify the records that have the same target value. |

### 132.3.1 EXPLAIN Procedure

The `EXPLAIN` procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not `NULL`). These records are used by the procedure to train a model that calculates the attribute importance.

#### Note:

`EXPLAIN` supports `DATE` and `TIMESTAMP` datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The `EXPLAIN` procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

#### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (  
    data_table_name      IN VARCHAR2,  
    explain_column_name  IN VARCHAR2,  
    result_table_name    IN VARCHAR2,  
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 132-2 EXPLAIN Procedure Parameters**

| Parameter                        | Description                        |
|----------------------------------|------------------------------------|
| <code>data_table_name</code>     | Name of input table or view        |
| <code>explain_column_name</code> | Name of the column to be explained |

**Table 132-2 (Cont.) EXPLAIN Procedure Parameters**

| Parameter         | Description                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| result_table_name | Name of the table where results are saved                                                                                    |
| data_schema_name  | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

**Usage Notes**

The `EXPLAIN` procedure creates a result table with the columns described in [Table 132-3](#).

**Table 132-3 EXPLAIN Procedure Result Table**

| Column Name       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATTRIBUTE_NAME    | VARCHAR2 (30) | Name of a column in the input data; all columns except the explained column are listed in the result table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EXPLANATORY_VALUE | NUMBER        | Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1.<br><br>An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column.<br><br>An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for <code>PREDICT</code> . In practice, an explanatory power equal to 1 is rarely returned. |
| RANK              | NUMBER        | Ranking of explanatory power. Rows with equal values for <code>explanatory_value</code> have the same rank. Rank values are not skipped in the event of ties.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Example**

The following example performs an `EXPLAIN` operation on the `SUPPLEMENTARY_DEMOGRAPHICS` table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name      => 'supplementary_demographics',
        explain_column_name  => 'home_theater_package',
        result_table_name    => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;
```

| ATTRIBUTE_NAME | EXPLANATORY_VALUE | RANK |
|----------------|-------------------|------|
| Y_BOX_GAMES    | .524311073        | 1    |
| YRS_RESIDENCE  | .495987246        | 2    |
| HOUSEHOLD_SIZE | .146208506        | 3    |
| AFFINITY_CARD  | .0598227          | 4    |

|                         |            |   |
|-------------------------|------------|---|
| EDUCATION               | .018462703 | 5 |
| OCCUPATION              | .009721543 | 6 |
| FLAT_PANEL_MONITOR      | .00013733  | 7 |
| PRINTER_SUPPLIES        | 0          | 8 |
| OS_DOC_SET_KANJI        | 0          | 8 |
| BULK_PACK_DISKETTES     | 0          | 8 |
| BOOKKEEPING_APPLICATION | 0          | 8 |
| COMMENTS                | 0          | 8 |
| CUST_ID                 | 0          | 8 |

The results show that Y\_BOX\_GAMES, YRS\_RESIDENCE, and HOUSEHOLD\_SIZE are the best predictors of HOME\_THEATER\_PACKAGE.

## 132.3.2 PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

### Note:

PREDICT supports DATE and TIMESTAMP datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 132-4 PREDICT Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accuracy            | Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean. |
| data_table_name     | Name of the input table or view.                                                                                                                                                                                                                              |
| case_id_column_name | Name of the column that uniquely identifies each case (record) in the input data.                                                                                                                                                                             |

**Table 132-4 (Cont.) PREDICT Procedure Parameters**

| Parameter          | Description                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| target_column_name | Name of the column to predict.                                                                                               |
| result_table_name  | Name of the table where results will be saved.                                                                               |
| data_schema_name   | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

### Usage Notes

The `PREDICT` procedure creates a result table with the columns described in [Table 132-5](#).

**Table 132-5 PREDICT Procedure Result Table**

| Column Name         | Datatype           | Description                                                                                                                                                      |
|---------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Case ID column name | VARCHAR2 or NUMBER | The name of the case ID column in the input data.                                                                                                                |
| PREDICTION          | VARCHAR2 or NUMBER | The predicted value of the target column for the given case.                                                                                                     |
| PROBABILITY         | NUMBER             | For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains <code>NULL</code> . |

#### Note:

Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

### Example

The following example performs a `PREDICT` operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy      => v_accuracy,
        data_table_name => 'supplementary_demographics',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        result_table_name => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/
```

Accuracy = .788696903

--Display results

SELECT \* FROM pa\_demographics\_predict\_result WHERE rownum < 10;

| CUST_ID | PREDICTION | PROBABILITY |
|---------|------------|-------------|
| 101501  | 1          | .834069848  |
| 101502  | 0          | .991269965  |
| 101503  | 0          | .99978311   |
| 101504  | 1          | .971643388  |
| 101505  | 1          | .541754127  |
| 101506  | 0          | .803719133  |
| 101507  | 0          | .999999303  |
| 101508  | 0          | .999999987  |
| 101509  | 0          | .999953074  |

## 132.3.3 PROFILE Procedure

The `PROFILE` procedure generates rules that describe the cases (records) from the input data.

For example, if a target column `CHURN` has values 'Yes' and 'No', `PROFILE` generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not `NULL`). These cases are used by the procedure to build a model that calculates the rules.

### Note:

`PROFILE` does not support nested types or dates.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The `PROFILE` procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
    data_table_name          IN VARCHAR2,
    target_column_name       IN VARCHAR2,
    result_table_name        IN VARCHAR2,
    data_schema_name         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 132-6 PROFILE Procedure Parameters**

| Parameter                       | Description                                           |
|---------------------------------|-------------------------------------------------------|
| <code>data_table_name</code>    | Name of the table containing the data to be analyzed. |
| <code>target_column_name</code> | Name of the target column.                            |

**Table 132-6 (Cont.) PROFILE Procedure Parameters**

| Parameter         | Description                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| result_table_name | Name of the table where the results will be saved.                                                                           |
| data_schema_name  | Name of the schema where the input table or view resides and where the result table is created. Default: the current schema. |

**Usage Notes**

The `PROFILE` procedure creates a result table with the columns described in [Table 132-7](#).

**Table 132-7 PROFILE Procedure Result Table**

| Column Name  | Datatype    | Description                                                             |
|--------------|-------------|-------------------------------------------------------------------------|
| PROFILE_ID   | NUMBER      | A unique identifier for this profile (rule).                            |
| RECORD_COUNT | NUMBER      | The number of records described by the profile.                         |
| DESCRIPTION  | SYS.XMLTYPE | The profile rule. See " <a href="#">XML Schema for Profile Rules</a> ". |

**XML Schema for Profile Rules**

The `DESCRIPTION` column of the result table contains XML that conforms to the following XSD:

```
<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>
```

**Example**

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```
SET serveroutput ON
SET trimspace ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE (
        DATA_TABLE_NAME      => 'cust_edu_occ_view',
        TARGET_COLUMN_NAME    => 'affinity_card',
        RESULT_TABLE_NAME     => 'profile_result');
END;
/
```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```
SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;
```

This `SELECT` statement returns the rules for a target value of 0.

```
SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;
```

The eight rules generated by this example are displayed as follows.

```
<SimpleRule id="1" score="0" recordCount="443">
  <CompoundPredicate booleanOperator="and">
    <SimpleSetPredicate field="OCCUPATION" booleanOperator="isIn">
      <Array type="string">"Armed-F" "Exec." "Prof." "Protec."
    </Array>
    </SimpleSetPredicate>
    <SimpleSetPredicate field="EDUCATION" booleanOperator="isIn">
      <Array type="string">"Bach." "Assoc-V" "HS-grad"
    </Array>
    </SimpleSetPredicate>
  </CompoundPredicate>
  <ScoreDistribution value="0" recordCount="297" />
  <ScoreDistribution value="1" recordCount="146" />
</SimpleRule>

<SimpleRule id="2" score="0" recordCount="18">

```

## DBMS\_PREPROCESSOR

The DBMS\_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics:

- [Overview](#)
- [Operating Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_PREPROCESSOR Subprograms](#)

### 133.1 DBMS\_PREPROCESSOR Overview

It is necessary to first understand the three styles of subprograms, in order to understand how DBMS\_PREPROCESSOR works.

The following are the three styles of subprograms:

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

### 133.2 DBMS\_PREPROCESSOR Operating Notes

These notes explain how DBMS\_PREPROCESSOR works with the three subprogram styles.

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be `VALID`. Likewise, the source text passed in as a `VARCHAR2` string or a `VARCHAR2` index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed

source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.

- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE OR REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

|                 |                         |
|-----------------|-------------------------|
| anonymous block | (BEGIN   DECLARE) ...   |
| package         | PACKAGE <name> ...      |
| package body    | PACKAGE BODY <name> ... |
| procedure       | PROCEDURE <name> ...    |
| function        | FUNCTION <name> ...     |
| type            | TYPE <name> ...         |
| type body       | TYPE BODY <name> ...    |
| trigger         | (BEGIN   DECLARE) ...   |

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET\\_POST\\_PROCESSED\\_SOURCE Functions](#) or to one of the [PRINT\\_POST\\_PROCESSED\\_SOURCE Procedures](#), the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

## 133.3 DBMS\_PREPROCESSOR Data Structures

The `DBMS_PREPROCESSOR` package defines a `TABLE` type.

### Table Types

[SOURCE\\_LINES\\_T](#) Table Type

### 133.3.1 DBMS\_PREPROCESSOR SOURCE\_LINES\_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

#### Syntax

```
TYPE source_lines_t IS
TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## 133.4 Summary of DBMS\_PREPROCESSOR Subprograms

This table lists the `DBMS_PREPROCESSOR` subprograms and briefly describes them.

**Table 133-1 DBMS\_PREPROCESSOR Package Subprograms**

| Subprogram                                             | Description                            |
|--------------------------------------------------------|----------------------------------------|
| <a href="#">GET_POST_PROCESSED_SOURCE Functions</a>    | Returns the post-processed source text |
| <a href="#">PRINT_POST_PROCESSED_SOURCE Procedures</a> | Prints post-processed source text      |

## 133.4.1 GET\_POST\_PROCESSED\_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

### Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    IN VARCHAR2,
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN source_lines_t)
RETURN source_lines_t;
```

### Parameters

**Table 133-2 GET\_POST\_PROCESSED\_SOURCE Function Parameters**

| Parameter      | Description                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_type    | Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.                                                                     |
| schema_name    | The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.                                                                          |
| object_name    | The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.                                                    |
| source         | The source text of the compilation unit                                                                                                                                     |
| source_lines_t | INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order. |

## Return Values

The function returns an `INDEX-BY` table containing the lines of the post-processed source text starting from index 1.

## Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the `INDEX-BY` table.
- In the post-processed source, unselected text will have blank lines.

## Exceptions

**Table 133-3** GET\_POST\_PROCESSED\_SOURCE Function Exceptions

| Exception | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-24234 | Insufficient privileges or object does not exist                                                                                                            |
| ORA-24235 | Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.                                        |
| ORA-24236 | The source text is empty                                                                                                                                    |
| ORA-00931 | Missing identifier. The object_name should not be NULL.                                                                                                     |
| ORA-06502 | Numeric or value error: <ul style="list-style-type: none"><li>• Character string buffer too small</li><li>• A line is too long (&gt; 32767 bytes)</li></ul> |

## 133.4.2 PRINT\_POST\_PROCESSED\_SOURCE Procedures

This overloaded procedure calls `DBMS_OUTPUT.PUT_LINE` to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

### Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (  
    object_type    IN VARCHAR2,  
    schema_name    IN VARCHAR2,  
    object_name    IN VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (  
    source         IN VARCHAR2);
```

Prints post-processed source text of an `INDEX-BY` table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (  
    source         IN source_lines_t);
```

## Parameters

**Table 133-4 PRINT\_POST\_PROCESSED\_SOURCE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_type    | Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.                                                                     |
| schema_name    | The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.                                                                          |
| object_name    | The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.                                                    |
| source         | The source text of the compilation unit                                                                                                                                     |
| source_lines_t | INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order. |

## Exceptions

**Table 133-5 PRINT\_POST\_PROCESSED\_SOURCE Procedure Exceptions**

| Exception | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-24234 | Insufficient privileges or object does not exist                                                                                                            |
| ORA-24235 | Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.                                        |
| ORA-24236 | The source text is empty                                                                                                                                    |
| ORA-00931 | Missing identifier. The object_name should not be NULL.                                                                                                     |
| ORA-06502 | Numeric or value error: <ul style="list-style-type: none"><li>• Character string buffer too small</li><li>• A line is too long (&gt; 32767 bytes)</li></ul> |

## Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

# DBMS\_PRIVILEGE\_CAPTURE

The `DBMS_PRIVILEGE_CAPTURE` package provides an interface to database privilege analysis.

## See Also:

Oracle® Database Security Guide regarding on how to analyze the use of privilege grants

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Summary of DBMS\\_PRIVILEGE\\_CAPTURE Subprograms](#)

## 134.1 DBMS\_PRIVILEGE\_CAPTURE Overview

Database privilege analysis enables you to create a policy that records the usage of system and object privileges that have been granted to users. You then can determine the privileges that your users are using and not using. From there, you can revoke any unused privileges, thereby reducing the number of excess privilege grants for users.

By analyzing the privileges that users must have to perform specific tasks, privilege analysis policies help you to achieve a least privilege model for your users.

## 134.2 DBMS\_PRIVILEGE\_CAPTURE Security Model

The privilege analysis administrator role, `CAPTURE_ADMIN`, is granted `EXECUTE` permission on the `DBMS_PRIVILEGE_CAPTURE` package by default.

The `CAPTURE_ADMIN` role is granted to the `DBA` role during database installation.

## 134.3 DBMS\_PRIVILEGE\_CAPTURE Constants

The `DBMS_PRIVILEGE_CAPTURE` package defines several enumerated constants for specifying parameter values.

**Table 134-1 DBMS\_PRIVILEGE\_CAPTURE Constants**

| Constant           | Value | Type   | Description                                                                                    |
|--------------------|-------|--------|------------------------------------------------------------------------------------------------|
| G_DATABASE         | 1     | NUMBER | Analyzes all privilege use, except privileges used by the SYS user.                            |
| G_ROLE             | 2     | NUMBER | Analyzes privilege use for the specified roles.                                                |
| G_CONTEXT          | 3     | NUMBER | Analyzes privilege use when the condition parameter evaluates to true.                         |
| G_ROLE_AND_CONTEXT | 4     | NUMBER | Analyzes privilege use for the specified roles when the condition parameter evaluates to true. |

## 134.4 DBMS\_PRIVILEGE\_CAPTURE Examples

These examples illustrate using the DBMS\_PRIVILEGE\_CAPTURE.CREATE\_CAPTURE procedure to create various types of privilege analysis, like database analysis, role analysis, and context-specific analysis. The examples also illustrate combining different conditions in context-specific analysis.

```
--Create a database privilege analysis policy
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'all_priv_analysis_pol',
    description    => 'database-wide policy to analyze all privileges',
    type          => DBMS_PRIVILEGE_CAPTURE.G_DATABASE);
END;

--Create a privilege analysis policy to analyze privileges from the role PUBLIC
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'pub_analysis_pol',
    description    => 'Policy to record privilege use by PUBLIC',
    type          => DBMS_PRIVILEGE_CAPTURE.G_ROLE,
    roles         => role_name_list('PUBLIC'));
END;

-- Create a policy to analyze privileges from the application module, "Account
-- Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type          => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition      => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable''');
END;

-- Create a policy that records privileges for session user APPS when running the
-- application module "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name          => 'acc_pay_analysis_pol',
    type          => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition      => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable'' AND
        SYS_CONTEXT(''USERENV'', ''SESSION_USER'') = ''APPS''');
END;
```

## 134.5 Summary of DBMS\_PRIVILEGE\_CAPTURE Subprograms

This table lists and briefly describes the DBMS\_PRIVILEGE\_CAPTURE package subprograms.

**Table 134-2 DBMS\_PRIVILEGE\_CAPTURE Package Subprograms**

| Subprogram                                         | Description                                                                                                          |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <a href="#">CAPTURE_DEPENDENCY_PRIVS Procedure</a> | Captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation. |
| <a href="#">CREATE_CAPTURE Procedure</a>           | Creates a policy that specifies the conditions for analyzing privilege use.                                          |
| <a href="#">DELETE_RUN Procedure</a>               | Deletes a privilege analysis capture run                                                                             |
| <a href="#">DISABLE_CAPTURE Procedure</a>          | Stops the recording of privilege use for a specified privilege analysis policy                                       |
| <a href="#">DROP_CAPTURE Procedure</a>             | Removes a privilege analysis policy together with the data recorded                                                  |
| <a href="#">ENABLE_CAPTURE Procedure</a>           | Starts the recording of privilege analysis for a specified privilege analysis policy                                 |
| <a href="#">GENERATE_RESULT Procedure</a>          | Populates the privilege analysis data dictionary views with data                                                     |

### 134.5.1 CAPTURE\_DEPENDENCY\_PRIVS Procedure

This procedure captures the privileges that are used by definer's rights and invoker's rights PL/SQL program units for compilation.

#### Syntax

```
DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS ();
```

#### Parameters

This procedure has no parameters.

#### Usage Notes

Every rerun of the DBMS\_PRIVILEGE\_CAPTURE.CAPTURE\_DEPENDENCY\_PRIVS procedure deletes any existing records from the privilege analysis data dictionary views. It then recaptures records based on the existing PL/SQL program units.

### 134.5.2 CREATE\_CAPTURE Procedure

This procedure creates a privilege analysis policy that specifies the conditions for analyzing privilege use. It also optionally specifies the roles for which privilege use is to be analyzed, and the conditions under which privilege use is to be analyzed.

#### Syntax

```
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE (  
    name           IN  VARCHAR2,  
    description    IN  VARCHAR2 DEFAULT NULL,  
    type           IN  NUMBER DEFAULT G_DATABASE,
```

```

roles          IN  ROLE_NAME_LIST DEFAULT ROLE_NAME_LIST(),
condition      IN  VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 134-3 CREATE\_CAPTURE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name        | Name of the privilege analysis policy. A string of size up to 30 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| description | Description of the policy (up to 1024 characters)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| type        | Type of the privilege analysis policy. Possible values are: <ul style="list-style-type: none"> <li>G_DATABASE: Captures all privilege use in the database, except privileges used by the SYS user.</li> <li>G_ROLE: Captures the use of a privilege if the privilege is part of a specified role or list of roles.</li> <li>G_CONTEXT: Captures the use of a privilege if the context specified by the condition parameter evaluates to true.</li> <li>G_ROLE_AND_CONTEXT: Captures the use of a privilege if the privilege is part of the specified list of roles and when the condition specified by the condition parameter is true.</li> </ul> |
| roles       | The roles whose privileges are to be analyzed. Required if the type is G_ROLE or G_ROLE_AND_CONTEXT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| condition   | PL/SQL boolean expression containing up to 4000 characters. Required if type is G_CONTEXT or G_ROLE_AND_CONTEXT. Note that the boolean expression can only contain SYS_CONTEXT, but not other functions.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage Notes

- When using role-based analysis for the CREATE\_CAPTURE procedure, privilege use is analyzed even if the privilege is indirectly granted to the specified role.  
For example, say role R2 contains role R1, and R1 contains privilege P1. If the privilege policy includes only role R2, any use of the P1 privilege is still analyzed, as privilege P1 is an indirect part of role R2.
- When using the condition parameter, use the following syntax for the PL/SQL expression:

```

condition ::= predicate | (predicate1) AND (predicate2)
            | (predicate1) OR (predicate2)

```

Where,

```

predicate ::= sys_context(namespace, attribute) relop constant_value |
sys_context(namespace, attribute) between constant_value and
constant_value | sys_context(namespace, attribute) in {constant_value
, constant_value}* }

```

Where,

```

relop ::= = | < | <= | > | >= | <>

```

- A privilege analysis policy cannot analyze the use of SYS user privileges.

## 134.5.3 DELETE\_RUN Procedure

This procedure deletes a privilege analysis capture run.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DELETE_RUN (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2);
```

### Parameters

**Table 134-4** *DELETE\_RUN Procedure Parameters*

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| name      | Name of the privilege analysis policy with which the capture run is associated |
| run_name  | Name of the capture run                                                        |

### Usage Notes

- You can find the names of existing privilege capture policies by querying the `DBA_PRIV_CAPTURES` data dictionary view.
- Another way to delete a capture run is to drop the policy with which the capture run is associated. Dropping the policy automatically drops its associated capture runs.
- When you drop a capture run it is no longer accessible through the privilege capture data dictionary views.

## 134.5.4 DISABLE\_CAPTURE Procedure

This procedure stops the recording of privilege use for a specified privilege analysis policy. When a policy is disabled, privilege use meeting the policy condition is no longer recorded.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DISABLE_CAPTURE (
    name          IN VARCHAR2);
```

### Parameters

**Table 134-5** *DISABLE\_CAPTURE Procedure Parameters*

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| name      | Name of the privilege analysis policy to be disabled |

### Usage Notes

When a privilege analysis policy is first created, it is disabled by default.

## 134.5.5 DROP\_CAPTURE Procedure

This procedure removes a privilege analysis policy together with the data recorded. When a policy is removed, all previously recorded privilege use data associated with the policy is deleted.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.DROP_CAPTURE (
    name          IN VARCHAR2);
```

### Parameters

**Table 134-6** *DROP\_CAPTURE Procedure Parameters*

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| name      | Name of the privilege analysis policy to be removed |

### Usage Notes

- You must disable a privilege analysis policy before removing it. An enabled policy cannot be removed.
- If there are capture runs associated with this policy, then they are automatically dropped when you drop the policy.

## 134.5.6 ENABLE\_CAPTURE Procedure

This procedure starts the recording of privilege analysis for a specified privilege analysis policy and optionally provides a capture run for this policy. After a policy is enabled, all privilege use under the policy condition is recorded.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.ENABLE_CAPTURE (
    name          IN VARCHAR2,
    run_name      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 134-7** *ENABLE\_CAPTURE Procedure Parameters*

| Parameter | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the privilege analysis policy to be enabled                                                                                   |
| run_name  | Name of the capture run to associate with this policy, less than 128 characters. Enclose exotic characters in double quotation marks. |

### Usage Notes

The following usage notes apply:

- When a privilege analysis policy is first created, it is disabled by default. You must run `ENABLE_CAPTURE` to enable the privilege analysis policy.

- You can enable only one privilege analysis policy at a time. However, a database-wide privilege analysis of the `G_DATABASE` type can be enabled together with another non `G_DATABASE` privilege analysis.
- You cannot enable the same run multiple times. For example, `run_01` cannot be used again if you want to re-enable the capture for `run_01`. Instead, create a new run.

## 134.5.7 GENERATE\_RESULT Procedure

This procedure populates the privilege analysis data dictionary views with data.

### See Also:

Oracle® Database Security Guide for more information about privilege analysis views.

### Syntax

```
DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT (
  name          IN VARCHAR2,
  run_name      IN VARCHAR2 DEFAULT NULL,
  DEPENDENCY    IN BOOLEAN DEFAULT NULL);
```

### Parameters

**Table 134-8** *GENERATE\_RESULT Procedure Parameters*

| Parameter               | Description                                                                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>       | Name of the privilege analysis policy for which views are populated                                                                                                                                                                                                                                  |
| <code>run_name</code>   | Name of the capture run that is associated with the privilege analysis policy. If you omit this parameter, then the records of all created runs will be analyzed. When you specify the <code>run_name</code> parameter, only the records of that run are analyzed and all other runs are unaffected. |
| <code>dependency</code> | Enter Y (yes) or N (no) to indicate if PL/SQL compilation privileges, set by the <code>DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS</code> procedure, should be included in the report.                                                                                                           |

### Usage Notes

You must disable a privilege analysis policy before populating the privilege analysis views for the policy. You cannot invoke this subprogram on an enabled privilege analysis policy.

# DBMS\_PROCESS

The `DBMS_PROCESS` package provides an interface to manage the prespawnd servers.

This chapter contains the following topics:

- [DBMS\\_PROCESS Overview](#)
- [DBMS\\_PROCESS Security Model](#)
- [Summary of DBMS\\_PROCESS Subprograms](#)

## 135.1 DBMS\_PROCESS Overview

By default, Oracle Database can prespawn foreground processes to improve the performance of client connections.

A prespawnd process refers to a process that has been spawned but does not have a session yet. When a user connects to the database or a service process is needed, the process performs further initialization as needed.

To manage foreground processes, use the `DBMS_PROCESS` package. The procedures in this package configure the number of foreground processes for a connection pool, start a connection pool, and stop a connection pool.

### See Also:

- *Oracle Database Administrator's Guide* for a detailed description of managing a pre-created processes
- *Oracle Database Reference* for information about the `USE_DEDICATED_BROKER` parameter, which determines how dedicated servers are spawned. `TRUE` enables the listener to send the connection to a dedicated connection broker that spawns the dedicated server. `FALSE` sets the listener to spawn a dedicated server directly.

## 135.2 DBMS\_PROCESS Security Model

You must be granted the `SYSDBA` administrative privilege to use the `DBMS_PROCESS` package.

## 135.3 Summary of DBMS\_PROCESS Subprograms

This table lists the DBMS\_PROCESS subprograms and briefly describes them.

**Table 135-1 DBMS\_PROCESS Package Subprograms**

| Subprogram                               | Description                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CONFIGURE_POOL Procedure</a> | Configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool |
| <a href="#">START_POOL Procedure</a>     | Starts a prespawnd foreground process pool.                                                                                                                                         |
| <a href="#">STOP_POOL Procedure</a>      | Stops a prespawnd foreground process pool.                                                                                                                                          |

### 135.3.1 CONFIGURE\_POOL Procedure

This procedure configures the minimum number of prespawnd processes, the number of prespawnd processes in a batch, and the initial number of pre-spawnd processes for a foreground connection pool.

#### Syntax

```
DBMS_PROCESS.CONFIGURE_POOL(  
    pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL",  
    min_count      IN  NUMBER DEFAULT 10,  
    batch_count    IN  NUMBER DEFAULT 20,  
    init_count     IN  NUMBER DEFAULT 0);
```

#### Parameters

**Table 135-2 CONFIGURE\_POOL Procedure Parameters**

| Parameter   | Description                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pool_name   | Name of the foreground pool                                                                                                                                             |
| min_count   | Count after which a batch of prespawnd processes will be spawned in the pool (default 10; maximum number of processes 64,000)                                           |
| batch_count | Batch of prespawnd servers to be spawned in the pool (default 20). The total value of the min_count and batch_count values cannot exceed the PROCESSES parameter value. |
| init_count  | Set of prespawnd servers to be spawned in startup, or before a storm of connections, spawned in batches (default 0). Do not exceed the PROCESSES parameter value.       |

## Exceptions

**Table 135-3** CONFIGURE\_POOL Procedure Exceptions

| Error   | Description                                 |
|---------|---------------------------------------------|
| ORA-456 | Prespawn not enabled                        |
| ORA-457 | Prespawn pool not found                     |
| ORA-458 | Prespawn pool already started               |
| ORA-459 | Prespawn pool not started                   |
| ORA-460 | Process pool invalid configuration value(s) |

## Usage Notes

- To find information about foreground processes, query the V\$PROCESS\_POOL dynamic view.

## Example

```
BEGIN
  DBMS_PROCESS.CONFIGURE_POOL (
    pool_name   => 'hrdb_pool',
    min_count   => 40,
    batch_count => 20,
    init_count  => 10);
END;
/
```

## 135.3.2 START\_POOL Procedure

This procedure starts a prespawned foreground process pool.

## Syntax

```
DBMS_PROCESS.START_POOL(
  pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

## Parameters

**Table 135-4** START\_POOL Procedure Parameters

| Parameter | Description                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------|
| pool_name | Name of prespawned foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view. |

## Exceptions

**Table 135-5** START\_POOL Procedure Exceptions

| Error   | Description                   |
|---------|-------------------------------|
| ORA-457 | Prespawn pool not found       |
| ORA-458 | Prespawn pool already started |

**Table 135-5 (Cont.) START\_POOL Procedure Exceptions**

| Error   | Description               |
|---------|---------------------------|
| ORA-459 | Prespawn pool not started |

**Example**

```
BEGIN
  DBMS_PROCESS.START_POOL (
    pool_name => 'hrdb_pool',
  END;
```

### 135.3.3 STOP\_POOL Procedure

This procedure stops a prespawnd foreground process pool.

**Syntax**

```
DBMS_PROCESS.STOP_POOL(
  pool_name      IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

**Parameters****Table 135-6 STOP\_POOL Procedure Parameters**

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| pool_name | Name of the prespawnd foreground process pool. To find existing pools, query the V\$PROCESS_POOL dynamic view. |

**Exceptions****Table 135-7 STOP\_POOL Procedure Exceptions**

| Error   | Description                   |
|---------|-------------------------------|
| ORA-457 | Prespawn pool not found       |
| ORA-458 | Prespawn pool already started |
| ORA-459 | Prespawn pool not started     |

**Example**

```
BEGIN
  DBMS_PROCESS.STOP_POOL (
    pool_name => 'hrdb_pool',
  END;
```

# DBMS\_PROFILER

The package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Summary of DBMS\\_PROFILER Subprograms](#)

## 136.1 DBMS\_PROFILER Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

 **Note:**

It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in the following tables.

**Table 136-1 Columns in Table PLSQL\_PROFILER\_RUNS**

| Column      | Datatype           | Definition                                           |
|-------------|--------------------|------------------------------------------------------|
| runid       | NUMBER PRIMARY KEY | Unique run identifier from plsql_profiler_runnumber  |
| related_run | NUMBER             | Runid of related run (for client/server correlation) |
| run_owner   | VARCHAR2 (128)     | User who started run                                 |
| run_date    | DATE               | Start time of run                                    |

**Table 136-1 (Cont.) Columns in Table PLSQL\_PROFILER\_RUNS**

| Column          | Datatype        | Definition                               |
|-----------------|-----------------|------------------------------------------|
| run_comment     | VARCHAR2 (2047) | User provided comment for this run       |
| run_total_time  | NUMBER          | Elapsed time for this run in nanoseconds |
| run_system_info | VARCHAR2 (2047) | Currently unused                         |
| run_comment1    | VARCHAR2 (2047) | Additional comment                       |
| spare1          | VARCHAR2 (256)  | Unused                                   |

**Table 136-2 Columns in Table PLSQL\_PROFILER\_UNITS**

| Column         | Datatype       | Definition                                                                                                                                    |
|----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| runid          | NUMBER         | Primary key, references plsql_profiler_runs,                                                                                                  |
| unit_number    | NUMBER         | Primary key, internally generated library unit #                                                                                              |
| unit_type      | VARCHAR2 (128) | Library unit type                                                                                                                             |
| unit_owner     | VARCHAR2 (128) | Library unit owner name                                                                                                                       |
| unit_name      | VARCHAR2 (128) | Library unit name timestamp on library unit                                                                                                   |
| unit_timestamp | DATE           | In the future will be used to detect changes to unit between runs                                                                             |
| total_time     | NUMBER         | Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools. |
| spare1         | NUMBER         | Unused                                                                                                                                        |
| spare2         | NUMBER         | Unused                                                                                                                                        |

**Table 136-3 Columns in Table PLSQL\_PROFILER\_DATA**

| Column      | Datatype | Definition                                            |
|-------------|----------|-------------------------------------------------------|
| runid       | NUMBER   | Primary key, unique (generated) run identifier        |
| unit_number | NUMBER   | Primary key, internally generated library unit number |
| line#       | NUMBER   | Primary key, not null, line number in unit            |
| total_occur | NUMBER   | Number of times line was executed                     |
| total_time  | NUMBER   | Total time spent executing line in nanoseconds        |
| min_time    | NUMBER   | Minimum execution time for this line in nanoseconds   |
| max_time    | NUMBER   | Maximum execution time for this line in nanoseconds   |
| spare1      | NUMBER   | Unused                                                |
| spare2      | NUMBER   | Unused                                                |
| spare3      | NUMBER   | Unused                                                |
| spare4      | NUMBER   | Unused                                                |

With Oracle database version 8.x, a sample textual report writer (profrep.sql) is provided with the PL/SQL demo scripts.

Note that prior to Oracle Database 10g, the `DBMS_PROFILER` package was not automatically loaded when the database was created, and the Oracle-supplied `PROFLOAD.SQL` script was used to create it. In 10g and beyond, the `DBMS_PROFILER` package is loaded automatically when the database is created, and `PROFLOAD.SQL` is no longer needed.

## 136.2 DBMS\_PROFILER Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

### Note:

`DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

## 136.3 DBMS\_PROFILER Operational Notes

These notes describe a typical run, how to interpret output, and two methods of exception generation.

### Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a *run*. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

The user must first create database tables in the profiler user's schema to collect the data. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, *warm up* the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFTAB.SQL` script which:

- Creates the profiler tables and sequence
- Grants `SELECT/INSERT/UPDATE` on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

 **Note:**

Do not alter the actual fields of the tables.

A typical run then involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

 **Note:**

The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures. Flushing the collected data involves storing collected data in the database tables created earlier.

 **See Also:**

["FLUSH\\_DATA Function and Procedure"](#).

### Interpreting Output

The table `plsql_profiler_data` contains one row for each line of the source unit for which code was generated. The `line#` value specifies which source line. If the row exists, and the `total_occur` value in that row is  $> 0$ , some code associated with that line was executed. If the row exists, and `total_occur` value is 0, no code associated with that line was executed. If the row doesn't exist in the table, no code was generated for that line, and therefore it should not be mentioned in reports

If the source of a single statement is on a single line, any code generated for that statement will be attributed to that line number. (In some cases, such as a simple declaration, or because of optimization, no code will be needed). To get coverage information, units should be compiled with `PLSQL_OPTIMIZE_LEVEL=1`.

If a statement spans multiple lines, any code generated for that statement will be attributed to some line in the range, but it is not guaranteed that every line in the range will have code attributed to it. In such a case there will be gaps in the set of line# values. In particular, multi-line SQL-related statements may appear to be on a single line (usually the first). This is because PL/SQL passes the processed text of the cursor to the SQL engine; therefore, as far as PL/SQL is concerned, the entire SQL statement is a single indivisible operation.

When multiple statements are on the same line, the profiler will combine the occurrences for each statement. This may be confusing if a line has embedded control flow. For example, if 'then ...' and 'else ...' are on the same line, it will not be possible to determine whether the 'then' or the 'else' was taken.

In general, profiler and coverage reports are most easily interpreted if each statement is on its own line.

### Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

## 136.4 DBMS\_PROFILER Exceptions

DBMS\_PROFILER throws the exceptions described in this topic.

**Table 136-4 DBMS\_PROFILER Exceptions**

| Exception        | Description                                        |
|------------------|----------------------------------------------------|
| version_mismatch | Corresponds to error_version.                      |
| profiler_error   | Corresponds to either "error_param" or "error_io". |

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'  

```
error_param constant binary_integer := 1;
```
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'  

```
error_io    constant binary_integer := 2;
```
- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the DBMS\_PROFILER package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

```
error_version constant binary_integer := -1;
```

## 136.5 Summary of DBMS\_PROFILER Subprograms

This table lists the DBMS\_PROFILER subprograms and briefly describes them.

**Table 136-5 DBMS\_PROFILER Package Subprograms**

| Subprogram                                              | Description                                                                                              |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <a href="#">FLUSH_DATA Function and Procedure</a>       | Flushes profiler data collected in the user's session                                                    |
| <a href="#">GET_VERSION Procedure</a>                   | Gets the version of this API                                                                             |
| <a href="#">INTERNAL_VERSION_CHECK Function</a>         | Verifies that this version of the DBMS_PROFILER package can work with the implementation in the database |
| <a href="#">PAUSE_PROFILER Function and Procedure</a>   | Pauses profiler data collection                                                                          |
| <a href="#">RESUME_PROFILER Function and Procedure</a>  | Resumes profiler data collection                                                                         |
| <a href="#">START_PROFILER Functions and Procedures</a> | Starts profiler data collection in the user's session                                                    |
| <a href="#">STOP_PROFILER Function and Procedure</a>    | Stops profiler data collection in the user's session                                                     |

### 136.5.1 FLUSH\_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

**Note:**

Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

**Syntax**

```
DBMS_PROFILER.FLUSH_DATA
    RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

### 136.5.2 GET\_VERSION Procedure

This procedure gets the version of this API.

**Syntax**

```
DBMS_PROFILER.GET_VERSION (
    major OUT BINARY_INTEGER,
    minor OUT BINARY_INTEGER);
```

## Parameters

**Table 136-6 GET\_VERSION Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| major     | Major version of DBMS_PROFILER. |
| minor     | Minor version of DBMS_PROFILER. |

### 136.5.3 INTERNAL\_VERSION\_CHECK Function

This function verifies that this version of the DBMS\_PROFILER package can work with the implementation in the database.

#### Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
RETURN BINARY_INTEGER;
```

### 136.5.4 PAUSE\_PROFILER Function and Procedure

This function pauses profiler data collection.

#### Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.PAUSE_PROFILER;
```

### 136.5.5 RESUME\_PROFILER Function and Procedure

This function resumes profiler data collection.

#### Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.RESUME_PROFILER;
```

### 136.5.6 START\_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the START\_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

#### Syntax

```
DBMS_PROFILER.START_PROFILER(  
    run_comment    IN VARCHAR2 := sysdate,  
    run_comment1   IN VARCHAR2 := '',  
    run_number     OUT BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(  
    run_comment IN VARCHAR2 := sysdate,  
    run_comment1 IN VARCHAR2 := '')  
RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.START_PROFILER(  
    run_comment    IN VARCHAR2 := sysdate,  
    run_comment1   IN VARCHAR2 := '',  
    run_number     OUT BINARY_INTEGER);  
  
DBMS_PROFILER.START_PROFILER(  
    run_comment IN VARCHAR2 := sysdate,  
    run_comment1 IN VARCHAR2 := '');
```

## Parameters

**Table 136-7** START\_PROFILER Function Parameters

| Parameter    | Description                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| run_comment  | Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data. |
| run_number   | Stores the number of the run so you can store and later recall the run's data.                                                                                       |
| run_comment1 | Allows you to make interesting comments about the run.                                                                                                               |

## 136.5.7 STOP\_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

### Syntax

```
DBMS_PROFILER.STOP_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.STOP_PROFILER;
```

# DBMS\_PROPAGATION\_ADM

The `DBMS_PROPAGATION_ADM` package, one of a set of Oracle Replication packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_PROPAGATION\\_ADM Subprograms](#)

## 137.1 DBMS\_PROPAGATION\_ADM Overview

This package provides interfaces to start, stop, and configure a propagation.

## 137.2 DBMS\_PROPAGATION\_ADM Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_PROPAGATION_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

## 137.3 Summary of DBMS\_PROPAGATION\_ADM Subprograms

This table lists the `DBMS_PROPAGATION_ADM` subprograms and briefly describes them.

**Table 137-1 DBMS\_PROPAGATION\_ADM Package Subprograms**

| Subprogram                                   | Description                                                                                               |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_PROPAGATION Procedure</a>  | Adds, alters, or removes a rule set for a propagation                                                     |
| <a href="#">CREATE_PROPAGATION Procedure</a> | Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation |
| <a href="#">DROP_PROPAGATION Procedure</a>   | Drops a propagation                                                                                       |
| <a href="#">START_PROPAGATION Procedure</a>  | Starts a propagation                                                                                      |
| <a href="#">STOP_PROPAGATION Procedure</a>   | Stops a propagation                                                                                       |

**Note:**

All subprograms commit unless specified otherwise.

## 137.3.1 ALTER\_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION (
    propagation_name      IN  VARCHAR2,
    rule_set_name          IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set       IN  BOOLEAN   DEFAULT FALSE,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 137-2 ALTER\_PROPAGATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| propagation_name | The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| rule_set_name    | <p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p> |
| remove_rule_set  | <p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                      |

**Table 137-2 (Cont.) ALTER\_PROPAGATION Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <code>negative_rule_set_name</code>   | <p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p> |
| <code>remove_negative_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 137.3.2 CREATE\_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

### Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    source_queue           IN  VARCHAR2,
    destination_queue      IN  VARCHAR2,
    destination_dblink     IN  VARCHAR2  DEFAULT NULL,
    rule_set_name          IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    queue_to_queue         IN  BOOLEAN   DEFAULT NULL,
    original_propagation_name IN VARCHAR2  DEFAULT NULL,
    auto_merge_threshold   IN  NUMBER    DEFAULT NULL);
```

## Parameters

**Table 137-3 CREATE\_PROPAGATION Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>propagation_name</code>   | <p>The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner.</p> <p><b>Note:</b> The <code>propagation_name</code> setting cannot be altered after the propagation is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>source_queue</code>       | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>destination_queue</code>  | <p>The name of the destination queue, specified as <code>[schema_name.]queue_name</code>.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>destination_dblink</code> | <p>The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue.</p> <p>If NULL, then the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>rule_set_name</code>      | <p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify NULL, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify NULL, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> |

**Table 137-3 (Cont.) CREATE\_PROPAGATION Procedure Parameters**

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>negative_rule_set_name</code>    | <p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p> |
| <code>queue_to_queue</code>            | <p>If <code>TRUE</code> or <code>NULL</code>, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>original_propagation_name</code> | <p>Specify the original propagation name if the propagation being created is part of a split and merge operation. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream.</p> <p>Specify <code>NULL</code> if the propagation being created is not part of a split and merge operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>auto_merge_theshold</code>       | <p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The propagation being created is part of a split and merge operation.</li> <li>• The stream will be merged back to the original stream automatically.</li> </ul> <p>Specify <code>NULL</code> if either of the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The propagation being created is not part of a split and merge operation.</li> <li>• The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

**See Also:**

[DBMS\\_RULE\\_ADM](#)

## 137.3.3 DROP\_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

### Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 137-4 DROP\_PROPAGATION Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| propagation_name      | The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| drop_unused_rule_sets | <p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Replication client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.</p> |

### Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

The following are the data dictionary views for Oracle Replication rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES

- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES

 **Note:**

When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

## 137.3.4 START\_PROPAGATION Procedure

This procedure starts a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
    propagation_name IN VARCHAR2);
```

### Parameter

**Table 137-5 START\_PROPAGATION Procedure Parameter**

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| propagation_name | The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner. |

### Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

## 137.3.5 STOP\_PROPAGATION Procedure

This procedure stops a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
    propagation_name IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE);
```

### Parameter

**Table 137-6 STOP\_PROPAGATION Procedure Parameter**

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| propagation_name | The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner. |

**Table 137-6 (Cont.) STOP\_PROPAGATION Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force     | If TRUE, then the procedure stops the propagation and clears the statistics for the propagation.<br>If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation. |

**Usage Notes**

The propagation status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the propagation is not started upon database instance startup.

# DBMS\_QOPATCH

The `DBMS_QOPATCH` package provides an interface to view the installed database patches.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Error Messages](#)
- [Summary of DBMS\\_QOPATCH Subprograms](#)

## 138.1 DBMS\_QOPATCH Overview

The `DBMS_QOPATCH` package provides a PLSQL/SQL interface to view the installed database patches. The interface provides all the patch information available as part of the `OPATCH` `LSINVENTORY -XML` command. The package accesses the OUI patch inventory in real time to provide patch and meta-information.

## 138.2 DBMS\_QOPATCH Security Model

The `DBMS_QOPATCH` package is created as part of SYS schema and SYS is the only user who can execute these subprograms.

## 138.3 DBMS\_QOPATCH Operational Notes

The following operational notes apply to `DBMS_QOPATCH`.

- The package will work only if the database is `OPEN`.
- In an Oracle Real Application Clusters (RAC) environment, if the subprogram requires to fetch data from other RAC nodes it spawns a job in the other node(s) to get the data. In this case `JOB_QUEUE_PROCESSES` needs to be `>0` for the package to fetch the data from other RAC nodes.
- If there is a delay in the job execution, the package returns `ORA-20008` error.

## 138.4 DBMS\_QOPATCH Exceptions

This table lists the exceptions raised by the `DBMS_QOPATCH` package.

**Table 138-1 DBMS\_QOPATCH Error Messages**

| Error Code | Description                                    |
|------------|------------------------------------------------|
| ORA-20001  | Latest XML inventory is not loaded into table. |

**Table 138-1 (Cont.) DBMS\_QOPATCH Error Messages**

| Error Code | Description                                                             |
|------------|-------------------------------------------------------------------------|
| ORA-20002  | Directory creation failed.                                              |
| ORA-20003  | Configuration of a job on a node failed.                                |
| ORA-20004  | Job configuration failed as node is inactive.                           |
| ORA-20005  | Job is not configured with given node, instance name.                   |
| ORA-20006  | Number of RAC active instances and opatch jobs configured are not same. |
| ORA-20007  | Job configuration failed as node or instance is not active.             |
| ORA-20008  | Timed out - job execution time is more than 120Secs.                    |
| ORA-20009  | Job execution failed.                                                   |
| ORA-20010  | Node is inactive and job cannot be executed.                            |
| ORA-20011  | Job name is NULL and inventory cannot be loaded.                        |
| ORA-20012  | JOB_QUEUE_PROCESSES is set to zero and the inventory cannot be loaded.  |
| ORA-20013  | DBMS_QOPATCH ran mostly in non-install area.                            |
| ORA-20014  | Database is not opened.                                                 |
| ORA-20015  | Database opened as read-only.                                           |

## 138.5 Summary of DBMS\_QOPATCH Subprograms

This table lists and briefly describes the DBMS\_QOPATCH package subprograms.

**Table 138-2 DBMS\_QOPATCH Package Subprograms**

| Subprogram                                       | Description                                                                                                                                                               |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CHECK_PATCH_INSTALLED Function</a>   | Checks if a patch is installed.                                                                                                                                           |
| <a href="#">GET_OPATCH_BUGS Function</a>         | Provides a bugs list for a patch in XML format if the patch number is given. If patch is not given then it lists all the bugs installed in all the patches in XML format. |
| <a href="#">GET_OPATCH_COUNT Function</a>        | Provides the total number of installed patches in XML format                                                                                                              |
| <a href="#">GET_OPATCH_DATA Function</a>         | Provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element                                                             |
| <a href="#">GET_OPATCH_FILES Function</a>        | Provides the list of files modified in the given patch number in XML format                                                                                               |
| <a href="#">GET_OPATCH_INSTALL_INFO Function</a> | Returns the XML element containing the ORACLE_HOME details such as patch and inventory location                                                                           |
| <a href="#">GET_OPATCH_LIST Function</a>         | Provides list of patches installed as an XML element from the XML inventory                                                                                               |
| <a href="#">GET_OPATCH_LSinVENTORY</a>           | Returns whole opatch inventory as XML instance document.                                                                                                                  |
| <a href="#">GET_OPATCH_OLAYS Function</a>        | Provides overlay patches for a given patch as XML element                                                                                                                 |

**Table 138-2 (Cont.) DBMS\_QOPATCH Package Subprograms**

| Subprogram                                       | Description                                                                                                                                                         |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_OPATCH_PREQS Function</a>        | Provides prerequisite patches for a given patch as XML element                                                                                                      |
| <a href="#">GET_OPATCH_XSLT</a>                  | Returns the style-sheet for the opatch XML inventory presentation                                                                                                   |
| <a href="#">GET_PATCH_DETAILS Function</a>       | Displays the detailed patch information from <code>opatch lsinventory</code> .                                                                                      |
| <a href="#">GET_SQLPATCH_STATUS Procedure</a>    | Displays the SQL patch status by querying from SQL patch registry to produce complete patch level information                                                       |
| <a href="#">IS_PATCH_INSTALLED Function</a>      | Provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory                |
| <a href="#">OPATCH_COMPARE_CURR ENT Function</a> | Compares the current database with a list of bugs.                                                                                                                  |
| <a href="#">OPATCH_COMPARE_NODE S Function</a>   | Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not. |
| <a href="#">SET_CURRENT_OPINST Procedure</a>     | Sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment                                |

## 138.5.1 CHECK\_PATCH\_INSTALLED Function

Checks if the patch is installed.

### Syntax

```
DBMS_QOPATCH.CHECK_PATCH_INSTALLED (  
    bugs      IN QOPATCH_LIST);  
RETURN VARCHAR2;
```

### Parameters

**Table 138-3 CHECK\_PATCH\_INSTALLED Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| bugs      | List of patches to be checked. |

## 138.5.2 GET\_OPATCH\_BUGS Function

This function provides a bugs list in a patch if the patch number is given. If a patch number is not given, it lists all the bugs in the specified XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_BUGS (  
    patchnum IN VARCHAR2 DEFAULT NULL);  
RETURN XMLTYPE;
```

## Parameters

**Table 138-4** GET\_OPATCH\_BUGS Function Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.3 GET\_OPATCH\_COUNT Function

This function provides the total number of installed patches in XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_COUNT (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 138-5** GET\_OPATCH\_COUNT Function Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.4 GET\_OPATCH\_DATA Function

This function provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_DATA (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 138-6** GET\_OPATCH\_DATA Function Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.5 GET\_OPATCH\_FILES Function

This function provides the list of files modified in the given patch number in XML format.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_FILES (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 138-7 GET\_OPATCH\_FILES Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.6 GET\_OPATCH\_INSTALL\_INFO Function

This function returns the XML element containing the `ORACLE_HOME` details such as patch and inventory location.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_INSTALL_INFO  
RETURN XMLTYPE;
```

## 138.5.7 GET\_OPATCH\_LIST Function

This function provides list of patches installed as an XML element from the XML inventory.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_LIST  
RETURN XMLTYPE;
```

## 138.5.8 GET\_OPATCH\_LSinVENTORY

This function returns whole opatch inventory as XML instance document.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_LSinVENTORY  
RETURN XMLTYPE;
```

## 138.5.9 GET\_OPATCH\_OLAYS Function

This function provides overlay patches for a given patch as XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_OLAYS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

## Parameters

**Table 138-8 GET\_OPATCH\_OLAYS Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.10 GET\_OPATCH\_PREQS Function

This function provides prerequisite patches for a given patch as XML element.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_PREQS (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

### Parameters

**Table 138-9** GET\_OPATCH\_PREQS Function Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.11 GET\_OPATCH\_XSLT

This function returns the style-sheet for the opatch XML inventory presentation. You can use the return type of this subprogram to perform XMLTRANSFORM and the transformed result has the same appearance as opatch text output.

### Syntax

```
DBMS_QOPATCH.GET_OPATCH_XSLT  
RETURN XMLTYPE;
```

## 138.5.12 GET\_PATCH\_DETAILS Function

Displays the detailed patch information from `opatch lsinventory`.

### Syntax

```
DBMS_QOPATCH.GET_PATCH_DETAILS (  
    patch    IN VARCHAR2);  
RETURN XMLTYPE;
```

### Parameters

**Table 138-10** GET\_PATCH\_DETAILS Function Parameters

| Parameter | Description       |
|-----------|-------------------|
| patch     | The patch number. |

## 138.5.13 GET\_SQLPATCH\_STATUS Procedure

This procedure displays the SQL patch status by querying from SQL patch registry to produce complete patch level information. If the patch number is given, it displays the information specific to the given SQL patch, otherwise information for all SQL patches.

### Syntax

```
DBMS_QOPATCH.GET_SQLPATCH_STATUS (  
    patchnum IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 138-11** GET\_SQLPATCH\_STATUS Procedure Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.14 IS\_PATCH\_INSTALLED Function

This function provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory.

### Syntax

```
DBMS_QOPATCH.IS_PATCH_INSTALLED (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

### Parameters

**Table 138-12** IS\_PATCH\_INSTALLED Function Parameters

| Parameter | Description  |
|-----------|--------------|
| patchnum  | Patch number |

## 138.5.15 OPATCH\_COMPARE\_CURRENT Function

Compares the current database with a list of bugs.

### Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_CURRENT Function (  
    bugs IN QOPATCH_LIST);  
RETURN VARCHAR2;
```

### Parameters

**Table 138-13** OPATCH\_COMPARE\_CURRENT Function Parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| bugs      | List of bugs to compare with the current database. |

## 138.5.16 OPATCH\_COMPARE\_NODES Function

Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.

### Syntax

```
DBMS_QOPATCH.OPATCH_COMPARE_NODES (  
    node      IN VARCHAR2 DEFAULT NULL,  
    inst      IN VARCHAR2 DEFAULT NULL);  
RETURN VARCHAR2;
```

### Parameters

**Table 138-14** OPATCH\_COMPARE\_NODES Function Parameters

| Parameter | Description   |
|-----------|---------------|
| node      | Node name     |
| inst      | Instance name |

## 138.5.17 SET\_CURRENT\_OPINST Procedure

This procedure sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment.

### Syntax

```
DBMS_QOPATCH.SET_CURRENT_OPINST (  
    node_name  IN VARCHAR2 DEFAULT NULL,  
    inst_name  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 138-15** SET\_CURRENT\_OPINST Procedure Parameters

| Parameter | Description      |
|-----------|------------------|
| node_name | Name of node     |
| inst_name | Name of instance |

# DBMS\_RANDOM

The `DBMS_RANDOM` package provides a built-in random number generator. `DBMS_RANDOM` is not intended for cryptography.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_RANDOM Subprograms](#)

## 139.1 DBMS\_RANDOM Deprecated Subprograms

These subprograms are deprecated with Oracle Database 11g. Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [INITIALIZE Procedure](#)
- [RANDOM Function](#)
- [TERMINATE Procedure](#)

## 139.2 DBMS\_RANDOM Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given `EXECUTE` privilege explicitly and should not rely on `PUBLIC EXECUTE` privilege.

## 139.3 DBMS\_RANDOM Operational Notes

These operational notes apply to `DBMS_RANDOM`.

- `DBMS_RANDOM.RANDOM` produces integers in  $[-2^{31}, 2^{31})$ .
- `DBMS_RANDOM.VALUE` produces numbers in  $[0,1)$  with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

## 139.4 Summary of DBMS\_RANDOM Subprograms

This table lists the DBMS\_RANDOM subprograms and briefly describes them.

**Table 139-1** DBMS\_RANDOM Package Subprograms

| Subprogram                           | Description                                                                                                                                                                                                                                                                          |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">INITIALIZE Procedure</a> | Initializes the package with a seed value                                                                                                                                                                                                                                            |
| <a href="#">NORMAL Function</a>      | Returns random numbers in a normal distribution                                                                                                                                                                                                                                      |
| <a href="#">RANDOM Function</a>      | Generates a random number                                                                                                                                                                                                                                                            |
| <a href="#">SEED Procedures</a>      | Resets the seed                                                                                                                                                                                                                                                                      |
| <a href="#">STRING Function</a>      | Gets a random string                                                                                                                                                                                                                                                                 |
| <a href="#">TERMINATE Procedure</a>  | Terminates package                                                                                                                                                                                                                                                                   |
| <a href="#">VALUE Functions</a>      | Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to <code>low</code> and less than <code>high</code> |

### 139.4.1 INITIALIZE Procedure

This deprecated procedure initializes the generator.

**Note:**

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

#### Syntax

```
DBMS_RANDOM.INITIALIZE (  
    val IN BINARY_INTEGER);
```

#### Pragmas

```
PRAGMA restrict_references (initialize, WNDS);
```

#### Parameters

**Table 139-2** INITIALIZE Procedure Parameters

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| <code>val</code> | Seed number used to generate a random number |

#### Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#).

## 139.4.2 NORMAL Function

This function returns random numbers in a standard normal distribution.

### Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

### Pragmas

```
PRAGMA restrict_references (normal, WNDS);
```

### Return Values

**Table 139-3** NORMAL Function Parameters

| Parameter | Description             |
|-----------|-------------------------|
| number    | Returns a random number |

## 139.4.3 RANDOM Function

This deprecated procedure generates a random number.

### Note:

This function is deprecated with Release 11gR1 and, although currently supported, it should not be used.

### Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

### Pragmas

```
PRAGMA restrict_references (random, WNDS);
```

### Return Values

**Table 139-4** RANDOM Function Parameters

| Parameter      | Description                                                                         |
|----------------|-------------------------------------------------------------------------------------|
| binary_integer | Returns a random integer greater or equal to -power(2,31) and less than power(2,31) |

## 139.4.4 SEED Procedures

This procedure resets the seed.

### Syntax

```
DBMS_RANDOM.SEED (  
    val IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (  
    val IN VARCHAR2);
```

### Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

### Parameters

**Table 139-5 SEED Procedure Parameters**

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| val       | Seed number or string used to generate a random number |

### Usage Notes

The seed can be a string up to length 2000.

## 139.4.5 STRING Function

This function gets a random string.

### Syntax

```
DBMS_RANDOM.STRING  
    opt IN CHAR,  
    len IN NUMBER)  
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA restrict_references (string, WNDS);
```

### Parameters

**Table 139-6 STRING Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| opt       | <p>Specifies what the returning string looks like:</p> <ul style="list-style-type: none"><li>• 'u', 'U' - returning string in uppercase alpha characters</li><li>• 'l', 'L' - returning string in lowercase alpha characters</li><li>• 'a', 'A' - returning string in mixed case alpha characters</li><li>• 'x', 'X' - returning string in uppercase alpha-numeric characters</li><li>• 'p', 'P' - returning string in any printable characters.</li></ul> <p>Otherwise the returning string is in uppercase alpha characters.</p> |

**Table 139-6 (Cont.) STRING Function Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| len       | Length of the returning string |

**Return Values****Table 139-7 STRING Function Return Values**

| Parameter | Description        |
|-----------|--------------------|
| VARCHAR2  | Returns a VARCHAR2 |

## 139.4.6 TERMINATE Procedure

When you are finished with the package, call the `TERMINATE` procedure.

**Note:**

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

**Syntax**

```
DBMS_RANDOM.TERMINATE;
```

## 139.4.7 VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number `x`, where `x` is greater than or equal to `low` and less than `high`.

**Syntax**

```
DBMS_RANDOM.VALUE  
RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE (  
    low IN NUMBER,  
    high IN NUMBER)  
RETURN NUMBER;
```

**Parameters****Table 139-8 VALUE Function Parameters**

| Parameter | Description                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------|
| low       | Lowest number in a range from which to generate a random number. The number generated may be equal to <code>low</code> |

**Table 139-8 (Cont.) VALUE Function Parameters**

| Parameter | Description                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------|
| high      | Highest number below which to generate a random number. The number generated will be less than <code>high</code> |

**Return Values**

**Table 139-9 VALUE Function Return Values**

| Parameter | Description              |
|-----------|--------------------------|
| NUMBER    | Returns an Oracle Number |

# DBMS\_REDACT

The `DBMS_REDACT` package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Summary of DBMS\\_REDACT Subprograms](#)

## See Also:

- *Oracle Database Advanced Security Guide* regarding using Data Redaction to protect sensitive data

## 140.1 DBMS\_REDACT Overview

Data redaction provides a way to define masking policies for an application. Oracle Data Redaction provides functionality to mask (redact) data that is returned from user `SELECT` queries in an application. The masking takes place in real time. The Data Redaction policy applies to the querying user, depending on this user's `SYS_CONTEXT` or `XS_SYS_CONTEXT` values. This redaction process does not require that the queried data be static or unchanging, or for the entire data set to be redacted at one time in an off-line manner. Oracle Database redacts only the data for the rows specified by the user's query, not the data for the entire column. The redaction takes place immediately before the data is returned to the querying user or application.

## 140.2 DBMS\_REDACT Security Model

If the querying user has the `EXEMPT REDACTION POLICY` system privilege, redaction will not be performed. If the user does not have the `EXEMPT REDACTION POLICY` system privilege, the policy expression will be evaluated in the current user's environment. If the policy expression evaluates to `TRUE`, then redaction will be performed, otherwise no redaction will be performed.

You need the `EXECUTE` privilege on the `DBMS_REDACT` package in order to execute its subprograms. Procedures in the interface are executed with privileges of the current user.

## 140.3 DBMS\_REDACT Constants

The `DBMS_REDACT` package defines several constants for specifying parameter values.

**Table 140-1 Values for function\_type Parameter of DBMS\_REDACT.ADD\_POLICY**

| Constant     | Value | Type           | Description                                                                                                                                                                                                    |
|--------------|-------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NONE         | 0     | BINARY_INTEGER | No redaction                                                                                                                                                                                                   |
| FULL         | 1     | BINARY_INTEGER | Redact to fixed values                                                                                                                                                                                         |
| NULLIFY      | 6     | BINARY_INTEGER | Returns a null value as a redacted value                                                                                                                                                                       |
| PARTIAL      | 2     | BINARY_INTEGER | Partial redaction, redact a portion of the column data                                                                                                                                                         |
| RANDOM       | 4     | BINARY_INTEGER | Random redaction, each query results in a different random value                                                                                                                                               |
| REGEXP       | 5     | BINARY_INTEGER | Regular expression based redaction                                                                                                                                                                             |
| REGEXP_WIDTH | 7     | BINARY_INTEGER | Regular expression based redaction that preserves the width of a column that uses a regular expression; designed for applications use the OCI_ATTR_CHAR_SIZE attribute of the Oracle OLE DB Provider interface |

**Table 140-2 Values for action Parameter of DBMS\_REDACT.ALTER\_POLICY**

| Constant               | Value | Type           | Description                                                                                                                                 |
|------------------------|-------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| ADD_COLUMN             | 1     | BINARY_INTEGER | Add a column to the redaction policy                                                                                                        |
| DROP_COLUMN            | 2     | BINARY_INTEGER | Drop a column from the redaction policy                                                                                                     |
| MODIFY_EXPRESSION      | 3     | BINARY_INTEGER | Modify the expression of a redaction policy (the expression evaluates to a BOOLEAN value: if TRUE then redaction is applied, otherwise not) |
| MODIFY_COLUMN          | 4     | BINARY_INTEGER | Modify a column in the redaction policy to change the redaction function_type or the function_parameters                                    |
| SET_POLICY_DESCRIPTION | 5     | BINARY_INTEGER | Set a description for the redaction policy                                                                                                  |
| SET_COLUMN_DESCRIPTION | 6     | BINARY_INTEGER | Set a description for the redaction performed on the column                                                                                 |

## 140.4 DBMS\_REDACT Operating Procedures

The following table presents the relationship between the type of redaction function and its parameters, based on the datatype of the column being redacted. Examples of the various format strings are provided, showing how to perform some commonplace redaction for a string datatype (in this case, a Social Security Number (SSN)), a DATE datatype, and various examples of redaction for the number datatype.

**Table 140-3 Data Redaction Function Types**

| function_type                                        | function_parameters                                                                                                                                                                                                                                                                                                                                                                       | Examples                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_REDACT.NONE                                     | -                                                                                                                                                                                                                                                                                                                                                                                         | -                                                                                                                                                                                                                                                                                                                                                               |
| DBMS_REDACT.FULL                                     | -                                                                                                                                                                                                                                                                                                                                                                                         | -                                                                                                                                                                                                                                                                                                                                                               |
| DBMS_REDACT.PARTIAL (for character types)            | <p>A comma-separated list, containing the following five fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> <li>REDACT_PARTIAL_INPUT_FORMAT</li> <li>REDACT_PARTIAL_OUTPUT_FORMAT</li> <li>REDACT_PARTIAL_MASKCHAR</li> <li>REDACT_PARTIAL_MASKFROM</li> <li>REDACT_PARTIAL_MASKTO</li> </ul> <p>See <a href="#">Table 140-4</a>.</p> | <p>'VVVFVVVFVVVV, VVV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN strings like 123-45-6789, adding dashes back to format it, resulting in strings like XXX-XX-6789</p> <p>'VVVFVVVFVVVV, VVV VVVVVV, X, 1, 5' for masking the first 5 digits of SSN strings like 123-45-6789, adding spaces to format it, resulting in strings like XXX XX 6789</p> |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_INPUT_FORMAT - the input format: V for value to be possibly redacted, F for formatting character to be ignored                                                                                                                                                                                                                                                             | The REDACT_PARTIAL_INPUT_FORMAT field value VVFVFVVVFVVVV for matching SSN strings like 123-45-6789                                                                                                                                                                                                                                                             |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_OUTPUT_FORMAT - the output format: V for output of redaction. Any other character will be treated as a formatting character and output literally.                                                                                                                                                                                                                          | The REDACT_PARTIAL_OUTPUT_FORMAT field value VVV-VV-VVVV can be used to redact SSN strings into XXX-XX-6789 (X comes from REDACT_PARTIAL_MASKCHAR field).                                                                                                                                                                                                       |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKCHAR - the character used to redact the input                                                                                                                                                                                                                                                                                                                          | The value X for redacting SSN strings into XXX-XX-6789.                                                                                                                                                                                                                                                                                                         |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKFROM - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT from which to start the redaction (see explanation following the next entry, REDACT_PARTIAL_MASKTO)                                                                                                                                                                                                    | The value 1 for redacting SSN strings starting at the first V of REDACT_PARTIAL_INPUT_FORMAT of VVFVFVVVFVVVV into strings like XXX-XX-6789                                                                                                                                                                                                                     |
| DBMS_REDACT.PARTIAL (for character types), continued | REDACT_PARTIAL_MASKTO - specifies which V within the REDACT_PARTIAL_INPUT_FORMAT at which to end the redaction                                                                                                                                                                                                                                                                            | The value 5 for redacting SSN strings up to and including the fifth V within REDACT_PARTIAL_INPUT_FORMAT of VVFVFVVVFVVVV into strings like XXX-XX-6789. Note how the format character '-' (corresponding to the first F within REDACT_PARTIAL_INPUT_FORMAT) is ignored as far as redaction is concerned, so the value here is 5 as opposed to 6.               |

**Table 140-3 (Cont.) Data Redaction Function Types**

| function_type                                        | function_parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Examples                                                                                                                            |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_REDACT.PARTIAL (for character types), continued | <p>The REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO field values are specified as counts of the number of V characters in the REDACT_PARTIAL_INPUT_FORMAT field, up to and including the intended position, starting from the leftmost V. This way, REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO are independent of the specific formatting of the data. For example, in the common use case of masking an SSN to show only the last four digits, data like 123456789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVVVVVVV) and data like 123-45-6789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVFVVVFVVV), would both use REDACT_PARTIAL_MASKFROM of 1 and REDACT_PARTIAL_MASKTO of 5.</p> | -                                                                                                                                   |
| DBMS_REDACT.PARTIAL (for number types)               | <p>A comma-separated list, containing the following three fields (with no spaces after the commas delimiting the fields):</p> <ul style="list-style-type: none"> <li>REDACT_PARTIAL_MASKCHAR</li> <li>REDACT_PARTIAL_MASKFROM</li> <li>REDACT_PARTIAL_MASKTO</li> </ul> <p>See <a href="#">Table 140-4</a>.</p>                                                                                                                                                                                                                                                                                                                                                                              | '9,1,5' for redacting the first 5 digits of an SSN number 123456789 into 999996789; or '0,1,2' for redacting a number 1.23 to 0.03. |
| DBMS_REDACT.PARTIAL (for number types), continued    | <p>REDACT_PARTIAL_MASKCHAR - the character used to redact the input, in the range between 0 and 9</p> <p>REDACT_PARTIAL_MASKFROM - the position, starting from 1, from which to start the redaction. The position does not include the decimal point if it is present.</p> <p>REDACT_PARTIAL_MASKTO - the position at which to end the redaction</p>                                                                                                                                                                                                                                                                                                                                         | -                                                                                                                                   |

**Table 140-3 (Cont.) Data Redaction Function Types**

| function_type                                           | function_parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Examples                                                            |

## 140.5 Summary of DBMS\_REDACT Subprograms

This table lists and briefly describes the DBMS\_REDACT package subprograms.

**Table 140-5 DBMS\_REDACT Package Subprograms**

| Subprogram                                             | Description                                                                          |
|--------------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">ADD_POLICY Procedure</a>                   | Defines a Data Redaction policy for a table or view                                  |
| <a href="#">ALTER_POLICY Procedure</a>                 | Alters a Data Redaction policy for a table or view                                   |
| <a href="#">APPLY_POLICY_EXPR_TO_COL Procedure</a>     | Applies a Data Redaction policy expression to a redacted column                      |
| <a href="#">CREATE_POLICY_EXPRESSION Procedure</a>     | Creates a Data Redaction policy expression                                           |
| <a href="#">DISABLE_POLICY Procedure</a>               | Disables a Data Redaction policy                                                     |
| <a href="#">DROP_POLICY Procedure</a>                  | Drops a Data Redaction policy                                                        |
| <a href="#">DROP_POLICY_EXPRESSION Procedure</a>       | Drops a Data Redaction policy expression                                             |
| <a href="#">ENABLE_POLICY Procedure</a>                | Enables a Data Redaction policy                                                      |
| <a href="#">UPDATE_FULL_REDACTION_VALUES Procedure</a> | Modifies the default displayed values for a Data Redaction policy for full redaction |
| <a href="#">UPDATE_POLICY_EXPRESSION Procedure</a>     | Updates a Data Redaction policy expression                                           |

### 140.5.1 ADD\_POLICY Procedure

This procedure defines a Data Redaction policy for a table or view.

#### Syntax

```

DBMS_REDACT.ADD_POLICY (
    object_schema          IN    VARCHAR2 := NULL,
    object_name            IN    VARCHAR2,
    policy_name            IN    VARCHAR2,
    column_name            IN    VARCHAR2 := NULL,
    function_type          IN    BINARY_INTEGER := DBMS_REDACT.FULL,
    function_parameters     IN    VARCHAR2 := NULL,
```

```

expression          IN    VARCHAR2,
enable              IN    BOOLEAN := TRUE,
regexp_pattern      IN    VARCHAR2 := NULL,
regexp_replace_string IN  VARCHAR2 := NULL,
regexp_position     IN    BINARY_INTEGER := 1,
regexp_occurrence   IN    BINARY_INTEGER := 0,
regexp_match_parameter IN  VARCHAR2 := NULL,
policy_description  IN    VARCHAR2 := NULL,
column_description  IN    VARCHAR2 := NULL);

```

## Parameters

**Table 140-6** *ADD\_POLICY Procedure Parameters*

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema owning the table, current user if NULL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| object_name   | Name of table or view to which to add a Data Redaction policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| policy_name   | Name of policy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| column_name   | [Optional] Name of one column to which the redaction policy applies.<br>If you must redact more than one column, use the <a href="#">ALTER_POLICY Procedure</a> to add the additional columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| function_type | Type of redaction function to use. Possible values are: <ul style="list-style-type: none"> <li>- DBMS_REDACT.NONE</li> <li>- DBMS_REDACT.FULL (default)</li> <li>- DBMS_REDACT.NULLIFY</li> <li>- DBMS_REDACT.PARTIAL</li> <li>- DBMS_REDACT.RANDOM</li> <li>- DBMS_REDACT.REGEXP</li> <li>- DBMS_REDACT.REGEXP_WIDTH</li> </ul> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <p>See <a href="#">Table 140-1</a> for an overview of the meanings of these values, and for some examples of their use.</p> |

**Table 140-6 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| function_parameters | <p>Parameters to the redaction function. The possible values depend on the value of the function_type provided.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</p> <ul style="list-style-type: none"> <li>- DBMS_REDACT.NONE: Can be omitted entirely and defaults to NULL</li> <li>- DBMS_REDACT.FULL: Can be omitted entirely and defaults to NULL</li> <li>- Masking parameters for partial character masking. For character datatypes, a comma-separated list containing these fields: <ul style="list-style-type: none"> <li>• Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored</li> <li>• Output format: 'V' for output of masking, any other characters will be treated as formatting characters.</li> <li>• Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.</li> <li>• Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.</li> <li>• Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVVFVVVV,VVV-VV-VVVV,X,1,5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789.</li> </ul> </li> </ul> <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> <li>• Mask character: this is a character between '0' to '9' that will be used to replace the actual values.</li> <li>• Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.</li> <li>• Ending digit position: this specifies the ending digit position to end masking. An example is '9,1,5' for masking the first 5 digits of a Social Security number 123456789, resulting in 999996789.</li> </ul> <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p> <ul style="list-style-type: none"> <li>• Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</li> <li>• Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</li> </ul> |

**Table 140-6 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <ul style="list-style-type: none"> <li>Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</li> <li>Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</li> <li>Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</li> <li>Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</li> </ul> <p>An example is 'm12d1y2001h1m1s1', which changes 02-May-13 12:30:23 to 01-Dec-01 01:01:01.</p> <p>For partial character and number-masking shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p>                                                                                                                                                                                                                                                                                                                 |
| expression | <p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>See</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> <li>SYS_CONTEXT</li> <li>XS_SYS_CONTEXT</li> <li>SUBSTR functions (includes SUBSTRB, SUBSTRC, SUBSTR2, SUBSTR4)</li> <li>LENGTH functions (includes LENGTHB, LENGTHC, LENGTH2, LENGTH4)</li> <li>V (APEX_UTIL.GET_SESSION_STATE)</li> <li>NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE)</li> <li>OLS_LABEL_DOMINATES</li> <li>DOMINATES</li> <li>OLS_DOMINATES</li> <li>OLS_DOM</li> <li>DOM</li> <li>OLS_STRICTLY_DOMINATES</li> <li>STRICTLY_DOMINATES</li> <li>S_DOM</li> <li>SA_UTL.DOMINATES</li> <li>SA_UTL.CHECK_READ</li> <li>SA_UTL.NUMERIC_LABEL</li> <li>CHAR_TO_LABEL</li> <li>SA_SESSION.LABEL</li> </ul> <p>See <i>Oracle Database Advanced Security Guide</i> for more information about these supported functions</p> |
| enable     | <p>Boolean value that determines whether the Data Redaction policy is enabled on creation.</p> <p>The default value is TRUE, which means that the policy is automatically enabled upon creation. If the enable parameter is set to FALSE, the policy takes effect only when it is subsequently enabled by calling the DBMS_REDACT.ENABLE_POLICY procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 140-6 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| regexp_pattern         | Regular expression pattern up to 512 bytes.<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> . Also, do not specify the <code>function_parameters</code> parameter when <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code> .<br>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns. |
| regexp_replace_string  | Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form <code>\n</code> , where <code>n</code> is a number between 1 and 9.<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> .                                                                                                                             |
| regexp_position        | Integer counting from 1, specifies the position where the search must begin.<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> .                                                                                                                                                                                                                                      |
| regexp_occurrence      | <ul style="list-style-type: none"> <li>Use 0 to replace all occurrences of the match</li> <li>Use positive integer <code>n</code> to replace the <code>n</code>-th occurrence of the match.</li> </ul> Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> .                                                                                                               |
| regexp_match_parameter | Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x'.<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code> .<br>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters.                                                                         |
| policy_description     | Description of redaction policy                                                                                                                                                                                                                                                                                                                                                                                |
| column_description     | Description of the column being redacted                                                                                                                                                                                                                                                                                                                                                                       |

**Exceptions**

- ORA-28060 - A Data Redaction policy already exists on this column.
- ORA-28061 - This object cannot have a Data Redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column `column`
- ORA-28069 - A Data Redaction policy already exists on this object.
- ORA-28073 - The column `column_name` has an unsupported datatype.
- ORA-28074 - The field `field_name` of the masking parameters is not valid

The field can be any of the following:

- `REDACT_PARTIAL_INPUT_FORMAT`
- `REDACT_PARTIAL_OUTPUT_FORMAT`
- `REDACT_PARTIAL_MASKCHAR`

- REDACT\_PARTIAL\_MASKFROM
- REDACT\_PARTIAL\_MASKTO
- REDACT\_PARTIAL\_DATE\_MONTH
- REDACT\_PARTIAL\_DATE\_DAY
- REDACT\_PARTIAL\_DATE\_YEAR
- REDACT\_PARTIAL\_DATE\_HOUR
- REDACT\_PARTIAL\_DATE\_MINUTE
- REDACT\_PARTIAL\_DATE\_SECOND

See [Table 140-3](#) and [Table 140-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions
- ORA-28076 - An attribute was not specified for SYS\_SESSION\_ROLES
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length
- ORA-28078 - A regular expression parameter is missing or invalid
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are `function_parameters`, `column_description`, `policy_name` and `policy_description`)
- ORA-28085 - The input and output lengths of the redaction do not match.

## Usage Notes

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the `expression` parameter. To find redacted columns that are affected by named policy expressions, query the `REDACTION_EXPRESSIONS` data dictionary view.

## Example

Partial redaction policy:

```
BEGIN
  DBMS_REDACT.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employees',
    column_name   => 'employee_id',
    policy_name   => 'mask_emp_id_nums',
    function_type  => DBMS_REDACT.PARTIAL,
    function_parameters => '7,1,5',
    expression    => '1=1');
END;
```

Full redaction policy:

```
BEGIN
  DBMS_REDACT.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employees',
    column_name   => 'employee_id',
    policy_name   => 'mask_emp_ids',
    function_type  => DBMS_REDACT.FULL,
    expression    => 'SYS_CONTEXT(''SYS_SESSION_ROLES'', ''CLERK'')
```

```
END;  
= 'FALSE');
```

## 140.5.2 ALTER\_POLICY Procedure

This procedure alters an existing Data Redaction policy for a table or view.

It alters a the policy in one or more of the following ways:

- By changing the policy expression
- By changing the type of redaction for a specified column
- By changing the parameters to the redaction function for a specified column
- By adding a column to the redaction policy (the redaction type and any parameters must be specified).
- By removing a column from the redaction policy

### Syntax

```
DBMS_REDACT.ALTER_POLICY (  
  object_schema          IN    VARCHAR2 := NULL,  
  object_name            IN    VARCHAR2,  
  policy_name            IN    VARCHAR2,  
  action                 IN    BINARY_INTEGER := DBMS_REDACT.ADD_COLUMN,  
  column_name            IN    VARCHAR2 := NULL,  
  function_type          IN    BINARY_INTEGER := DBMS_REDACT.FULL,  
  function_parameters     IN    VARCHAR2 := NULL,  
  expression             IN    VARCHAR2,  
  regexp_pattern         IN    VARCHAR2 := NULL,  
  regexp_replace_string  IN    VARCHAR2 := NULL,  
  regexp_position       IN    BINARY_INTEGER := 1,  
  regexp_occurrence      IN    BINARY_INTEGER := 0,  
  regexp_match_parameter IN    VARCHAR2 := NULL,  
  policy_description     IN    VARCHAR2 := NULL,  
  column_description     IN    VARCHAR2 := NULL);
```

### Parameters

**Table 140-7** *ALTER\_POLICY Procedure Parameters*

| Parameter     | Description                                                            |
|---------------|------------------------------------------------------------------------|
| object_schema | Schema owning the table, current user if NULL                          |
| object_name   | Name of table or view to which to alter a Data Redaction policy        |
| policy_name   | Name of policy limited to 30 bytes                                     |
| action        | Action to take. For more information see <a href="#">Table 140-2</a> . |
| column_name   | [Optional] Name of one column to which the redaction policy applies.   |

**Table 140-7 (Cont.) ALTER\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| function_type | <p>Type of redaction function to use. Possible values are:</p> <ul style="list-style-type: none"> <li>- DBMS_REDACT.NONE</li> <li>- DBMS_REDACT.FULL (default)</li> <li>- DBMS_REDACT.NULLIFY</li> <li>- DBMS_REDACT.PARTIAL</li> <li>- DBMS_REDACT.RANDOM</li> <li>- DBMS_REDACT.REGEXP</li> <li>- DBMS_REDACT.REGEXP_WIDTH</li> </ul> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <p>See <a href="#">Table 140-1</a> for an overview of the meanings of these values, and for some examples of their use.</p> |

**Table 140-7 (Cont.) ALTER\_POLICY Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| function_parameters | <p>Parameters to the redaction function. The possible values depend on the value of the function_type provided.</p> <p>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy.</p> <ul style="list-style-type: none"> <li>- If the function_type is DBMS_REDACT.NONE, the function_parameters parameter can be omitted entirely and defaults to NULL.</li> <li>- If the function_type is DBMS_REDACT.FULL, the function_parameters parameter can be omitted entirely and defaults to NULL.</li> <li>- If the function_type is DBMS_REDACT.PARTIAL, the function_parameters parameter represents the masking parameters for partial masking.</li> </ul> <ul style="list-style-type: none"> <li>• Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored</li> <li>• Output format: 'V' for output of masking, any other characters will be treated as formatting characters.</li> <li>• Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.</li> <li>• Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.</li> <li>• Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVFVVVFVVV, VVV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789.</li> </ul> <p>For number datatypes, a comma-separated list containing these fields:</p> <ul style="list-style-type: none"> <li>• Mask character: this is a character between '0' to '9' that will be used to replace the actual values.</li> <li>• Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.</li> <li>• Ending digit position: this specifies the ending digit position to end masking. An example is '9, 1, 5' for masking the first 5 digits of a Social Security number number 123456789, resulting in 999996789.</li> </ul> <p>For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</p> |

**Table 140-7 (Cont.) ALTER\_POLICY Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | <ul style="list-style-type: none"> <li>Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12</li> <li>Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</li> <li>Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</li> <li>Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</li> <li>Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</li> <li>Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</li> </ul> <p>An example is 'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01</p> <p>For partial character and number-masking shortcuts, see <i>Oracle Database Advanced Security Guide</i>.</p> |
| expression            | <p>Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.</p> <p>The following functions are supported:</p> <ul style="list-style-type: none"> <li>SYS_CONTEXT</li> <li>NV(APEX_UTIL.GET_NUMERIC_SESSION_STATE)</li> <li>V(APEX_UTIL.GET_SESSION_STATE)</li> <li>OLS_LABEL_DOMINATES</li> <li>DOMINATES</li> <li>OLS_DOMINATES</li> <li>OLS_DOM</li> <li>DOM</li> <li>OLS_STRICTLY_DOMINATES</li> <li>STRICTLY_DOMINATES</li> <li>S_DOM</li> <li>SA_UTL.DOMINATES</li> <li>SA_UTL.CHECK_READ</li> <li>SA_UTL.NUMERIC_LABEL</li> <li>CHAR_TO_LABEL</li> <li>SA_SESSION.LABEL</li> </ul>                                                                                                                                                                                                                                             |
| regexp_pattern        | <p>Regular expression pattern up to 512 bytes.</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>. Also, do not specify the <code>function_parameters</code> parameter when <code>function_type</code> is <code>DBMS_REDACT.REGEXP</code>.</p> <p>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression patterns</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| regexp_replace_string | <p>Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form <code>\n</code>, where <code>n</code> is a number between 1 and 9.</p> <p>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 140-7 (Cont.) ALTER\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| regexp_position        | Integer counting from 1, specifies the position where the search must begin.<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>                                                                                                                                                             |
| regexp_occurrence      | <ul style="list-style-type: none"> <li>Use 0 to replace all occurrences of the match</li> <li>Use positive integer <i>n</i> to replace the <i>n</i>-th occurrence of the match.</li> </ul> Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code>                                                  |
| regexp_match_parameter | Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x'<br>Use only if the <code>function_type</code> parameter is <code>DBMS_REDACT.REGEXP</code><br>See <i>Oracle Database SQL Language Reference</i> for more information and examples on using regular expression match parameters. |
| policy_description     | Description of redaction policy                                                                                                                                                                                                                                                                                                     |
| column_description     | Description of the column being redacted                                                                                                                                                                                                                                                                                            |

**Exceptions**

- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column *column*
- ORA-28067 - Missing or invalid column name
- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28070 - The column *column* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28073 - The column *column\_name* has an unsupported datatype.
- ORA-28074 - The field *field\_name* of the masking parameters is not valid

The field can be any of the following:

- REDACT\_PARTIAL\_INPUT\_FORMAT
- REDACT\_PARTIAL\_OUTPUT\_FORMAT
- REDACT\_PARTIAL\_MASKCHAR
- REDACT\_PARTIAL\_MASKFROM
- REDACT\_PARTIAL\_MASKTO
- REDACT\_PARTIAL\_DATE\_MONTH
- REDACT\_PARTIAL\_DATE\_DAY
- REDACT\_PARTIAL\_DATE\_YEAR
- REDACT\_PARTIAL\_DATE\_HOUR

- REDACT\_PARTIAL\_DATE\_MINUTE
- REDACT\_PARTIAL\_DATE\_SECOND

See [Table 140-3](#) and [Table 140-4](#) for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions.
- ORA-28076 - An attribute was not specified for SYS\_SESSION\_ROLES.
- ORA-28077 - The attribute specified (*attribute*) exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter *parameter* is invalid (where the possible values are *function\_parameters*, *column\_description*, *policy\_name* and *policy\_description* )
- ORA-28085 - The input and output lengths of the redaction do not match.

### Usage Notes

See [Operating Procedures](#) for more information regarding Function Types and Function Parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the *expression* parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION\_EXPRESSIONS data dictionary view.

### Examples

```
BEGIN
  DBMS_REDACT.ALTER_POLICY(
    object_schema    => 'HR',
    object_name      => 'EMPLOYEES',
    policy_name      => 'mask_emp_id_nums',
    action           => DBMS_REDACT.DROP_COLUMN,
    column_name      => 'EMAIL');
END;
```

## 140.5.3 APPLY\_POLICY\_EXPR\_TO\_COL Procedure

This procedure associates a named Oracle Data Redaction policy expression with a redacted column from a table or view.

### Syntax

```
DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL (
  object_schema      IN VARCHAR2 := NULL,
  object_name        IN VARCHAR2,
  column_name        IN VARCHAR2,
  policy_expression_name IN VARCHAR2 := NULL);
```

### Parameters

**Table 140-8** *APPLY\_POLICY\_EXPR\_TO\_COL Procedure Parameters*

| Parameter            | Description                                          |
|----------------------|------------------------------------------------------|
| <i>object_schema</i> | Name of the schema that contains the redacted column |

**Table 140-8 (Cont.) APPLY\_POLICY\_EXPR\_TO\_COL Procedure Parameters**

| Parameter              | Description                                                           |
|------------------------|-----------------------------------------------------------------------|
| object_name            | Name of the object (table or view) that contains the redacted column  |
| column_name            | Name of the redacted column to which the policy expression is applied |
| policy_expression_name | Name of the policy expression                                         |

**Exceptions**

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

**Usage Notes**

You can find existing Data Redaction policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view. To find columns that have been redacted, query the REDACTION\_COLUMNS data dictionary view.

**Example**

```
BEGIN
  DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL(
    object_schema      => 'OE',
    object_name        => 'CUSTOMERS',
    column_name        => 'INCOME_LEVEL',
    policy_expression_name => 'oe_redact_pol');
END;
```

## 140.5.4 CREATE\_POLICY\_EXPRESSION Procedure

This procedure creates a named Oracle Data Redaction policy expression.

**Syntax**

```
DBMS_REDACT.CREATE_POLICY_EXPRESSION (
  policy_expression_name  IN   VARCHAR2,
  expression              IN   VARCHAR2,
  policy_expression_description  IN   VARCHAR2 := NULL);
```

**Parameters****Table 140-9 CREATE\_POLICY\_EXPRESSION Procedure Parameters**

| Parameter                     | Description                          |
|-------------------------------|--------------------------------------|
| policy_expression_name        | Name of the policy expression        |
| expression                    | Definition of the policy expression  |
| policy_expression_description | Description of the policy expression |

### Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

### Usage Notes

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

After you create a policy expression, you can associate it with a redacted table or view column by running the DBMS\_REDACT.APPLY\_POLICY\_EXPR\_TO\_COL procedure. To find existing redacted columns, query the REDACTION\_COLUMNS data dictionary view.

### Example

```
BEGIN
  DBMS_REDACT.CREATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression             => 'SYS_CONTEXT(''USERENV'', 'SESSION_USER') =
    'OE''),
    policy_expression_description => 'Enables policy for user OE ');
END;
```

## 140.5.5 DISABLE\_POLICY Procedure

This procedure disables a Data Redaction policy.

### Syntax

```
DBMS_REDACT.DISABLE_POLICY (
  object_schema  IN  VARCHAR2 := NULL,
  object_name    IN  VARCHAR2,
  policy_name    IN  VARCHAR2);
```

### Parameters

**Table 140-10** *DISABLE\_POLICY Procedure Parameters*

| Parameter     | Description                                                        |
|---------------|--------------------------------------------------------------------|
| object_schema | Schema owning the table or view, current user if NULL              |
| object_name   | Name of table or view for which to disable a Data Redaction policy |
| policy_name   | Name of policy to be disabled                                      |

### Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28080 - The policy was already disabled.

### Examples

```
BEGIN
  DBMS_REDACT.DISABLE_POLICY (
```

```
object_schema => 'hr',  
object_name   => 'employees',  
policy_name   => 'mask_emp_ids');  
END;
```

## 140.5.6 DROP\_POLICY Procedure

This procedure drops a Data Redaction policy by removing a masking policy from the table or view.

### Syntax

```
DBMS_REDACT.DROP_POLICY (  
    object_schema      IN    VARCHAR2 := NULL,  
    object_name        IN    VARCHAR2,  
    policy_name        IN    VARCHAR2);
```

### Parameters

**Table 140-11** *DROP\_POLICY Procedure Parameters*

| Parameter     | Description                                                      |
|---------------|------------------------------------------------------------------|
| object_schema | Schema owning the table or view, current user if NULL            |
| object_name   | Name of table or view from which to drop a Data Redaction policy |
| policy_name   | Name of policy to be dropped                                     |

### Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.

### Examples

```
BEGIN  
    DBMS_REDACT.DROP_POLICY (  
        object_schema => 'hr',  
        object_name   => 'employees',  
        policy_name   => 'mask_emp_ids');  
END;
```

## 140.5.7 DROP\_POLICY\_EXPRESSION Procedure

This procedure drops a named policy expression.

### Syntax

```
DBMS_REDACT.DROP_POLICY_EXPRESSION (  
    policy_expression_name    IN    VARCHAR2);
```

## Parameters

**Table 140-12** *DROP\_POLICY\_EXPRESSION Procedure Parameters*

| Parameter                           | Description                   |
|-------------------------------------|-------------------------------|
| <code>policy_expression_name</code> | Name of the policy expression |

## Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

## Usage Notes

You can find existing Data Redaction policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view.

## Example

```
BEGIN
  DBMS_REDACT.DROP_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol');
END;
```

# 140.5.8 ENABLE\_POLICY Procedure

This procedure re-enables a Data Redaction policy.

## Syntax

```
DBMS_REDACT.ENABLE_POLICY (
  object_schema      IN   VARCHAR2 := NULL,
  object_name        IN   VARCHAR2,
  policy_name        IN   VARCHAR2);
```

## Parameters

**Table 140-13** *ENABLE\_POLICY Procedure Parameters*

| Parameter                  | Description                                                      |
|----------------------------|------------------------------------------------------------------|
| <code>object_schema</code> | Schema owning the table or view, current user if NULL            |
| <code>object_name</code>   | Name of table or view to which to enable a Data Redaction policy |
| <code>policy_name</code>   | Name of policy to be enabled                                     |

## Exceptions

- ORA-28068 - The object *object* does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28079 - The policy was already enabled.

## Examples

```

BEGIN
    DBMS_REDACT.ENABLE_POLICY (
        object_schema => 'hr',
        object_name    => 'employees',
        policy_name     => 'mask_emp_ids');
END;

```

## 140.5.9 UPDATE\_FULL\_REDACTION\_VALUES Procedure

This procedure modifies the default displayed values for a Data Redaction policy for full redaction.

### Syntax

```

DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES (
    number_val      IN NUMBER           := NULL,
    binfloat_val    IN BINARY_FLOAT     := NULL,
    bindouble_val   IN BINARY_DOUBLE   := NULL,
    char_val        IN CHAR             := NULL,
    varchar_val     IN VARCHAR2        := NULL,
    nchar_val       IN NCHAR            := NULL,
    nvarchar_val    IN NVARCHAR2       := NULL,
    date_val        IN DATE             := NULL,
    ts_val          IN TIMESTAMP        := NULL,
    tswtz_val       IN TIMESTAMP WITH TIME ZONE := NULL,
    blob_val        IN BLOB             := NULL,
    clob_val        IN CLOB             := NULL,
    nclob_val       IN NCLOB            := NULL);

```

### Parameters

**Table 140-14** *UPDATE\_FULL\_REDACTION\_VALUES Procedure Parameters*

| Parameter     | Description                                                                            |
|---------------|----------------------------------------------------------------------------------------|
| number_val    | Modifies the default value for columns of the <b>NUMBER</b> datatype                   |
| binfloat_val  | Modifies the default value for columns of the <b>BINARY_FLOAT</b> datatype             |
| bindouble_val | Modifies the default value for columns of the <b>BINARY_DOUBLE</b> datatype            |
| char_val      | Modifies the default value for columns of the <b>CHAR</b> datatype                     |
| varchar_val   | Modifies the default value for columns of the <b>VARCHAR2</b> datatype                 |
| nchar_val     | Modifies the default value for columns of the <b>NCHAR</b> datatype                    |
| nvarchar_val  | Modifies the default value for columns of the <b>NVARCHAR2</b> datatype                |
| date          | Modifies the default value for columns of the <b>DATE</b> datatype                     |
| ts_val        | Modifies the default value for columns of the <b>TIMESTAMP</b> datatype                |
| tswtz_val     | Modifies the default value for columns of the <b>TIMESTAMP WITH TIME ZONE</b> datatype |
| blob_val      | Modifies the default value for columns of the <b>BLOB</b> datatype                     |
| clob_val      | Modifies the default value for columns of the <b>CLOB</b> datatype                     |
| nclob_val     | Modifies the default value for columns of the <b>NCLOB</b> datatype                    |

Exceptions

ORA-28082 - The parameter *parameter* is invalid (where the possible values are *char\_val*, *nchar\_val*, *varchar\_val* and *nvarchar\_val*)

140.5.10 UPDATE\_POLICY\_EXPRESSION Procedure

This procedure updates a named Oracle Data Redaction policy expression.

Syntax

```
DBMS_REDACT.UPDATE_POLICY_EXPRESSION (
    policy_expression_name      IN    VARCHAR2,
    expression                  IN    VARCHAR2,
    policy_expression_description IN    VARCHAR2 := NULL);
```

Parameters

Table 140-15 UPDATE\_POLICY\_EXPRESSION Procedure Parameters

| Parameter                     | Description                          |
|-------------------------------|--------------------------------------|
| policy_expression_name        | Name of the policy expression        |
| expression                    | Definition of the policy expression  |
| policy_expression_description | Description of the policy expression |

Exceptions

- ORA-28082 - The parameter *parameter* is invalid.
- ORA-28092 - The parameter *parameter* with value *value* has an error.

Usage Notes

You can find existing policy expressions by querying the REDACTION\_EXPRESSIONS data dictionary view.

Example

```
BEGIN
    DBMS_REDACT.UPDATE_POLICY_EXPRESSION(
        policy_expression_name => 'oe_redact_pol',
        expression              => 'SYS_CONTEXT(''USERENV'', ''SESSION_USER'') !=
''OE'',
        policy_expression_description => 'Disables policy for user OE ');
END;
```

# DBMS\_REDEFINITION

The `DBMS_REDEFINITION` package provides an interface to perform an online redefinition of tables.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of DBMS\\_REDEFINITION Subprograms](#)

## See Also:

*Oracle Database Administrator's Guide* for more information about online redefinition of tables

## 141.1 DBMS\_REDEFINITION Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

## 141.2 DBMS\_REDEFINITION Security Model

Subprograms in the `DBMS_REDEFINITION` package are run with invokers' rights (with the privileges of the current user).

There are two modes:

- In `USER` mode, the user who has the `CREATE TABLE` and `CREATE MVIEW` privileges may redefine a table residing in his own schema.
- In `FULL` mode, the user who has the `ANY` privilege may redefine tables in any schema.

## 141.3 DBMS\_REDEFINITION Constants

The `DBMS_REDEFINITION` package defines several constants for specifying parameter values.

**Table 141-1 DBMS\_REDEFINITION Constants**

| Constant         | Type           | Value | Description                                                                                                                                                                                                       |
|------------------|----------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONS_CONSTRAINT  | PLS_INTEGER    | 3     | Used to specify that dependent object type is a constraint                                                                                                                                                        |
| CONS_INDEX       | PLS_INTEGER    | 2     | Used to specify that dependent object type is a index                                                                                                                                                             |
| CONS_MVLOG       | PLS_INTEGER    | 10    | Used to (un)register a materialized view log, as a dependent object of the table, through the <a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a> and the <a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a> . |
| CONS_ORIG_PARAMS | PLS_INTEGER    | 1     | Used to specify that indexes should be cloned with their original storage parameters                                                                                                                              |
| CONS_TRIGGER     | PLS_INTEGER    | 4     | Used to specify that dependent object type is a trigger                                                                                                                                                           |
| CONS_USE_PK      | BINARY_INTEGER | 1     | Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)                                              |
| CONS_USE_ROWID   | BINARY_INTEGER | 2     | Used to indicate that the redefinition should be done using rowids                                                                                                                                                |
| CONS_VPD_AUTO    | BINARY_INTEGER | 2     | Used to indicate to copy VPD policies automatically                                                                                                                                                               |
| CONS_VPD_MANUAL  | BINARY_INTEGER | 4     | Used to indicate to copy VPD policies manually                                                                                                                                                                    |
| CONS_VPD_NONE    | BINARY_INTEGER | 1     | Used to indicate that there are no VPD policies on the original table                                                                                                                                             |

## 141.4 DBMS\_REDEFINITION Operational Notes

The following operational notes apply to DBMS\_REDEFINITION.

- CONS\_USE\_PK and CONS\_USE\_ROWID are constants used as input to the `OPTIONS_FLAG` parameter in both the [START\\_REDEF\\_TABLE Procedure](#) and [CAN\\_REDEF\\_TABLE Procedure](#). CONS\_USE\_ROWID is used to indicate that the redefinition should be done using rowids while CONS\_USE\_PK implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
  - CONS\_INDEX, CONS\_MVLOG, CONS\_TRIGGER and CONS\_CONSTRAINT are used to specify the type of the dependent object being (un)registered in [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#) and [UNREGISTER\\_DEPENDENT\\_OBJECT Procedure](#) (parameter `DEP_TYPE`).
- CONS\_INDEX ==> dependent object is of type INDEX
- CONS\_TRIGGER ==> dependent object is of type TRIGGER
- CONS\_CONSTRAINT ==> dependent object type is of type CONSTRAINT
- CONS\_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG

- `CONS_ORIG_PARAMS` as used as input to the `COPY_INDEXES` parameter in [COPY\\_TABLE\\_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.
- After a table redefinition is complete, the interim table will have the object ID of the original table. That is, the object IDs are essentially swapped during the redefinition operation. If there are any audit policies on the original table, they will now audit the interim table instead. This happens because audit policies are created on object IDs, not object names. Check any audit policies on tables involved in a redefinition operation and alter them as needed to audit the desired table.

## 141.5 DBMS\_REDEFINITION Rules and Limits

Various rules and limits apply to implementation of the `DBMS_REDEFINITION` package.

For more information about these, see the *Oracle Database Administrator's Guide*.

## 141.6 DBMS\_REDEFINITION Examples

The following examples demonstrate `DBMS_REDEFINITION` functionality.

We create two tables `EMP` and `EMP_INT` as the original and the interim tables, respectively:

```
CREATE TABLE emp
( empno      NUMBER(4,0) PRIMARY KEY,
  ename      VARCHAR2(10),
  job        VARCHAR2(9),
  mgr        NUMBER(4,0),
  hiredate   DATE,
  sal        NUMBER(7,2),
  comm       NUMBER(7,2),
  deptno     NUMBER(2,0)
)
TABLESPACE myts;
```

```
CREATE TABLE emp_int
( empno      NUMBER(4,0) PRIMARY KEY,
  ename      VARCHAR2(10),
  job        VARCHAR2(9),
  mgr        NUMBER(4,0),
  hiredate   DATE,
  sal        NUMBER(7,2),
  comm       NUMBER(7,2),
  deptno     NUMBER(2,0)
)
TABLESPACE compressed_ts;
```

### Regular Multi-Step Redefinition

```
DBMS_REDEFINITION.START_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT',
ENABLE_ROLLBACK => TRUE);
DBMS_REDEFINITION.FINISH_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Assume the DBA wants to evaluate the performance of the application for 2 days, after moving the table `EMP` from tablespace `myts` to `compressed_ts`. One can run `sync_interim_table` [SYNC\\_INTERIM\\_TABLE Procedure](#) to keep both the tables in sync (say, every hour).

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

**Case 1 — DBA is not happy with the performance, so decides to rollback.**

```
DBMS_REDEFINITION.ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

**Case 2 — DBA is happy with the performance, so decides not to rollback.**

```
DBMS_REDEFINITION.ABORT_ROLLBACK('SCOTT', 'EMP', 'EMP_INT');
```

This terminates the possibility of rollback.

### Single-Step Redefinition

```
DBMS_REDEFINITION.REDEF_TABLE('SCOTT','EMP','ROW STORE COMPRESS ADVANCED',  
enable_rollback => TRUE);
```

#### Note:

Online table redefinition rollback is not supported when the `REDEF_TABLE` procedure is used to redefine a table.

## 141.7 Summary of DBMS\_REDEFINITION Subprograms

This table lists the `DBMS_REDEFINITION` subprograms and briefly describes them.

**Table 141-2 DBMS\_REDEFINITION Package Subprograms**

| Subprogram                                      | Description                                                                                                                         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ABORT_REDEF_TABLE Procedure</a>     | Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process |
| <a href="#">ABORT_ROLLBACK Procedure</a>        | Aborts rollback                                                                                                                     |
| <a href="#">ABORT_UPDATE Procedure</a>          | Aborts an update started with the <code>EXECUTE_UPDATE</code> procedure                                                             |
| <a href="#">CAN_REDEF_TABLE Procedure</a>       | Determines if a given table can be redefined online                                                                                 |
| <a href="#">COPY_TABLE_DEPENDENTS Procedure</a> | Copies the dependent objects of the original table onto the interim table                                                           |
| <a href="#">EXECUTE_UPDATE Procedure</a>        | Optimizes the performance of bulk updates to a table                                                                                |
| <a href="#">FINISH_REDEF_TABLE Procedure</a>    | Completes the redefinition process                                                                                                  |
| <a href="#">REDEF_TABLE Procedure</a>           | Provides a single push-button interface that integrates several redefinition steps                                                  |

**Table 141-2 (Cont.) DBMS\_REDEFINITION Package Subprograms**

| Subprogram                                            | Description                                                                                                                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a>   | Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table   |
| <a href="#">ROLLBACK Procedure</a>                    | Performs rollback                                                                                                                                                             |
| <a href="#">SET_PARAM Procedure</a>                   | Sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID                                                                   |
| <a href="#">START_REDEF_TABLE Procedure</a>           | Initiates the redefinition process                                                                                                                                            |
| <a href="#">SYNC_INTERIM_TABLE Procedure</a>          | Keeps the interim table synchronized with the original table                                                                                                                  |
| <a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a> | Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table |

## 141.7.1 ABORT\_REDEF\_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process.

This procedure can also be used to terminate the redefinition process any time after the [START\\_REDEF\\_TABLE Procedure](#) has been called and before the [FINISH\\_REDEF\\_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

### Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (  
    uname           IN VARCHAR2,  
    orig_table      IN VARCHAR2,  
    int_table       IN VARCHAR2,  
    part_name       IN VARCHAR2 := NULL);
```

### Parameters

**Table 141-3 ABORT\_REDEF\_TABLE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                  |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname      | Schema name of the tables                                                                                                                                                                                                                                    |
| orig_table | Name of the table to be redefined                                                                                                                                                                                                                            |
| int_table  | Name of the interim table. Can take a comma-delimited list of interim table names.                                                                                                                                                                           |
| part_name  | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |

## 141.7.2 ABORT\_ROLLBACK Procedure

This procedure aborts rollback for a table that was redefined.

When online redefinition of a table is started with the `START_REDEF_TABLE` procedure, rollback can be enabled for the changes performed by online redefinition of a table by setting the `enable_rollback` parameter to `TRUE`. If you want to retain the changes made by online redefinition, you can abort the rollback to clean up the database objects that enable rollback.

### Syntax

```
DBMS_REDEFINITION.ABORT_ROLLBACK (  
    uname           IN  VARCHAR2,  
    orig_table      IN  VARCHAR2,  
    int_table       IN  VARCHAR2 := NULL,  
    part_name       IN  VARCHAR2 := NULL);
```

### Parameters

**Table 141-4 ABORT\_ROLLBACK Procedure Parameters**

| Parameter               | Description                           |
|-------------------------|---------------------------------------|
| <code>uname</code>      | Schema name of the tables             |
| <code>orig_table</code> | Name of the table to be redefined     |
| <code>int_table</code>  | Name of the interim table             |
| <code>part_name</code>  | Name of the partition being redefined |

## 141.7.3 ABORT\_UPDATE Procedure

This procedure can aborts an update started with the `EXECUTE_UPDATE` procedure in the `RDBMS_REDEFINITION` package.

### Syntax

```
DBMS_REDEFINITION.ABORT_UPDATE (  
    update_stmt IN  CLOB);
```

### Parameters

**Table 141-5 ABORT\_UPDATE Procedure Parameters**

| Parameter                | Description                                                                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>update_stmt</code> | The SQL <code>UPDATE</code> statement to be aborted<br>The SQL statement must exactly match the SQL statement in the <code>EXECUTE_UPDATE</code> procedure. |

## 141.7.4 CAN\_REDEF\_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

### Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
    uname          IN  VARCHAR2,
    tname          IN  VARCHAR2,
    options_flag    IN  PLS_INTEGER := 1,
    part_name       IN  VARCHAR2 := NULL);
```

### Parameters

**Table 141-6** CAN\_REDEF\_TABLE Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname        | Schema name of the table                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| tname        | Name of the table to be re-organized                                                                                                                                                                                                                                                                                                                                                                                                                              |
| options_flag | Indicates the type of redefinition method to use. <ul style="list-style-type: none"><li>If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys.</li><li>If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li></ul> |
| part_name    | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined.                                                                                                                                                                                                                                                             |

### Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

## 141.7.5 COPY\_TABLE\_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

### Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
    uname          IN  VARCHAR2,
    orig_table      IN  VARCHAR2,
    int_table       IN  VARCHAR2,
    copy_indexes    IN  PLS_INTEGER := 1,
    copy_triggers   IN  BOOLEAN      := TRUE,
    copy_constraints IN  BOOLEAN      := TRUE,
```

```

copy_privileges      IN  BOOLEAN      := TRUE,
ignore_errors        IN  BOOLEAN      := FALSE,
num_errors            OUT PLS_INTEGER,
copy_statistics       IN  BOOLEAN      := FALSE,
copy_mvlog            IN  BOOLEAN      := FALSE);

```

## Parameters

**Table 141-7 COPY\_TABLE\_DEPENDENTS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname            | Schema name of the tables                                                                                                                                                                                                                  |
| orig_table       | Name of the table being redefined                                                                                                                                                                                                          |
| int_table        | Name of the interim table                                                                                                                                                                                                                  |
| copy_indexes     | Flag indicating whether to copy the indexes <ul style="list-style-type: none"> <li>0 - do not copy any index</li> <li>dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes</li> </ul> |
| copy_triggers    | TRUE = clone triggers, FALSE = do nothing                                                                                                                                                                                                  |
| copy_constraints | TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints                                                                                                        |
| copy_privileges  | TRUE = clone privileges, FALSE = do nothing                                                                                                                                                                                                |
| ignore_errors    | TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.                        |
| num_errors       | Number of errors that occurred while cloning dependent objects                                                                                                                                                                             |
| copy_statistics  | TRUE = copy statistics, FALSE = do nothing                                                                                                                                                                                                 |
| copy_mvlog       | TRUE = copy materialized view log, FALSE = do nothing                                                                                                                                                                                      |

## Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY\\_TABLE\\_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#).
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

## 141.7.6 EXECUTE\_UPDATE Procedure

This procedure can optimize the performance of bulk updates to a table. Performance is optimized because the updates are not logged in the redo log.

The `EXECUTE_UPDATE` procedure automatically uses the components of online table redefinition, such as an interim table, a materialized view, and a materialized view log, to enable optimized bulk updates to a table. The `EXECUTE_UPDATE` procedure also removes fragmentation of the affected rows and ensures that the update is atomic. If the bulk updates raise any errors, then you can use the `ABORT_UPDATE` procedure to undo the changes made by the `EXECUTE_UPDATE` procedure.

### Syntax

```
DBMS_REDEFINITION.EXECUTE_UPDATE (  
    update_stmt IN CLOB);
```

### Parameters

**Table 141-8 EXECUTE\_UPDATE Procedure Parameters**

| Parameter   | Description              |
|-------------|--------------------------|
| update_stmt | The SQL UPDATE statement |

### See Also:

*Oracle Database Administrator's Guide*

## 141.7.7 FINISH\_REDEF\_TABLE Procedure

This procedure completes the redefinition process.

Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

### Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    uname                IN VARCHAR2,  
    orig_table           IN VARCHAR2,  
    int_table            IN VARCHAR2,  
    part_name            IN VARCHAR2 := NULL,  
    dml_lock_timeout     IN PLS_INTEGER := NULL,  
    continue_after_errors IN BOOLEAN := FALSE,  
    disable_rollback     IN PLS_INTEGER := FALSE);
```

## Parameters

**Table 141-9 FINISH\_REDEF\_TABLE Procedure Parameters**

| Parameters            | Description                                                                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname                 | Schema name of the tables                                                                                                                                                                                                                                    |
| orig_table            | Name of the table to be redefined                                                                                                                                                                                                                            |
| int_table             | Name of the interim table. Can take a comma-delimited list of interim table names.                                                                                                                                                                           |
| part_name             | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |
| dml_lock_timeout      | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).                                                                   |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition).                                                                                                           |
| disable_rollback      | When set to TRUE, disables the rollback option if it was enabled in the START_REDEF_TABLE procedure. Specifying TRUE cleans up the database objects that enable rollback.                                                                                    |

## Examples

Wait up to 600 seconds for required locks on SH.SALES:

```
EXECUTE DBMS_REDEFINITION.FINISH_REDEF_TABLE (
  'SH', 'SALES', 'INT_SALES', 600);
```

## 141.7.8 REDEF\_TABLE Procedure

This procedure provides a single interface that integrates several redefinition steps including the CAN\_REDEF\_TABLE Procedure, the START\_REDEF\_TABLE Procedure, the COPY\_TABLE\_DEPENDENTS Procedure and the FINISH\_REDEF\_TABLE Procedure.

This procedure can change data storage properties including tablespaces (for table, partition, subpartition, index, LOB column), compress type (for table, partition, subpartition, index, LOB column) and STORE\_AS clause for the LOB column.

## Syntax

```
DBMS_REDEFINITION.REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  table_compression_type  IN  VARCHAR2 := NULL,
  table_part_tablespace  IN  VARCHAR2 := NULL,
  index_key_compression_type  IN  VARCHAR2 := NULL,
  index_tablespace      IN  VARCHAR2 := NULL,
  lob_compression_type  IN  VARCHAR2 := NULL,
  lob_tablespace        IN  VARCHAR2 := NULL,
  lob_store_as          IN  VARCHAR2 := NULL,
  refresh_dep_mviews    IN  VARCHAR2 := 'N',
  dml_lock_timeout      IN  PLS_INTEGER := NULL);
```

## Parameters

**Table 141-10 REDEF\_TABLE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname                      | Schema name of the table                                                                                                                                                                   |
| tname                      | Name of the table to be redefined                                                                                                                                                          |
| table_compression_type     | Text string of the table compression clause. NULL means there is no change.                                                                                                                |
| table_part_tablespace      | Tablespace name for the entire table or partitions. NULL means there is no change.                                                                                                         |
| index_key_compression_type | Text string of the compression clause for all indexes on the table. NULL means there is no change.                                                                                         |
| index_tablespace           | Tablespace name for all indexes on the table. NULL means there is no change.                                                                                                               |
| lob_compression_type       | Text string of the compression clause for all LOBs in the entire table. NULL means there is no change.                                                                                     |
| lob_tablespace             | Tablespace name for all LOBs in the table. NULL means there is no change.                                                                                                                  |
| lob_store_as               | Specifies LOB store as 'SECUREFILE' or 'BASICFILE'. NULL means there is no change.                                                                                                         |
| refresh_dep_mviews         | When set to 'Y', fast refresh of dependent materialized views is performed once at the end of the redefinition operation.                                                                  |
| dml_lock_timeout           | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode). |

## Examples

```
BEGIN
  DBMS_REDEFINITION.REDEF_TABLE (
    uname          => 'TABOWNER2',
    tname          => 'EMP2',
    table_compression_type => 'ROW STORE COMPRESS ADVANCED',
    table_part_tablespace  => 'NEWTBS',
    index_key_compression_type => 'COMPRESS 1',
    index_tablespace      => 'NEWIDXTBS',
    lob_compression_type  => 'COMPRESS HIGH',
    lob_tablespace        => 'SLOBTBS',
    lob_store_as         => 'SECUREFILE');
END;
```

## Related Topics

- [CAN\\_REDEF\\_TABLE Procedure](#)  
This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.
- [START\\_REDEF\\_TABLE Procedure](#)  
This procedure starts a table redefinition.

- [COPY\\_TABLE\\_DEPENDENTS Procedure](#)  
This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.
- [FINISH\\_REDEF\\_TABLE Procedure](#)  
This procedure completes the redefinition process.

## 141.7.9 REGISTER\_DEPENDENT\_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

### Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(  
    uname           IN    VARCHAR2,  
    orig_table      IN    VARCHAR2,  
    int_table       IN    VARCHAR2,  
    dep_type        IN    PLS_INTEGER,  
    dep_owner       IN    VARCHAR2,  
    dep_orig_name   IN    VARCHAR2,  
    dep_int_name    IN    VARCHAR2);
```

### Parameters

**Table 141-11 REGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

| Parameters    | Description                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------|
| uname         | Schema name of the tables                                                                           |
| orig_table    | Name of the table to be redefined                                                                   |
| int_table     | Name of the interim table                                                                           |
| dep_type      | Type of the dependent object (see <a href="#">Constants</a> and <a href="#">Operational Notes</a> ) |
| dep_owner     | Owner of the dependent object                                                                       |
| dep_orig_name | Name of the original dependent object                                                               |
| dep_int_name  | Name of the interim dependent object                                                                |

### Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA\_REDEFINITION\_ERRORS if an entry exists for that object.

## 141.7.10 ROLLBACK Procedure

This procedure rolls back changes to a table after online table redefinition to return the table to its original definition and preserve DML changes made to the table.

### Syntax

```
DBMS_REDEFINITION.ROLLBACK (  
    uname                IN  VARCHAR2,  
    orig_table            IN  VARCHAR2,  
    int_table             IN  VARCHAR2 := NULL,  
    part_name            IN  VARCHAR2 := NULL,  
    dml_lock_timeout     IN  PLS_INTEGER := NULL,  
    continue_after_errors IN  BOOLEAN := FALSE);
```

### Parameters

**Table 141-12 ROLLBACK Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname                 | Schema name of the table to be redefined                                                                                                                                                   |
| orig_table            | Name of the table to be redefined                                                                                                                                                          |
| int_table             | Name of the interim table.                                                                                                                                                                 |
| part_name             | Name of the partition being redefined.                                                                                                                                                     |
| dml_lock_timeout      | Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode). |
| continue_after_errors | When rolling back redefinition changes on multiple partitions, allows operation execution to continue on the next partition (applies only to batched partition redefinition).              |

## 141.7.11 SET\_PARAM Procedure

This procedure sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID.

### Note:

Currently, the only value that can be changed by this procedure is the value for the of the `refresh_dep_mviews` parameter that is specified in the `REDEF_TABLE` procedure or the `START_REDEF_TABLE` procedure. You can determine the redefinition ID and check the value of the `refresh_dep_mviews` parameter for an online table redefinition operation by querying the `DBA_REDEFINITION_STATUS` view.

### Syntax

```
DBMS_REDEFINITION.SET_PARAM (  
    redefinition_id IN  VARCHAR2,  
    param_name      IN  VARCHAR2,  
    param_value     IN  VARCHAR2);
```

## Parameters

**Table 141-13 SET\_PARAM Procedure Parameters**

| Parameter       | Description                                                  |
|-----------------|--------------------------------------------------------------|
| redefinition_id | The redefinition ID that identifies the redefinition process |
| param_name      | The parameter name                                           |
| param_value     | The new parameter value                                      |

### See Also:

*Oracle Database Administrator's Guide*

## 141.7.12 START\_REDEF\_TABLE Procedure

This procedure starts a table redefinition.

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

### Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  col_mapping    IN VARCHAR2 := NULL,
  options_flag   IN BINARY_INTEGER := 1,
  orderby_cols   IN VARCHAR2 := NULL,
  part_name      IN VARCHAR2 := NULL,
  continue_after_errors IN BOOLEAN := FALSE,
  copy_vpd_opt   IN BINARY_INTEGER := CONS_VPD_NONE,
  refresh_dep_mviews IN VARCHAR2 := 'N',
  enable_rollback IN BOOLEAN := FALSE);
```

## Parameters

**Table 141-14 START\_REDEF\_TABLE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname       | Schema name of the tables                                                                                                                                                                                                                                                    |
| orig_table  | Name of the table to be redefined                                                                                                                                                                                                                                            |
| int_table   | Name of the interim table. Can take a comma-delimited list of interim table names.                                                                                                                                                                                           |
| col_mapping | Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition. |

**Table 141-14 (Cont.) START\_REDEF\_TABLE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options_flag          | Indicates the type of redefinition method to use: <ul style="list-style-type: none"> <li>If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</li> <li>If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li> </ul>                                                                                                                                                                                                                                                              |
| orderby_cols          | This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)                                                                                                                                                                                                                                                                                                                                                                                                                |
| part_name             | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| copy_vpd_opt          | Specifies how VPD policies are handled in online redefinition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| refresh_dep_mviews    | When set to 'Y', fast refresh of dependent materialized views is performed when the <code>START_REDEF_TABLE</code> procedure is run, each time the <code>SYNC_INTERIM_TABLE</code> procedure is run, and when the <code>FINISH_REDEF_TABLE</code> procedure is run.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| enable_rollback       | When set to TRUE, enables the rollback option.<br><br>When this parameter is set to true, Oracle Database maintains the interim table created during redefinition after redefinition is complete. You can run the <code>SYNC_INTERIM_TABLE</code> procedure to synchronize the interim table periodically to apply DML changes made to the redefined table to the interim table. An internal materialized view and materialized view log enables maintenance of the interim table. If you decide to roll back the online table redefinition with the <code>ROLLBACK</code> procedure, then the interim table is synchronized, and Oracle Database switches back to it so that the table has its original definition. |

### Examples

Start redefinition of three partitions (`sal03q1`, `sal03q2`, `sal03q3`) in table 'STEVE.salestable' using three interim tables of `int_salestable1`, `int_salestable2` and `int_salestable3`, respectively. The operation will continue on `sal03q3` even if it fails on `sal03q1`.

```
DBMS_REDEFINITION.START_REDEF_TABLE(
  uname          => 'STEVE',
  orig_table      => 'salestable',
  int_table       => 'int_salestable1, int_salestable2, int_salestable3',
  col_mapping     => NULL,
  options_flag    => DBMS_REDEFINITION.CONST_USE_ROWID,
  part_name       => 'sal03q1,sal03q2,sal03q3',
  continue_after_errors => TRUE);
```

Specify to copy VPD policies automatically:

```
EXECUTE DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          => 'SCOTT',
  orig_table     => 'T',
  int_table      => 'INT_T',
  copy_vpd_opt   => DBMS_REDEFINITION.CONST_VPD_AUTO);
```

## 141.7.13 SYNC\_INTERIM\_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

### Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL,
  continue_after_errors IN BOOLEAN := FALSE);
```

### Parameters

**Table 141-15 SYNC\_INTERIM\_TABLE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uname                 | Schema name of the table                                                                                                                                                                                                                                     |
| orig_table            | Name of the table to be redefined                                                                                                                                                                                                                            |
| int_table             | Name of the interim table. Can take a comma-delimited list of interim table names.                                                                                                                                                                           |
| part_name             | Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined. |
| continue_after_errors | When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)                                                                                                            |

### Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH\\_REDEF\\_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as `CREATE INDEX`) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

## 141.7.14 UNREGISTER\_DEPENDENT\_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

### Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
```

```
dep_type      IN PLS_INTEGER,  
dep_owner     IN VARCHAR2,  
dep_orig_name IN VARCHAR2,  
dep_int_name  IN VARCHAR2);
```

### Parameters

**Table 141-16 UNREGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

| Parameters    | Description                           |
|---------------|---------------------------------------|
| uname         | Schema name of the tables             |
| orig_table    | Name of the table to be redefined     |
| int_table     | Name of the interim table             |
| dep_type      | Type of the dependent object          |
| dep_owner     | Owner of the dependent object         |
| dep_orig_name | Name of the original dependent object |
| dep_int_name  | Name of the interim dependent object  |

# DBMS\_REFRESH

The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time. These groups are called refresh groups.

This chapter contains the following topics:

- [DBMS\\_REFRESH Overview](#)
- [DBMS\\_REFRESH Security Model](#)

## 142.1 DBMS\_REFRESH Overview

When it is important for materialized views to be transactionally consistent with each other, you can organize them into refresh groups.

By refreshing the refresh group, you can ensure that the data in all of the materialized views in the refresh group correspond to the same transactionally consistent point in time. A materialized view in a refresh group still can be refreshed individually, but doing so nullifies the benefits of the refresh group because refreshing the materialized view individually does not refresh the other materialized views in the refresh group.

## 142.2 DBMS\_REFRESH Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_REFRESH` package.

## 142.3 Summary of DBMS\_REFRESH Subprograms

This table lists the `DBMS_REFRESH` subprograms and briefly describes them.

**Table 142-1 DBMS\_REFRESH Package Subprograms**

| Subprogram                         | Description                                                                                                                |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD Procedure</a>      | Adds materialized views to a refresh group                                                                                 |
| <a href="#">CHANGE Procedure</a>   | Changes the refresh interval for a refresh group                                                                           |
| <a href="#">DESTROY Procedure</a>  | Removes all of the materialized views from a refresh group and deletes the refresh group                                   |
| <a href="#">MAKE Procedure</a>     | Specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group |
| <a href="#">REFRESH Procedure</a>  | Manually refreshes a refresh group                                                                                         |
| <a href="#">SUBTRACT Procedure</a> | Removes materialized views from a refresh group                                                                            |

## 142.3.1 ADD Procedure

This procedure adds materialized views to a refresh group.

### Syntax

```
DBMS_REFRESH.ADD (  
    name      IN VARCHAR2,  
    { list    IN VARCHAR2,  
      | tab   IN DBMS_UTILITY.UNCL_ARRAY, }  
    lax       IN BOOLEAN := FALSE);
```

### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

### Parameters

**Table 142-2 ADD Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code> | Name of the refresh group to which you want to add members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                   |
| <code>list</code> | Comma-delimited list of materialized views that you want to add to the refresh group. Synonyms are not supported.<br>Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.                                                                                                                                                                     |
| <code>tab</code>  | Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code> .<br>Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| <code>lax</code>  | A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from one group to another, then you must set the <code>lax</code> flag to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>ADD</code> generates an error message.                         |

## 142.3.2 CHANGE Procedure

This procedure changes the refresh interval for a refresh group.

### Syntax

```
DBMS_REFRESH.CHANGE (  
    name      IN VARCHAR2,  
    next_date IN DATE      := NULL,
```

```

interval          IN VARCHAR2          := NULL,
implicit_destroy  IN BOOLEAN           := NULL,
rollback_seg      IN VARCHAR2          := NULL,
push_deferred_rpc IN BOOLEAN           := NULL,
refresh_after_errors IN BOOLEAN        := NULL,
purge_option      IN BINARY_INTEGER    := NULL,
parallelism       IN BINARY_INTEGER    := NULL,
heap_size         IN BINARY_INTEGER    := NULL);

```

## Parameters

**Table 142-3 CHANGE Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                 | Name of the refresh group for which you want to alter the refresh interval.                                                                                                                                                                                                                                                                        |
| next_date            | Next date that you want a refresh to occur. By default, this date remains unchanged.                                                                                                                                                                                                                                                               |
| interval             | Function used to calculate the next time to refresh the materialized views in the refresh group. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. By default, the interval remains unchanged.                                                      |
| implicit_destroy     | Allows you to reset the value of the <code>implicit_destroy</code> flag. If this flag is set, then Oracle automatically deletes the group if it no longer contains any members. By default, this flag remains unchanged.                                                                                                                           |
| rollback_seg         | Allows you to change the rollback segment used. By default, the rollback segment remains unchanged. To reset this parameter to use the default rollback segment, specify <code>NULL</code> , including the quotes. Specifying <code>NULL</code> without quotes indicates that you do not want to change the rollback segment currently being used. |
| push_deferred_rpc    | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.                                                                                                                                                                                                                                                                     |
| refresh_after_errors | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.                                                                                                                                                                                                                                                                     |
| purge_option         | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.                                                                                                                                                                                                                                                                     |
| parallelism          | <ul style="list-style-type: none"> <li>0 specifies serial propagation.</li> <li><math>n &gt; 1</math> specifies parallel propagation with <math>n</math> parallel processes.</li> <li>1 specifies parallel propagation using only one parallel process.</li> </ul>                                                                                 |
| heap_size            | Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.                                                                                                                                                                     |

### Note:

Do not set this parameter unless directed to do so by Oracle Support Services.

## 142.3.3 DESTROY Procedure

This procedure removes all of the materialized views from a refresh group and delete the refresh group.

### Syntax

```
DBMS_REFRESH.DESTROY (  
    name      IN    VARCHAR2);
```

### Parameters

**Table 142-4 DESTROY Procedure Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| name      | Name of the refresh group that you want to destroy. |

## 142.3.4 MAKE Procedure

This procedure specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group.

### Syntax

```
DBMS_REFRESH.MAKE (  
    name                IN    VARCHAR2  
    { list              IN    VARCHAR2,  
      | tab             IN    DBMS_UTILITY.UNCL_ARRAY, }  
    next_date           IN    DATE,  
    interval            IN    VARCHAR2,  
    implicit_destroy    IN    BOOLEAN           := FALSE,  
    lax                 IN    BOOLEAN           := FALSE,  
    job                 IN    BINARY_INTEGER    := 0,  
    rollback_seg        IN    VARCHAR2         := NULL,  
    push_deferred_rpc   IN    BOOLEAN           := TRUE,  
    refresh_after_errors IN    BOOLEAN           := FALSE  
    purge_option         IN    BINARY_INTEGER    := NULL,  
    parallelism         IN    BINARY_INTEGER    := NULL,  
    heap_size           IN    BINARY_INTEGER    := NULL  
    job_name            IN    VARCHAR2         := NULL,  
    auto_commit         IN    BOOLEAN           := NULL);
```

### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

## Parameters

**Table 142-5 MAKE Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name                 | Unique name used to identify the refresh group, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default. Refresh groups must follow the same naming conventions as tables.                                                                                                                                                                                                                                                                                                      |
| list                 | Comma-delimited list of materialized views that you want to refresh. Synonyms are not supported. These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default.                                                                      |
| tab                  | Instead of a comma-delimited list, you can supply a PL/SQL associative array of names of materialized views that you want to refresh using the data type <code>DBMS_UTILITY.UNCL_ARRAY</code> . If the table contains the names of $n$ materialized views, then the first materialized view should be in position 1 and the $n + 1$ position should be set to <code>NULL</code> . Each materialized view is specified as <code>[schema_name.]materialized_view_name</code> . If the schema is not specified, then the refresh group owner is the default. |
| next_date            | Next date that you want a refresh to occur.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| interval             | Function used to calculate the next time to refresh the materialized views in the group. This field is used with the <code>next_date</code> value.<br>For example, if you specify <code>NEXT_DAY(SYSDATE+1, 'MONDAY')</code> as your interval, and if your <code>next_date</code> evaluates to Monday, then Oracle refreshes the materialized views every Monday. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh.                                        |
| implicit_destroy     | Set this to <code>TRUE</code> to delete the refresh group automatically when it no longer contains any members. Oracle checks this flag only when you call the <code>SUBTRACT</code> procedure. That is, setting this flag still enables you to create an empty refresh group.                                                                                                                                                                                                                                                                            |
| lax                  | A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from an existing group to a new refresh group, then you must set this to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>MAKE</code> generates an error message.                                                                                                                  |
| job                  | Needed by the Import utility. Use the default value, 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| rollback_seg         | Name of the rollback segment to use while refreshing materialized views. The default, <code>NULL</code> , uses the default rollback segment.                                                                                                                                                                                                                                                                                                                                                                                                              |
| push_deferred_rpc    | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| refresh_after_errors | Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| job_name                                                                                                                                                                                     | This parameter is needed by the import utility. User should use the default value, NULL.                                                                                                                                                                                                                                                                                                                                          |
| auto_commit                                                                                                                                                                                  | <p>Supported values are NULL, TRUE, and FALSE.</p> <ul style="list-style-type: none"><li>NULL—allows the user to continue using DBMS_JOB.</li><li>TRUE—commit statement will be automatically issued after the job of the refresh group are created by DBMS_REFRESH.MAKE.</li><li>FALSE—user must issue a commit statement to finish the transaction after calling DBMS_REFRESH.MAKE.</li></ul> <p>The default value is NULL.</p> |

### Usage Notes

Import utility and export utility need CREATE JOB privilege if DBMS\_SCHEDULER jobs are used.

## 142.3.5 REFRESH Procedure

This procedure manually refreshes a refresh group.

### Syntax

```
DBMS_REFRESH.REFRESH (  
    name    IN    VARCHAR2);
```

### Parameters

**Table 142-6 REFRESH Procedure Parameters**

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| name      | Name of the refresh group that you want to refresh manually. |

## 142.3.6 SUBTRACT Procedure

This procedure removes materialized views from a refresh group.

### Syntax

```
DBMS_REFRESH.SUBTRACT (  
    name      IN    VARCHAR2,  
    { list    IN    VARCHAR2,  
      | tab    IN    DBMS_UTILITY.UNCL_ARRAY, }  
    lax       IN    BOOLEAN := FALSE);
```

### Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

### Parameters

**Table 142-7 SUBTRACT Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the refresh group from which you want to remove members, specified as <code>[schema_name.]refresh_group_name</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                       |
| list      | <p>Comma-delimited list of materialized views that you want to remove from the refresh group. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database.</p> <p>Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</p> |
| tab       | <p>Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code>.</p> <p>Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</p>                                                  |
| lax       | Set this to <code>FALSE</code> if you want Oracle to generate an error message if the materialized view you are attempting to remove is not a member of the refresh group.                                                                                                                                                                                                                                                                                                                                                |

# DBMS\_REPAIR

The `DBMS_REPAIR` package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_REPAIR Subprograms](#)

## See Also:

For detailed information about using the `DBMS_REPAIR` package, see *Oracle Database Administrator's Guide*

## 143.1 DBMS\_REPAIR Overview

The `DBMS_REPAIR` package is intended for use by database administrators only. It is not intended for use by application developers.

## 143.2 DBMS\_REPAIR Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

## 143.3 DBMS\_REPAIR Constants

The `DBMS_REPAIR` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_REPAIR.TABLE_OBJECT`.

The following table lists the parameters and the enumerated constants.

**Table 143-1 DBMS\_REPAIR Parameters with Enumerated Constants**

| Parameter     | Option                                                                                                       | Type           | Description                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------|----------------|----------------------------------------------------------------------------------------|
| object_type   | <ul style="list-style-type: none"> <li>TABLE_OBJECT</li> <li>INDEX_OBJECT</li> <li>CLUSTER_OBJECT</li> </ul> | BINARY_INTEGER | -                                                                                      |
| action        | <ul style="list-style-type: none"> <li>CREATE_ACTION</li> <li>DROP_ACTION</li> <li>PURGE_ACTION</li> </ul>   | BINARY_INTEGER | -                                                                                      |
| table_type    | <ul style="list-style-type: none"> <li>REPAIR_TABLE</li> <li>ORPHAN_TABLE</li> </ul>                         | BINARY_INTEGER | -                                                                                      |
| flags         | <ul style="list-style-type: none"> <li>SKIP_FLAG</li> <li>NOSKIP_FLAG</li> </ul>                             | BINARY_INTEGER | -                                                                                      |
| object_id     | <ul style="list-style-type: none"> <li>ALL_INDEX_ID := 0</li> </ul>                                          | BINARY_INTEGER | Clean up all objects that qualify                                                      |
| wait_for_lock | <ul style="list-style-type: none"> <li>LOCK_WAIT := 1</li> <li>LOCK_NOWAIT := 0</li> </ul>                   | BINARY_INTEGER | Specifies whether to try getting DML locks on underlying table [[sub]partition] object |

**Note:**

The default table\_name will be REPAIR\_TABLE when table\_type is REPAIR\_TABLE, and will be ORPHAN\_KEY\_TABLE when table\_type is ORPHAN\_TABLE.

## 143.4 DBMS\_REPAIR Operating Notes

The procedure to create the ORPHAN\_KEYS\_TABLE is similar to the one used to create the REPAIR\_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK\\_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR\_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN\_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
```

```

DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;

```

When invoking the [CHECK\\_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN\\_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN\\_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

## 143.5 DBMS\_REPAIR Exceptions

The table in this topic describes the exceptions raised by the DDBMS\_REPAIR subprograms.

**Table 143-2 DBMS\_REPAIR Exceptions**

| Exception | Description                                                                                                                       | Action                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 942       | Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.                                 | -                                                                                                                                                      |
| 955       | Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.                                                    | -                                                                                                                                                      |
| 24120     | An invalid parameter was passed to the specified DBMS_REPAIR procedure.                                                           | Specify a valid parameter value or use the parameter's default.                                                                                        |
| 24122     | An incorrect block range was specified.                                                                                           | Specify correct values for the BLOCK_START and BLOCK_END parameters.                                                                                   |
| 24123     | An attempt was made to use the specified feature, but the feature is not yet implemented.                                         | Do not attempt to use the feature.                                                                                                                     |
| 24124     | An invalid ACTION parameter was specified.                                                                                        | Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.                                                                           |
| 24125     | An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run. | Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed. |
| 24127     | TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.                                                           | Do not specify TABLESPACE when performing actions other than CREATE_ACTION.                                                                            |
| 24128     | A partition name was specified for an object that is not partitioned.                                                             | Specify a partition name only if the object is partitioned.                                                                                            |
| 24129     | An attempt was made to pass a table name parameter without the specified prefix.                                                  | Pass a valid table name parameter.                                                                                                                     |
| 24130     | An attempt was made to specify a repair or orphan table that does not exist.                                                      | Specify a valid table name parameter.                                                                                                                  |
| 24131     | An attempt was made to specify a repair or orphan table that does not have a correct definition.                                  | Specify a table name that refers to a properly created table.                                                                                          |

**Table 143-2 (Cont.) DBMS\_REPAIR Exceptions**

| Exception | Description                                                                     | Action                                |
|-----------|---------------------------------------------------------------------------------|---------------------------------------|
| 24132     | An attempt was made to specify a table name is greater than 30 characters long. | Specify a valid table name parameter. |

## 143.6 DBMS\_REPAIR Examples

This topic shows examples of DBMS\_REPAIR usage.

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');  
  
/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

## 143.7 Summary of DBMS\_REPAIR Subprograms

This table lists the DBMS\_REPAIR subprograms and briefly describes them.

**Table 143-3 DBMS\_REPAIR Package Subprograms**

| Subprogram                                    | Description                                                                                                                                |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADMIN_TABLES Procedure</a>        | Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions    |
| <a href="#">CHECK_OBJECT Procedure</a>        | Detects and reports corruptions in a table or index                                                                                        |
| <a href="#">DUMP_ORPHAN_KEYS Procedure</a>    | Reports on index entries that point to rows in corrupt data blocks                                                                         |
| <a href="#">FIX_CORRUPT_BLOCKS Procedure</a>  | Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT                                                |
| <a href="#">ONLINE_INDEX_CLEAN Function</a>   | Performs a manual cleanup of failed or interrupted online index builds or rebuilds                                                         |
| <a href="#">REBUILD_FREELISTS Procedure</a>   | Rebuilds an object's freelists                                                                                                             |
| <a href="#">SEGMENT_FIX_STATUS Procedure</a>  | Fixes the corrupted state of a bitmap entry                                                                                                |
| <a href="#">SKIP_CORRUPT_BLOCKS Procedure</a> | Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered |

### 143.7.1 ADMIN\_TABLES Procedure

This procedure provides administrative functions for the DBMS\_REPAIR package repair and orphan key tables.

#### Syntax

```
DBMS_REPAIR.ADMIN_TABLES (  
    table_name IN    VARCHAR2,  
    table_type IN    BINARY_INTEGER,
```

```
action      IN  BINARY_INTEGER,
tablespace  IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 143-4 ADMIN\_TABLES Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name | Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| table_type | Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE.<br>See " <a href="#">Constants</a> ".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| action     | Indicates what administrative action to perform.<br>Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned.<br>When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA <table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated.<br>Created in the SYS schema.<br>See " <a href="#">Constants</a> ". |
| tablespace | Indicates the tablespace to use when creating a table.<br>By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 143.7.2 CHECK\_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

### Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN  VARCHAR2,
  object_name       IN  VARCHAR2,
  partition_name    IN  VARCHAR2      DEFAULT NULL,
  object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags             IN  BINARY_INTEGER DEFAULT NULL,
  relative_fno      IN  BINARY_INTEGER DEFAULT NULL,
  block_start       IN  BINARY_INTEGER DEFAULT NULL,
  block_end         IN  BINARY_INTEGER DEFAULT NULL,
  corrupt_count     OUT BINARY_INTEGER);
```

## Parameters

**Table 143-5 CHECK\_OBJECT Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schema_name</code>       | Schema name of the object to be checked.                                                                                                                                                                                                                                                                              |
| <code>object_name</code>       | Name of the table or index to be checked.                                                                                                                                                                                                                                                                             |
| <code>partition_name</code>    | Partition or subpartition name to be checked.<br>If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked. |
| <code>object_type</code>       | Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> .<br>See " <a href="#">Constants</a> ".                                                                                                                                                      |
| <code>repair_table_name</code> | Name of the repair table to be populated.<br>The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .                                                                                               |
| <code>flags</code>             | Reserved for future use.                                                                                                                                                                                                                                                                                              |
| <code>relative_fno</code>      | Relative file number: Used when specifying a block range.                                                                                                                                                                                                                                                             |
| <code>block_start</code>       | First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.                                                                                                                                                                                |
| <code>block_end</code>         | Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.                    |
| <code>corrupt_count</code>     | Number of corruptions reported.                                                                                                                                                                                                                                                                                       |

## Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

## 143.7.3 DUMP\_ORPHAN\_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

## Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
```

```
orphan_table_name IN VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
flags             IN BINARY_INTEGER DEFAULT NULL,
key_count         OUT BINARY_INTEGER);
```

## Parameters

**Table 143-6 DUMP\_ORPHAN\_KEYS Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name       | Schema name.                                                                                                                                                                                                                                                                                                                |
| object_name       | Object name.                                                                                                                                                                                                                                                                                                                |
| partition_name    | Partition or subpartition name to be processed.<br>If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type       | Type of the object to be processed. The default is <code>INDEX_OBJECT</code> .<br>See " <a href="#">Constants</a> ".                                                                                                                                                                                                        |
| repair_table_name | Name of the repair table that has information regarding corrupt blocks in the base table.<br>The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.                                                                                            |
| orphan_table_name | Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block.<br>The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.                                                   |
| flags             | Reserved for future use.                                                                                                                                                                                                                                                                                                    |
| key_count         | Number of index entries processed.                                                                                                                                                                                                                                                                                          |

## 143.7.4 FIX\_CORRUPT\_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the `CHECK_OBJECT` Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

## Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags            IN BINARY_INTEGER DEFAULT NULL,
  fix_count        OUT BINARY_INTEGER);
```

## Parameters

**Table 143-7** FIX\_CORRUPT\_BLOCKS Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name       | Schema name.                                                                                                                                                                                                                                                                                                   |
| object_name       | Name of the object with corrupt blocks to be fixed.                                                                                                                                                                                                                                                            |
| partition_name    | Partition or subpartition name to be processed.<br>If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type       | Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.<br>See " <a href="#">Constants</a> ".                                                                                                                                                                          |
| repair_table_name | Name of the repair table with the repair directives.<br>Must exist in the SYS schema.                                                                                                                                                                                                                          |
| flags             | Reserved for future use.                                                                                                                                                                                                                                                                                       |
| fix_count         | Number of blocks fixed.                                                                                                                                                                                                                                                                                        |

## Related Topics

- [CHECK\\_OBJECT Procedure](#)  
This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

## 143.7.5 ONLINE\_INDEX\_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds.

This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

## Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (  
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,  
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)  
RETURN BOOLEAN;
```

## Parameters

**Table 143-8** ONLINE\_INDEX\_CLEAN Function Parameters

| Parameter | Description                                                                             |
|-----------|-----------------------------------------------------------------------------------------|
| object_id | Object id of index to be cleaned up. The default cleans up all object ids that qualify. |

**Table 143-8 (Cont.) ONLINE\_INDEX\_CLEAN Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wait_for_lock | This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If LOCK_NOWAIT is specified, then the lock get does not retry. |

## 143.7.6 REBUILD\_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object.

All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

### Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (  
    schema_name      IN VARCHAR2,  
    object_name      IN  VARCHAR2,  
    partition_name   IN VARCHAR2 DEFAULT NULL,  
    object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

### Parameters

**Table 143-9 REBUILD\_FREELISTS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name    | Schema name.                                                                                                                                                                                                                                                                                                               |
| object_name    | Name of the object whose freelists are to be rebuilt.                                                                                                                                                                                                                                                                      |
| partition_name | Partition or subpartition name whose freelists are to be rebuilt.<br>If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed. |
| object_type    | Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.<br>See " <a href="#">Constants</a> ".                                                                                                                                                                                      |

## 143.7.7 SEGMENT\_FIX\_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

### Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (  
    segment_owner    IN VARCHAR2,  
    segment_name     IN VARCHAR2,  
    segment_type     IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
```

```
file_number      IN BINARY_INTEGER DEFAULT NULL,
block_number     IN BINARY_INTEGER DEFAULT NULL,
status_value     IN BINARY_INTEGER DEFAULT NULL,
partition_name   IN VARCHAR2 DEFAULT NULL,);
```

## Parameters

**Table 143-10 SEGMENT\_FIX\_STATUS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_owner   | Schema name of the segment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| segment_name   | Segment name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| partition_name | Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| segment_type   | Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| file_number    | (optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| block_number   | (optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| status_value   | <p>(optional) The value to which the block status described by the <code>file_number</code> and <code>block_number</code> will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values:</p> <ul style="list-style-type: none"> <li>• 1 = block is full</li> <li>• 2 = block is 0-25% free</li> <li>• 3 = block is 25-50% free</li> <li>• 4 = block is 50-75% free</li> <li>• 5 = block is 75-100% free</li> </ul> <p>The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.</p> |

## 143.7.8 SKIP\_CORRUPT\_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

### Note:

When Oracle performs an index range scan on a corrupt index after DBMS\_REPAIR.SKIP\_CORRUPT\_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (  
  schema_name  IN VARCHAR2,  
  object_name   IN VARCHAR2,  
  object_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,  
  flags         IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 143-11 SKIP\_CORRUPT\_BLOCKS Procedure Parameters

| Parameter   | Description                                                                                                                                                                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name | Schema name of the object to be processed.                                                                                                                                                                                                                            |
| object_name | Name of the object.                                                                                                                                                                                                                                                   |
| object_type | Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT.<br>See " <a href="#">Constants</a> ".                                                                                                                               |
| flags       | If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578.<br>See " <a href="#">Constants</a> ". |

# DBMS\_RESCONFIG

The `DBMS_RESCONFIG` package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

This chapter contains the following topics:

- [Overview](#)
- [Summary of DBMS\\_RESCONFIG Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

## 144.1 DBMS\_RESCONFIG Overview

The `DBMS_RESCONFIG` package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

## 144.2 Summary of DBMS\_RESCONFIG Subprograms

This table lists and briefly describes the `DBMS_RESCONFIG` package subprograms.

**Table 144-1 DBMS\_RESCONFIG Package Subprograms**

| Subprogram                                          | Description                                                                                                                                 |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDREPOSITORYRESCONFIG Procedure</a>    | Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list                  |
| <a href="#">ADDRESCONFIG Procedure</a>              | Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list         |
| <a href="#">APPENDRESCONFIG Procedure</a>           | Appends the resource configuration specified by rcpth to the target resource's configuration list if it is not already included in the list |
| <a href="#">DELETEREPOSITORYRESCONFIG Procedure</a> | Removes the configuration at the given position in the repository's configuration list.                                                     |
| <a href="#">DELETERESCONFIG Procedures</a>          | Removes the configuration at the given position in the target resource's configuration list.                                                |
| <a href="#">GETLISTENERS Function</a>               | Returns the list of listeners applicable for a given resource                                                                               |
| <a href="#">GETREPOSITORYRESCONFIG Function</a>     | Returns the resource configuration at the specified position of the repository's configuration list                                         |

**Table 144-1 (Cont.) DBMS\_RESCONFIG Package Subprograms**

| Subprogram                                             | Description                                                                                                    |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">GETREPOSITORYRESCONFIGPATHS Function</a>   | Returns a list of resource configuration paths defined for the repository                                      |
| <a href="#">GETRESCONFIG Function</a>                  | Returns the resource configuration at the specified position of the target resource's configuration list       |
| <a href="#">GETRESCONFIGPATHS Function</a>             | Returns a list of resource configuration paths defined in the target resource's configuration list             |
| <a href="#">PATCHREPOSITORYRESCONFIGLIST Procedure</a> | Removes invalid references from the repository resource configuration list, and makes the repository available |

## 144.2.1 ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG (
    rcpath      IN   VARCHAR2,
    pos         IN   PLS_INTEGER := NULL);
```

### Parameters

**Table 144-2 ADDREPOSITORYRESCONFIG Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rcpath    | Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list.                                                                                                                                                            |
| pos       | Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;</code> the size of the target resource's configuration list). |

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 144.2.2 ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(  
    respath      IN   VARCHAR2,  
    rcpath       IN   VARCHAR2,  
    pos          IN   PLS_INTEGER := NULL);
```

### Parameters

**Table 144-3** ADDRESCONFIG Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| respath   | Absolute path of the target resource                                                                                                                                                                                                                                                        |
| rcpath    | Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.                                                                                                                                             |
| pos       | Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( $pos < 0$ or $pos >$ the size of the target resource's configuration list). |

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 144.2.3 APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by `rcpath` to the target resource's configuration list if it is not already included in the list.

### Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(  
    respath      IN   VARCHAR2,  
    rcpath       IN   VARCHAR2,  
    appendOption IN   PLS_INTEGER);
```

### Parameters

**Table 144-4** ADDRESCONFIG Function Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| respath   | Absolute path of the target resource |

**Table 144-4 (Cont.) ADDRESCONFIG Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rcpath       | Absolute path of the resource configuration to be appended at the end of the target's configuration list. If <code>rcpath</code> already exists in the list then nothing is appended.                                                                                           |
| appendOption | Either <code>APPEND_RESOURCE</code> or <code>APPEND_RECURSIVE</code> . If <code>APPEND_RESOURCE</code> is specified then only the target resource is affected. If <code>APPEND_RECURSIVE</code> is specified then the target resource and all its descendents will be affected. |

**Usage Notes**

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## 144.2.4 DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

**Syntax**

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(  
    pos          IN    PLS_INTEGER);
```

**Parameters****Table 144-5 DELETEREPOSITORYRESCONFIG Function Parameters**

| Parameter | Description                                                                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pos       | The index of the configuration to be removed. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list). |

**Usage Notes**

- Users must have `XDBADMIN` role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

## 144.2.5 DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

### Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(  
    respath      IN   VARCHAR2,  
    pos          IN   PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG(  
    respath      IN   VARCHAR2,  
    rcpath       IN   VARCHAR2,  
    deleteOption IN   PLS_INTEGER);
```

### Parameters

**Table 144-6 DELETERESCONFIG Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| respath      | Absolute path of the target resource                                                                                                                                                                                                                                                                                                |
| pos          | The index of the configuration to be removed. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the target resource's configuration list).                                                                                                                                                  |
| rcpath       | Absolute path of the resource configuration to be deleted if found in list.                                                                                                                                                                                                                                                         |
| deleteOption | Either <code>DELETE_RESOURCE</code> or <code>DELETE_RECURSIVE</code> . If <code>DELETE_RESOURCE</code> is specified then only the configuration list of the target resource is affected. If <code>DELETE_RECURSIVE</code> is specified then the configuration list of the target resource and all its descendents will be affected. |

### Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

## 144.2.6 GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

### Syntax

```
DBMS_RESCONFIG.GETLISTENERS(  
    path      IN   VARCHAR2)  
RETURN XMLTYPE;
```

## Parameters

**Table 144-7 GETLISTENERS Function Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| path      | Absolute path of the target resource |

## Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

## 144.2.7 GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(  
    pos    IN    PLS_INTEGER)  
RETURN XMLTYPE;
```

## Parameters

**Table 144-8 GETREPOSITORYRESCONFIG Function Parameters**

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pos       | Index of element to return. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the repository's configuration list). |

## Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## 144.2.8 GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS  
RETURN XDB$STRING_LIST_T;
```

## Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## 144.2.9 GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(  
    respath IN VARCHAR2,  
    pos IN PLS_INTEGER)  
RETURN XMLTYPE;
```

### Parameters

**Table 144-9 GETRESCONFIG Function Parameters**

| Parameter | Description                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| respath   | Absolute path of the target resource                                                                                                                             |
| pos       | Index of element to return. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the target resource's configuration list). |

### Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## 144.2.10 GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(  
    respath IN VARCHAR2)  
RETURN XDB$STRING_LIST_T;
```

### Parameters

**Table 144-10 GETRESCONFIGPATHS Function Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| respath   | Absolute path of the target resource |

### Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## 144.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure

This procedure removes invalid references from the repository resource configuration list, and makes the repository available.

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes those invalid references.

This procedure must be run as SYS.

### Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

# DBMS\_RESOURCE\_MANAGER

The `DBMS_RESOURCE_MANAGER` package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_RESOURCE\\_MANAGER Subprograms](#)

## See Also:

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

## 145.1 DBMS\_RESOURCE\_MANAGER Deprecated Subprograms

The `SET_INITIAL_CONSUMER_GROUP` Procedure has been deprecated with Oracle Database 11g.

- [SET\\_INITIAL\\_CONSUMER\\_GROUP Procedure](#)

## Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

## 145.2 DBMS\_RESOURCE\_MANAGER Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures.

The procedures to grant and revoke this privilege are in the package [DBMS\\_RESOURCE\\_MANAGER\\_PRIVS](#).

## 145.3 DBMS\_RESOURCE\_MANAGER Constants

The `DBMS_RESOURCE_MANAGER` package defines several constants for specifying parameter values.

These are shown in the following table.

**Table 145-1 DBMS\_RESOURCE\_MANAGER Constants**

| Constant                        | Type                       | Value                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CLIENT_ID</code>          | <code>VARCHAR2 (30)</code> | <code>CLIENT_ID</code>          | Client identifier of the session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>CLIENT_MACHINE</code>     | <code>VARCHAR2 (30)</code> | <code>CLIENT_MACHINE</code>     | Name of the computer from which the client is making the connection                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>CLIENT_OS_USER</code>     | <code>VARCHAR2 (30)</code> | <code>CLIENT_OS_USER</code>     | Operating system user name of the client that is logging in                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>CLIENT_PROGRAM</code>     | <code>VARCHAR2 (30)</code> | <code>CLIENT_PROGRAM</code>     | Name of the client program used to log in to the server                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>MODULE_NAME</code>        | <code>VARCHAR2 (30)</code> | <code>MODULE_NAME</code>        | Module name in the currently running application as set by the <a href="#">SET_MODULE Procedure</a> in the <a href="#">DBMS_APPLICATION_INFO</a> package, or the equivalent OCI attribute setting                                                                                                                                                                                                                                                                                                                            |
| <code>MODULE_NAME_ACTION</code> | <code>VARCHAR2 (30)</code> | <code>MODULE_NAME_ACTION</code> | <p>A combination of the current module and the action being performed as set by either of the following procedures in the <a href="#">DBMS_APPLICATION_INFO</a> package, or their equivalent OCI attribute setting:</p> <ul style="list-style-type: none"> <li><a href="#">SET_MODULE Procedure</a></li> <li><a href="#">SET_ACTION Procedure</a></li> </ul> <p>The attribute is specified as the module name followed by a period (<code>.</code>), followed by the action name (<code>module_name.action_name</code>).</p> |
| <code>ORACLE_FUNCTION</code>    | <code>VARCHAR2 (30)</code> | <code>ORACLE_FUNCTION</code>    | <p>Function the session is currently executing. Valid functions are the <code>BACKUP</code>, <code>COPY</code>, <code>DATALOAD</code>, and <code>INMEMORY</code>. <code>BACKUP</code> is set for sessions that are doing backup operations using <code>RMAN</code>. <code>COPY</code> is set for sessions that are doing image copies using <code>RMAN</code>. <code>DATALOAD</code> is set for sessions that are loading data using Oracle Data Pump.</p>                                                                   |
| <code>ORACLE_USER</code>        | <code>VARCHAR2 (30)</code> | <code>ORACLE_USER</code>        | Oracle Database user name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>SERVICE_MODULE</code>     | <code>VARCHAR2 (30)</code> | <code>SERVICE_MODULE</code>     | Combination of service and module names in this form: <code>service_name.module_name</code>                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 145-1 (Cont.) DBMS\_RESOURCE\_MANAGER Constants**

| Constant              | Type          | Value                 | Description                                                                                                             |
|-----------------------|---------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| SERVICE_MODULE_ACTION | VARCHAR2 (30) | SERVICE_MODULE_ACTION | Combination of service name, module name, and action name, in this form:<br><i>service_name.module_name.action_name</i> |
| SERVICE_NAME          | VARCHAR2 (30) | SERVICE_NAME          | Service name used by the client to establish a connection                                                               |

## 145.4 Summary of DBMS\_RESOURCE\_MANAGER Subprograms

This table lists the DBMS\_RESOURCE\_MANAGER subprograms and briefly describes them.

**Table 145-2 DBMS\_RESOURCE\_MANAGER Package Subprograms**

| Subprogram                                             | Description                                                                                   |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">BEGIN_SQL_BLOCK Procedure</a>              | Indicates the start of a block of SQL statements to be treated as a group by resource manager |
| <a href="#">CALIBRATE_IO Procedure</a>                 | Calibrates the I/O capabilities of storage                                                    |
| <a href="#">CLEAR_PENDING_AREA Procedure</a>           | Clears the work area for the resource manager                                                 |
| <a href="#">CREATE_CATEGORY Procedure</a>              | Creates a new resource consumer group category                                                |
| <a href="#">CREATE_CDB_PLAN Procedure</a>              | Creates entries which define consolidation resource plans.                                    |
| <a href="#">CREATE_CDB_PLAN_DIRECTIVE Procedure</a>    | Creates the plan directives of the consolidation resource plan                                |
| <a href="#">CREATE_CDB_PROFILE_DIRECTIVE Procedure</a> | Creates the performance profile directives of the consolidation resource plan                 |
| <a href="#">CREATE_CONSUMER_GROUP Procedure</a>        | Creates entries which define resource consumer groups                                         |
| <a href="#">CREATE_PENDING_AREA Procedure</a>          | Creates a work area for changes to resource manager objects                                   |
| <a href="#">CREATE_PLAN Procedure</a>                  | Creates entries which define resource plans                                                   |
| <a href="#">CREATE_PLAN_DIRECTIVE Procedure</a>        | Creates resource plan directives                                                              |
| <a href="#">CREATE_SIMPLE_PLAN Procedure</a>           | Creates a single-level resource plan containing up to eight consumer groups in one step       |
| <a href="#">DELETE_CATEGORY Procedure</a>              | Deletes an existing resource consumer group category                                          |
| <a href="#">DELETE_CDB_PLAN Procedure</a>              | Deletes the consolidation resource plan                                                       |
| <a href="#">DELETE_CDB_PLAN_DIRECTIVE Procedure</a>    | Deletes the plan directive of the consolidation resource plan                                 |
| <a href="#">DELETE_CDB_PROFILE_DIRECTIVE Procedure</a> | Deletes the performance profile directive of the consolidation resource plan                  |
| <a href="#">DELETE_CONSUMER_GROUP Procedure</a>        | Deletes entries which define resource consumer groups                                         |

**Table 145-2 (Cont.) DBMS\_RESOURCE\_MANAGER Package Subprograms**

| Subprogram                                                    | Description                                                                                            |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">DELETE_PLAN Procedure</a>                         | Deletes the specified plan as well as all the plan directives it refers to                             |
| <a href="#">DELETE_PLAN_CASCADE Procedure</a>                 | Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups) |
| <a href="#">DELETE_PLAN_DIRECTIVE Procedure</a>               | Deletes resource plan directives                                                                       |
| <a href="#">DEQUEUE_PARALLEL_STATEMENT Procedure</a>          | Dequeues a parallel statement from the parallel statement queue                                        |
| <a href="#">END_SQL_BLOCK Procedure</a>                       | Indicates the end of a block of SQL statements that should be treated as a group by resource manager   |
| <a href="#">SET_CONSUMER_GROUP_MAPPING Procedure</a>          | Adds, deletes, or modifies entries for the login and run-time attribute mappings                       |
| <a href="#">SET_CONSUMER_GROUP_MAPPING_PRIORITY Procedure</a> | Creates the session attribute mapping priority list                                                    |
| <a href="#">SET_INITIAL_CONSUMER_GROUP Procedure</a>          | Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)                |
| <a href="#">SUBMIT_PENDING_AREA Procedure</a>                 | Submits pending changes for the resource manager                                                       |
| <a href="#">SWITCH_CONSUMER_GROUP_FOR_SESSION Procedure</a>   | Changes the resource consumer group of a specific session                                              |
| <a href="#">SWITCH_CONSUMER_GROUP_FOR_USER Procedure</a>      | Changes the resource consumer group for all sessions with a given user name                            |
| <a href="#">SWITCH_PLAN Procedure</a>                         | Sets the current resource manager plan                                                                 |
| <a href="#">UPDATE_CATEGORY Procedure</a>                     | Updates an existing resource consumer group category                                                   |
| <a href="#">UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure</a>       | Updates the plan directives with regard to automated maintenance tasks                                 |
| <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a>        | Updates the default values for a consolidation plan                                                    |
| <a href="#">UPDATE_CDB_PLAN Procedure</a>                     | Updates the consolidation resource plan                                                                |

## 145.4.1 BEGIN\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

### Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

### Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

## 145.4.2 CALIBRATE\_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the V\$IO\_CALIBRATION\_STATUS view and results for a successful calibration run are located in DBA\_RSRC\_IO\_CALIBRATE table.

### Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (  
    num_physical_disks      IN  PLS_INTEGER DEFAULT 1,  
    max_latency              IN  PLS_INTEGER DEFAULT 20,  
    max_iops                 OUT PLS_INTEGER,  
    max_mbps                 OUT PLS_INTEGER,  
    actual_latency           OUT PLS_INTEGER);
```

### Parameters

**Table 145-3 CALIBRATE\_IO Procedure Parameters**

| Parameter          | Description                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| num_physical_disks | Approximate number of physical disks in the database storage. This parameter is used to determine the initial I/O load for the calibration run.  |
| max_latency        | Maximum tolerable latency in milliseconds for database-block-sized IO requests                                                                   |
| max_iops           | Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.          |
| max_mbps           | Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads. |
| actual_latency     | Average latency of database-block-sized I/O requests at max_iops rate, expressed in milliseconds                                                 |

### Usage Notes

- Only users with the SYSDBA privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:

```
col name format a50  
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
```

```
WHERE f.file#      = i.file_no
AND   filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.
- In a multitenant container database (CDB), calibration can only be run from the CDB root (CDB\$ROOT).
- Calibration is extremely disruptive to the database performance. It is strongly recommended to run calibration only when database users can tolerate severe deterioration to database performance.
- For optimal calibration results, no other database workloads should be running.

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about calibration

## Examples

### Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat NUMBER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
  -- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
  DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

end;
/
```

### View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
      Name                                         Null?      Type
-----
STATUS                                           VARCHAR2(13)
CALIBRATION_TIME                                TIMESTAMP(3)

SQL> desc gv$sql_io_calibration_status
      Name                                         Null?      Type
-----
INST_ID                                           NUMBER
STATUS                                           VARCHAR2(13)
CALIBRATION_TIME                                TIMESTAMP(3)
```

Column explanation:

```
STATUS:
  IN PROGRESS   : Calibration in Progress (Results from previous calibration
                  run displayed, if available)
  READY         : Results ready and available from earlier run
```

NOT AVAILABLE : Calibration results not available.

CALIBRATION\_TIME: End time of the last calibration run

#### DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
```

| Name               | Null? | Type          |
|--------------------|-------|---------------|
| START_TIME         |       | TIMESTAMP (6) |
| END_TIME           |       | TIMESTAMP (6) |
| MAX_IOPS           |       | NUMBER        |
| MAX_MBPS           |       | NUMBER        |
| MAX_PMBPS          |       | NUMBER        |
| LATENCY            |       | NUMBER        |
| NUM_PHYSICAL_DISKS |       | NUMBER        |

```
comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is
'start time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is
'end time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is
'maximum number of data-block read requests that can be sustained per second'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is
'maximum megabytes per second of maximum-sized read requests that can be
sustained'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is
'maximum megabytes per second of large I/O requests that
can be sustained by a single process'
/
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is
'latency for data-block read requests'
/
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is
'number of physical disks in the storage subsystem (as specified by user)'
/
```

### 145.4.3 CLEAR\_PENDING\_AREA Procedure

This procedure clears pending changes for the resource manager.

#### Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

### 145.4.4 CREATE\_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans.

The view `DBA_RSRC_CATEGORIES` defines the currently defined categories. The `ADMINISTRATIVE`, `INTERACTIVE`, `BATCH`, `MAINTENANCE`, and `OTHER` categories are available.

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (
    category    IN    VARCHAR2,
    comment     IN    VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 145-4 CREATE\_CATEGORY Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| category  | Name of consumer group category |
| comment   | User comment                    |

## 145.4.5 CREATE\_CDB\_PLAN Procedure

Creates entries which define consolidation resource plans.

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN (
    plan        IN    VARCHAR2(32),
    comment     IN    VARCHAR2(2000) DEFAULT NULL);
```

## Parameters

**Table 145-5 CREATE\_CDB\_PLAN Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| plan      | Name of the consolidation plan |
| comment   | User comment                   |

## Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 145.4.6 CREATE\_CDB\_PLAN\_DIRECTIVE Procedure

This procedure creates the plan directives of the consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2,
    pluggable_database  IN    VARCHAR2,
    comment             IN    VARCHAR2 (2000) DEFAULT '',
    shares              IN    NUMBER          DEFAULT NULL,
    utilization_limit    IN    NUMBER          DEFAULT NULL,
    parallel_server_limit IN    NUMBER          DEFAULT NULL,
    memory_limit         IN    NUMBER          DEFAULT 100,
    memory_min          IN    NUMBER          DEFAULT 0);
```

## Parameters

**Table 145-6 CREATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plan</code>                  | Name of the consolidation plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>pluggable_database</code>    | Name of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>comment</code>               | User comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>shares</code>                | Specifies the share of resource allocation for the PDB. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>utilization_limit</code>     | Specifies the maximum percentage of the CDB's CPU and Exadata I/O resources that the PDB can utilize.<br><br>CPU Resource Manager and Exadata I/O Resource Manager can also be limited by setting the <code>CPU_COUNT</code> parameter for the PDB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>parallel_server_limit</code> | Parallel servers that the PDB can use after which parallel statements are queued. Alternatively, you can set the <code>parallel_servers_target</code> at the PDB level.<br><br>A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the <code>PARALLEL_SERVERS_TARGET</code> initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower limit is used.<br><br>For example, assume that the <code>parallel_servers_target</code> initialization parameter is set to 100 in the CDB root and <code>parallel_server_limit</code> is set to 70 for <code>hrpdb</code> in the CDB resource plan. Also, assume that <code>hrpdb</code> has its <code>parallel_servers_target</code> initialization parameter set to 50. In this case, the limit for parallel execution servers for <code>hrpdb</code> is 50, because 50 is lower than the CDB resource plan limit of 70 for <code>hrpdb</code> . |
| <code>memory_limit</code>          | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>memory_min</code>            | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Note:

Oracle recommends, that you use `parallel_servers_target` parameter instead of `parallel_servers_limit` in a CDB resource plan.

## Usage Notes

- The default value for `shares`, `utilization_limit`, and `parallel_server_limit` is `NULL`. When a user specifies `NULL`, or does not specify a value, this indicates that the default value should be used.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

## 145.4.7 CREATE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure creates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use the new performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the profile name.

This procedure provides an easy way to specify the directive for a large number of PDBs with the same resource requirements. Each PDB with a `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name inherits the settings specified by this directive, including the shares, utilization limit, and so on.

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE (
    plan           IN    VARCHAR2,
    profile        IN    VARCHAR2,
    comment        IN    VARCHAR2 (2000) DEFAULT '',
    shares         IN    NUMBER          DEFAULT NULL,
    utilization_limit IN    NUMBER          DEFAULT NULL,
    parallel_server_limit IN    NUMBER          DEFAULT NULL,
    memory_limit   IN    NUMBER          DEFAULT 100,
    memory_min     IN    NUMBER          DEFAULT 0);
```

## Parameters

**Table 145-7 CREATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plan</code>                  | Name of the consolidation plan                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>profile</code>               | Name of the performance profile                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>comment</code>               | User comment                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>shares</code>                | Specifies the share of resource allocation for PDBs that use the performance profile. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> . |
| <code>utilization_limit</code>     | Specifies the maximum percentage of CPU Resource Manager and Exadata I/O Resource Manager that PDBs that use the performance profile can utilize.                                                                                                                                                                                                                                                                                  |
| <code>parallel_server_limit</code> | Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use.                                                                                                                                                                                                                                                                                      |

**Table 145-7 (Cont.) CREATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| memory_limit | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache. |
| memory_min   | This parameter is only applicable to Oracle Exadata storage for configuring the Exadata Smart Flash Cache and Exadata PMEM Cache. |

## 145.4.8 CREATE\_CONSUMER\_GROUP Procedure

This procedure creates entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2,  
    comment        IN VARCHAR2 DEFAULT NULL,  
    cpu_mth        IN VARCHAR2 DEFAULT NULL,  
    mgmt_mth       IN VARCHAR2 DEFAULT 'ROUND-ROBIN',  
    category       IN VARCHAR2 DEFAULT 'OTHER');
```

### Parameters

**Table 145-8 CREATE\_CONSUMER\_GROUP Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| consumer_group | Name of the consumer group                                                                                                                                                                                                                                                                                                                                                                          |
| comment        | User comment                                                                                                                                                                                                                                                                                                                                                                                        |
| cpu_mth        | Name of CPU resource allocation method (deprecated)                                                                                                                                                                                                                                                                                                                                                 |
| mgmt_mth       | Name of CPU resource allocation method                                                                                                                                                                                                                                                                                                                                                              |
| category       | Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view DBA_RSRC_CATEGORIES defines the currently defined categories. Categories can be modified, using the <a href="#">CREATE_CATEGORY Procedure</a> , <a href="#">UPDATE_CATEGORY Procedure</a> , and <a href="#">DELETE_CATEGORY Procedure</a> . |

## 145.4.9 CREATE\_PENDING\_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

## Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

### Note:

Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

For resource plans, the following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

### Note:

These rules are not applicable for CDB resource plans.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the validate or submit procedures.

## 145.4.10 CREATE\_PLAN Procedure

This procedure creates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
    plan                IN    VARCHAR2,
    comment             IN    VARCHAR2 DEFAULT NULL,
    cpu_mth             IN    VARCHAR2 DEFAULT NULL, -- deprecated
    active_sess_pool_mth IN    VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
    parallel_degree_limit_mth IN    VARCHAR2 DEFAULT
                                'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
    queueing_mth        IN    VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
    mgmt_mth            IN    VARCHAR2 DEFAULT 'EMPHASIS',
    sub_plan            IN    BOOLEAN DEFAULT FALSE,
    max_iops            IN    NUMBER DEFAULT NULL,
    max_mbps            IN    NUMBER DEFAULT NULL);
```

### Parameters

**Table 145-9 CREATE\_PLAN Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                      | Name of the resource plan                                                                                                                                                                                                                                                                                                                                                                                      |
| comment                   | User comment                                                                                                                                                                                                                                                                                                                                                                                                   |
| cpu_mth                   | Allocation method for CPU resources (deprecated)                                                                                                                                                                                                                                                                                                                                                               |
| active_sess_pool_mth      | Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.                                                                                                                                                                                 |
| parallel_degree_limit_mth | Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.                                                                                                                                                                                                                                      |
| queueing_mth              | Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available                                                                                                                                                                                                                                                       |
| mgmt_mth                  | Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>• EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups</li> <li>• RATIO - for single-level plans that use ratios to specify how I/O resources are distributed</li> </ul> |
| sub_plan                  | If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.                                                                                                                                                                                                                                                      |
| max_iops                  | Nonoperative                                                                                                                                                                                                                                                                                                                                                                                                   |
| max_mbps                  | Nonoperative                                                                                                                                                                                                                                                                                                                                                                                                   |

## Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

## 145.4.11 CREATE\_PLAN\_DIRECTIVE Procedure

This procedure creates resource plan directives.

### Note:

The parameters `max_utilization_limit` and `parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (11.1.0.1), and are replaced by `utilization_limit` and `parallel_server_limit`.

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
    plan                IN VARCHAR2,
    group_or_subplan    IN VARCHAR2,
    comment             IN VARCHAR2 DEFAULT NULL,
    cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p2              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p3              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p4              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p5              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p6              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p7              IN NUMBER   DEFAULT NULL, -- deprecated
    cpu_p8              IN NUMBER   DEFAULT NULL, -- deprecated
    active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
    queueing_p1         IN NUMBER   DEFAULT NULL,
    parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
    switch_group        IN VARCHAR2 DEFAULT NULL,
    switch_time         IN NUMBER   DEFAULT NULL,
    switch_estimate     IN BOOLEAN  DEFAULT FALSE,
    max_est_exec_time   IN NUMBER   DEFAULT NULL,
    undo_pool           IN NUMBER   DEFAULT NULL,
    max_idle_time       IN NUMBER   DEFAULT NULL,
    max_idle_blocker_time IN NUMBER DEFAULT NULL,
    switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
    mgmt_p1             IN NUMBER   DEFAULT NULL,
    mgmt_p2             IN NUMBER   DEFAULT NULL,
    mgmt_p3             IN NUMBER   DEFAULT NULL,
    mgmt_p4             IN NUMBER   DEFAULT NULL,
    mgmt_p5             IN NUMBER   DEFAULT NULL,
    mgmt_p6             IN NUMBER   DEFAULT NULL,
    mgmt_p7             IN NUMBER   DEFAULT NULL,
    mgmt_p8             IN NUMBER   DEFAULT NULL,
    switch_io_megabytes IN NUMBER   DEFAULT NULL,
    switch_io_reqs      IN NUMBER   DEFAULT NULL,
    switch_for_call     IN BOOLEAN  DEFAULT NULL,
    max_utilization_limit IN NUMBER DEFAULT NULL, -- deprecated
    parallel_target_percentage IN NUMBER DEFAULT NULL, -- deprecated
    parallel_server_limit IN NUMBER DEFAULT NULL,
    utilization_limit    IN NUMBER   DEFAULT NULL,
    switch_io_logical    IN NUMBER   DEFAULT NULL,
    switch_elapsed_time  IN NUMBER   DEFAULT NULL,
```

```

shares                IN NUMBER    DEFAULT NULL,
parallel_stmt_critical IN VARCHAR2  DEFAULT NULL,
session_pga_limit      IN NUMBER    DEFAULT NULL,
pq_timeout_action      IN NUMBER    DEFAULT NULL,
parallel_queue_timeout IN NUMBER    DEFAULT NULL,);

```

**Note:**

Oracle recommends that you use `shares` instead of `mgmt_p*`.

**Parameters****Table 145-10 CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plan</code>                     | Name of the resource plan                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>group_or_subplan</code>         | Name of the consumer group or subplan                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>comment</code>                  | Comment for the plan directive                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>cpu_p1</code>                   | -- deprecated: use <code>mgmt_p1</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p2</code>                   | -- deprecated: use <code>mgmt_p2</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p3</code>                   | -- deprecated: use <code>mgmt_p3</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p4</code>                   | -- deprecated: use <code>mgmt_p4</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p5</code>                   | -- deprecated: use <code>mgmt_p5</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p6</code>                   | -- deprecated: use <code>mgmt_p6</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p7</code>                   | -- deprecated: use <code>mgmt_p7</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cpu_p8</code>                   | -- deprecated: use <code>mgmt_p8</code> or, even better, <code>shares</code> instead                                                                                                                                                                                                                                                                                                                                                                         |
| <code>active_sess_pool_p1</code>      | Specifies maximum number of sessions that can currently have an active call                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>queueing_p1</code>              | Specified time (in seconds) after which a call in the inactive session queue (waiting for execution) will time out. Default is <code>NULL</code> , which means unlimited.                                                                                                                                                                                                                                                                                    |
| <code>parallel_degree_limit_p1</code> | Specifies a limit on the degree of parallelism for any operation. Default is <code>NULL</code> , which means unlimited. If the value is 0, then all operations will be serial.                                                                                                                                                                                                                                                                               |
| <code>switch_group</code>             | Specifies consumer group to switch to, once a switch condition is met. If the group name is <code>CANCEL_SQL</code> , then the current call is canceled when the switch condition is met. If the group name is <code>KILL_SESSION</code> , then the session is killed when the switch condition is met. If the group name is <code>LOG_ONLY</code> , then no action is taken other than recording this event via SQL monitor. Default is <code>NULL</code> . |
| <code>switch_time</code>              | Specifies the time on CPU (not elapsed time) that a session can execute before an action is taken. Default is <code>NULL</code> , which means unlimited. As with other switch directives, if <code>switch_for_call</code> is <code>TRUE</code> , the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.                                                                     |

**Table 145-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| switch_estimate       | If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. This is used in conjunction with the <code>switch_time</code> directive. Default value is FALSE.                                                                                                        |
| max_est_exec_time     | Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than <code>MAX_EST_EXEC_TIME</code> , the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited. |
| undo_pool             | Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group                                                                                                                                                                                                                                           |
| max_idle_time         | Indicates the maximum session idle time. Default is NULL, which means unlimited.                                                                                                                                                                                                                                                                            |
| max_idle_blocker_time | Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource                                                                                                                                                                                                                                     |
| switch_time_in_call   | Deprecated. If this parameter is specified, <code>switch_time</code> is set to <code>switch_time_in_call</code> (in seconds) and <code>switch_for_call</code> is effectively set to TRUE. It is better to use <code>switch_time</code> and <code>switch_for_call</code> .                                                                                   |
| mgmt_p1               | Resource allocation value for level 1 (replaces <code>cpu_p1</code> ): <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the first level</li> <li>RATIO - specifies the weight of resource usage</li> </ul>                                                                                                            |
| mgmt_p2               | Resource allocation value for level 2 (replaces <code>cpu_p2</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the second level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                    |
| mgmt_p3               | Resource allocation value for level 3 (replaces <code>cpu_p3</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the third level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                     |
| mgmt_p4               | Resource allocation value for level 4 (replaces <code>cpu_p4</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the fourth level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                    |
| mgmt_p5               | Resource allocation value for level 5 (replaces <code>cpu_p5</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the fifth level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                     |
| mgmt_p6               | Resource allocation value for level 6 (replaces <code>cpu_p6</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the sixth level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                     |
| mgmt_p7               | Resource allocation value for level 7 (replaces <code>cpu_p7</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the seventh level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                   |
| mgmt_p8               | Resource allocation value for level 8 (replaces <code>cpu_p8</code> ) <ul style="list-style-type: none"> <li>EMPHASIS - specifies the resource percentage at the eighth level</li> <li>RATIO - non-applicable</li> </ul>                                                                                                                                    |

**Table 145-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>switch_io_megabytes</code>        | Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if <code>switch_for_call</code> is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.                                                                                  |
| <code>switch_io_reqs</code>             | Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if <code>switch_for_call</code> is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.                                                                                 |
| <code>switch_for_call</code>            | Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , <code>switch_io_reqs</code> , <code>switch_io_logical</code> or <code>switch_elapsed_time</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is NULL, which means that the original consumer group is not restored at the end of the top call. |
| <code>max_utilization_limit</code>      | -- deprecated: use <code>utilization_limit</code> instead                                                                                                                                                                                                                                                                                                                                                                          |
| <code>parallel_target_percentage</code> | -- deprecated: use <code>parallel_sever_limit</code> instead                                                                                                                                                                                                                                                                                                                                                                       |
| <code>parallel_queue_timeout</code>     | Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454).                                                                                                                                                                                                                                              |

 **Note:**

You can use the `pq_timeout_action` parameter to specify the action to be taken when a parallel statement is removed from the queue.

|                                   |                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>parallel_sever_limit</code> | Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that the Consumer Group can use, after which parallel statements are queued.                                                                                                                                                      |
| <code>utilization_limit</code>    | Resource limit. Currently it includes CPU and I/O for Exadata.<br>For CPU, this limits the CPU utilization for the consumer group.<br>For Exadata I/O, this limits the disk utilization for the consumer group.<br>This does not apply to parallel servers.                                                                 |
| <code>switch_io_logical</code>    | Number of logical IOs that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>switch_for_call</code> is TRUE, the number of logical IOs is accumulated from the start of a call. Otherwise, the number of logical IOs is accumulated for the length of the session. |
| <code>switch_elapsed_time</code>  | Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>switch_for_call</code> is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.                            |

**Table 145-10 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>shares</code>                 | Specifies the share of resource allocation for the consumer group. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each consumer group. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.                                                                                                                                                                               |
| <code>parallel_stmt_critical</code> | <p>If set to <code>BYPASS_QUEUE</code>, parallel statements from the Consumer Group are not queued, regardless of the <code>PARALLEL_DEGREE_POLICY</code> parameter value.</p> <p>If set to <code>QUEUE</code>, all the parallel statements from the consumer group, irrespective of the <code>parallel_degree_policy</code> parameter value, are eligible for queuing.</p> <p>Default is <code>FALSE</code>, which means that parallel statements are eligible for queuing, based on the <code>parallel_degree_policy</code> parameter value.</p> |
| <code>session_pga_limit</code>      | <p>Maximum amount of untunable PGA (in MB) that a session in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no limit.</p> <p>SQL operations that allocate tunable PGA (operations that can opt to use temp space) are not controlled by this limit.</p>                                                                                                                                                                                                                                           |
| <code>pq_timeout_action</code>      | <p>Specifies the action to be taken when a parallel statement is removed from the queue due to <code>parallel_queue_timeout</code>.</p> <p>The values are:</p> <ul style="list-style-type: none"> <li><code>CANCEL</code> — The parallel statement is terminated with error <code>ORA-7454</code></li> <li><code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable</li> </ul> <p>The default action of this parameter is <code>CANCEL</code>.</p>                                      |

#### Usage Notes

- All parameters default to `NULL`.
- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_for_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_for_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.
- An error is thrown if `PQ_TIMEOUT_ACTION` is specified, but `PARALLEL_QUEUE_TIMEOUT` is not specified.
- Specifies the action to be taken when a parallel statement is removed from the queue.

## 145.4.12 CREATE\_SIMPLE\_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan,

or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

## Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
    simple_plan      IN  VARCHAR2  DEFAULT NULL,
    consumer_group1  IN  VARCHAR2  DEFAULT NULL,
    group1_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group2  IN  VARCHAR2  DEFAULT NULL,
    group2_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group3  IN  VARCHAR2  DEFAULT NULL,
    group3_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group4  IN  VARCHAR2  DEFAULT NULL,
    group4_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group5  IN  VARCHAR2  DEFAULT NULL,
    group5_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group6  IN  VARCHAR2  DEFAULT NULL,
    group6_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group7  IN  VARCHAR2  DEFAULT NULL,
    group7_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    consumer_group8  IN  VARCHAR2  DEFAULT NULL,
    group8_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
    group1_percent   IN  NUMBER     DEFAULT NULL,
    group2_percent   IN  NUMBER     DEFAULT NULL,
    group3_percent   IN  NUMBER     DEFAULT NULL,
    group4_percent   IN  NUMBER     DEFAULT NULL,
    group5_percent   IN  NUMBER     DEFAULT NULL,
    group6_percent   IN  NUMBER     DEFAULT NULL,
    group7_percent   IN  NUMBER     DEFAULT NULL,
    group8_percent   IN  NUMBER     DEFAULT NULL);
```

## Parameters

**Table 145-11** `CREATE_SIMPLE_PLAN` Procedure Parameters

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>simple_plan</code>     | Name of the resource plan         |
| <code>consumer_group1</code> | Name of the consumer group        |
| <code>group1_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group2</code> | Name of the consumer group        |
| <code>group2_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group3</code> | Name of the consumer group        |
| <code>group3_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group4</code> | Name of the consumer group        |
| <code>group4_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group5</code> | Name of the consumer group        |
| <code>group5_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group6</code> | Name of the consumer group        |
| <code>group6_cpu</code>      | Percentage for group (deprecated) |
| <code>consumer_group7</code> | Name of the consumer group        |
| <code>group7_cpu</code>      | Percentage for group (deprecated) |

**Table 145-11 (Cont.) CREATE\_SIMPLE\_PLAN Procedure Parameters**

| Parameter       | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| consumer_group8 | OTHER_GROUPS - all sessions that aren't mapped to a consumer group. |
| group8_cpu      | Percentage for group (deprecated)                                   |
| group1_percent  | Percentage of resources allocated for this consumer group           |
| group2_percent  | Percentage of resources allocated for this consumer group           |
| group3_percent  | Percentage of resources allocated for this consumer group           |
| group4_percent  | Percentage of resources allocated for this consumer group           |
| group5_percent  | Percentage of resources allocated for this consumer group           |
| group6_percent  | Percentage of resources allocated for this consumer group           |
| group7_percent  | Percentage of resources allocated for this consumer group           |
| group8_percent  | Percentage of resources allocated to other groups                   |

### 145.4.13 DELETE\_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

#### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (  
    category          IN      VARCHAR2);
```

#### Parameters

**Table 145-12 DELETE\_CATEGORY Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| category  | Name of consumer group category |

### 145.4.14 DELETE\_CDB\_PLAN Procedure

This procedure deletes the consolidation resource plan.

#### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN (  
    plan      IN      VARCHAR2(32)    DEFAULT NULL);
```

#### Parameters

**Table 145-13 DELETE\_CDB\_PLAN Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| plan      | Name of the consolidation plan |

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 145.4.15 DELETE\_CDB\_PLAN\_DIRECTIVE Procedure

This procedure deletes the plan directives of the consolidation resource plan. Once the plan directive is deleted, the pluggable database will get the default resource allocation.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN_DIRECTIVE (  
    plan                IN    VARCHAR2(32)    DEFAULT NULL,  
    pluggable_database  IN    VARCHAR2(32)    DEFAULT NULL);
```

### Parameters

**Table 145-14 DELETE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter          | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| plan               | Name of the consolidation plan                                              |
| pluggable_database | Name of the pluggable database in which the plan directive is to be deleted |

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 145.4.16 DELETE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure deletes the performance profile directive of the consolidation resource plan. Once the directive is deleted, the pluggable databases (PDBs) that use the performance profile use the default resource allocation.

For a PDB to use a performance profile, the PDB must have the DB\_PERFORMANCE\_PROFILE initialization parameter set to the performance profile name.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PROFILE_DIRECTIVE (  
    plan        IN    VARCHAR2(32)    DEFAULT NULL,  
    profile      IN    VARCHAR2(32)    DEFAULT NULL);
```

### Parameters

**Table 145-15 DELETE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| plan      | Name of the consolidation plan                          |
| profile   | Name of the performance profile directive to be deleted |

### Usage Notes

This procedure can be run only from the CDB root (CDB\$ROOT).

## 145.4.17 DELETE\_CONSUMER\_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 145-16 DELETE\_CONSUMER\_GROUP Procedure Parameters**

| Parameters     | Description                              |
|----------------|------------------------------------------|
| consumer_group | Name of the consumer group to be deleted |

## 145.4.18 DELETE\_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (  
    plan IN VARCHAR2);
```

### Parameters

**Table 145-17 DELETE\_PLAN Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| plan      | Name of the resource plan to delete |

## 145.4.19 DELETE\_PLAN\_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (  
    plan IN VARCHAR2);
```

### Parameters

**Table 145-18 DELETE\_PLAN\_CASCADE Procedure Parameters**

| Parameters | Description      |
|------------|------------------|
| plan       | Name of the plan |

### Usage Notes

If `DELETE_PLAN_CASCADE` encounters any error, then it rolls back the operation, and nothing is deleted.

## 145.4.20 DELETE\_PLAN\_DIRECTIVE Procedure

This procedure deletes resource plan directives.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (  
    plan                IN VARCHAR2,  
    group_or_subplan    IN VARCHAR2);
```

### Parameters

**Table 145-19** DELETE\_PLAN\_DIRECTIVE Procedure Parameters

| Parameter        | Description                  |
|------------------|------------------------------|
| plan             | Name of the resource plan    |
| group_or_subplan | Name of the group or subplan |

## 145.4.21 DEQUEUE\_PARALLEL\_STATEMENT Procedure

This procedure dequeues a parallel statement from the parallel statement queue.

If the `PARALLEL_DEGREE_POLICY` initialization parameter is set to `AUTO` or `ADAPTIVE`, then parallel statement queuing is enabled. If a parallel statement is in the parallel statement queue, then you can use this procedure to dequeue the parallel statement so that it runs immediately.

### Syntax

```
DBMS_RESOURCE_MANAGER.DEQUEUE_PARALLEL_STATEMENT (  
    session_id          IN  PLS_INTEGER,  
    session_serial      IN  PLS_INTEGER,  
    inst_id             IN  PLS_INTEGER DEFAULT NULL,  
    sql_id              IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 145-20** DEQUEUE\_PARALLEL\_STATEMENT Procedure Parameters

| Parameter      | Description                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| session_id     | The session id of the session running the parallel statement to be dequeued.                                                                 |
| session_serial | The serial number of the session.                                                                                                            |
| inst_id        | Instance ID where the session is running.<br>If <code>NULL</code> , then the current instance is used.                                       |
| sql_id         | The SQL ID of the session's statement to dequeue. If the session is running SQL with a different SQL ID, then the statement is not dequeued. |

## 145.4.22 END\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

### Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

### Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

## 145.4.23 SET\_CONSUMER\_GROUP\_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
    attribute      IN VARCHAR2,
    value          IN VARCHAR2,
    consumer_group IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 145-21 SET\_CONSUMER\_GROUP\_MAPPING Procedure Parameters**

| Parameters     | Description                                                                                |
|----------------|--------------------------------------------------------------------------------------------|
| attribute      | Mapping attribute to add or modify. It can be one of the <a href="#">Constants</a> listed. |
| value          | Attribute value to match. This includes both absolute mapping and regular expressions.     |
| consumer_group | Name of the mapped consumer group, or NULL to delete a mapping                             |

### Usage Notes

- If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.
- The subprogram supports simple regex expressions for the `value` parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '\_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:

```
— CLIENT_OS_USER
— CLIENT_PROGRAM
— CLIENT_MACHINE
— MODULE_NAME
```

- MODULE\_NAME\_ACTION
- SERVICE\_MODULE
- SERVICE\_MODULE\_ACTION
- Consumer group mapping comparisons for `DBMS_RESOURCE_MANAGER.CLIENT_PROGRAM` are performed by stripping the @ sign and following characters from `V$SESSION.PROGRAM` before comparing it to the `CLIENT_PROGRAM` value supplied.

## 145.4.24 SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
    explicit          IN NUMBER,
    oracle_user       IN NUMBER,
    service_name      IN NUMBER,
    client_os_user    IN NUMBER,
    client_program    IN NUMBER,
    client_machine    IN NUMBER,
    module_name       IN NUMBER,
    module_name_action IN NUMBER,
    service_module    IN NUMBER,
    service_module_action IN NUMBER,
    client_id         IN NUMBER DEFAULT 11);
```

### Parameters

**Table 145-22 SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure Parameters**

| Parameters                      | Description                                                                           |
|---------------------------------|---------------------------------------------------------------------------------------|
| <code>explicit</code>           | Priority of the explicit mapping                                                      |
| <code>oracle_user</code>        | Priority of the Oracle user name mapping                                              |
| <code>service_name</code>       | Priority of the client service name mapping                                           |
| <code>client_os_user</code>     | Priority of the client operating system user name mapping                             |
| <code>client_program</code>     | Priority of the client program mapping                                                |
| <code>client_machine</code>     | Priority of the client machine mapping                                                |
| <code>module_name</code>        | Priority of the application module name mapping                                       |
| <code>module_name_action</code> | Priority of the application module name and action mapping                            |
| <code>service_module</code>     | Priority of the service name and application module name mapping                      |
| <code>module_name_action</code> | Priority of the service name, application module name, and application action mapping |
| <code>client_id</code>          | Client identifier                                                                     |

### Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:

- DBMS\_SESSION.SWITCH\_CURRENT\_CONSUMER\_GROUP
- DBMS\_RESOURCE\_MANAGER.SWITCH\_CONSUMER\_GROUP\_FOR\_SESS
- DBMS\_RESOURCE\_MANAGER.SWITCH\_CONSUMER\_GROUP\_FOR\_USER
- Each priority value must be a unique integer from 1 to 11. Together, they establish an ordering where 1 is the highest priority and 11 is the lowest.

## 145.4.25 SET\_INITIAL\_CONSUMER\_GROUP Procedure

This deprecated procedure sets the initial resource consumer group for a user.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs.

### Note:

This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN   VARCHAR2,
    consumer_group IN   VARCHAR2);
```

### Parameters

**Table 145-23 SET\_INITIAL\_CONSUMER\_GROUP Procedure Parameters**

| Parameters     | Description                   |
|----------------|-------------------------------|
| user           | Name of the user              |
| consumer_group | User's initial consumer group |

### Usage Notes

- The ADMINISTER\_RESOURCE\_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

### Note:

These semantics are similar to those for ALTER USER DEFAULT ROLE.

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT\_CONSUMER\_GROUP.

- `DEFAULT_CONSUMER_GROUP` has switch privileges granted to `PUBLIC`; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to `DEFAULT_CONSUMER_GROUP`.

## 145.4.26 SUBMIT\_PENDING\_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

### Note:

A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

### Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

## 145.4.27 SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any parallel execution servers that are related to the top user session. This procedure is RAC instance specific. You need to connect to the PDB in same RAC instance where the session to be switched is running, and then run this procedure.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
    session_id      IN NUMBER,
    session_serial  IN NUMBER,
    consumer_group  IN VARCHAR2);
```

### Parameters

**Table 145-24 SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure Parameters**

| Parameter                   | Description                                        |
|-----------------------------|----------------------------------------------------|
| <code>session_id</code>     | SID column from the view <code>V\$SESSION</code>   |
| <code>session_serial</code> | SERIAL# column from view <code>V\$SESSION</code> . |
| <code>consumer_group</code> | Name of the consumer group to which to switch      |

### Note:

Specifying a value of `'KILL_SESSION'` for the `CONSUMER_GROUP` parameter is not permitted. It will return error `ORA-29366: invalid CONSUMER_GROUP argument specified`.

## 145.4.28 SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any parallel execution servers that are related to the top user session.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user          IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 145-25 SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure Parameters**

| Parameter      | Description                                   |
|----------------|-----------------------------------------------|
| user           | Name of the user                              |
| consumer_group | Name of the consumer group to which to switch |

### Usage Notes

- The [SWITCH\\_CONSUMER\\_GROUP\\_FOR\\_SESS Procedure](#) and the SWITCH\_CONSUMER\_GROUP\_FOR\_USER procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

## 145.4.29 SWITCH\_PLAN Procedure

This procedure sets the current resource manager plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name      IN   VARCHAR2,
    sid            IN   VARCHAR2 DEFAULT '*',
    allow_scheduler_plan_switches IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 145-26 SWITCH\_PLAN Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_name | Name of the plan to which to switch. Passing in an empty string (") for the plan_name, disables the resource manager                                                                                                                                                                                 |
| sid       | The sid parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances. |

**Table 145-26 (Cont.) SWITCH\_PLAN Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow_scheduler_plan_switches | FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenable automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled. |

## 145.4.30 UPDATE\_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
    category      IN    VARCHAR2,
    new_comment   IN    VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 145-27 UPDATE\_CATEGORY Procedure Parameters**

| Parameter   | Description                     |
|-------------|---------------------------------|
| category    | Name of consumer group category |
| new_comment | User comment                    |

### Usage Notes

To clear (reset to the directive's default value), use the value -1.

## 145.4.31 UPDATE\_CDB\_AUTOTASK\_DIRECTIVE Procedure

This procedure updates the plan directives with regard to automated maintenance tasks in the CDB root (CDB\$ROOT).

By default, all maintenance tasks occur directly in the PDBs themselves.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_AUTOTASK_DIRECTIVE (
    plan              IN    VARCHAR2,
    new_comment       IN    VARCHAR2  DEFAULT NULL,
    new_shares        IN    NUMBER     DEFAULT NULL,
    new_utilization_limit IN    NUMBER     DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER     DEFAULT NULL,
    new_memory_limit  IN    NUMBER     DEFAULT NULL,
    new_memory_min    IN    NUMBER     DEFAULT NULL);
```

## Parameters

**Table 145-28 UPDATE\_CDB\_AUTOTASK\_DIRECTIVE Procedure Parameters**

| Parameter                 | Description                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                      | Name of the consolidation plan                                                                                                                       |
| new_comment               | New user comment                                                                                                                                     |
| new_shares                | Specifies the new share of resource allocation for CDB root's automated maintenance tasks                                                            |
| new_utilization_limit     | Specifies the new maximum percentage of CPU that automated maintenance tasks in the CDB root can utilize                                             |
| new_parallel_server_limit | Specifies the new maximum percentage of parallel_servers_target parallel servers that automated maintenance tasks in the CDB root are allowed to use |
| new_memory_limit          | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.                           |
| new_memory_min            | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.                           |

## Usage Notes

- By default for automated maintenance tasks, the values are
  - shares: -1
  - utilization\_limit: 90
  - parallel\_server\_limit: 100
- The shares = -1 means that the automated maintenance tasks get an allocation of 20% of the system. If the user specifies the shares, it behaves the same properties as the other CDB plan directive functions. If the user does not change the shares or later changes it back to -1, autotask will get 20% of the system.
- This procedure can be run only from the CDB root.
- To clear (reset to the directive's default value), use the value -1.

## 145.4.32 UPDATE\_CDB\_DEFAULT\_DIRECTIVE Procedure

This procedure updates the plan directives of the consolidation resource plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_DEFAULT_DIRECTIVE (
  plan                IN   VARCHAR2    DEFAULT NULL,
  new_comment         IN   VARCHAR2    DEFAULT NULL,
  new_shares          IN   NUMBER       DEFAULT NULL,
  new_utilization_limit IN   NUMBER       DEFAULT NULL,
  new_parallel_server_limit IN   NUMBER   DEFAULT NULL,
  new_memory_limit    IN   NUMBER       DEFAULT NULL,
  new_memory_min      IN   NUMBER       DEFAULT NULL);
```

## Parameters

**Table 145-29 UPDATE\_CDB\_DEFAULT\_DIRECTIVE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                      | Name of the consolidation plan                                                                                                                                                                                                                                 |
| new_comment               | New user comment                                                                                                                                                                                                                                               |
| new_shares                | Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>new_shares</code> parameter is also used for Parallel Statement Queuing. |
| new_utilization_limit     | Specifies the maximum percentage of CPU that the pluggable database can utilize.                                                                                                                                                                               |
| new_parallel_server_limit | Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that the pluggable database can use.                                                                                                                                 |
| new_memory_limit          | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.                                                                                                                                     |
| new_memory_min            | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.                                                                                                                                     |

## Usage Notes

- By default, the default values are
  - `new_shares: 1`
  - `utilization_limit: 100`
  - `parallel_server_limit: 100`
- Note that the default values are `NULL`. This has the same meaning as in [UPDATE\\_CDB\\_PLAN\\_DIRECTIVE Procedure](#). If the user does not specify a value, the value will not be modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

## 145.4.33 UPDATE\_CDB\_PLAN Procedure

This procedure updates the consolidation resource plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN (
  plan          IN  VARCHAR2(32),
  new_comment   IN  VARCHAR2(2000) DEFAULT NULL);
```

## Parameters

**Table 145-30 UPDATE\_CDB\_PLAN Procedure Parameters**

| Parameter   | Description                    |
|-------------|--------------------------------|
| plan        | Name of the consolidation plan |
| new_comment | User comment                   |

## Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value -1.

## 145.4.34 UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure

Updates the plan directives for a consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

## Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN_DIRECTIVE (
    plan                IN    VARCHAR2 (30),
    pluggable_database  IN    VARCHAR2 (30)
    new_comment         IN    VARCHAR2 (200) DEFAULT NULL,
    new_shares          IN    NUMBER          DEFAULT NULL,
    new_utilization_limit IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
    new_memory_limit    IN    NUMBER          DEFAULT NULL,
    new_memory_min      IN    NUMBER          DEFAULT NULL);
```

## Parameters

**Table 145-31 UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                      | Name of the consolidation plan                                                                                                                                                                                                                                                                                                                                                |
| pluggable_database        | Name of the pluggable database                                                                                                                                                                                                                                                                                                                                                |
| new_comment               | New user comment                                                                                                                                                                                                                                                                                                                                                              |
| new_shares                | The share of resource allocation for the pluggable database<br>CPU Resource Manager is enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through the <a href="#">UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</a> . |
| new_utilization_limit     | The new maximum percentage of CPU that the pluggable database can utilize                                                                                                                                                                                                                                                                                                     |
| new_parallel_server_limit | The new maximum percentage of<br><code>parallel_servers_target</code> parallel servers that the pluggable database can use                                                                                                                                                                                                                                                    |

**Table 145-31 (Cont.) UPDATE\_CDB\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                     | Description                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>new_memory_limit</code> | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |
| <code>new_memory_min</code>   | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache. |

**Usage Notes**

- The default value for the `new_*` parameters is `NULL` which indicates that the existing value is left unchanged. If the user does not specify one of the arguments when calling this function, the value is not modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).
- To clear (reset to the directive's default value), use the value `-1`.

## 145.4.35 UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure

This procedure updates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use a performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name.

**Syntax**

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PROFILE_DIRECTIVE (
    plan          IN    VARCHAR2,
    profile       IN    VARCHAR2,
    new_comment   IN    VARCHAR2 (2000) DEFAULT '',
    new_shares    IN    NUMBER          DEFAULT NULL,
    new_utilization_limit IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit IN    NUMBER          DEFAULT NULL,
    new_memory_limit IN    NUMBER          DEFAULT 100,
    new_memory_min IN    NUMBER          DEFAULT 0);
```

**Parameters****Table 145-32 UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

| Parameter                          | Description                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------|
| <code>plan</code>                  | Name of the consolidation plan                                                       |
| <code>profile</code>               | Name of the performance profile                                                      |
| <code>new_comment</code>           | New user comment                                                                     |
| <code>new_shares</code>            | The share of resource allocation for the PDBs that use the performance profile       |
| <code>new_utilization_limit</code> | The new maximum percentage of CPU that PDBs that use the performance profile can use |

**Table 145-32 (Cont.) UPDATE\_CDB\_PROFILE\_DIRECTIVE Procedure Parameters**

| Parameter                              | Description                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <code>new_parallel_server_limit</code> | The new maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use |
| <code>new_memory_limit</code>          | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.             |
| <code>new_memory_min</code>            | This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache and PMEM Cache.             |

#### Usage Notes

- This procedure can be run only from the CDB root (CDB\$ROOT).
- To clear (reset to the directive's default value), use the value -1.

## 145.4.36 UPDATE\_CONSUMER\_GROUP Procedure

This procedure updates entries which define resource consumer groups.

#### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2,
    new_comment    IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth   IN VARCHAR2 DEFAULT NULL,
    new_category   IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 145-33 UPDATE\_CONSUMER\_GROUP Procedure Parameter**

| Parameter                   | Description                                                 |
|-----------------------------|-------------------------------------------------------------|
| <code>consumer_group</code> | Name of consumer group                                      |
| <code>new_comment</code>    | New user comment                                            |
| <code>new_cpu_mth</code>    | Name of new method for CPU resource allocation (deprecated) |
| <code>new_mgmt_mth</code>   | Name of new method for CPU resource allocation              |
| <code>new_category</code>   | New consumer group category                                 |

#### Usage Notes

- If the parameters to the `UPDATE_CONSUMER_GROUP` procedure are not specified, then they remain unchanged in the data dictionary.
- To clear (reset to the directive's default value), use the value -1.

## 145.4.37 UPDATE\_PLAN Procedure

This procedure updates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan                                IN VARCHAR2,
    new_comment                         IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth                        IN VARCHAR2 DEFAULT NULL, -- deprecated
    new_active_sess_pool_mth          IN VARCHAR2 DEFAULT NULL,
    new_parallel_degree_limit_mth     IN VARCHAR2 DEFAULT NULL,
    new_queueing_mth                  IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth                      IN VARCHAR2 DEFAULT NULL,
    new_sub_plan                       IN BOOLEAN DEFAULT FALSE,
    new_max_iops                      IN NUMBER DEFAULT NULL,
    new_max_mbps                      IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 145-34 UPDATE\_PLAN Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                          | Name of resource plan                                                                                                                                                                                                                                                                                                                                                                                        |
| new_comment                   | New user comment                                                                                                                                                                                                                                                                                                                                                                                             |
| new_cpu_mth                   | Name of new allocation method for CPU resources (deprecated)                                                                                                                                                                                                                                                                                                                                                 |
| new_active_sess_pool_mth      | Name of new method for maximum active sessions                                                                                                                                                                                                                                                                                                                                                               |
| new_parallel_degree_limit_mth | Name of new method for degree of parallelism                                                                                                                                                                                                                                                                                                                                                                 |
| new_queueing_mth              | Specifies type of queuing policy to use with active session pool feature                                                                                                                                                                                                                                                                                                                                     |
| new_mgmt_mth                  | Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups.</li> <li>RATIO - for single-level plans that use ratios to specify how I/O resources are distributed.</li> </ul> |
| new_sub_plan                  | New setting for whether the plan is only intended for use as a sub-plan                                                                                                                                                                                                                                                                                                                                      |
| new_max_iops                  | Nonoperative                                                                                                                                                                                                                                                                                                                                                                                                 |
| new_max_mbps                  | Nonoperative                                                                                                                                                                                                                                                                                                                                                                                                 |

### Usage Notes

- If the parameters to [UPDATE\\_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.
- To clear (reset to the directive's default value), use the value -1.

## 145.4.38 UPDATE\_PLAN\_DIRECTIVE Procedure

This procedure updates resource plan directives.

### Note:

The parameters `new_max_utilization_limit` and `new_parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (12.1.0.1), and are replaced by `new_utilization_limit` and `new_parallel_server_limit`.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
    plan                      IN VARCHAR2,
    group_or_subplan          IN VARCHAR2,
    new_comment               IN VARCHAR2 DEFAULT NULL,
    new_cpu_p1                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p2                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p3                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p4                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p5                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p6                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p7                IN NUMBER   DEFAULT NULL, -- deprecated
    new_cpu_p8                IN NUMBER   DEFAULT NULL, -- deprecated
    new_active_sess_pool_p1   IN NUMBER   DEFAULT NULL,
    new_queueing_p1           IN NUMBER   DEFAULT NULL,
    new_parallel_degree_limit_p1 IN NUMBER   DEFAULT NULL,
    new_switch_group          IN VARCHAR2 DEFAULT NULL,
    new_switch_time           IN NUMBER   DEFAULT NULL,
    new_switch_estimate       IN BOOLEAN  DEFAULT FALSE,
    new_max_est_exec_time     IN NUMBER   DEFAULT NULL,
    new_undo_pool             IN NUMBER   DEFAULT NULL,
    new_max_idle_time         IN NUMBER   DEFAULT NULL,
    new_max_idle_blocker_time IN NUMBER   DEFAULT NULL,
    switch_time_in_call        IN NUMBER   DEFAULT NULL, -- deprecated
    new_mgmt_p1               IN NUMBER   DEFAULT NULL,
    new_mgmt_p2               IN NUMBER   DEFAULT NULL,
    new_mgmt_p3               IN NUMBER   DEFAULT NULL,
    new_mgmt_p4               IN NUMBER   DEFAULT NULL,
    new_mgmt_p5               IN NUMBER   DEFAULT NULL,
    new_mgmt_p6               IN NUMBER   DEFAULT NULL,
    new_mgmt_p7               IN NUMBER   DEFAULT NULL,
    new_mgmt_p8               IN NUMBER   DEFAULT NULL,
    new_switch_io_megabytes   IN NUMBER   DEFAULT NULL,
    new_switch_io_reqs        IN NUMBER   DEFAULT NULL,
    new_switch_for_call       IN BOOLEAN  DEFAULT NULL,
    new_max_utilization_limit IN NUMBER   DEFAULT NULL,
    new_parallel_target_percentage IN NUMBER   DEFAULT NULL,
    new_parallel_queue_timeout IN NUMBER   DEFAULT NULL,
    new_parallel_server_limit IN NUMBER   DEFAULT NULL,
    new_utilization_limit     IN NUMBER   DEFAULT NULL,
    new_switch_io_logical     IN NUMBER   DEFAULT NULL,
    new_switch_elapsed_time   IN NUMBER   DEFAULT NULL,
    new_shares                IN NUMBER   DEFAULT NULL,
    new_parallel_stmt_critical IN VARCHAR2 DEFAULT NULL,
```

```

new_session_pga_limit      IN NUMBER      DEFAULT NULL,
new_pq_timeout_action      IN NUMBER      DEFAULT NULL);

```

## Parameters

**Table 145-35 UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan                         | Name of the resource plan                                                                                                                                                                                                                                                                                                                     |
| group_or_subplan             | Name of the consumer group or subplan                                                                                                                                                                                                                                                                                                         |
| new_comment                  | Comment for the plan directive                                                                                                                                                                                                                                                                                                                |
| new_cpu_p1                   | Deprecated - use new_mgmt_p1 instead                                                                                                                                                                                                                                                                                                          |
| new_cpu_p2                   | Deprecated - use new_mgmt_p2 instead                                                                                                                                                                                                                                                                                                          |
| new_cpu_p3                   | Deprecated - use new_mgmt_p3 instead                                                                                                                                                                                                                                                                                                          |
| new_cpu_p4                   | Deprecated- use new_mgmt_p4 instead                                                                                                                                                                                                                                                                                                           |
| new_cpu_p5                   | Deprecated - use new_mgmt_p5 instead                                                                                                                                                                                                                                                                                                          |
| new_cpu_p6                   | Deprecated- use new_mgmt_p6 instead                                                                                                                                                                                                                                                                                                           |
| new_cpu_p7                   | Deprecated- use new_mgmt_p7 instead                                                                                                                                                                                                                                                                                                           |
| new_cpu_p8                   | Deprecated- use new_mgmt_p8 instead                                                                                                                                                                                                                                                                                                           |
| new_active_sess_pool_p1      | Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.                                                                                                                                                                                                                        |
| new_queueing_p1              | Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.                                                                                                                                                                                    |
| new_parallel_degree_limit_p1 | Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.                                                                                                                                                                                                                                     |
| new_switch_group             | Specifies consumer group to which this session is switched if other switch criteria are met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.                    |
| new_switch_time              | Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.                                                                                                                                                                                                                 |
| new_switch_estimate          | If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.                                                                                                                                                                         |
| new_max_est_exec_time        | Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited. |
| new_undo_pool                | Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group                                                                                                                                                                                                                             |
| new_max_idle_time            | Indicates the maximum session idle time. Default is NULL, which means unlimited.                                                                                                                                                                                                                                                              |
| new_max_idle_blocker_time    | Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource                                                                                                                                                                                                                       |

**Table 145-35 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>new_switch_time_in_call</code>        | Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to <code>TRUE</code> .                                                                                                                                                                |
| <code>new_mgmt_p1</code>                    | Resource allocation value for level 1 (replaces <code>new_cpu_p1</code> ): <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the first level</li> <li>• <code>RATIO</code> - specifies the weight of resource usage</li> </ul>                                                                                                          |
| <code>new_mgmt_p2</code>                    | Resource allocation value for level 2 (replaces <code>new_cpu_p2</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the second level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                  |
| <code>new_mgmt_p3</code>                    | Resource allocation value for level 3 (replaces <code>new_cpu_p3</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the third level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                   |
| <code>new_mgmt_p4</code>                    | Resource allocation value for level 4 (replaces <code>new_cpu_p4</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the fourth level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                  |
| <code>new_mgmt_p5</code>                    | Resource allocation value for level 5 (replaces <code>new_cpu_p5</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the fifth level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                   |
| <code>new_mgmt_p6</code>                    | Resource allocation value for level 6 (replaces <code>new_cpu_p6</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the sixth level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                   |
| <code>new_mgmt_p7</code>                    | Resource allocation value for level 7 (replaces <code>new_cpu_p7</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the seventh level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                 |
| <code>new_mgmt_p8</code>                    | Resource allocation value for level 8 (replaces <code>new_cpu_p8</code> ) <ul style="list-style-type: none"> <li>• <code>EMPHASIS</code> - specifies the resource percentage at the eighth level</li> <li>• <code>RATIO</code> - non-applicable</li> </ul>                                                                                                                                  |
| <code>new_switch_io_megabytes</code>        | Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.                                                                                                                                                                                                                                               |
| <code>new_switch_io_reqs</code>             | Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.                                                                                                                                                                                                                                              |
| <code>new_switch_for_call</code>            | Specifies that if an action is taken because of the <code>new_switch_time</code> , <code>new_switch_io_megabytes</code> , or <code>new_switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call. |
| <code>new_max_utilization_limit</code>      | Deprecated - use <code>new_utilization_limit</code> instead                                                                                                                                                                                                                                                                                                                                 |
| <code>new_parallel_target_percentage</code> | Deprecated - use <code>new_parallel_server_limit</code> instead                                                                                                                                                                                                                                                                                                                             |
| <code>new_parallel_server_limit</code>      | Parallel server limit. Setting this overwrites the limit for parallel server set by <code>utilization_limit</code> .                                                                                                                                                                                                                                                                        |

**Table 145-35 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>new_utilization_limit</code>      | Resource limit. For CPU, this limits the CPU utilization for the consumer group. For parallel servers, this limits the parallel servers used as a percentage of <code>parallel_servers_target</code> .                                                                                                                                                                                                                                                                      |
| <code>new_switch_elapsed_time</code>    | Elapsed time that will trigger the action specified by <code>switch_group</code> . As with other switch directives, if <code>new_switch_for_call</code> is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.                                                                                                                                                                        |
| <code>new_shares</code>                 | Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>shares</code> parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.                                                                                                               |
| <code>new_parallel_stmt_critical</code> | <p>If set to <code>BYPASS_QUEUE</code>, parallel statements from this consumer group are not queued.</p> <p>If set to <code>QUEUE</code>, all the parallel statements, irrespective of the <code>parallel_degree_policy</code> parameter value, from the consumer group get queued.</p> <p>Default is <code>FALSE</code>, which means that certain parallel statements are eligible for queuing depending upon the <code>parallel_degree_policy</code> parameter value.</p> |
| <code>new_session_pga_limit</code>      | Maximum amount of PGA in MB that sessions in this consumer group can allocate before being terminated. <code>NULL</code> (default) indicates no change.                                                                                                                                                                                                                                                                                                                     |
| <code>new_parallel_queue_timeout</code> | <p>Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed.</p> <p>The default action of this parameter is <code>ERROR</code>. This action can be altered using the <code>new_pq_timeout_action</code> parameter.</p>                                                                                                                                                                    |
| <code>new_pq_timeout_action</code>      | <p>Specifies the action to be taken when a parallel statement is removed from the queue due to <code>new_parallel_queue_timeout</code>.</p> <p>The values are:</p> <ul style="list-style-type: none"> <li><code>CANCEL</code> — The SQL statement is terminated with error <code>ORA-7454</code></li> <li><code>RUN</code> — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable</li> </ul>                                    |

#### Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (reset to the directive's default value), use the value `-1`.

## 145.4.39 VALIDATE\_PENDING\_AREA Procedure

This procedure validates pending changes for the resource manager.

### Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

# DBMS\_RESOURCE\_MANAGER\_PRIVS

The DBMS\_RESOURCE\_MANAGER\_PRIVS package maintains privileges associated with the Resource Manager.

This chapter contains the following topics:

- [Summary of DBMS\\_RESOURCE\\_MANAGER\\_PRIVS Subprograms](#)

**See Also:**

For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*

## 146.1 Summary of DBMS\_RESOURCE\_MANAGER\_PRIVS Subprograms

This table lists the DBMS\_RESOURCE\_MANAGER\_PRIVS subprograms and briefly describes them.

**Table 146-1 DBMS\_RESOURCE\_MANAGER\_PRIVS Package Subprograms**

| Subprogram                                             | Description                                                  |
|--------------------------------------------------------|--------------------------------------------------------------|
| <a href="#">GRANT_SWITCH_CONSUMER_GROUP Procedure</a>  | Grants the privilege to switch to resource consumer groups   |
| <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>       | Performs a grant of a system privilege                       |
| <a href="#">REVOKE_SWITCH_CONSUMER_GROUP Procedure</a> | Revokes the privilege to switch to resource consumer groups. |
| <a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>      | Performs a revoke of a system privilege                      |

### 146.1.1 GRANT\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

**Syntax**

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (  
    grantee_name    IN VARCHAR2,  
    consumer_group  IN VARCHAR2,  
    grant_option    IN BOOLEAN);
```

## Parameters

**Table 146-2 GRANT\_SWITCH\_CONSUMER\_GROUP Procedure Parameters**

| Parameter      | Description                                                         |
|----------------|---------------------------------------------------------------------|
| grantee_name   | Name of the user or role to whom privilege is to be granted.        |
| consumer_group | Name of consumer group.                                             |
| grant_option   | TRUE if grantee should be allowed to grant access, FALSE otherwise. |

## Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

**See Also:**

[DBMS\\_RESOURCE\\_MANAGER](#)

## Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

## 146.1.2 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name      IN VARCHAR2,
  privilege_name    IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
  admin_option      IN BOOLEAN);
```

## Parameters

**Table 146-3 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter      | Description                                                  |
|----------------|--------------------------------------------------------------|
| grantee_name   | Name of the user or role to whom privilege is to be granted. |
| privilege_name | Name of the privilege to be granted.                         |
| admin_option   | TRUE if the grant is with admin_option, FALSE otherwise.     |

## Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

## Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/
```

## 146.1.3 REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

## Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  revokee_name    IN VARCHAR2,
  consumer_group  IN VARCHAR2);
```

## Parameters

**Table 146-4 REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure Parameter**

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| revokee_name   | Name of user/role from which to revoke access. |
| consumer_group | Name of consumer group.                        |

## Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

### Examples

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group');
END;
/
```

## 146.1.4 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
  revokee_name    IN VARCHAR2,
  privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

### Parameters

**Table 146-5 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter                   | Description                                                    |
|-----------------------------|----------------------------------------------------------------|
| <code>revokee_name</code>   | Name of the user or role from whom privilege is to be revoked. |
| <code>privilege_name</code> | Name of the privilege to be revoked.                           |

### Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

# DBMS\_RESULT\_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache.

Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_RESULT\\_CACHE Subprograms](#)

## See Also:

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

## 147.1 DBMS\_RESULT\_CACHE Security Model

Only database administrators should be granted the `EXECUTE` privilege for this package.

## 147.2 DBMS\_RESULT\_CACHE Constants

The `DBMS_RESULT_CACHE` package defines several constants for specifying parameter values.

The following table describes these constants.

**Table 147-1 DBMS\_RESULT\_CACHE Constants**

| Constant                 | Definition                                        | Description                                  |
|--------------------------|---------------------------------------------------|----------------------------------------------|
| <code>STATUS_BYPS</code> | <code>CONSTANT VARCHAR2(10) := 'BYPASS';</code>   | Cache has been made temporarily unavailable. |
| <code>STATUS_CORR</code> | <code>CONSTANT VARCHAR2(10) := 'CORRUPT';</code>  | The result cache is in an unusable state.    |
| <code>STATUS_DISA</code> | <code>CONSTANT VARCHAR2(10) := 'DISABLED';</code> | Cache is not available.                      |

**Table 147-1 (Cont.) DBMS\_RESULT\_CACHE Constants**

| Constant    | Definition                             | Description                                                        |
|-------------|----------------------------------------|--------------------------------------------------------------------|
| STATUS_ENAB | CONSTANT VARCHAR2(10) :=<br>'ENABLED'; | Cache is available.                                                |
| STATUS_SYNC | CONSTANT VARCHAR2(10) :=<br>'SYNC';    | Cache is available, but<br>synchronizing with Oracle RAC<br>nodes. |

## 147.3 Summary of DBMS\_RESULT\_CACHE Subprograms

This table lists the DBMS\_RESULT\_CACHE subprograms and briefly describes them.

**Table 147-2 DBMS\_RESULT\_CACHE Package Subprograms**

| Subprogram                                                   | Description                                                                                                                                                  |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BLACK_LIST Function</a>                          | Returns a pipelined BL_TABT.                                                                                                                                 |
| <a href="#">BLACK_LIST_ADD Procedure</a>                     | Adds a <code>cache_id</code> to the black-list.                                                                                                              |
| <a href="#">BLACK_LIST_CLEAR Procedure</a>                   | Removes all <code>cache_ids</code> from the black-list.                                                                                                      |
| <a href="#">BLACK_LIST_REMOVE Procedure</a>                  | Removes the <code>cache_id</code> from the black-list.                                                                                                       |
| <a href="#">BYPASS Procedure</a>                             | Sets the bypass mode for the Result Cache                                                                                                                    |
| <a href="#">FLUSH Function &amp; Procedure</a>               | Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics |
| <a href="#">INVALIDATE Functions &amp; Procedures</a>        | Invalidates all the result-set objects that dependent upon the specified dependency object                                                                   |
| <a href="#">INVALIDATE_OBJECT Functions &amp; Procedures</a> | Invalidates the specified result-set object(s)                                                                                                               |

### 147.3.1 BLACK\_LIST Function

This table function returns all the blocklisted cache ids of a local instance.

#### Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST
RETURN BL_TABT;
```

### 147.3.2 BLACK\_LIST\_ADD Procedure

This procedure adds a `cache_id` to the blocklist.

#### Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_ADD (
  cache_id  IN  VARCHAR2,
  global    IN  BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 147-3 BLACK\_LIST\_ADD Procedure Parameters**

| Parameter | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| cache_id  | The cache_id is added to the blocklist.                                                                       |
| global    | TRUE — applies to all caches in a RAC cluster.<br>FALSE (default) — applies only to the local instance cache. |

## 147.3.3 BLACK\_LIST\_CLEAR Procedure

This procedure removes all cache\_ids from the blocklist.

### Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_CLEAR (  
    global IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 147-4 BLACK\_LIST\_CLEAR Procedure Parameters**

| Parameter | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| global    | TRUE — applies to all caches in a RAC cluster.<br>FALSE (default) — applies only to the local instance cache. |

## 147.3.4 BLACK\_LIST\_REMOVE Procedure

This procedures removes the cache\_id from the blocklist.

### Syntax

```
DBMS_RESULT_CACHE.BLACK_LIST_REMOVE (  
    cache_id IN VARCHAR2,  
    global IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 147-5 BLACK\_LIST\_REMOVE Procedure Parameters**

| Parameter | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| cache_id  | The cache_id is removed from the blocklist.                                                                   |
| global    | TRUE — applies to all caches in a RAC cluster.<br>FALSE (default) — applies only to the local instance cache. |

## 147.3.5 BYPASS Procedure

This procedure sets the bypass mode for the Result Cache.

It sets one of the following bypass modes:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

### Syntax

```
DBMS_RESULT_CACHE.BYPASS (  
    bypass_mode    IN    BOOLEAN,  
    session        IN    BOOLEAN);
```

### Parameters

**Table 147-6** BYPASS Procedure Parameters

| Parameter   | Description                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| bypass_mode | <ul style="list-style-type: none"><li>• TRUE =&gt; Result Cache usage is bypassed</li><li>• FALSE =&gt; Result Cache usage is turned on</li></ul> |
| session     | <ul style="list-style-type: none"><li>• TRUE =&gt; Applies to current session</li><li>• FALSE (default) =&gt; Applies to all sessions</li></ul>   |

### Usage Notes

This operation is database instance specific.

### Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN  
    DBMS_RESULT_CACHE.BYPASS(TRUE);  
    DBMS_RESULT_CACHE.FLUSH;  
END;  
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN  
    DBMS_RESULT_CACHE.BYPASS(FALSE);
```

```
END;  
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

## 147.3.6 FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

### Syntax

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE)  
RETURN BOOLEAN;  
  
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 147-7 FLUSH Function & Procedure Parameters**

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retainMem | <ul style="list-style-type: none"><li>TRUE =&gt; retains the free memory in the cache</li><li>FALSE (default) =&gt; releases the free memory to the system</li></ul> |
| retainSta | <ul style="list-style-type: none"><li>TRUE =&gt; retains the existing cache statistics</li><li>FALSE (default) =&gt; clears the existing cache statistics</li></ul>  |

### Return Values

TRUE if successful in removing all the objects.

## 147.3.7 INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (  
    owner      IN VARCHAR2,  
    name       IN VARCHAR2)  
RETURN NUMBER;  
  
DBMS_RESULT_CACHE.INVALIDATE (  
    owner      IN VARCHAR2,  
    name       IN VARCHAR2);  
  
DBMS_RESULT_CACHE.INVALIDATE (  
    object_id  IN BINARY_INTEGER)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
    object_id    IN BINARY_INTEGER);
```

### Parameters

**Table 147-8** INVALIDATE Function & Procedure Parameters

| Parameter | Description              |
|-----------|--------------------------|
| owner     | Schema name              |
| name      | Object name              |
| object_id | Dictionary object number |

### Return Values

The number of objects invalidated.

## 147.3.8 INVALIDATE\_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    id          IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    id          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    cache_id    IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
    cache_id    IN VARCHAR2);
```

### Parameters

**Table 147-9** INVALIDATE\_OBJECT Function & Procedure Parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| id        | Address of the cache object in the Result Cache             |
| cache_id  | Result cache identifier of a SQL cursor or PL/SQL function. |

### Return Values

The number of objects invalidated.

## 147.3.9 MEMORY\_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (  
    detailed    IN    BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 147-10** MEMORY\_REPORT Procedure Parameters

| Parameter | Description                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| detailed  | <ul style="list-style-type: none"><li>TRUE =&gt; produces a more detailed report</li><li>FALSE (default) =&gt; produces the standard report</li></ul> |

### Usage Notes

Invoking this procedure from SQL\*Plus requires that the serveroutput be turned on.

### Examples

```
SET SERVEROUTPUT ON  
  
EXECUTE DBMS_RESULT_CACHE.MEMORY_REPORT;
```

## 147.3.10 STATUS Function

This function checks the status of the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.STATUS  
    RETURN VARCHAR2;
```

#### Note:

For more information on the constants, see [DBMS\\_RESULT\\_CACHE Constants](#).

# DBMS\_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Operational Notes](#)
- [Summary of DBMS\\_RESUMABLE Subprograms](#)

## 148.1 DBMS\_RESUMABLE Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

## 148.2 Summary of DBMS\_RESUMABLE Subprograms

This table lists the `DBMS_RESUMABLE` subprograms and briefly describes them.

**Table 148-1** *DBMS\_RESUMABLE Package Subprograms*

| Subprogram                                    | Description                                                                                                     |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">ABORT Procedure</a>               | Aborts a suspended resumable space allocation                                                                   |
| <a href="#">GET_SESSION_TIMEOUT Function</a>  | Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code> |
| <a href="#">GET_TIMEOUT Function</a>          | Returns the current timeout value of resumable space allocations for the current session                        |
| <a href="#">SET_SESSION_TIMEOUT Procedure</a> | Sets the timeout of resumable space allocations for a session with <code>session_id</code>                      |
| <a href="#">SET_TIMEOUT Procedure</a>         | Sets the timeout of resumable space allocations for the current session                                         |
| <a href="#">SPACE_ERROR_INFO Function</a>     | Looks for space-related errors in the error stack, otherwise returning <code>FALSE</code>                       |

## 148.2.1 ABORT Procedure

This procedure aborts a suspended resumable space allocation.

The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

### Syntax

```
DBMS_RESUMABLE.ABORT (  
    session_id IN NUMBER);
```

### Parameters

**Table 148-2 ABORT Procedure Parameters**

| Parameter               | Description                                               |
|-------------------------|-----------------------------------------------------------|
| <code>session_id</code> | The session identifier of the resumable space allocation. |

### Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

## 148.2.2 GET\_SESSION\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

### Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (  
    session_id IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 148-3 GET\_SESSION\_TIMEOUT Function Parameters**

| Parameter               | Description                                               |
|-------------------------|-----------------------------------------------------------|
| <code>session_id</code> | The session identifier of the resumable space allocation. |

### Return Values

**Table 148-4 GET\_SESSION\_TIMEOUT Function Return Values**

| Return Value | Description                                                                                                                               |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| NUMBER       | The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds. |

### Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

## 148.2.3 GET\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

### Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

### Return Values

**Table 148-5 GET\_TIMEOUT Function Return Values**

| Return Value | Description                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------|
| NUMBER       | The current timeout value of resumable space allocations for the current session. The returned value is in seconds. |

### Usage Notes

If the current session is not resumable enabled, the `GET_TIMEOUT` function returns -1.

## 148.2.4 SET\_SESSION\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`.

The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

### Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

### Parameters

**Table 148-6 SET\_SESSION\_TIMEOUT Procedure Parameters**

| Parameter               | Description                                               |
|-------------------------|-----------------------------------------------------------|
| <code>session_id</code> | The session identifier of the resumable space allocation. |
| <code>timeout</code>    | The timeout of the resumable space allocation.            |

## 148.2.5 SET\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

### Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (  
    timeout IN NUMBER);
```

### Parameters

**Table 148-7 SET\_TIMEOUT Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| timeout   | The timeout of the resumable space allocation. |

## 148.2.6 SPACE\_ERROR\_INFO Function

This function looks for space-related errors in the error stack.

If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

### Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO  
    error_type      OUT VARCHAR2,  
    object_type     OUT VARCHAR2,  
    object_owner    OUT VARCHAR2,  
    table_space_name OUT VARCHAR2,  
    object_name     OUT VARCHAR2,  
    sub_object_name OUT VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 148-8 SPACE\_ERROR\_INFO Function Parameters**

| Parameter  | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| error_type | The space error type. It will be one of the following: <ul style="list-style-type: none"><li>• NO MORE SPACE</li><li>• MAX EXTENTS REACHED</li><li>• SPACE QUOTA EXCEEDED</li></ul> |

**Table 148-8 (Cont.) SPACE\_ERROR\_INFO Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_type      | <p>The object type. It will be one of the following:</p> <ul style="list-style-type: none"><li>• TABLE</li><li>• INDEX</li><li>• CLUSTER</li><li>• TABLE SPACE</li><li>• ROLLBACK SEGMENT</li><li>• UNDO SEGMENT</li><li>• LOB SEGMENT</li><li>• TEMP SEGMENT</li><li>• INDEX PARTITION</li><li>• TABLE PARTITION</li><li>• LOB PARTITION</li><li>• TABLE SUBPARTITION</li><li>• INDEX SUBPARTITION</li><li>• LOB SUBPARTITION</li></ul> <p>The type can also be <code>NULL</code> if it does not apply.</p> |
| object_owner     | The owner of the object. <code>NULL</code> if it cannot be determined.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| table_space_name | The table space where the object resides. <code>NULL</code> if it cannot be determined.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| object_name      | The name of rollback segment, temp segment, table, index, or cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| sub_object_name  | The partition name or sub-partition name of <code>LOB</code> , <code>TABLE</code> , or <code>INDEX</code> . <code>NULL</code> if it cannot be determined.                                                                                                                                                                                                                                                                                                                                                    |

# DBMS\_RLS

The `DBMS_RLS` package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD).

`DBMS_RLS` is available with the Enterprise Edition only.

## See Also:

*Oracle Database Security Guide* for usage information about `DBMS_RLS`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of DBMS\\_RLS Subprograms](#)

## 149.1 DBMS\_RLS Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select', 'user_ctx', 'time');
```

Whenever the `EMPLOYEES` table, under the `HR` schema, is referenced in a query or subquery (`SELECT`), the server calls the `EMP_SEC` function (under the `HR` schema). This function returns a predicate specific to the current schema for the `EMP_POLICY` policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: `INDEX`, `SELECT`, `INSERT`, `UPDATE`, or `DELETE`.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, `P1` (for example, where `SAL > 10000`, or even a subquery) is the predicate returned from the `EMP_SEC` function. The server treats the `EMPLOYEES` table as a view and does the view

expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require `EXECUTE` privilege on the policy function, because the server makes the call with the function definer's right.

**Note:**

The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no `JOIN`, `ORDER BY`, `GROUP BY`, and so on.

DBMS\_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the `EMP_POLICY` with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

## 149.2 DBMS\_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

## 149.3 DBMS\_RLS Constants

The DBMS\_RLS package includes constants that can be used for specifying parameter values.

**Table 149-1 DBMS\_RLS Constants**

| Constant                     | Type           | Value | Description                                                                                                                                       |
|------------------------------|----------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| ADD_ATTRIBUTE_ASSOCIATION    | BINARY_INTEGER | 1     | Used with DBMS_RLS.ALTER_POLICY and DBMS_RLS.ALTER_GROUPED_POLICY: adds the specified namespace and attribute to the policy or grouped policy     |
| REMOVE_ATTRIBUTE_ASSOCIATION | BINARY_INTEGER | 2     | Used with DBMS_RLS.ALTER_POLICY and DBMS_RLS.ALTER_GROUPED_POLICY: removes the specified namespace and attribute to the policy or grouped policy. |

## 149.4 DBMS\_RLS Operational Notes

The `DBMS_RLS` procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the `DBMS_RLS` procedures are part of the DDL transaction.

For example, you may create a trigger for `CREATE TABLE`. Inside the trigger, you may add a column through `ALTER TABLE`, and you can add a policy through `DBMS_RLS`. All these operations are in the same transaction as `CREATE TABLE`, even though each one is a DDL statement. The `CREATE TABLE` succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from `V$VPD_POLICIES`.

A synonym can reference only a view or a table.

## 149.5 DBMS\_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as `object_schema`, `object_name`, and `policy_name`, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

## 149.6 Summary of DBMS\_RLS Subprograms

This table lists and briefly describes the subprograms available in `DBMS_RLS`.

**Table 149-2 DBMS\_RLS Package Subprograms**

| Subprogram                                       | Description                                                                           |
|--------------------------------------------------|---------------------------------------------------------------------------------------|
| <a href="#">ADD_GROUPED_POLICY Procedure</a>     | Adds a policy associated with a policy group                                          |
| <a href="#">ADD_POLICY Procedure</a>             | Adds a fine-grained access control policy to a table, view, or synonym                |
| <a href="#">ADD_POLICY_CONTEXT Procedure</a>     | Adds the context for the active application                                           |
| <a href="#">ALTER_POLICY Procedure</a>           | Associates an application context attribute with VPD policies                         |
| <a href="#">ALTER_GROUPED_POLICY Procedure</a>   | Adds application context related changes                                              |
| <a href="#">CREATE_POLICY_GROUP Procedure</a>    | Creates a policy group                                                                |
| <a href="#">DELETE_POLICY_GROUP Procedure</a>    | Deletes a policy group                                                                |
| <a href="#">DISABLE_GROUPED_POLICY Procedure</a> | Disables a row-level group security policy                                            |
| <a href="#">DROP_GROUPED_POLICY Procedure</a>    | Drops a policy associated with a policy group                                         |
| <a href="#">DROP_POLICY Procedure</a>            | Drops a fine-grained access control policy from a table, view, or synonym             |
| <a href="#">DROP_POLICY_CONTEXT Procedure</a>    | Drops a driving context from the object so that it will have one less driving context |
| <a href="#">ENABLE_GROUPED_POLICY Procedure</a>  | Enables or disables a row-level group security policy                                 |
| <a href="#">ENABLE_POLICY Procedure</a>          | Enables or disables a fine-grained access control policy                              |
| <a href="#">REFRESH_GROUPED_POLICY Procedure</a> | Reparses the SQL statements associated with a refreshed policy                        |

**Table 149-2 (Cont.) DBMS\_RLS Package Subprograms**

| Subprogram                               | Description                                                                |
|------------------------------------------|----------------------------------------------------------------------------|
| <a href="#">REFRESH_POLICY Procedure</a> | Causes all the cached statements associated with the policy to be reparsed |

## 149.6.1 ADD\_GROUPED\_POLICY Procedure

This procedure adds a policy associated with a policy group.

### Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
    object_schema      IN VARCHAR2      DEFAULT NULL,
    object_name        IN VARCHAR2,
    policy_group       IN VARCHAR2      DEFAULT 'SYS_DEFAULT',
    policy_name        IN VARCHAR2,
    function_schema    IN VARCHAR2      DEFAULT NULL,
    policy_function     IN VARCHAR2,
    statement_types    IN VARCHAR2      DEFAULT NULL,
    update_check       IN BOOLEAN       DEFAULT FALSE,
    enable             IN BOOLEAN       DEFAULT TRUE,
    static_policy      IN BOOLEAN       DEFAULT FALSE,
    policy_type        IN BINARY_INTEGER DEFAULT NULL,
    long_predicate     IN BOOLEAN       DEFAULT FALSE,
    sec_relevant_cols  IN VARCHAR2,
    sec_relevant_cols_opt IN BINARY_INTEGER DEFAULT NULL,
    namespace         IN VARCHAR2      DEFAULT NULL,
    attribute          IN VARCHAR2      DEFAULT NULL);
```

### Parameters

**Table 149-3 ADD\_GROUPED\_POLICY Procedure Parameters**

| Parameter       | Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema   | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.                                                       |
| object_name     | Name of the table, view, or synonym to which the policy is added                                                                                                                   |
| policy_group    | Name of the policy group to which the policy belongs                                                                                                                               |
| policy_name     | Name of the policy; must be unique for the same table or view                                                                                                                      |
| function_schema | Schema owning the policy function. If no function_schema is specified or is NULL, then the current schema is used.                                                                 |
| policy_function | Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.                              |
| statement_types | Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX. |

**Table 149-3 (Cont.) ADD\_GROUPED\_POLICY Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update_check      | For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.<br><br>The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.                                                                                                                         |
| enable            | Indicates if the policy is enable when it is added. The default is TRUE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| static_policy     | Default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.                                                                                                                                                                                                                                                                                                            |
| policy_type       | Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in <a href="#">Table 149-5</a> . Specifying any of these policy types overrides the value of static_policy.                                                                                                                                                                                                                                                                                                                                      |
| long_predicate    | Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.                                                                                                                                                                                                                                                                                                         |
| sec_relevant_cols | Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object. |
| namespace         | Name which determines the application context namespace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| attribute         | Attribute which determines the application context attribute name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Usage Notes**

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE\\_POLICY\\_GROUP Procedure](#).
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS\_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.

## 149.6.2 ADD\_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:**[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

**Syntax**

```
DBMS_RLS.ADD_POLICY (
    object_schema          IN VARCHAR2          DEFAULT NULL,
    object_name            IN VARCHAR2,
    policy_name            IN VARCHAR2,
    function_schema        IN VARCHAR2          DEFAULT NULL,
    policy_function         IN VARCHAR2,
    statement_types        IN VARCHAR2          DEFAULT NULL,
    update_check           IN BOOLEAN           DEFAULT FALSE,
    enable                 IN BOOLEAN           DEFAULT TRUE,
    static_policy          IN BOOLEAN           DEFAULT FALSE,
    policy_type            IN BINARY_INTEGER    DEFAULT NULL,
    long_predicate         IN BOOLEAN           DEFAULT FALSE,
    sec_relevant_cols      IN VARCHAR2          DEFAULT NULL,
    sec_relevant_cols_opt  IN BINARY_INTEGER    DEFAULT NULL,
    namespace             IN VARCHAR2          DEFAULT NULL,
    attribute              IN VARCHAR2          DEFAULT NULL);
```

**Parameters****Table 149-4 ADD\_POLICY Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema   | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| object_name     | Name of table, view, or synonym to which the policy is added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| policy_name     | Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.                                                                                                                                                                                                                                                                                                             |
| function_schema | Schema owning the policy function. If no function_schema is specified or is NULL, then the current schema is used.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| policy_function | Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.                                                                                                                                                                                                                                                                                                                                                                                            |
| statement_types | Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX .                                                                                                                                                                                                                                                                                                                                                                  |
| update_check    | Optional argument for the INSERT or UPDATE statement type. The default is FALSE. If you plan to use the INSERT statement type, then you must set update_check to TRUE. Otherwise, an ORA-28104 input value for string is not valid error is generated.<br><br>The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement. |

**Table 149-4 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable                | Indicates if the policy is enabled when it is added. The default is <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| static_policy         | The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privileged user who has the <code>EXEMPT ACCESS POLICY</code> privilege.                                                                                                                                                                                                                                                                                 |
| policy_type           | Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in <a href="#">Table 149-5</a> . Specifying any of these policy types overrides the value of <code>static_policy</code> .                                                                                                                                                                                                                                                                                                               |
| long_predicate        | Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.                                                                                                                                                                                                                                                                                                              |
| sec_relevant_cols     | Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.                                 |
| sec_relevant_cols_opt | Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries ( <code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_ols.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See <a href="#">Usage Notes</a> for restrictions and additional information about this option. |
| namespace             | Name which determines the application context namespace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| attribute             | Attribute which determines the application context attribute name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 149-5 DBMS\_RLS.ADD\_POLICY Policy Types**

| Policy Type       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATIC            | Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as <code>SYS_CONTEXT</code> or <code>SYSDATE</code> . Applies to only one object. |
| SHARED_STATIC     | Same as <code>STATIC</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.                                                                                                                                                                                                                                                                                                              |
| CONTEXT_SENSITIVE | Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.                                         |

**Table 149-5 (Cont.) DBMS\_RLS.ADD\_POLICY Policy Types**

| Policy Type              | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHARED_CONTEXT_SENSITIVE | Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects. |
| DYNAMIC                  | The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.                                                                                                                                                       |

### Usage Notes

- SYS is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:
 

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy applies.
```
- The policy functions must have the purity level of WNDS (write no database state).

#### See Also:

The *Oracle Database Development Guide* has more details about the RESTRICT\_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like
 

```
"select c1, c2, ... from tab tab where <predicate>"
```
- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with sec\_relevant\_cols\_opt => dbms\_rls.ALL\_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:
  - Only applies to SELECT statements

- Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
- If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
- If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
- This option may prevent some rows from displaying. For example:

```
SELECT * FROM employees
WHERE salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- The maximum number of policies that can be created for a single object is 255.

### Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hr_policy',
    function_schema => 'hr',
    policy_function => 'hrfun',
    statement_types => 'select,index',
    policy_type   => DBMS_RLS.CONTEXT_SENSITIVE,
    sec_relevant_cols => 'salary,birthdate,ssn',
    namespace    => 'empno_ctx',
    attribute     => 'emp_id');
END;
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
```

```
policy_name      => 'hosting_policy',  
function_schema  => 'hr',  
policy_function  => 'subfun',  
policy_type      => dbms_ols.SHARED_STATIC);  
END;
```

## 149.6.3 ADD\_POLICY\_CONTEXT Procedure

This procedure adds the context for the active application.

### Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (  
  object_schema  IN VARCHAR2 NULL,  
  object_name    IN VARCHAR2,  
  namespace     IN VARCHAR2,  
  attribute      IN VARCHAR2);
```

### Parameters

**Table 149-6 ADD\_POLICY\_CONTEXT Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is added.                                                            |
| namespace     | Name which determines the application context namespace                                                                      |
| attribute     | Attribute which determines the application context attribute name                                                            |

### Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS\_DEFAULT policy group.
- To add a policy to table HR.EMPLOYEES in group access\_control\_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS',  
  'HR.ACCESS');
```

## 149.6.4 ALTER\_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

### Syntax

```
DBMS_RLS.ALTER_POLICY (  
    object_schema    IN VARCHAR2 DEFAULT NULL,  
    object_name      IN VARCHAR2,  
    policy_name      IN VARCHAR2,  
    alter_option     IN NUMBER,  
    namespace        IN VARCHAR2 DEFAULT NULL,  
    attribute        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 149-7 ALTER\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is added                                                                                        |
| policy_name   | Name of the policy, unique for the same table or view                                                                                                   |
| alter_option  | Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy                              |
| namespace     | Name which determines the application context namespace                                                                                                 |
| attribute     | Attribute which determines the application context attribute name                                                                                       |

### Usage Notes

Note the following:

- This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for `DYNAMIC`, `STATIC` or `SHARED_STATIC` policies will result in an error. If `namespace` is specified, `attribute` should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of `ALTER_POLICY` which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.

- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS\_DEFAULT policy group.
- To add a policy to table hr.employees in group access\_control\_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY(
    'hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
```

## 149.6.5 ALTER\_GROUPED\_POLICY Procedure

This procedure adds application context related changes.

### Syntax

```
DBMS_RLS.ALTER_GROUPED_POLICY (
    object_schema    IN VARCHAR2 DEFAULT NULL,
    object_name      IN VARCHAR2,
    policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,
    policy_name      IN VARCHAR2,
    alter_option     IN NUMBER,
    namespace        IN VARCHAR2 DEFAULT NULL,
    attribute        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 149-8 ALTER\_GROUPED\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is added                                                             |
| policy_group  | Name of the policy group to which this policy belongs; must be unique for the same table or view                             |
| policy_name   | Name of the policy, unique for the same table or view                                                                        |
| alter_option  | Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy  |
| namespace     | Name that determines the application context namespace                                                                       |
| attribute     | Attribute determines the application context attribute name                                                                  |

### Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED\_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER\_GROUPED\_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.

- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY (  
    'hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
```

## 149.6.6 CREATE\_POLICY\_GROUP Procedure

This procedure creates a policy group.

### Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_group     IN VARCHAR2);
```

### Parameters

**Table 149-9 CREATE\_POLICY\_GROUP Procedure Parameters**

| Parameter                  | Description                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_schema</code> | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| <code>object_name</code>   | Name of the table, view, or synonym to which the policy is added                                                                                        |
| <code>policy_group</code>  | Name of the policy group that the policy belongs to                                                                                                     |

### Usage Notes

The group must be unique for each table or view.

## 149.6.7 DELETE\_POLICY\_GROUP Procedure

This procedure deletes a policy group.

### Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_group     IN VARCHAR2);
```

## Parameters

**Table 149-10 DELETE\_POLICY\_GROUP Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is added                                                             |
| policy_group  | Name of the policy group that the policy belongs to                                                                          |

## Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

## 149.6.8 DISABLE\_GROUPED\_POLICY Procedure

This procedure disables a row-level group security policy.

## Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (  
    object_schema  IN VARCHAR2 NULL,  
    object_name    IN VARCHAR2,  
    group_name     IN VARCHAR2,  
    policy_name    IN VARCHAR2);
```

## Parameters

**Table 149-11 DISABLE\_GROUPED\_POLICY Procedure Parameters**

| Parameter     | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym                           |
| object_name   | Name of the table, view, or synonym with which the policy is associated |
| group_name    | Name of the group of the policy                                         |
| policy_name   | Name of the policy to be enabled or disabled                            |

## Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE\_GROUPED\_POLICY procedure is executed with "enable" set to FALSE.

## 149.6.9 DROP\_GROUPED\_POLICY Procedure

This procedure drops a policy associated with a policy group.

### Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_group     IN VARCHAR2 'SYS_DEFAULT',  
    policy_name      IN VARCHAR2);
```

### Parameters

**Table 149-12 DROP\_GROUPED\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is dropped                                                           |
| policy_group  | Name of the policy group to which the policy belongs                                                                         |
| policy_name   | Name of the policy                                                                                                           |

## 149.6.10 DROP\_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:**

[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.DROP_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_name      IN VARCHAR2);
```

### Parameters

**Table 149-13 DROP\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed. |

**Table 149-13 (Cont.) DROP\_POLICY Procedure Parameters**

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| object_name | Name of the table, view, or synonym for which the policy is dropped |
| policy_name | Name of policy to be dropped from table, view, or synonym           |

**Usage Notes**

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

## 149.6.11 DROP\_POLICY\_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

**Syntax**

```
DBMS_RLS.DROP_POLICY_CONTEXT (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    namespace        IN VARCHAR2,  
    attribute         IN VARCHAR2);
```

**Parameters****Table 149-14 DROP\_POLICY\_CONTEXT Procedure Parameters**

| Parameter     | Description                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no <code>object_schema</code> is specified or is <code>NULL</code> , then the current schema is used. |
| object_name   | Name of the table, view, or synonym to which the policy is dropped                                                                                      |
| namespace     | Namespace of the driving context                                                                                                                        |
| attribute     | Attribute of the driving context                                                                                                                        |

## 149.6.12 ENABLE\_GROUPED\_POLICY Procedure

This procedure enables or disables a row-level group security policy.

**Syntax**

```
DBMS_RLS.ENABLE_GROUPED_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    group_name       IN VARCHAR2,  
    policy_name      IN VARCHAR2,  
    enable           IN BOOLEAN TRUE);
```

## Parameters

**Table 149-15** ENABLE\_GROUPED\_POLICY Procedure Parameters

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym with which the policy is associated                                                      |
| group_name    | Name of the group of the policy                                                                                              |
| policy_name   | Name of the policy to be enabled or disabled                                                                                 |
| enable        | TRUE enables the policy; FALSE disables the policy                                                                           |

## Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

## 149.6.13 ENABLE\_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

 **See Also:**  
[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

## Syntax

```
DBMS_RLS.ENABLE_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    policy_name   IN VARCHAR2,  
    enable        IN BOOLEAN TRUE);
```

## Parameters

**Table 149-16** ENABLE\_POLICY Procedure Parameters

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |

**Table 149-16 (Cont.) ENABLE\_POLICY Procedure Parameters**

| Parameter   | Description                                                         |
|-------------|---------------------------------------------------------------------|
| object_name | Name of table, view, or synonym with which the policy is associated |
| policy_name | Name of policy to be enabled or disabled                            |
| enable      | TRUE to enable the policy, FALSE to disable the policy              |

## 149.6.14 REFRESH\_GROUPED\_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

### Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2 NULL,  
    group_name       IN VARCHAR2 NULL,  
    policy_name      IN VARCHAR2 NULL);
```

### Parameters

**Table 149-17 REFRESH\_GROUPED\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of the table, view, or synonym with which the policy is associated                                                      |
| group_name    | Name of the group of the policy                                                                                              |
| policy_name   | Name of the policy                                                                                                           |

### Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

## 149.6.15 REFRESH\_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:**[Operational Notes](#)

A COMMIT is also performed at the end of the operation.

**Syntax**

```
DBMS_RLS.REFRESH_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);
```

**Parameters****Table 149-18 REFRESH\_POLICY Procedure Parameters**

| Parameter     | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used. |
| object_name   | Name of table, view, or synonym with which the policy is associated                                                          |
| policy_name   | Name of policy to be refreshed                                                                                               |

**Usage Notes**

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

# DBMS\_ROLLING

The `DBMS_ROLLING` PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option, and can be used for database version upgrades starting with the first patchset of Oracle Database 12c.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12c Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing `XMLType` stored as `CLOB` to `XMLType` stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_ROLLING Subprograms](#)

## See Also:

- *Oracle Data Guard Concepts and Administration* for information about using `DBMS_ROLLING` to perform a rolling upgrade

## 150.1 DBMS\_ROLLING Overview

The `DBMS_ROLLING` PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion, including a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)

The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle

Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the `DBMS_ROLLING` package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the `DBMS_ROLLING.INIT_PLAN` procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

## 150.2 DBMS\_ROLLING Security Model

The `DBMS_ROLLING` package is available to users who have been granted the DBA role.

## 150.3 Summary of DBMS\_ROLLING Subprograms

This table lists and briefly describes the `DBMS_ROLLING` package subprograms.

**Table 150-1 DBMS\_ROLLING Package Subprograms**

| Subprogram                              | Description                                                                                                            |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">INIT_PLAN Procedure</a>     | Initializes a rolling operation plan with system-generated default values.                                             |
| <a href="#">DESTROY_PLAN Procedure</a>  | Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation. |
| <a href="#">BUILD_PLAN Procedure</a>    | Validates plan parameters and creates or modifies a rolling operation plan.                                            |
| <a href="#">SET_PARAMETER Procedure</a> | Modifies a rolling operation parameter.                                                                                |
| <a href="#">START_PLAN Procedure</a>    | Starts the rolling operation.                                                                                          |
| <a href="#">SWITCHOVER Procedure</a>    | Performs a switchover between the current primary database and the transient logical standby database.                 |
| <a href="#">FINISH_PLAN Procedure</a>   | Finalizes the rolling operation.                                                                                       |
| <a href="#">ROLLBACK_PLAN Procedure</a> | Completely rolls back the rolling operation.                                                                           |

## 150.3.1 INIT\_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

### Syntax

```
DBMS_ROLLING.INIT_PLAN (  
    future_primary    IN VARCHAR2);
```

### Parameters

**Table 150-2** *INIT\_PLAN Procedure Parameters*

| Parameter      | Description                                                                         |
|----------------|-------------------------------------------------------------------------------------|
| future_primary | DB_UNIQUE_NAME of the future primary (also known as the Leading Group Master (LGM)) |

### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45401: upgrade plan is already active
- ORA-45402: LOG\_ARCHIVE\_CONFIG must contain the DG\_CONFIG attribute
- ORA-45403: database %s must be specified in DG\_CONFIG
- ORA-45411: operation requires additional arguments
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- A plan must be prepared before any parameters can be customized.

## 150.3.2 DESTROY\_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

### Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

### Parameters

This procedure has no parameters.

### Exceptions

- ORA-45422: operation requires existing plan
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- When a rolling operation is complete, this procedure can be called to completely purge all states related to a rolling operation.

## 150.3.3 BUILD\_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the `START_PLAN` procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the `BUILD_PLAN` procedure to modify the existing plan. The `DBA_ROLLING_EVENTS` view will indicate if any invocation of the `SET_PARAMETER` procedure requires a plan rebuild. Failure to rebuild the plan will result in an `ORA-45416` error when attempting to resume the rolling operation.

### Syntax

```
DBMS_ROLLING.BUILD_PLAN ();
```

### Parameters

This procedure has no parameters.

### Exceptions

- `ORA-45400`: operation not permitted on current database
- `ORA-45403`: database %s must be specified in the `DG_CONFIG`
- `ORA-45414`: could not connect to a remote database
- `ORA-45419`: `DB_UNIQUE_NAME` parameter must be specified
- `ORA-45433`: failover was detected on an unsupported database
- `ORA-45434`: multiple failovers of the same type detected
- `ORA-65040`: operation not allowed from within a pluggable database

### Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

## 150.3.4 SET\_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

### Syntax

```
DBMS_ROLLING.SET_PARAMETER (  
    scope    IN VARCHAR2 DEFAULT NULL,  
    name     IN NUMBER,  
    value    IN VARCHAR2);
```

## Parameters

**Table 150-3 SET\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| scope     | Parameter scope. It can either be NULL for global parameters, or the DB_UNIQUE_NAME of a specific database for local parameters. |
| name      | The DBMS_ROLLING constant for a given parameter.                                                                                 |
| value     | New value for the parameter or NULL to revert to a default value.                                                                |

## Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database
- ORA-65040: operation not allowed from within a pluggable database

## Usage Notes

- Changes to a parameter value may require a call to the DBMS\_ROLLING.BUILD\_PLAN procedure to modify the existing plan. Users should check the DBA\_ROLLING\_EVENTS view after setting a parameter to determine if a rebuild is necessary.
- Table 150-4 lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type VARCHAR2.
- The MINVAL and MAXVAL columns in the DBA\_ROLLING\_PARAMETERS view identify the valid range of values for a parameter. The view does not contain any parameters until the DBMS\_ROLLING.INIT\_PLAN procedure has been successfully invoked.

**Table 150-4 Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

| Parameter Name          | Global? | Description                                                                                                                                                                                                                                   | Default                 |
|-------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| ACTIVE_SESSIONS_TIMEOUT | Yes     | The maximum amount of time in seconds to enforce ACTIVE_SESSIONS_WAIT before halting the rolling upgrade. This parameter is only valid if ACTIVE_SESSIONS_WAIT is set to 1.                                                                   | 3600                    |
| ACTIVE_SESSIONS_WAIT    | Yes     | Whether the switchover operation will wait for active sessions to finish. If set to 1, the SWITCHOVER procedure waits for active sessions to compete. If set to 0, the SWITCHOVER procedure kills active sessions to expedite the switchover. | 0                       |
| BACKUP_CONTROLFILE      | Yes     | File name of the backup control file that is created during a rolling upgrade.                                                                                                                                                                | rolling_change_backup.f |

**Table 150-4 (Cont.) Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

| Parameter Name              | Global? | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Default                              |
|-----------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| DGBROKER                    | Yes     | Use Data Guard broker for managing apply, recovery, and log archive destinations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 1 if broker is enabled, 0 otherwise. |
| DICTIONARY_LOAD_TIMEOUT     | Yes     | The maximum amount of time in seconds to enforce <code>DICTIONARY_LOAD_WAIT</code> before halting the rolling upgrade. This parameter is only valid if <code>DICTIONARY_LOAD_WAIT</code> is set to 1.                                                                                                                                                                                                                                                                                                                                                                                              | 3600                                 |
| DICTIONARY_LOAD_WAIT        | Yes     | Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the <code>START_PLAN</code> procedure will not return until the dictionary has been completely loaded. If set to 0, then the <code>START_PLAN</code> procedure will only verify that the loading of the dictionary has started.                                                                                                                                                                                                 | 0                                    |
| DICTIONARY_PLS_WAIT_IN IT   | Yes     | The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 300                                  |
| DICTIONARY_PLS_WAIT_TIMEOUT | Yes     | The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 3600                                 |
| EVENT_RECORDS               | Yes     | The maximum number of records to permit in <code>DBA_ROLLING_EVENTS</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 10000                                |
| FAILOVER                    | Yes     | Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to <code>BUILD_PLAN</code> .                                                                                                                                                                                                                                                                                                                                                                                                           | 0                                    |
| GRP_PREFIX                  |         | Execution of procedures in <code>DBMS_ROLLING</code> results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix.                                                                                                                                                                                                                                                                                                | DBMSRU                               |
| IGNORE_BUILD_WARNINGS       | Yes     | Ignore warnings which would otherwise raise exceptions during execution of the <code>BUILD_PLAN</code> procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | 1                                    |
| IGNORE_LAST_ERROR           | Yes     | Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade.                                                                                                                                                                                                                                                                                                                                                                                                                  | 0                                    |
| LAD_ENABLED_TIMEOUT         | Yes     | The maximum time in seconds to wait for a recently enabled log archive destination to reach a <code>VALID</code> state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 600                                  |
| LOG_LEVEL                   | Yes     | Logging level for the <code>DBS_ROLLING</code> PL/SQL package. A value of <code>INFO</code> results in the logging of errors and relevant non-fatal warnings. A value of <code>FULL</code> results in the logging of all events.                                                                                                                                                                                                                                                                                                                                                                   | INFO                                 |
| MEMBER                      | No      | The upgrade group in which the specified database is a member.<br><br>A value of <code>LEADING</code> indicates that the standby is a member of the leading upgrade group. As such, it is a standby of the Leading Group Master (LGM). The LGM is the database which is converted into the transient logical standby, and which becomes the new primary after the switchover.<br><br>A value of <code>TRAILING</code> indicates that the standby is a member of the trailing upgrade group. As such, it is a standby of the Trailing Group Master (TGM). The TGM is the original primary database. | LEADING                              |

**Table 150-4 (Cont.) Valid Values for DBMS\_ROLLING.SET\_PARAMETER Procedure**

| Parameter Name         | Global? | Description                                                                                                                                                                                                                                              | Default |
|------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| READY_LGM_LAG_TIME     | Yes     | The apply lag time in seconds associated with the READY_LGM_LAG_WAIT parameter.                                                                                                                                                                          | 600     |
| READY_LGM_LAG_TIMEOUT  | Yes     | The maximum amount of time in seconds to enforce READY_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if READY_LGM_LAG_WAIT is set to 1.                                                                                  | 60      |
| READY_LGM_LAG_WAIT     | Yes     | Whether the START_PLAN procedure will wait for the apply lag on the leading group master to fall below READY_LGM_LAG_TIME seconds before returning control back to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed. | 0       |
| SWITCH_LGM_LAG_TIME    | Yes     | The apply lag time in seconds associated with the SWITCH_LGM_LAG_WAIT parameter.                                                                                                                                                                         | 600     |
| SWITCH_LGM_LAG_TIMEOUT | Yes     | The maximum amount of time in seconds to enforce SWITCH_LGM_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGM_LAG_WAIT is set to 1.                                                                                | 60      |
| SWITCH_LGM_LAG_WAIT    | Yes     | Whether the SWITCHOVER procedure will wait for the apply lag on the leading group master to fall below SWITCH_LGM_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.         | 1       |
| SWITCH_LGS_LAG_TIME    | Yes     | The apply lag time in seconds associated with the SWITCH_LGS_LAG_WAIT parameter.                                                                                                                                                                         | 60      |
| SWITCH_LGS_LAG_TIMEOUT | Yes     | The maximum amount of time in seconds to enforce SWITCH_LGS_LAG_WAIT before halting the rolling upgrade. This parameter is only valid if SWITCH_LGS_LAG_WAIT is set to 1.                                                                                | 60      |
| SWITCH_LGS_LAG_WAIT    | Yes     | Whether the SWITCHOVER procedure will wait for the apply lag on the leading group standbys to fall below SWITCH_LGS_LAG_TIME seconds before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed.       | 0       |
| UPDATED_LGS_TIMEOUT    | Yes     | The maximum amount of time in seconds to enforce UPDATED_LGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_LGS_WAIT is set to 1.                                                                                      | 10800   |
| UPDATED_LGS_WAIT       | Yes     | Whether the SWITCHOVER procedure will wait for the leading group standbys to complete recovery of all upgrade redo before initiating the switchover. If set to 1, the wait is performed. If set to 0, the wait is not performed                          | 1       |
| UPDATED_TGS_TIMEOUT    | Yes     | The maximum amount of time in seconds to enforce UPDATED_TGS_WAIT before halting the rolling upgrade. This parameter is only valid if UPDATED_TGS_WAIT is set to 1.                                                                                      | 10800   |
| UPDATED_TGS_WAIT       | Yes     | Whether the FINISH_PLAN procedure will wait for the trailing group standbys to complete recovery of all upgrade redo before returning control to the user. If set to 1, the wait is performed. If set to 0, the wait is not performed.                   | 1       |

## 150.3.5 START\_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the `START_PLAN` procedure is complete, the LGM (identified with the `future_primary` parameter in the `INIT_PLAN` procedure) will be converted into a fully configured transient logical standby database.

### Syntax

```
DBMS_ROLLING.START_PLAN ();
```

### Parameters

This procedure has no parameters.

### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- A rolling operation plan must have previously been generated through the `BUILD_PLAN` procedure.

## 150.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database (also known as the TGM) and the transient logical standby database (also known as the LGM).

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

**Syntax**

```
DBMS_ROLLING.SWITCHOVER ();
```

**Parameters**

This procedure has no parameters.

**Exceptions**

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

**Usage Notes**

- This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.

## 150.3.7 FINISH\_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary (also known as the TGM) as a physical standby, and configures remaining physical standbys to recover the upgrade redo from the future primary.

**Syntax**

```
DBMS_ROLLING.FINISH_PLAN ();
```

**Parameters**

This procedure has no parameters.

**Exceptions**

- ORA-45400: operation not permitted on current database

- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

#### Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

## 150.3.8 ROLLBACK\_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the `START_PLAN` procedure was invoked.

#### Syntax

```
DBMS_ROLLING.ROLLBACK_PLAN;
```

#### Parameters

This procedure has no parameters.

#### Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

### Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.

# DBMS\_ROWID

The `DBMS_ROWID` package lets you create `ROWIDs` and obtain information about `ROWIDs` from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other `ROWID` components without writing code to interpret the base-64 character external `ROWID`. `DBMS_ROWID` is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

**Note:**

`DBMS_ROWID` is not to be used with universal `ROWIDs` (`UROWIDs`).

This chapter contains the following topics:

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS\\_ROWID Subprograms](#)

## 151.1 DBMS\_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

## 151.2 DBMS\_ROWID Types

There are four `DBMS_ROWID` types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

### Extension and Restriction Type

The types are as follows:

- `RESTRICTED`—restricted `ROWID`
- `EXTENDED`—extended `ROWID`

For example:

```
rowid_type_restricted constant integer := 0;  
rowid_type_extended   constant integer := 1;
```

**Note:**

Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

**Verification Types****Table 151-1 Verification Types**

| Result  | Description   |
|---------|---------------|
| VALID   | Valid ROWID   |
| INVALID | Invalid ROWID |

For example:

```
rowid_is_valid   constant integer := 0;  
rowid_is_invalid constant integer := 1;
```

**Object Types****Table 151-2 Object Types**

| Result    | Description                                       |
|-----------|---------------------------------------------------|
| UNDEFINED | Object Number not defined (for restricted ROWIDs) |

For example:

```
rowid_object_undefined constant integer := 0;
```

**Conversion Types****Table 151-3 Conversion Types**

| Result   | Description                          |
|----------|--------------------------------------|
| INTERNAL | Convert to/from column of ROWID type |
| EXTERNAL | Convert to/from string format        |

For example:

```
rowid_convert_internal constant integer := 0;  
rowid_convert_external constant integer := 1;
```

## 151.3 DBMS\_ROWID Exceptions

This table describes the Exceptions raised by DBMS\_ROWID subprograms.

**Table 151-4 Exceptions**

| Exception       | Description                 |
|-----------------|-----------------------------|
| ROWID_INVALID   | Invalid rowid format        |
| ROWID_BAD_BLOCK | Block is beyond end of file |

For example:

```
ROWID_INVALID exception;
pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

## 151.4 DBMS\_ROWID Operational Notes

These operation notes apply to `DBMS_ROWID`.

- Some of the functions in this package take a single parameter, such as a `ROWID`. This can be a character or a PL/SQL `ROWID`, either restricted or extended, as required.
- You can call the `DBMS_ROWID` functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

### Note:

`ROWID_INFO` is a procedure. It can only be used in PL/SQL code.

- You can use functions from the `DBMS_ROWID` package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the `ROWID_BLOCK_NUMBER` function is used to return just the block number of a single row in the `EMP` table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
FROM emp
WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict\_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

## 151.5 DBMS\_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID\_OBJECT function in the DBMS\_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
    WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

## 151.6 Summary of DBMS\_ROWID Subprograms

This table lists the DBMS\_ROWID subprograms and briefly describes them.

**Table 151-5 DBMS\_ROWID Package Subprograms**

| Subprogram                                     | Description                                                                              |
|------------------------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">ROWID_BLOCK_NUMBER Function</a>    | Returns the block number of a ROWID                                                      |
| <a href="#">ROWID_CREATE Function</a>          | Creates a ROWID, for testing only                                                        |
| <a href="#">ROWID_INFO Procedure</a>           | Returns the type and components of a ROWID                                               |
| <a href="#">ROWID_OBJECT Function</a>          | Returns the object number of the extended ROWID                                          |
| <a href="#">ROWID_RELATIVE_FNO Function</a>    | Returns the file number of a ROWID                                                       |
| <a href="#">ROWID_ROW_NUMBER Function</a>      | Returns the row number                                                                   |
| <a href="#">ROWID_TO_ABSOLUTE_FNO Function</a> | Returns the absolute file number associated with the ROWID for a row in a specific table |
| <a href="#">ROWID_TO_EXTENDED Function</a>     | Converts a ROWID from restricted format to extended                                      |
| <a href="#">ROWID_TO_RESTRICTED Function</a>   | Converts an extended ROWID to restricted format                                          |
| <a href="#">ROWID_TYPE Function</a>            | Returns the ROWID type: 0 is restricted, 1 is extended                                   |
| <a href="#">ROWID_VERIFY Function</a>          | Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function            |

### 151.6.1 ROWID\_BLOCK\_NUMBER Function

This function returns the database block number for the input ROWID.

#### Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
  row_id      IN   ROWID,
  ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 151-6 ROWID\_BLOCK\_NUMBER Function Parameters**

| Parameter  | Description                                                             |
|------------|-------------------------------------------------------------------------|
| row_id     | ROWID to be interpreted                                                 |
| ts_type_in | The type of the tablespace (bigfile/smallfile) to which the row belongs |

## Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
FROM some_table
WHERE key_value = 42);
```

## 151.6.2 ROWID\_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

## Syntax

```
DBMS_ROWID.ROWID_CREATE (
    rowid_type    IN NUMBER,
    object_number IN NUMBER,
    relative_fno  IN NUMBER,
    block_number  IN NUMBER,
    row_number    IN NUMBER)
RETURN ROWID;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 151-7 ROWID\_CREATE Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rowid_type    | Type (restricted or extended)<br><br>Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID.<br><br>If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID. |
| object_number | Data object number (rowid_object_undefined for restricted)                                                                                                                                                                                                                        |
| relative_fno  | Relative file number                                                                                                                                                                                                                                                              |

**Table 151-7 (Cont.) ROWID\_CREATE Function Parameters**

| Parameter    | Description                      |
|--------------|----------------------------------|
| block_number | Block number in this file        |
| row_number   | Returns row number in this block |

### Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid\_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj\_number now contains 9999.

## 151.6.3 ROWID\_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

### Syntax

```
DBMS_ROWID.ROWID_INFO (  
    rowid_in          IN   ROWID,  
    rowid_type         OUT  NUMBER,  
    object_number      OUT  NUMBER,  
    relative_fno       OUT  NUMBER,  
    block_number       OUT  NUMBER,  
    row_number         OUT  NUMBER);
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 151-8 ROWID\_INFO Procedure Parameters**

| Parameter     | Description                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------|
| rowid_in      | ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID. |
| rowid_type    | Returns type (restricted/extended)                                                               |
| object_number | Returns data object number (rowid_object_undefined for restricted)                               |
| relative_fno  | Returns relative file number                                                                     |
| block_number  | Returns block number in this file                                                                |
| row_number    | Returns row number in this block                                                                 |

See Also:

"ROWID\_TYPE Function"

Examples

This example reads back the values for the ROWID that you created in the ROWID\_CREATE:

```
DBMS_ROWID.ROWID_INFO (  
  my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

151.6.4 ROWID\_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (  
  rowid_id IN ROWID)  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES (rowid_object, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 151-9 ROWID\_OBJECT Function Parameters

| Parameter | Description             |
|-----------|-------------------------|
| row_id    | ROWID to be interpreted |

Note:

The ROWID\_OBJECT\_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object (ROWID)  
FROM emp  
WHERE empno = 7499;
```

## 151.6.5 ROWID\_RELATIVE\_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

### Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (  
    rowid_id      IN   ROWID,  
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 151-10** ROWID\_RELATIVE\_FNO Function Parameters

| Parameter  | Description                                                         |
|------------|---------------------------------------------------------------------|
| row_id     | ROWID to be interpreted                                             |
| ts_type_in | Type of the tablespace (bigfile/smallfile) to which the row belongs |

### Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE  
    file_number    INTEGER;  
    rowid_val      ROWID;  
BEGIN  
    SELECT ROWID INTO rowid_val  
    FROM dept  
    WHERE loc = 'Boston';  
    file_number :=  
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');  
    ...
```

## 151.6.6 ROWID\_ROW\_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

### Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
RETURN NUMBER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 151-11 ROWID\_ROW\_NUMBER Function Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| row_id    | ROWID to be interpreted. |

## Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)
FROM emp
WHERE ename = 'ALLEN';
```

## 151.6.7 ROWID\_TO\_ABSOLUTE\_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

## Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
    row_id      IN ROWID,
    schema_name IN VARCHAR2,
    object_name IN VARCHAR2)
RETURN NUMBER;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

## Parameters

**Table 151-12 ROWID\_TO\_ABSOLUTE\_FNO Function Parameters**

| Parameter   | Description                                 |
|-------------|---------------------------------------------|
| row_id      | ROWID to be interpreted                     |
| schema_name | Name of the schema which contains the table |
| object_name | Table name                                  |

## Examples

```
DECLARE
    abs_fno      INTEGER;
    rowid_val    CHAR(18);
    object_name  VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
    FROM emp
    WHERE empno = 9999;
```

```
abs_fno := dbms_rowid.rowid_to_absolute_fno(
rowid_val, 'SCOTT', object_name);
```

**Note:**

For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

## 151.6.8 ROWID\_TO\_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

**Syntax**

```
DBMS_ROWID.ROWID_TO_EXTENDED (
    old_rowid      IN ROWID,
    schema_name    IN VARCHAR2,
    object_name     IN VARCHAR2,
    conversion_type IN INTEGER)
RETURN ROWID;
```

**Pragmas**

```
pragma RESTRICT_REFERENCES (rowid_to_extended, WNDS, WNPS, RNPS);
```

**Parameters**

**Table 151-13 ROWID\_TO\_EXTENDED Function Parameters**

| Parameter       | Description                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------|
| old_rowid       | ROWID to be converted                                                                                |
| schema_name     | Name of the schema which contains the table (optional)                                               |
| object_name     | Table name (optional).                                                                               |
| conversion_type | The following constants are defined:<br>ROWID_CONVERT_INTERNAL (:=0)<br>ROWID_CONVERT_EXTERNAL (:=1) |

**Return Values**

ROWID\_TO\_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

**Examples**

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID\_COL that holds ROWIDs (restricted), and a column TABLE\_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (
    rowid_col, 'SCOTT', TABLE_COL, 0);
```

### Usage Notes

- If the schema and object names are provided as `IN` parameters, then this function verifies `SELECT` authority on the table named, and converts the restricted `ROWID` provided to an extended `ROWID`, using the data object number of the table. That `ROWID_TO_EXTENDED` returns a value, however, does not guarantee that the converted `ROWID` actually references a valid row in the table, either at the time that the function is called, or when the extended `ROWID` is actually used.
- If the schema and object name are not provided (are passed as `NULL`), then this function attempts to fetch the page specified by the restricted `ROWID` provided. It treats the file number stored in this `ROWID` as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended `ROWID` value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended `ROWID` value is supplied, the data object number in the input extended `ROWID` is verified against the data object number computed from the table name parameter. If the two numbers do not match, the `INVALID_ROWID` exception is raised. If they do match, the input `ROWID` is returned.
- `ROWID_TO_EXTENDED` cannot be used with partition tables.

#### See Also:

The [ROWID\\_VERIFY Function](#) has a method to determine if a given `ROWID` can be converted to the extended format.

## 151.6.9 ROWID\_TO\_RESTRICTED Function

This function converts an extended `ROWID` into restricted `ROWID` format.

### Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
  old_rowid      IN ROWID,
  conversion_type IN INTEGER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (rowid_to_restricted, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 151-14 ROWID\_TO\_RESTRICTED Function Parameters**

| Parameter       | Description                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------|
| old_rowid       | ROWID to be converted                                                                                |
| conversion_type | The following constants are defined:<br>ROWID_CONVERT_INTERNAL (:=0)<br>ROWID_CONVERT_EXTERNAL (:=1) |

## 151.6.10 ROWID\_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

### Syntax

```
DBMS_ROWID.ROWID_TYPE (  
    rowid_id IN ROWID)  
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (rowid_type,WNDS,RNDS,WNPS,RNPS);
```

## Parameters

**Table 151-15 ROWID\_TYPE Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| row_id    | ROWID to be interpreted |

### Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN  
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

## 151.6.11 ROWID\_VERIFY Function

This function verifies the ROWID.

It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

### Note:

You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (  
    rowid_in      IN ROWID,  
    schema_name   IN VARCHAR2,  
    object_name   IN VARCHAR2,  
    conversion_type IN INTEGER  
    RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES (rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 151-16 ROWID\_VERIFY Function Parameters

| Parameter       | Description                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------|
| rowid_in        | ROWID to be verified                                                                                 |
| schema_name     | Name of the schema which contains the table                                                          |
| object_name     | Table name                                                                                           |
| conversion_type | The following constants are defined:<br>ROWID_CONVERT_INTERNAL (:=0)<br>ROWID_CONVERT_EXTERNAL (:=1) |

Examples

Considering the schema in the example for the ROWID\_TO\_EXTENDED function, you can use the following statement to find bad ROWIDS prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col  
FROM SCOTT.RIDS  
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

# DBMS\_RULE

The `DBMS_RULE` package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_RULE Subprograms](#)

## 152.1 DBMS\_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

 **See Also:**

- [Rule TYPEs](#) for more information about the types used with the `DBMS_RULE` package
- [DBMS\\_RULE\\_ADM](#)

## 152.2 DBMS\_RULE Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

 **See Also:**

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 152.3 Summary of DBMS\_RULE Subprograms

This table lists the `DBMS_RULE` subprograms and briefly describes them.

**Table 152-1    DBMS\_RULE Package Subprograms**

| Subprogram                               | Description                                                                             |
|------------------------------------------|-----------------------------------------------------------------------------------------|
| <a href="#">CLOSE_ITERATOR Procedure</a> | Closes an open iterator                                                                 |
| <a href="#">EVALUATE Procedure</a>       | Evaluates the rules in the specified rule set that use the evaluation context specified |

**Table 152-1 (Cont.) DBMS\_RULE Package Subprograms**

| Subprogram                                             | Description                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EVALUATE_EXPRESSION Procedure</a>          | Evaluates an expression under the logged in user in a session                                                                                                                                                                                                                                     |
| <a href="#">EVALUATE_EXPRESSION_ITERATOR Procedure</a> | Finds the relevant datapoints and pass <code>re\$value_list</code> into evaluation interface                                                                                                                                                                                                      |
| <a href="#">EVALUATE_RULE Procedure</a>                | Evaluates the condition defined in the Rule                                                                                                                                                                                                                                                       |
| <a href="#">EVALUATE_RULE_ITERATOR Procedure</a>       | Finds the relevant datapoints and pass <code>re\$value_list</code> into evaluation interface                                                                                                                                                                                                      |
| <a href="#">GET_NEXT_HIT Function</a>                  | Returns the next rule that evaluated to <code>TRUE</code> from a true rules iterator, or returns the next rule that evaluated to <code>MAYBE</code> from a maybe rules iterator; returns <code>NULL</code> if there are no more rules that evaluated to <code>TRUE</code> or <code>MAYBE</code> . |
| <a href="#">IS_FAST Procedure</a>                      | Returns <code>TRUE</code> if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.                                               |
| <a href="#">GET_NEXT_RESULT Function</a>               | Iterates over result from the expression given <code>result_val_iterator</code> .                                                                                                                                                                                                                 |

## 152.3.1 CLOSE\_ITERATOR Procedure

This procedure closes an open iterator.

### Syntax

```
DBMS_RULE.CLOSE_ITERATOR(  
    iterator IN BINARY_INTEGER);
```

### Parameter

**Table 152-2 CLOSE\_ITERATOR Procedure Parameter**

| Parameter             | Description           |
|-----------------------|-----------------------|
| <code>iterator</code> | Iterator to be closed |

### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

## 152.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

### Syntax

```
DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context          IN      SYS.RE$NV_LIST              DEFAULT NULL,
    table_values           IN      SYS.RE$TABLE_VALUE_LIST     DEFAULT NULL,
    column_values          IN      SYS.RE$COLUMN_VALUE_LIST    DEFAULT NULL,
    variable_values        IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values       IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

    skip_rules             IN      SYS.RE$RULE_NAME_LIST        DEFAULT NULL,

    dop                   IN      NUMBER,

    result_cache           IN      BOOLEAN                     DEFAULT FALSE,
    stop_on_first_hit      IN      BOOLEAN                     DEFAULT FALSE,
    simple_rules_only      IN      BOOLEAN                     DEFAULT FALSE,
    true_rules             OUT     SYS.RE$RULE_HIT_LIST,
    maybe_rules            OUT     SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE (
    rule_set_name          IN      VARCHAR2,
    evaluation_context     IN      VARCHAR2,
    event_context          IN      SYS.RE$NV_LIST              DEFAULT NULL,
    table_values           IN      SYS.RE$TABLE_VALUE_LIST     DEFAULT NULL,
    column_values          IN      SYS.RE$COLUMN_VALUE_LIST    DEFAULT NULL,
    variable_values        IN      SYS.RE$VARIABLE_VALUE_LIST  DEFAULT NULL,
    attribute_values       IN      SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,

    skip_rules             IN      SYS.RE$RULE_NAME_LIST        DEFAULT NULL,

    dop                   IN      NUMBER,

    simple_rules_only      IN      BOOLEAN                     DEFAULT FALSE,
    true_rules_iterator    OUT     BINARY_INTEGER,
    maybe_rules_iterator   OUT     BINARY_INTEGER);
```

### Parameters

**Table 152-3 EVALUATE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_set_name</code> | Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used. |

**Table 152-3 (Cont.) EVALUATE Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>evaluation_context</code>  | <p>An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>. If the schema is not specified, then the name of the current user is used.</p> <p>Only rules that use the specified evaluation context are evaluated.</p>                                                                                                                                                                                                                                                                  |
| <code>event_context</code>       | A list of name-value pairs that identify events that cause evaluation                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>table_values</code>        | Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.                                                                                                                                                                                                                                                                                                                                                                 |
| <code>column_values</code>       | Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .                                                                                                                                                                                                                                                                                                                                                                |
| <code>variable_values</code>     | <p>A list containing the data for variables.</p> <p>The only way for an explicit variable value to be known is to specify its value in this list.</p> <p>If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.</p>                                                                                                |
| <code>attribute_values</code>    | Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .                                                                                                                                                                                                                                                                                                                                                         |
| <code>stop_on_first_hit</code>   | <p>If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule.</p> <p>If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data.</p> <p>If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.</p>                                                                                                                                                                     |
| <code>simple_rules_only</code>   | <p>If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation.</p> <p>If FALSE, then evaluates all rules.</p>                                                                                                                                                                                                                                                                                                                                        |
| <code>true_rules</code>          | <p>Receives the output of the EVALUATE procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.</p> <p>If no rules evaluate to TRUE, then <code>true_rules</code> is empty.</p> <p>If at least one rule evaluates to TRUE and <code>stop_on_first_hit</code> is TRUE, then <code>true_rules</code> contains one rule that evaluates to TRUE.</p> <p>If <code>stop_on_first_hit</code> is FALSE, then <code>true_rules</code> contains all rules that evaluate to TRUE.</p>                                        |
| <code>maybe_rules</code>         | <p>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.</p> <p>If <code>stop_on_first_hit</code> is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then <code>maybe_rules</code> contains one rule that may evaluate to TRUE.</p> <p>If <code>stop_on_first_hit</code> is FALSE, then <code>maybe_rules</code> contains all rules that may evaluate to TRUE given more data.</p> |
| <code>true_rules_iterator</code> | Contains the iterator for accessing rules that are TRUE                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 152-3 (Cont.) EVALUATE Procedure Parameters**

| Parameter                         | Description                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>maybe_rules_iterator</code> | Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL                                                                                                           |
| <code>skip_rules</code>           | List of rules to skip within this evaluation.                                                                                                                                                                          |
| <code>dop</code>                  | Degree of parallelism                                                                                                                                                                                                  |
| <code>result_cache</code>         | If TRUE, Result Cache will be created. If <code>evaluate</code> procedure is called with either <code>true_rules_iterator</code> or <code>maybe_rules_iterator</code> , then <code>result_cache</code> is not enabled. |

**Usage Notes****Note:**

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first TRUE rule or the first MAYBE rule (if there are no TRUE rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as MAYBE rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as MAYBE rules, unless they can be determined to be TRUE or FALSE based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as TRUE, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- TRUE rules, which is the list of rules that evaluate to TRUE based on the given data. These rules are returned either in the OUT parameter `true_rules`, which returns all of the rules that evaluate to TRUE, or in the OUT parameter `true_rules_iterator`, which returns each rule that evaluates to TRUE one at a time.
- MAYBE rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".

- The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

 **Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

### 152.3.3 EVALUATE\_EXPRESSION Procedure

This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, its possible of aging....

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION(  
  rule_expression      IN      VARCHAR2,  
  table_aliases        IN      SYS.RE$TABLE_ALIAS_LIST:= NULL,  
  variable_types       IN      SYS.RE$VARIABLE_TYPE_LIST:= NULL,  
  table_values         IN      SYS.RE$TABLE_VALUE_LIST:= NULL,  
  column_values        IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,  
  variable_values      IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,  
  attribute_values     IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL,  
  cache               IN      BOOLEAN DEFAULT FALSE,  
  result_val           OUT     BOOLEAN);
```

Parameters

Table 152-4 EVALUATE\_EXPRESSION Procedure Parameters

| Parameter        | Description                                                 |
|------------------|-------------------------------------------------------------|
| rule_expression  | Contains an expression string.                              |
| table_alias      | Contains alias of tables referred in the expression string. |
| variable_types   | Contains type definitions of variables used in expression.  |
| table_values     | Contains ROWID of table row for expression evaluation.      |
| column_values    | Contains values of columns referred in the expression.      |
| variable_values  | Contains values of variables referred in the expression.    |
| attribute_values | Contains values of attributes referred in the expression.   |
| cache            | If TRUE, Result Cache will be created.                      |
| result_val       | Result of the evaluation.                                   |

152.3.4 EVALUATE\_EXPRESSION\_ITERATOR Procedure

This is an user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

Syntax

```
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(  
  rule_expression      IN      varchar2,  
  table_aliases        IN      sys.re$table_alias_list:= NULL,  
  variable_types       IN      sys.re$variable_type_list:= NULL,  
  values              IN      sys.re$value_list,  
  cache               IN      boolean DEFAULT FALSE,  
  result_val_iter_id   OUT     BINARY_INTEGER)
```

## Parameters

**Table 152-5 EVALUATE\_EXPRESSION\_ITERATOR Procedure Parameter**

| Parameter          | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| rule_expression    | Contains an expression string.                                    |
| table_alias        | Alias of tables referred in the above expression string.          |
| variable_types     | Type definitions of variables used in expression.                 |
| values             | List of datapoint values for evaluation.                          |
| cache              | If TRUE, Result Cache will be created.                            |
| result_val_iter_id | Contains iterator for result of array of values sent using value. |

## 152.3.5 EVALUATE\_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

### Syntax

```
DBMS_RULE.EVALUATE_RULE(  
  rule_name          IN  VARCHAR2,  
  event_context      IN  SYS.RE$NV_LIST          DEFAULT NULL,  
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,  
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,  
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,  
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,  
  cache             IN  BOOLEAN DEFAULT FALSE,  
  result_val         OUT BOOLEAN);
```

## Parameters

**Table 152-6 EVALUATE\_RULE Procedure Parameter**

| Parameter        | Description                                                                  |
|------------------|------------------------------------------------------------------------------|
| rule_name        | Name of the rule previously create using <code>CREATE_RULE</code> procedure. |
| event_context    | A list of name-value pairs that identify events that cause evaluation.       |
| table_values     | ROWID of table row for expression evaluation.                                |
| column_values    | Values of columns referred in the expression                                 |
| variable_values  | Values of variables referred in expression                                   |
| attribute_values | Values of attributes referred in expression                                  |
| cache            | If TRUE, Result Cache will be created.                                       |
| result_val       | Result of the evaluation                                                     |

## 152.3.6 EVALUATE\_RULE\_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element. User can use `DBMS_RULE.GET_NEXT_RESULT` procedure to iterate through the result list.

### Syntax

```
DBMS_RULE.EVALUATE_RULE_ITERATOR(  
  rule_name          IN          VARCHAR2,  
  event_context      IN          SYS.RE$NV_LIST DEFAULT NULL,  
  values             IN          SYS.RE$VALUE_LIST,  
  cache              IN          BOOLEAN DEFAULT FALSE,  
  result_val_iter_id OUT         BINARY_INTEGER);
```

### Parameters

**Table 152-7 EVALUATE\_RULE\_ITERATOR Procedure Parameter**

| Parameter                       | Description                                                                    |
|---------------------------------|--------------------------------------------------------------------------------|
| <code>rule_name</code>          | Name of the rule previously create using <code>CREATE_RULE</code> procedure.   |
| <code>event_context</code>      | A list of name-value pairs that identify events that cause evaluation          |
| <code>values</code>             | List of datapoint values for evaluation.                                       |
| <code>cache</code>              | If <code>TRUE</code> , Result Cache will be created.                           |
| <code>result_val_iter_id</code> | Contains iterator for result of array of values sent using <code>values</code> |

## 152.3.7 GET\_NEXT\_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

### Syntax

```
DBMS_RULE.GET_NEXT_HIT(  
  iterator IN BINARY_INTEGER)  
RETURN SYS.RE$RULE_HIT;
```

### Parameter

**Table 152-8 GET\_NEXT\_HIT Function Parameter**

| Parameter             | Description                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------|
| <code>iterator</code> | The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved |

### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

#### Note:

This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

#### See Also:

- [Rule TYPES](#) for more information about the types used with the `DBMS_RULE` package
- [EVALUATE Procedure](#)
- [CLOSE\\_ITERATOR Procedure](#)

## 152.3.8 GET\_NEXT\_RESULT Function

This function iterates over result from the expression given in `RESULT_VAL_ITERATOR`. It returns the expression at iterator evaluated to `TRUE` or `FALSE`.

### Syntax

```
DBMS_RULE.GET_NEXT_RESULT (  
  result_val_iterator_id    IN    BINARY_INTEGER)  
RETURN BOOLEAN;
```

### Parameter

**Table 152-9** GET\_NEXT\_RESULT Function Parameter

| Parameter              | Description                                                      |
|------------------------|------------------------------------------------------------------|
| result_val_iterator_id | Iterator returned from <code>EVALUATE_EXPRESSION_ITERATOR</code> |

## 152.3.9 IS\_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return `TRUE` if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine

does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

### Syntax

```
DBMS_RULE.IS_FAST(  
    expression          IN      VARCHAR2,  
    table_aliases       IN      SYS.RE$TABLE_ALIAS_LIST:= NULL,  
    variable_types      IN      SYS.RE$VARIABLE_TYPE_LIST:= NULL,  
    result_val          OUT     BOOLEAN);
```

### Parameter

**Table 152-10 IS\_FAST Procedure Parameter**

| Parameter      | Description                                             |
|----------------|---------------------------------------------------------|
| expression     | Expression to check                                     |
| table_aliases  | Alias of tables referred in the above expression string |
| variable_types | Type definitions of variables used in expression        |
| result_val     | If the expression can be evaluated as fast              |

# DBMS\_RULE\_ADM

The `DBMS_RULE_ADM` package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_RULE\\_ADM Subprograms](#)

## 153.1 DBMS\_RULE\_ADM Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

 **See Also:**

- [Rule TYPEs](#) for more information about the types used with the `DBMS_RULE_ADM` package
- [DBMS\\_RULE](#)

## 153.2 DBMS\_RULE\_ADM Security Model

`PUBLIC` is granted `EXECUTE` privilege on this package.

 **See Also:**

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 153.3 Summary of DBMS\_RULE\_ADM Subprograms

This table lists the `DBMS_RULE_ADM` subprograms and briefly describes them.

**Table 153-1    DBMS\_RULE\_ADM Package Subprograms**

| Subprogram                                         | Description                                       |
|----------------------------------------------------|---------------------------------------------------|
| <a href="#">ADD_RULE Procedure</a>                 | Adds the specified rule to the specified rule set |
| <a href="#">ALTER_EVALUATION_CONTEXT Procedure</a> | Alters a rule evaluation context                  |

**Table 153-1 (Cont.) DBMS\_RULE\_ADM Package Subprograms**

| Subprogram                                          | Description                                                                                    |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_RULE Procedure</a>                | Changes one or more aspects of the specified rule                                              |
| <a href="#">CREATE_EVALUATION_CONTEXT Procedure</a> | Creates a rule evaluation context                                                              |
| <a href="#">CREATE_RULE Procedure</a>               | Creates a rule with the specified name                                                         |
| <a href="#">CREATE_RULE_SET Procedure</a>           | Creates a rule set with the specified name                                                     |
| <a href="#">DROP_EVALUATION_CONTEXT Procedure</a>   | Drops the rule evaluation context with the specified name                                      |
| <a href="#">DROP_RULE Procedure</a>                 | Drops the rule with the specified name                                                         |
| <a href="#">DROP_RULE_SET Procedure</a>             | Drops the rule set with the specified name                                                     |
| <a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a>    | Grants the specified object privilege on the specified object to the specified user or role    |
| <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>    | Grants the specified system privilege to the specified user or role                            |
| <a href="#">REMOVE_RULE Procedure</a>               | Removes the specified rule from the specified rule set                                         |
| <a href="#">REVOKE_OBJECT_PRIVILEGE Procedure</a>   | Revokes the specified object privilege on the specified object from the specified user or role |
| <a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>   | Revokes the specified system privilege from the specified user or role                         |

**Note:**

All subprograms commit unless specified otherwise.

## 153.3.1 ADD\_RULE Procedure

This procedure adds the specified rule to the specified rule set.

### Syntax

```
DBMS_RULE_ADM.ADD_RULE (
    rule_name          IN  VARCHAR2,
    rule_set_name      IN  VARCHAR2,
    evaluation_context IN  VARCHAR2  DEFAULT NULL,
    rule_comment       IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 153-2 ADD\_RULE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name | The name of the rule you are adding to the rule set, specified as <code>[schema_name.]rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |

**Table 153-2 (Cont.) ADD\_RULE Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_set_name</code>      | The name of the rule set to which you are adding the rule, specified as <code>[schema_name.]rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. |
| <code>evaluation_context</code> | An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default.<br><br>Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.           |
| <code>rule_comment</code>       | Optional description, which can contain the reason for adding the rule to the rule set                                                                                                                                                                                                                                                                  |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

## 153.3.2 ALTER\_EVALUATION\_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST  DEFAULT NULL,
  remove_table_aliases        IN  BOOLEAN                  DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST DEFAULT NULL,
  remove_variable_types       IN  BOOLEAN                  DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                  DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                  DEFAULT FALSE);
```

### Parameters

**Table 153-3 ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>evaluation_context_name</code> | The name of the evaluation context you are altering, specified as <code>[schema_name.]evaluation_context_name</code> .<br><br>For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                   |
| <code>table_aliases</code>           | If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code> , then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code> , then the procedure removes the existing table aliases.<br><br>If non- <code>NULL</code> , then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases.<br><br>Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions. |
| <code>remove_table_aliases</code>    | If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code> , then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non- <code>NULL</code> , then the procedure raises an error.<br><br>If <code>FALSE</code> , then the procedure does not remove table aliases.                                                                                                                                                                                                                 |
| <code>variable_types</code>          | If <code>NULL</code> and <code>remove_variable_types</code> is <code>FALSE</code> , then the procedure retains the variable types. If <code>NULL</code> and <code>remove_variable_types</code> is <code>TRUE</code> , then the procedure removes the existing variable types.<br><br>If non- <code>NULL</code> , then the procedure replaces the existing variable types for the evaluation context with the specified variable types.                                                                                                                                            |

**Table 153-3 (Cont.) ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>remove_variable_types</code>       | <p>If TRUE and <code>variable_types</code> is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and <code>variable_types</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>evaluation_function</code>         | <p>If NULL and <code>remove_evaluation_function</code> is FALSE, then the procedure retains the existing evaluation function. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.</p> <p>See <a href="#">CREATE_EVALUATION_CONTEXT Procedure</a> for more information about evaluation functions.</p> |
| <code>remove_evaluation_function</code>  | <p>If TRUE and <code>evaluation_function</code> is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and <code>evaluation_function</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>evaluation_context_comment</code>  | <p>If NULL and <code>remove_eval_context_comment</code> is FALSE, then the procedure retains the existing evaluation context comment. If NULL and <code>remove_evaluation_function</code> is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>                                                                                                                                                                                                                                                                                                          |
| <code>remove_eval_context_comment</code> | <p>If TRUE and <code>evaluation_context_comment</code> is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and <code>evaluation_context_comment</code> is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation context comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered

- Have `ALL_ON_EVALUATION_CONTEXT` or `ALTER_ON_EVALUATION_CONTEXT` object privilege on an evaluation context owned by another user
- Have `ALTER_ANY_EVALUATION_CONTEXT` system privilege

#### See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

## 153.3.3 ALTER\_RULE Procedure

This procedure changes one or more aspects of the specified rule.

### Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
    rule_name          IN  VARCHAR2,
    condition          IN  VARCHAR2          DEFAULT NULL,
    evaluation_context IN  VARCHAR2          DEFAULT NULL,
    remove_evaluation_context IN BOOLEAN      DEFAULT FALSE,
    action_context     IN  SYS.RE$NV_LIST    DEFAULT NULL,
    remove_action_context IN BOOLEAN          DEFAULT FALSE,
    rule_comment       IN  VARCHAR2          DEFAULT NULL,
    remove_rule_comment IN BOOLEAN            DEFAULT FALSE);
```

### Parameters

**Table 153-4 ALTER\_RULE Procedure Parameters**

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code>                 | The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code> . For example, to alter a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.                                             |
| <code>condition</code>                 | The condition to be associated with the rule.<br>If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.                                                                                                                                                                                        |
| <code>evaluation_context</code>        | An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the current user is the default.<br>If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.                                                  |
| <code>remove_evaluation_context</code> | If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule.<br>If FALSE, then the procedure retains any evaluation context for the specified rule.<br>If the <code>evaluation_context</code> parameter is non-NULL, then this parameter should be set to FALSE. |

**Table 153-4 (Cont.) ALTER\_RULE Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>action_context</code>        | If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.                                                                                                |
| <code>remove_action_context</code> | If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule.<br>If FALSE, then the procedure retains any action context for the specified rule.<br>If the <code>action_context</code> parameter is non-NULL, then this parameter should be set to FALSE. |
| <code>rule_comment</code>          | If non-NULL, then the existing comment of the rule is replaced by the specified comment.                                                                                                                                                                                                                                          |
| <code>remove_rule_comment</code>   | If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule.<br>If FALSE, then the procedure retains any comment for the specified rule.<br>If the <code>rule_comment</code> parameter is non-NULL, then this parameter should be set to FALSE.                        |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE` privilege on the rule
- Have `ALTER_ANY_RULE` system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

## 153.3.4 CREATE\_EVALUATION\_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(  
    evaluation_context_name    IN  VARCHAR2,  
    table_aliases              IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,  
    variable_types             IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,  
    evaluation_function        IN  VARCHAR2                  DEFAULT NULL,  
    evaluation_context_comment IN  VARCHAR2                  DEFAULT NULL);
```

### Parameters

**Table 153-5 CREATE\_EVALUATION\_CONTEXT Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| evaluation_context_name    | The name of the evaluation context you are creating, specified as <code>[schema_name.]evaluation_context_name</code> .<br><br>For example, to create an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default. |
| table_aliases              | Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.                                                                                                                                                                                                                                            |
| variable_types             | A list of variables for the evaluation context                                                                                                                                                                                                                                                                                                                                   |
| evaluation_function        | An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.<br><br>See " <a href="#">Usage Notes</a> " for more information about the evaluation function.                                       |
| evaluation_context_comment | An optional description of the rule evaluation context.                                                                                                                                                                                                                                                                                                                          |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

#### See Also:

[Rule TYPES](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
    rule_set_name      IN   VARCHAR2,
    evaluation_context IN   VARCHAR2,
    event_context      IN   SYS.RE$NV_LIST          DEFAULT NULL,
    table_values       IN   SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
    column_values      IN   SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
    variable_values    IN   SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
    attribute_values   IN   SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
    stop_on_first_hit  IN   BOOLEAN                 DEFAULT FALSE,
    simple_rules_only  IN   BOOLEAN                 DEFAULT FALSE,
    true_rules         OUT  SYS.RE$RULE_HIT_LIST,
    maybe_rules        OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

#### Note:

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

## 153.3.5 CREATE\_RULE Procedure

This procedure creates a rule.

#### Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
    rule_name      IN   VARCHAR2,
    condition      IN   VARCHAR2,
    evaluation_context IN VARCHAR2          DEFAULT NULL,
    action_context IN   SYS.RE$NV_LIST     DEFAULT NULL,
    rule_comment   IN   VARCHAR2           DEFAULT NULL);
```

## Parameters

**Table 153-6 CREATE\_RULE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name          | The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code> . For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                      |
| condition          | The condition to be associated with the rule. A condition evaluates to <code>TRUE</code> or <code>FALSE</code> and can be any condition allowed in the <code>WHERE</code> clause of a <code>SELECT</code> statement. For example, the following is a valid rule condition:<br><br><code>department_id = 30</code><br><br>Ensure that the proper case is used for text in rule conditions.<br><b>Note:</b> Do not include the word "WHERE" in the condition. |
| evaluation_context | An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> , which is associated with the rule. If the schema is not specified, then the current user is the default.<br><br>If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set.                                                                                                                  |
| action_context     | The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.                                                                                                                                                                                                                                                                  |
| rule_comment       | An optional description of the rule                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the `CREATE_RULE_OBJ` system privilege
- Have `CREATE_ANY_RULE` system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

## 153.3.6 CREATE\_RULE\_SET Procedure

This procedure creates a rule set.

### Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(  
    rule_set_name      IN  VARCHAR2,  
    evaluation_context IN  VARCHAR2  DEFAULT NULL,  
    rule_set_comment   IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 153-7 CREATE\_RULE\_SET Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_set_name      | The name of the rule set you are creating, specified as <i>[schema_name.]rule_set_name</i> . For example, to create a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. |
| evaluation_context | An optional evaluation context name in the form <i>[schema_name.]evaluation_context_name</i> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.                                           |
| rule_set_comment   | An optional description of the rule set                                                                                                                                                                                                                                                                                  |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

## 153.3.7 DROP\_EVALUATION\_CONTEXT Procedure

This procedure drops a rule evaluation context.

### Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(  
    evaluation_context_name IN  VARCHAR2,  
    force                   IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 153-8 DROP\_EVALUATION\_CONTEXT Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>evaluation_context_name</code> | The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code> .<br><br>For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>force</code>                   | If <code>TRUE</code> , then the procedure removes the rule evaluation context from all rules and rule sets that use it.<br><br>If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.<br><br>If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.<br><br><b>Caution:</b> Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated. |

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

## 153.3.8 DROP\_RULE Procedure

This procedure drops a rule.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE(
    rule_name IN VARCHAR2,
    force     IN BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 153-9 DROP\_RULE Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code> | The name of the rule you are dropping, specified as <code>[schema_name.]rule_name</code> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default. |

**Table 153-9 (Cont.) DROP\_RULE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force     | If TRUE, then the procedure removes the rule from all rule sets that contain it.<br>If FALSE and no rule sets contain the rule, then the procedure drops the rule.<br>If FALSE and one or more rule sets contain the rule, then the procedure raises an exception. |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP\_ANY\_RULE system privilege

#### Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE\_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

## 153.3.9 DROP\_RULE\_SET Procedure

This procedure drops a rule set.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(  
    rule_set_name IN VARCHAR2,  
    delete_rules  IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 153-10 DROP\_RULE\_SET Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_set_name | The name of the rule set you are dropping, specified as [schema_name.]rule_set_name. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default. |
| delete_rules  | If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped.<br>If FALSE, then the procedure does not drop the rules in the rule set.                      |

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `DROP_ANY_RULE_SET` system privilege
- Be the owner of the rule set

### Note:

The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

## 153.3.10 GRANT\_OBJECT\_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

### Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(  
    privilege      IN  BINARY_INTEGER,  
    object_name    IN  VARCHAR2,  
    grantee        IN  VARCHAR2,  
    grant_option   IN  BOOLEAN    DEFAULT FALSE);
```

### Parameters

**Table 153-11 GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege    | The name of the object privilege to grant to the grantee on the object. See "Usage Notes" for the available object privileges.                                                                                                                                                                                                                                                                                                                          |
| object_name  | The name of the object for which you are granting the privilege to the grantee, specified as <code>[schema_name.]object_name</code> . For example, to grant the privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context. |
| grantee      | The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.                                                                                                                                                                                                                                                                                                                                  |
| grant_option | If <code>TRUE</code> , then the specified user or users granted the specified privilege can grant this privilege to others.<br>If <code>FALSE</code> , then the specified user or users granted the specified privilege cannot grant this privilege to others.                                                                                                                                                                                          |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have `EXECUTE` privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 153-12 lists the object privileges.

**Table 153-12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets**

| Privilege                                                    | Description                                                                |
|--------------------------------------------------------------|----------------------------------------------------------------------------|
| <code>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</code>     | Alter and execute a particular evaluation context in another user's schema |
| <code>SYS.DBMS_RULE_ADM.ALL_ON_RULE</code>                   | Alter and execute a particular rule in another user's schema               |
| <code>SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET</code>               | Alter and execute a particular rule set in another user's schema           |
| <code>SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT</code>   | Alter a particular evaluation context in another user's schema             |
| <code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE</code>                 | Alter a particular rule in another user's schema                           |
| <code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET</code>             | Alter a particular rule set in another user's schema                       |
| <code>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</code> | Execute a particular evaluation context in another user's schema           |
| <code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</code>               | Execute a particular rule in another user's schema                         |
| <code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET</code>           | Execute a particular rule set in another user's schema                     |

### Examples

For example, to grant the `HR` user the privilege to alter a rule named `hr_dml` in the `strmadmin` schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege   => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name => 'strmadmin.hr_dml',
    grantee     => 'hr',
    grant_option => FALSE);
END;
/
```

## 153.3.11 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

### Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
  privilege   IN  BINARY_INTEGER,
  grantee     IN  VARCHAR2,
  grant_option IN  BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 153-13 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege    | The name of the system privilege to grant to the grantee.                                                                                                                                                                                      |
| grantee      | The name of the user or role for which the privilege is granted                                                                                                                                                                                |
| grant_option | If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others.<br>If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others. |

## Usage Notes

[Table 153-14](#) lists the system privileges.

**Table 153-14 System Privileges for Evaluation Contexts, Rules, and Rule Sets**

| Privilege                                        | Description                                             |
|--------------------------------------------------|---------------------------------------------------------|
| SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT   | Alter any evaluation context owned by any user          |
| SYS.DBMS_RULE_ADM.ALTER_ANY_RULE                 | Alter any rule owned by any user                        |
| SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET             | Alter any rule set owned by any user                    |
| SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT  | Create a new evaluation context in any schema           |
| SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ  | Create a new evaluation context in the grantee's schema |
| SYS.DBMS_RULE_ADM.CREATE_ANY_RULE                | Create a new rule in any schema                         |
| SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ                | Create a new rule in the grantee's schema               |
| SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET            | Create a new rule set in any schema                     |
| SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ            | Create a new rule set in the grantee's schema           |
| SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT    | Drop any evaluation context in any schema               |
| SYS.DBMS_RULE_ADM.DROP_ANY_RULE                  | Drop any rule in any schema                             |
| SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET              | Drop any rule set in any schema                         |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT | Execute any evaluation context owned by any user        |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE               | Execute any rule owned by any user                      |
| SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET           | Execute any rule set owned by any user                  |

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

## 153.3.12 REMOVE\_RULE Procedure

This procedure removes the specified rule from the specified rule set.

### Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
    rule_name          IN VARCHAR2,
    rule_set_name      IN VARCHAR2,
    evaluation_context IN VARCHAR2 DEFAULT NULL,
    all_evaluation_contexts IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 153-15 REMOVE\_RULE Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name               | The name of the rule you are removing from the rule set, specified as <i>[schema_name.]rule_name</i> . For example, to remove a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| rule_set_name           | The name of the rule set from which you are removing the rule, specified as <i>[schema_name.]rule_set_name</i> . For example, to remove the rule from a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| evaluation_context_name | <p>The name of the evaluation context associated with the rule you are removing, specified as <i>[schema_name.]evaluation_context_name</i>. For example, to specify an evaluation context named <i>dept_eval_context</i> in the <i>hr</i> schema, enter <i>hr.dept_eval_context</i> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <i>ADD_RULE</i> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.</p> <p>Specify <i>NULL</i> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <i>NULL</i> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.</p> |
| all_evaluation_contexts | <p>If <i>TRUE</i>, then the procedure removes the rule from the rule set with all of its associated evaluation contexts.</p> <p>If <i>FALSE</i>, then the procedure only removes the rule with the specified evaluation context.</p> <p>This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

 **Note:**

This procedure does not drop a rule from the database. To drop a rule from the database, use the `DROP_RULE` procedure.

## 153.3.13 REVOKE\_OBJECT\_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

### Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(  
    privilege    IN    BINARY_INTEGER,  
    object_name  IN    VARCHAR2,  
    revokee      IN    VARCHAR2);
```

### Parameters

**Table 153-16** REVOKE\_OBJECT\_PRIVILEGE Procedure Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege   | The name of the object privilege on the object to revoke from the revokee. See <a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a> for a list of the object privileges.                                                                                                                                                                                                                                                                                             |
| object_name | The name of the object for which you are revoking the privilege from the revokee, specified as <code>[schema_name.]object_name</code> . For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context. |
| revokee     | The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.                                                                                                                                                                                                                                                                                                                                              |

## 153.3.14 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

### Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(  
    privilege IN    BINARY_INTEGER,  
    revokee   IN    VARCHAR2);
```

## Parameters

**Table 153-17 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter | Description                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege | The name of the system privilege to revoke from the revokee. See <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> for a list of the system privileges. |
| revokee   | The name of the user or role from which the privilege is revoked                                                                                       |

# DBMS\_SCHEDULER

The `DBMS_SCHEDULER` package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_SCHEDULER Subprograms](#)

## See Also:

*Oracle Database Administrator's Guide* for more information regarding how to use `DBMS_SCHEDULER`

## 154.1 DBMS\_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- [CREATE\\_CREDENTIAL Procedure](#)
- [DROP\\_CREDENTIAL Procedure](#)

## 154.2 DBMS\_SCHEDULER Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

## 154.3 DBMS\_SCHEDULER Rules and Limits

These rules apply when using the `DBMS_SCHEDULER` package.

- Only `SYS` can perform actions on objects in the `SYS` schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If `job3` cannot be stopped, then the jobs that follow it, `jobclass1`, `jobclass2`, and `jobclass3` cannot be stopped. The jobs that preceded `job3`, `job1` and `job2`, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

## 154.4 DBMS\_SCHEDULER Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendar

ing syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendar

ing syntax.

### Calendaring Syntax

This section starts with the calendar

ing syntax. It is followed by descriptions of various parts of the syntax.

In the calendar

ing syntax, `*` means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule
```

```
regular_schedule = frequency_clause

**Table 154-1 Values for repeat\_interval**

| Name     | Description                                                                                                                                                                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREQ     | This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency. |
| INTERVAL | This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.                                                          |

**Table 154-1 (Cont.) Values for repeat\_interval**

| Name       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BYMONTH    | This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYWEEKNO   | <p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p> |
| BYEARDAY   | This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BYDATE     | <p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows:</p> <p>BYDATE=0115,0315,0615,0915,1215,20060115</p> <p>The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10:</p> <p>BYDATE=0110+SPAN:5D</p> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks.</p> <p>BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.</p>                                                                               |
| BYMONTHDAY | This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BYDAY      | This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BYHOUR     | This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 154-1 (Cont.) Values for repeat\_interval**

| Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| BYMINUTE | This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BYSECOND | This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BYSETPOS | <p>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other <b>BY</b> clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the <b>BYSETPOS</b> clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be:</p> <pre>FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</pre> <p>Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The <b>BYSETPOS</b> clause is always evaluated last. <b>BYSETPOS</b> is only supported with the <b>MONTHLY</b> and <b>YEARLY</b> frequencies.</p> <p>The <b>BYSETPOS</b> clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as <b>MONTHLY</b>, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the <b>BYSETPOS</b> clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</p> |
| INCLUDE  | <p>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the <b>CREATE_SCHEDULE</b> procedure.</p> <p>This clause only works on a full day and therefore cannot be used with <b>BYHOUR</b>, <b>BYMIN</b>, and <b>BYSECOND</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| EXCLUDE  | <p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the <b>CREATE_SCHEDULE</b> procedure.</p> <p>This clause only works on a full day and therefore cannot be used with <b>BYHOUR</b>, <b>BYMIN</b>, and <b>BYSECOND</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 154-1 (Cont.) Values for repeat\_interval**

| Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INTERSECT | <p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <p><code>3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</code></p> <p>These calendaring expressions result in the dates that follow:</p> <p><code>3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</code></p> <p><code>FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</code></p> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p> <p>This clause only works on a full day and therefore cannot be used with <code>BYHOUR</code>, <code>BYMIN</code>, and <code>BYSECOND</code>.</p> |
| PERIODS   | <p>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.</p> <p><code>FREQ=YEARLY; BYDATE=0301,0601,0901,1201; PERIODS=4</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BYPERIOD  | <p>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules  
For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.
- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses  
With this method, the embedded schedules inherit certain attributes from the main schedule.
  - Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.

- Days that are added by the `INCLUDE` clause follow the hourly/minutes/seconds execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "[Start Dates and Repeat Intervals](#)", later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY; INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

### User-Defined Frequencies

Instead of using predefined frequencies like `DAILY`, `WEEKLY`, `MONTHLY`, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

### Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is

retrieved from the start date. If present, BYHOUR, BYMINUTE, and BYSECOND defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the INCLUDE, EXCLUDE, or INTERSECT clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are. The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a repeat\_interval of  
FREQ=YEARLY;BYDATE=0701.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an INCLUDE clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

### General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the include, exclude, and intersect clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific BY clause do not need to be ordered.
- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

"FREQ=YEARLY;BYMONTH=JAN, JUL" with start date 01/21/2003 becomes

"FREQ=YEARLY;BYMONTH=JAN, JUL;BYMONTHDAY=21", which means every year on January 21 and July 21.

- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003, 01/12/2003,
01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1,53" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.
- When `start_date` is `NULL`, the Scheduler determines the time zone for the repeat interval as follows:
  - It checks whether or not the session time zone is a region name. The session time zone can be set by either:
    - Issuing an `ALTER SESSION` statement, for example:
 

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
    - Setting the `ORA_SDTZ` environment variable.

2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the `DEFAULT_TIMEZONE` Scheduler attribute. For more information, see the [SET\\_SCHEDULER\\_ATTRIBUTE Procedure](#).
3. If the `DEFAULT_TIMEZONE` attribute is `NULL`, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled.

### BYSETPOS Clause Rules

The following are rules for the `BYSETPOS` clause.

- The `BYSETPOS` clause is the last clause to be evaluated. It is processed after all other `BY` clauses and the `INCLUDE`, `EXCLUDE` and `INTERSECT` clauses have been evaluated.
- The `INTERVAL` clause does not change the size of the period to which the `BYSETPOS` clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which `BYSETPOS` is applied is generated from a month, not a quarter. The only impact of the `INTERVAL` clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which `BYSETPOS` is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

### BYDATE Clause Rules

The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

### EXCLUDE Clause Rules

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

### OFFSET Rules

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

### Example 154-1 Putting It All Together

This example demonstrates the use of user-defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
dbms_scheduler.create_schedule('year_start', repeat_interval=>
  'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
dbms_scheduler.create_schedule('retail_fiscal_year',
  to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
  'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
  BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

## 154.5 DBMS\_SCHEDULER Data Structures

The `DBMS_SCHEDULER` package defines `OBJECT` types and `TABLE` types.

### OBJECT Types

- [JOBARG Object Type](#)
- [JOB\\_DEFINITION Object Type](#)
- [JOBATTR Object Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE Object Type](#)
- [SCHEDULER\\$\\_EVENT\\_INFO Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_REQUEST Object Type](#)

**TABLE Types**

- [JOBARG\\_ARRAY Table Type](#)
- [JOB\\_DEFINITION\\_ARRAY Table Type](#)
- [JOBATTR\\_ARRAY Table Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE\\_LIST Table Type](#)

## 154.5.1 DBMS\_SCHEDULER JOBARG Object Type

This type is used by the `JOB` and `JOBATTR` object types. It represents a job argument in a batch of job arguments.

**Syntax**

```
TYPE jobarg IS OBJECT (  
    arg_position          NUMBER,  
    arg_text_value       VARCHAR2(4000),  
    arg_anydata_value    ANYDATA,  
    arg_operation        VARCHAR2(5));
```

**Attributes**

**Table 154-2 JOBARG Object Type Attributes**

| Attribute                      | Description                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <code>arg_position</code>      | Position of the argument                                                                                               |
| <code>arg_text_value</code>    | Value of the argument if the type is <code>VARCHAR2</code>                                                             |
| <code>arg_anydata_value</code> | Value of the argument if the type is <code>AnyData</code>                                                              |
| <code>arg_operation</code>     | Type of the operation: <ul style="list-style-type: none"><li>• <code>SET</code></li><li>• <code>RESET</code></li></ul> |

**JOBARG Constructor Function**

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

**Syntax**

Constructs a job argument with a text value.

```
constructor function jobarg (  
    arg_position          IN POSITIVEN,  
    arg_value             IN VARCHAR2)  
    RETURN SELF AS RESULT;
```

Constructs a job argument with an `AnyData` value.

```
constructor function jobarg (  
    arg_position          IN POSITIVEN,  
    arg_value             IN ANYDATA)  
    RETURN SELF AS RESULT;
```

Constructs a job argument with a `NULL` value.

```

constructor function jobarg (
    arg_position      IN POSITIVEN,
    arg_reset         IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

```

### Parameters

**Table 154-3 JOBARG Constructor Function Parameters**

| Parameter    | Description                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arg_position | Position of the argument                                                                                                                                           |
| arg_value    | Value of the argument                                                                                                                                              |
| arg_reset    | If arg_reset is TRUE, then the argument at that position is reset.<br>Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value. |

### JOBARG\_ARRAY Table Type

#### Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

## 154.5.2 JOBARG\_ARRAY Table Type

The `jobarg_array` type is a table of `jobarg`.

#### Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

## 154.5.3 DBMS\_SCHEDULER JOB\_DEFINITION Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

#### Syntax

```

TYPE job_definition IS OBJECT (
    job_name          VARCHAR2(100),
    job_class         VARCHAR2(32),
    job_style         VARCHAR2(11),
    program_name      VARCHAR2(100),
    job_action        VARCHAR2(4000),
    job_type          VARCHAR2(20),
    schedule_name     VARCHAR2(65),
    repeat_interval   VARCHAR2(4000),
    schedule_limit    INTERVAL DAY TO SECOND,
    start_date        TIMESTAMP WITH TIME ZONE,
    end_date          TIMESTAMP WITH TIME ZONE,
    event_condition   VARCHAR2(4000),
    queue_spec        VARCHAR2(100),
    number_of_arguments NUMBER,
    arguments         SYS.JOBARG_ARRAY,
    job_priority      NUMBER,
    job_weight        NUMBER,
    max_run_duration  INTERVAL DAY TO SECOND,
    max_runs          NUMBER,
    max_failures      NUMBER,

```

```

logging_level          NUMBER,
restartable            VARCHAR2(5),
stop_on_window_close  VARCHAR2(5),
raise_events           NUMBER,
comments              VARCHAR2(240),
auto_drop              VARCHAR2(5),
enabled               VARCHAR2(5),
follow_default_timezone VARCHAR2(5),
parallel_instances     VARCHAR2(5),
aq_job                VARCHAR2(5),
instance_id            NUMBER,
credential_name        VARCHAR2(65),
destination            VARCHAR2(4000),
database_role          VARCHAR2(20),
allow_runs_in_restricted_mode VARCHAR2(5);
restart_on_recovery     BOOLEAN;
restart_on_failure      BOOLEAN;

```

### Object Attributes

[Table 154-4](#) provides brief descriptions of the attributes of the `JOB_DEFINITION` object type. For more complete information about these attributes, see the "[CREATE\\_JOB Procedure](#)" and the "[SET\\_ATTRIBUTE Procedure](#)".

**Table 154-4** `JOB_DEFINITION` Object Types

| Attribute                        | Description                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>job_name</code>            | Name of the job                                                                                                                                                                                                 |
| <code>job_class</code>           | Name of the job class                                                                                                                                                                                           |
| <code>job_style</code>           | Style of the job: <ul style="list-style-type: none"> <li>• <code>REGULAR</code></li> <li>• <code>LIGHTWEIGHT</code></li> <li>• <code>IN_MEMORY_RUNTIME</code></li> <li>• <code>IN_MEMORY_FULL</code></li> </ul> |
| <code>program_name</code>        | Name of the program that the job runs                                                                                                                                                                           |
| <code>job_action</code>          | Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.                                                               |
| <code>job_type</code>            | Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')                                                                                |
| <code>schedule_name</code>       | Name of the schedule that specifies when the job has to execute                                                                                                                                                 |
| <code>repeat_interval</code>     | Inline time-based schedule                                                                                                                                                                                      |
| <code>schedule_limit</code>      | Maximum delay time between scheduled and actual job start before a job run is canceled                                                                                                                          |
| <code>start_date</code>          | Start date and time of the job                                                                                                                                                                                  |
| <code>end_date</code>            | End date and time of the job                                                                                                                                                                                    |
| <code>event_condition</code>     | Event condition for event-based jobs                                                                                                                                                                            |
| <code>queue_spec</code>          | File watcher name or queue specification for event-based jobs                                                                                                                                                   |
| <code>number_of_arguments</code> | Number of job arguments                                                                                                                                                                                         |
| <code>arguments</code>           | Array of job arguments                                                                                                                                                                                          |
| <code>job priority</code>        | Job priority                                                                                                                                                                                                    |

**Table 154-4 (Cont.) JOB\_DEFINITION Object Types**

| Attribute                     | Description                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_weight                    | *** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.<br>Weight of the job for parallel execution.                                                                                                                                                                    |
| max_run_duration              | Maximum run duration of the job                                                                                                                                                                                                                                                                                                  |
| max_runs                      | Maximum number of runs before the job is marked as completed                                                                                                                                                                                                                                                                     |
| max_failures                  | Maximum number of failures tolerated before the job is marked as broken                                                                                                                                                                                                                                                          |
| logging_level                 | Job logging level                                                                                                                                                                                                                                                                                                                |
| restartable                   | Indicates whether the job is restartable (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                   |
| stop_on_window_close          | Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the <a href="#">SET_ATTRIBUTE Procedure</a> .                                                                                                                 |
| raise_events                  | State changes that raise events                                                                                                                                                                                                                                                                                                  |
| comments                      | Comments on the job                                                                                                                                                                                                                                                                                                              |
| auto_drop                     | If TRUE (the default), indicates that the job should be dropped once completed                                                                                                                                                                                                                                                   |
| enabled                       | Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)                                                                                                                                                                                                                                  |
| follow_default_timezone       | If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.                                                                                                   |
| parallel_instances            | For event-based jobs only.<br>If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel.<br>If FALSE, then an event is discarded if it is raised while the job that handles it is already running, |
| aq_job                        | For internal use only                                                                                                                                                                                                                                                                                                            |
| instance_id                   | The instance ID of the instance that the job must run on<br>For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.                                                                                                                      |
| credential_name               | The credential to use for a single destination or the default credential for a group of destinations                                                                                                                                                                                                                             |
| destination                   | The name of a single external destination or database destination, or a group name of type external destination or database destination                                                                                                                                                                                          |
| database_role                 | In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs                                                                                                                                                                                                                   |
| allow_runs_in_restricted_mode | If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode                                                                                                                                                                                |

**Table 154-4 (Cont.) JOB\_DEFINITION Object Types**

| Attribute           | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| restart_on_recovery | If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered.<br>If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.                                                                                                                             |
| restart_on_failure  | If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED.<br>If set to FALSE (the default), a failed job is immediately marked FAILED. |

### JOB\_DEFINITION Constructor Function

This constructor function constructs a `job_definition` object.

#### Syntax

```

constructor function job_definition (
    job_name          IN    VARCHAR2,
    job_style         IN    VARCHAR2 DEFAULT 'REGULAR',
    program_name      IN    VARCHAR2 DEFAULT NULL,
    job_action        IN    VARCHAR2 DEFAULT NULL,
    job_type          IN    VARCHAR2 DEFAULT NULL,
    schedule_name     IN    VARCHAR2 DEFAULT NULL,
    repeat_interval   IN    VARCHAR2 DEFAULT NULL,
    event_condition   IN    VARCHAR2 DEFAULT NULL,
    queue_spec        IN    VARCHAR2 DEFAULT NULL,
    start_date        IN    TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date          IN    TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments IN  NATURAL DEFAULT NULL,
    arguments         IN    SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class         IN    VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit    IN    INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority      IN    NATURAL DEFAULT NULL,
    job_weight        IN    NATURAL DEFAULT NULL,
    max_run_duration  IN    INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs          IN    NATURAL DEFAULT NULL,
    max_failures      IN    NATURAL DEFAULT NULL,
    logging_level     IN    NATURALN DEFAULT 64,
    restartable       IN    BOOLEAN DEFAULT FALSE,
    stop_on_window_close IN  BOOLEAN DEFAULT FALSE,
    raise_events      IN    NATURAL DEFAULT NULL,
    comments          IN    VARCHAR2 DEFAULT NULL,
    auto_drop         IN    BOOLEAN DEFAULT TRUE,
    enabled           IN    BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN  BOOLEAN DEFAULT FALSE,
    parallel_instances IN    BOOLEAN DEFAULT FALSE,
    aq_job            IN    BOOLEAN DEFAULT FALSE,
    instance_id       IN    NATURAL DEFAULT NULL,
    credential_name    IN    VARCHAR2 DEFAULT NULL,
    destination       IN    VARCHAR2 DEFAULT NULL,
    database_role      IN    VARCHAR2 DEFAULT NULL,
    allow_runs_in_restricted_mode IN  BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

```

## JOB\_DEFINITION\_ARRAY Table Type

### Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

## 154.5.4 JOB\_DEFINITION\_ARRAY Table Type

The type `job_definition_array` is a table of `job_definition`.

### Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

## 154.5.5 JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

### Syntax

```
TYPE jobattr IS OBJECT (  
    job_name          VARCHAR2(100),  
    attr_name         VARCHAR2(30),  
    char_value        VARCHAR2(4000),  
    char_value2       VARCHAR2(4000),  
    args_value        JOBARG_ARRAY,  
    num_value         NUMBER,  
    timestamp_value   TIMESTAMP(6) WITH TIME ZONE,  
    interval_value    INTERVAL DAY(2) TO SECOND(6));
```

### Attributes

**Table 154-5** JOBATTR Object Type Attributes

| Attribute                    | Description                                                                |
|------------------------------|----------------------------------------------------------------------------|
| <code>job_name</code>        | Name of the job                                                            |
| <code>attr_name</code>       | Name of the attribute                                                      |
| <code>char_value</code>      | Value of the argument if the type is <code>VARCHAR2</code>                 |
| <code>char_value2</code>     | Second <code>VARCHAR2</code> attribute value                               |
| <code>args_value</code>      | Value of the argument if the type is a <code>JOBARG</code> array           |
| <code>num_value</code>       | Value of the argument if the type is <code>NUMBER</code>                   |
| <code>timestamp_value</code> | Value of the argument if the type is <code>TIMESTAMP WITH TIME ZONE</code> |
| <code>interval_value</code>  | Value of the argument if the type is <code>INTERVAL DAY TO SECOND</code>   |

### JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: `VARCHAR2`, `NUMBER`, `TIMESTAMP WITH TIME ZONE`, `INTERVAL DAY TO SECOND`, and an array of `JOBARG` types.

### Syntax

```

constructor function jobattr (
    job_name          IN VARCHAR2,
    attr_name         IN VARCHAR2,
    attr_value        IN VARCHAR2,
    attr_value2       IN VARCHAR2 DEFAULT NULL)
RETURN SELF AS RESULT;

constructor function jobattr (
    job_name          IN VARCHAR2,
    attr_name         IN VARCHAR2,
    attr_value        IN [NUMBER, BOOLEAN,
                        TIMESTAMP WITH TIME ZONE,
                        INTERVAL DAY TO SECOND, JOBARG_ARRAY])
RETURN SELF AS RESULT;

constructor function jobattr (
    job_name          IN VARCHAR2,
    attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;

```

## Parameters

**Table 154-6 JOBATTR Constructor Function Parameters**

| Parameter   | Description                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| job_name    | Name of the job                                                                                                                              |
| attr_name   | Name of the argument                                                                                                                         |
| attr_value  | Value of the argument                                                                                                                        |
| attr_value2 | Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value. |

## JOBATTR Table Type

### Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

## 154.5.6 JOBATTR\_ARRAY Table Type

The type jobattr\_array is a table of jobattr.

### Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

## 154.5.7 SCHEDULER\$\_STEP\_TYPE Object Type

This type is used by RUN\_CHAIN to return a list of chain steps with an initial state.

### Syntax

```

TYPE scheduler$_step_type IS OBJECT (
    step_name  VARCHAR2(32),
    step_type  VARCHAR2(32));

```

## Attributes

**Table 154-7 SCHEDULER\$\_STEP\_TYPE Object Type Attributes**

| Attribute | Description       |
|-----------|-------------------|
| step_name | Name of the step  |
| step_type | State of the step |

## 154.5.8 SCHEDULER\$\_STEP\_TYPE\_LIST Table Type

This type is a table of scheduler\$\_step\_type.

### Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

## 154.5.9 SCHEDULER\$\_EVENT\_INFO Object Type

This the datatype of the Scheduler event queue SYS.SCHEDULER\$\_EVENT\_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

### Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (  
    event_type          VARCHAR2(4000),  
    object_owner        VARCHAR2(4000),  
    object_name         VARCHAR2(4000),  
    event_timestamp     TIMESTAMP WITH TIME ZONE,  
    error_code          NUMBER,  
    error_msg           VARCHAR2(4000),  
    event_status        NUMBER,  
    log_id              NUMBER,  
    run_count           NUMBER,  
    failure_count       NUMBER,  
    retry_count         NUMBER,  
    spare1              NUMBER,  
    spare2              NUMBER,  
    spare3              VARCHAR2(4000),  
    spare4              VARCHAR2(4000),  
    spare5              TIMESTAMP WITH TIME ZONE,  
    spare6              TIMESTAMP WITH TIME ZONE,  
    spare7              RAW(2000),  
    spare8              RAW(2000));
```

## Attributes

**Table 154-8 SCHEDULER\_EVENT\_INFO Object Type Attributes**

| Attribute       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event_type      | One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR".<br>For descriptions of these event types, see <a href="#">Table 154-84</a> .                                                                                                                                                                                                                                                                                          |
| object_owner    | Owner of the job that raised the event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| object_name     | Name of the job that raised the event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| event_timestamp | Time at which the event occurred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| error_code      | Applicable only when an error is thrown during job execution. Contains the top-level error code.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| error_msg       | Applicable only when an error is thrown during job execution. Contains the entire error stack.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| event_status    | Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry.<br><br>If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind.<br><br>If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE. |
| log_id          | Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.                                                                                                                                                                                                                                                                                                                                                    |
| run_count       | Run count for the job when the event was raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| failure_count   | Failure count for the job when the event was raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| retry_count     | Retry count for the job when the event was raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| spare1 – spare8 | Not currently in use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 154.5.10 SCHEDULER\_FILEWATCHER\_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

### Syntax

```

TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch     NUMBER,
  matching_requests    SYS.SCHEDULER_FILEWATCHER_REQ_LIST);

```

## Attributes

**Table 154-9 SCHEDULER\_FILEWATCHER\_RESULT Object Type Attributes**

| Attribute         | Description                                                                                                                                                                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination       | Destination at which the file was found, expressed as a host name or IP address.                                                                                                                                                                                                                      |
| directory_path    | Absolute path of directory in which the file was found.                                                                                                                                                                                                                                               |
| actual_file_name  | Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.                                                                                                                    |
| file_size         | Size of the file that was found, in bytes.                                                                                                                                                                                                                                                            |
| file_timestamp    | Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.                                                                                                                                                  |
| ts_ms_from_epoch  | For internal use only.                                                                                                                                                                                                                                                                                |
| matching_requests | List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See <a href="#">"SCHEDULER_FILEWATCHER_REQUEST Object Type"</a> . |

## 154.5.11 SCHEDULER\_FILEWATCHER\_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the SCHEDULER\_FILEWATCHER\_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

### Syntax

```

TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name  VARCHAR2(4000),
  min_file_size   NUMBER,
  steady_state_dur NUMBER);

```

## Attributes

**Table 154-10 SCHEDULER\_FILEWATCHER\_REQUEST Object Type Attributes**

| Attribute           | Description                                                                     |
|---------------------|---------------------------------------------------------------------------------|
| owner               | Owner of the matched file watcher.                                              |
| name                | Name of the matched file watcher.                                               |
| requested_path_name | Value of the <code>directory_path</code> attribute of the matched file watcher. |
| requested_file_name | Value of the <code>file_name</code> attribute of the matched file watcher.      |
| credential_owner    | Owner of the credential referenced by the matched file watcher.                 |

**Table 154-10 (Cont.) SCHEDULER\_FILEWATCHER\_REQUEST Object Type Attributes**

| Attribute                     | Description                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------|
| <code>credential_name</code>  | Name of the credential referenced by the matched file watcher.                         |
| <code>min_file_size</code>    | Value of the <code>min_file_size</code> attribute of the matched file watcher.         |
| <code>steady_state_dur</code> | Value of the <code>steady_state_duration</code> attribute of the matched file watcher. |

- [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#)  
This is the datatype of a file arrival event message.

## 154.6 Summary of DBMS\_SCHEDULER Subprograms

This table lists the `DBMS_SCHEDULER` subprograms and briefly describes them.

**Table 154-11 DBMS\_SCHEDULER Package Subprograms**

| Subprogram                                            | Description                                                                                                                                                                       |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_EVENT_QUEUE_SUBSCRIBER Procedure</a>  | Adds a user as a subscriber to the Scheduler event queue<br><code>SYS.SCHEDULER\$_EVENT_QUEUE</code>                                                                              |
| <a href="#">ADD_GROUP_MEMBER Procedure</a>            | Adds one or more members to an existing group                                                                                                                                     |
| <a href="#">ADD_JOB_EMAIL_NOTIFICATION Procedure</a>  | Adds e-mail notifications for a job for a list of recipients and a list of job state events                                                                                       |
| <a href="#">ADD_TO_INCOMPATIBILITY Procedure</a>      | Adds jobs or programs to an existing incompatibility definition                                                                                                                   |
| <a href="#">ALTER_CHAIN Procedure</a>                 | Alters specified steps of a chain                                                                                                                                                 |
| <a href="#">ALTER_RUNNING_CHAIN Procedure</a>         | Alters specified steps of a running chain                                                                                                                                         |
| <a href="#">CLOSE_WINDOW Procedure</a>                | Closes an open window prematurely                                                                                                                                                 |
| <a href="#">COPY_JOB Procedure</a>                    | Copies an existing job                                                                                                                                                            |
| <a href="#">CREATE_CHAIN Procedure</a>                | Creates a chain, which is a named series of programs that are linked together for a combined objective                                                                            |
| <a href="#">CREATE_CREDENTIAL Procedure</a>           | Creates a credential                                                                                                                                                              |
| <a href="#">CREATE_DATABASE_DESTINATION Procedure</a> | Creates a database destination for use with remote database jobs                                                                                                                  |
| <a href="#">CREATE_EVENT_SCHEDULE Procedure</a>       | Creates an event schedule, which is a schedule that starts a job based on the detection of an event                                                                               |
| <a href="#">CREATE_FILE_WATCHER Procedure</a>         | Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job |

**Table 154-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

| Subprogram                                         | Description                                                                                                                                                              |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_GROUP Procedure</a>             | Creates a group                                                                                                                                                          |
| <a href="#">CREATE_INCOMPATIBILITY Procedure</a>   | Creates an incompatibility definition                                                                                                                                    |
| <a href="#">CREATE_JOB Procedure</a>               | Creates a single job                                                                                                                                                     |
| <a href="#">CREATE_JOB_CLASS Procedure</a>         | Creates a job class, which provides a way to group jobs for resource allocation and prioritization                                                                       |
| <a href="#">CREATE_JOBS Procedure</a>              | Creates multiple jobs                                                                                                                                                    |
| <a href="#">CREATE_PROGRAM Procedure</a>           | Creates a program                                                                                                                                                        |
| <a href="#">CREATE_RESOURCE Procedure</a>          | Specifies resources used by jobs or creates a new resource                                                                                                               |
| <a href="#">CREATE_SCHEDULE Procedure</a>          | Creates a schedule                                                                                                                                                       |
| <a href="#">CREATE_WINDOW Procedure</a>            | Creates a window, which provides a way to automatically activate different resource plans at different times                                                             |
| <a href="#">DEFINE_ANYDATA_ARGUMENT Procedure</a>  | Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object                                                         |
| <a href="#">DEFINE_CHAIN_EVENT_STEP Procedure</a>  | Adds or replaces a chain step and associates it with an event schedule or inline event. See also: <a href="#">DEFINE_CHAIN_STEP</a> .                                    |
| <a href="#">DEFINE_CHAIN_RULE Procedure</a>        | Adds a rule to an existing chain                                                                                                                                         |
| <a href="#">DEFINE_CHAIN_STEP Procedure</a>        | Defines a chain step, which can be a program or another (nested) chain. See also: <a href="#">DEFINE_CHAIN_EVENT_STEP</a> .                                              |
| <a href="#">DEFINE_METADATA_ARGUMENT Procedure</a> | Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.                                                           |
| <a href="#">DEFINE_PROGRAM_ARGUMENT Procedure</a>  | Defines a program argument whose value can be passed as a string literal to the program                                                                                  |
| <a href="#">DISABLE Procedure</a>                  | Disables a program, job, chain, window, database destination, external destination, file watcher, group, or incompatibility                                              |
| <a href="#">DROP_AGENT_DESTINATION Procedure</a>   | Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails. |
| <a href="#">DROP_CHAIN Procedure</a>               | Drops an existing chain                                                                                                                                                  |
| <a href="#">DROP_CHAIN_RULE Procedure</a>          | Removes a rule from an existing chain                                                                                                                                    |
| <a href="#">DROP_CHAIN_STEP Procedure</a>          | Drops a chain step                                                                                                                                                       |
| <a href="#">DROP_CREDENTIAL Procedure</a>          | Drops a credential                                                                                                                                                       |

**Table 154-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

| Subprogram                                          | Description                                                                                                                                                                                 |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DROP_DATABASE_DESTINATION Procedure</a> | Drops one or more database destinations                                                                                                                                                     |
| <a href="#">DROP_FILE_WATCHER Procedure</a>         | Drops one or more file watchers                                                                                                                                                             |
| <a href="#">DROP_GROUP Procedure</a>                | Drops one or more groups                                                                                                                                                                    |
| <a href="#">DROP_INCOMPATIBILITY Procedure</a>      | Drops an existing incompatibility definition                                                                                                                                                |
| <a href="#">DROP_JOB Procedure</a>                  | Drops a job or all jobs in a job class                                                                                                                                                      |
| <a href="#">DROP_JOB_CLASS Procedure</a>            | Drops a job class                                                                                                                                                                           |
| <a href="#">DROP_PROGRAM Procedure</a>              | Drops a program                                                                                                                                                                             |
| <a href="#">DROP_PROGRAM_ARGUMENT Procedure</a>     | Drops a program argument                                                                                                                                                                    |
| <a href="#">DROP_SCHEDULE Procedure</a>             | Drops a schedule                                                                                                                                                                            |
| <a href="#">DROP_WINDOW Procedure</a>               | Drops a window                                                                                                                                                                              |
| <a href="#">ENABLE Procedure</a>                    | Enables a program, job, chain, window, database destination, external destination, file watcher, or group                                                                                   |
| <a href="#">END_DETACHED_JOB_RUN Procedure</a>      | Ends a running detached job                                                                                                                                                                 |
| <a href="#">EVALUATE_CALENDAR_STRING Procedure</a>  | Evaluates the calendar string and tells you what the next execution date of a job or window will be                                                                                         |
| <a href="#">EVALUATE_RUNNING_CHAIN Procedure</a>    | Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied                                                                            |
| <a href="#">GENERATE_JOB_NAME Function</a>          | Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on |
| <a href="#">GET_AGENT_INFO Function</a>             | Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected                                                                   |
| <a href="#">GET_AGENT_VERSION Function</a>          | Returns the version string of a Scheduler agent that is registered with the database and is currently running                                                                               |
| <a href="#">GET_ATTRIBUTE Procedure</a>             | Retrieves the value of an attribute of an object                                                                                                                                            |
| <a href="#">GET_FILE Procedure</a>                  | Retrieves a file from a host                                                                                                                                                                |
| <a href="#">GET_SCHEDULER_ATTRIBUTE Procedure</a>   | Retrieves the value of a Scheduler attribute                                                                                                                                                |
| <a href="#">OPEN_WINDOW Procedure</a>               | Opens a window prematurely. The window is opened immediately for the duration                                                                                                               |
| <a href="#">PURGE_LOG Procedure</a>                 | Purges specific rows from the job and window logs                                                                                                                                           |
| <a href="#">PUT_FILE Procedure</a>                  | Saves a file to one or more hosts                                                                                                                                                           |

**Table 154-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

| Subprogram                                              | Description                                                                                    |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <a href="#">REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure</a> | Unsubscribes a user from the Scheduler event queue<br><code>SYS.SCHEDULER\$_EVENT_QUEUE</code> |
| <a href="#">REMOVE_FROM_INCOMPATIBILITY Procedure</a>   | Removes jobs or programs from an incompatibility definition                                    |
| <a href="#">REMOVE_GROUP_MEMBER Procedure</a>           | Removes one or more members from a group                                                       |
| <a href="#">REMOVE_JOB_EMAIL_NOTIFICATION Procedure</a> | Removes e-mail notifications for a job                                                         |
| <a href="#">RESET_JOB_ARGUMENT_VALUE Procedure</a>      | Resets the current value assigned to an argument defined with the associated program           |
| <a href="#">RUN_CHAIN Procedure</a>                     | Immediately runs a chain by creating a run-once job                                            |
| <a href="#">RUN_JOB Procedure</a>                       | Runs a job immediately                                                                         |
| <a href="#">SET_AGENT_REGISTRATION_PASS Procedure</a>   | Sets the agent registration password for a database                                            |
| <a href="#">SET_ATTRIBUTE Procedure</a>                 | Changes an attribute of a job, schedule, or other Scheduler object                             |
| <a href="#">SET_ATTRIBUTE_NULL Procedure</a>            | Changes an attribute of an object to <code>NULL</code>                                         |
| <a href="#">SET_JOB_ANYDATA_VALUE Procedure</a>         | Sets the value of a job argument encapsulated in an <code>AnyData</code> object                |
| <a href="#">SET_JOB_ARGUMENT_VALUE Procedure</a>        | Sets the value of a job argument                                                               |
| <a href="#">SET_JOB_ATTRIBUTES Procedure</a>            | Sets the value of a job attribute                                                              |
| <a href="#">SET_RESOURCE_CONSTRAINT Procedure</a>       | Specifies the resources used by jobs                                                           |
| <a href="#">SET_SCHEDULER_ATTRIBUTE Procedure</a>       | Sets the value of a Scheduler attribute                                                        |
| <a href="#">STOP_JOB Procedure</a>                      | Stops a currently running job or all jobs in a job class                                       |

## 154.6.1 ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

### Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-12** ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure Parameters

| Parameter       | Description                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subscriber_name | Name of the Oracle Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user. |

## Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

## 154.6.2 ADD\_GROUP\_MEMBER Procedure

This procedure adds one or more members to an existing group.

## Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (  
    group_name          IN VARCHAR2,  
    member              IN VARCHAR2);
```

## Parameters

**Table 154-13** ADD\_GROUP\_MEMBER Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name | The name of the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| member     | <p>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated.</p> <p>The keyword <code>LOCAL</code> can be included as a member for database destination or external destination groups. See the "<a href="#">CREATE_GROUP Procedure</a>" for information about this keyword.</p> |

## Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the `ALTER` object privilege on the group
- A user with the `CREATE ANY JOB` system privilege

You must have the `MANAGE SCHEDULER` privilege to add a member to a group of type `WINDOW`.

**See Also:**["CREATE\\_GROUP Procedure"](#)

## 154.6.3 ADD\_JOB\_EMAIL\_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

### Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2,
  sender            IN VARCHAR2 DEFAULT NULL,
  subject           IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body             IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events            IN VARCHAR2 DEFAULT 'JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,
                                     JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR',
  filter_condition  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-14** ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name   | Name of the job that e-mail notifications are added for. Cannot be NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| recipients | Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL.                                                                                                                                                                                                                                                                                                                                                |
| sender     | e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute <code>email_sender</code> is used. See <i>Oracle Database Administrator's Guide</i> for more information on this Scheduler attribute.                                                                                                                                                                                                  |
| subject    | The subject to use in the e-mail header. <a href="#">Table 154-15</a> describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>subject</code> is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable:<br><br>'Oracle Scheduler Job Notification -<br>%job_owner%.%job_name%.%job_subname% %event_type%' |

**Table 154-14 (Cont.) ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| body             | <p>The body of the e-mail message. <a href="#">Table 154-15</a> describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:</p> <pre>'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'</pre>                       |
| events           | <p>Comma-separate list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. <a href="#">Table 154-84</a> lists the valid events for this parameter. If <code>events</code> is omitted, notifications are sent for the following default events:</p> <pre>JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OV ER_MAX_DUR</pre>                                                                                                                                                                                                                                                          |
| filter_condition | <p>Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. <code>filter_condition</code> must be a boolean SQL WHERE clause that may refer to the <code>:event</code> bind variable. This bind variable is automatically bound to an object of type <code>SCHEDULER\$_EVENT_INFO</code> that represents the raised event.</p> <p>For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following <code>filter_condition</code>:</p> <pre>:event.error_code=600 or :event.error_code=700</pre> <p>See "<a href="#">SCHEDULER\$_EVENT_INFO Object Type</a>".</p> |

[Table 154-15](#) lists the variables that you can use in the subject and body arguments.

**Table 154-15 Variables Used in the SUBJECT and BODY Parameters**

| Variable          | Comment                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------|
| %job_owner%       | Schema in which job was created                                                                                                 |
| %job_name%        | Name of the job that e-mail notifications are added for                                                                         |
| %job_subname%     | Present for event-based jobs with the <code>parallel_instances</code> attribute set and for chain steps                         |
| %event_type%      | Valid values are listed in <a href="#">Table 154-84</a>                                                                         |
| %event_timestamp% | Time at which the event occurred                                                                                                |
| %log_id%          | Refers to the <code>LOG_ID</code> column in views <code>*_SCHEDULER_JOB_LOG</code> and <code>*_SCHEDULER_JOB_RUN_DETAILS</code> |
| %error_code%      | Number of the error code.                                                                                                       |

**Table 154-15 (Cont.) Variables Used in the SUBJECT and BODY Parameters**

| Variable                     | Comment                                             |
|------------------------------|-----------------------------------------------------|
| <code>%error_message%</code> | The text of the error message                       |
| <code>%run_count%</code>     | Run count for the job when the event was raised     |
| <code>%failure_count%</code> | Failure count for the job when the event was raised |
| <code>%retry_count%</code>   | Retry count for the job when the event was raised   |

### Usage Notes

You can call `ADD_JOB_EMAIL_NOTIFICATION` once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the `JOB_FAILED`, `JOB_BROKEN`, `JOB_SCH_LIM_REACHED`, and `JOB_CHAIN_STALLED` events to the principle DBA and all senior DBAs, but send a notification for the `JOB_OVER_MAX_DUR` event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute `email_server` is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

## 154.6.4 ADD\_TO\_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

### Syntax

```
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (  
    incompatibility_name    IN VARCHAR2,  
    object_name             IN VARCHAR2);
```

### Parameters

**Table 154-16 ADD\_TO\_INCOMPATIBILITY Procedure Parameters**

| Parameter                         | Description                                    |
|-----------------------------------|------------------------------------------------|
| <code>incompatibility_name</code> | The name of the incompatibility definition.    |
| <code>object_name</code>          | One or more (comma-separated) programs or jobs |

### Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.

#### See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

## 154.6.5 ALTER\_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

### Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
    chain_name      IN VARCHAR2,
    step_name       IN VARCHAR2,
    attribute        IN VARCHAR2,
    value           IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
    chain_name      IN VARCHAR2,
    step_name       IN VARCHAR2,
    attribute        IN VARCHAR2,
    char_value      IN VARCHAR2);
```

### Parameters

**Table 154-17 ALTER\_CHAIN Procedure Parameters**

| Parameter  | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| chain_name | The name of the chain to alter                                                         |
| step_name  | The name of the step or a comma-separated list of steps to alter. This cannot be NULL. |

**Table 154-17 (Cont.) ALTER\_CHAIN Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute  | <p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> <li>'PAUSE' <p>If set to <b>TRUE</b> for a step, after the step has run, its state changes to <b>PAUSED</b> (and the <b>completed</b> attribute remains <b>FALSE</b>).</p> <p>If <b>PAUSE</b> is reset to <b>FALSE</b> for a paused chain step (using <b>ALTER_RUNNING_CHAIN</b>), the state is set to its completion state (<b>SUCCEEDED</b>, <b>FAILED</b>, or <b>STOPPED</b>) and the <b>completed</b> attribute is set to <b>TRUE</b>.</p> <p>Setting <b>PAUSE</b> has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</p> </li> <li>'PAUSED_BEFORE' <p>If set to <b>TRUE</b> for a step and if any of the rule conditions that start the step are true, then its state changes to <b>PAUSED</b> and the step does not run.</p> <p>If <b>PAUSE_BEFORE</b> is reset to <b>FALSE</b> for a chain step that has paused before starting (using <b>ALTER_RUNNING_CHAIN</b>), then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting <b>PAUSE_BEFORE</b> has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> </li> <li>'SKIP' <p>If set to <b>TRUE</b> for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting <b>SKIP</b> to <b>TRUE</b> has no effect for a step that is running, scheduled to run after a delay, or has already run. If <b>SKIP</b> is set <b>TRUE</b> for a step that <b>PAUSE</b> is also set for, when the step condition is met, the step immediately changes to state <b>PAUSED</b>.</p> </li> <li>'RESTART_ON_FAILURE' <p>If set to <b>TRUE</b> for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked <b>FAILED</b>.</p> <p>If set to <b>FALSE</b> (the default), a failed chain step is immediately marked <b>FAILED</b>.</p> </li> <li>'RESTART_ON_RECOVERY' <p>If set to <b>TRUE</b> for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</p> <p>If set to <b>FALSE</b>, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</p> </li> <li>'DESTINATION_NAME' <p>The name of an existing database destination or external destination. You can view external destination names in the view <b>ALL_SCHEDULER_EXTERNAL_DESTS</b>, and database destination names in the views <b>*_SCHEDULER_DB_DESTS</b>. You cannot specify a destination group for this attribute. This parameter is <b>NULL</b> by default.</p> </li> <li>'CREDENTIAL_NAME' <p>The credential to use when running this step. <b>NULL</b> by default.</p> </li> </ul> |
| value      | The value to set for the attribute (for a boolean attribute).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| char_value | The value to set for the attribute (for a character attribute).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage Notes

Altering a chain requires `ALTER` privileges on the chain either by being the owner of the chain, or by having the `ALTER` object privilege on the chain or by having the `CREATE ANY JOB` system privilege.

## 154.6.6 ALTER\_RUNNING\_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

### Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
    job_name          IN VARCHAR2,
    step_name         IN VARCHAR2,
    attribute          IN VARCHAR2,
    value             IN {BOOLEAN|VARCHAR2});
```

### Parameters

**Table 154-18 ALTER\_RUNNING\_CHAIN Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | The name of the job that is running the chain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| step_name | The name of the step or a comma-separated list of steps to alter. If this is set to <code>NULL</code> and attribute is <code>PAUSE</code> or <code>SKIP</code> , then all steps of the running chain are altered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| attribute | <p>The attribute of the steps to change. Valid values are:</p> <ul style="list-style-type: none"> <li>'PAUSE' <p>If the <code>PAUSE</code> attribute is set <code>TRUE</code> for a step, then after the step runs, its state changes to <code>PAUSED</code> (and the <code>completed</code> attribute remains false).</p> <p>If <code>PAUSE</code> is reset to <code>FALSE</code> for a paused chain step (using <code>ALTER_RUNNING_CHAIN</code>), the state is set to completion (<code>SUCCEEDED</code>, <code>FAILED</code>, or <code>STOPPED</code>) and the <code>completed</code> attribute is set to <code>TRUE</code>. Setting <code>PAUSE</code> has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If <code>step_name</code> is set to <code>NULL</code>, <code>PAUSE</code> is set to <code>TRUE</code> for all steps of this running chain.</p> </li> <li>'PAUSE_BEFORE' <p>If set to <code>TRUE</code> for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to <code>PAUSED</code> and the step does not run.</p> <p>If <code>PAUSE_BEFORE</code> is reset to <code>FALSE</code> for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting <code>PAUSE_BEFORE</code> has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> <p>If <code>step_name</code> is set to <code>NULL</code>, then <code>PAUSE_BEFORE</code> is set to the specified value for all steps of this running chain.</p> </li> </ul> |

**Table 154-18 (Cont.) ALTER\_RUNNING\_CHAIN Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute<br>CONTINUED | <ul style="list-style-type: none"> <li>'SKIP'<br/>If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run.<br/>If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED.</li> <li>'RESTART_ON_FAILURE'<br/>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.<br/>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</li> <li>'RESTART_ON_RECOVERY'<br/>If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered.<br/>If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues.</li> <li>'STATE'<br/>This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following:<br/>'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code'<br/><br/>If the state is being changed to FAILED, an error code must be included (this must be a positive integer).</li> </ul> |
| value                  | The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

When trying to update a step defined with a nested chain, it is necessary to specify the job\_name as <SCHEMA>.<JOB\_NAME>.<STEP\_NAME\_IN\_TOP\_LEVEL\_CHAIN> to be able to make reference to the steps inside the subchain.

## 154.6.7 CLOSE\_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the one that is in effect outside the window, or in the case of overlapping windows, to another window.

### Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (  
    window_name          IN VARCHAR2);
```

### Parameters

**Table 154-19** CLOSE\_WINDOW Procedure Parameters

| Parameter   | Description            |
|-------------|------------------------|
| window_name | The name of the window |

### Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to `TRUE` for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

## 154.6.8 COPY\_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

### Syntax

```
DBMS_SCHEDULER.COPY_JOB (  
    old_job              IN VARCHAR2,  
    new_job              IN VARCHAR2);
```

### Parameters

**Table 154-20** COPY\_JOB Procedure Parameters

| Parameter | Description                  |
|-----------|------------------------------|
| old_job   | The name of the existing job |
| new_job   | The name of the new job      |

## Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY JOB` system privilege). If the old job is not in the your own schema, then you must also have `ALTER` privileges on the old job or the `CREATE ANY JOB` system privilege.

## 154.6.9 CREATE\_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.myname`).

A chain is always created as disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

## Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (  
    chain_name          IN VARCHAR2,  
    rule_set_name       IN VARCHAR2 DEFAULT NULL,  
    evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,  
    comments            IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-21** CREATE\_CHAIN Procedure Parameters

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name          | The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| rule_set_name       | <p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code></p> |
| evaluation_interval | If this is <code>NULL</code> , reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non- <code>NULL</code> value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at <code>NULL</code> if possible. <code>evaluation_interval</code> cannot be less than a minute or greater than a day.                                                                                                                                                                                                                                                                                                                                                                                                     |
| comments            | An optional comment describing the purpose of the chain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage Notes

To create a chain in your own schema, you must have the `CREATE JOB` system privilege. To create a chain in a different schema you must have the `CREATE ANY JOB` system privilege. If you do not provide a `rule_set_name`, a rule set and evaluation context is created in the schema

that the chain is being created in, so you must have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

## 154.6.10 CREATE\_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

### Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the [DBMS\\_CREDENTIAL](#) package, specifically the [CREATE\\_CREDENTIAL Procedure](#).

### Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-22 CREATE\_CREDENTIAL Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>credential_name</code> | The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks.                  |
| <code>username</code>        | The user name for logging into to the host operating system or remote Oracle database. This cannot be set to <code>NULL</code> and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.   |
| <code>password</code>        | The password for the user name. This cannot be set to <code>NULL</code> and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.          |
| <code>database_role</code>   | The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job.<br>Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code> |
| <code>windows_domain</code>  | For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.                                                 |
| <code>comments</code>        | A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.                                                                                                 |

## Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

## 154.6.11 CREATE\_DATABASE\_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

## Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name      IN VARCHAR2,
    agent                 IN VARCHAR2,
    tns_name              IN VARCHAR2,
    comments              IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-23** CREATE\_DATABASE\_DESTINATION Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_name | The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| agent            | <p>The external destination name of the Scheduler agent to connect. Equivalent to an agent name.</p> <p>The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance.</p> <p>An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| tns_name         | <p>An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <i>net service name</i>, which is an alias for a connect descriptor. The alias must be resolved in the <code>tnsnames.ora</code> file on the local computer. The maximum size for <code>tns_name</code> is 2000 characters.</p> <p>If <code>tns_name</code> is NULL, the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, <code>schagent.conf</code>, located in the agent home directory.</p> <p>See <i>Oracle Database Net Services Administrator's Guide</i> for more information on connect identifiers.</p> |
| comments         | A text string that describes the database destination. Scheduler does not use this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

## 154.6.12 CREATE\_EVENT\_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

### Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
    schedule_name      IN VARCHAR2,
    start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    event_condition     IN VARCHAR2 DEFAULT NULL,
    queue_spec         IN VARCHAR2,
    end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    comments           IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-24 CREATE\_EVENT\_SCHEDULE Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schedule_name</code>   | The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>start_date</code>      | This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>event_condition</code> | This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.                                                                                                                                                                  |
| <code>queue_spec</code>      | This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the <b>source queue</b> ). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <i>queue_name</i> , <i>agent name</i> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue. |
| <code>end_date</code>        | The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever.<br><br><code>end_date</code> must be after the <code>start_date</code> . If it is not, then an error is generated when the schedule is created.                                                                                                                                                                                                                                                                                                                                          |
| <code>comments</code>        | This attribute specifies an optional comment about the schedule. By default, this attribute is <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

## 154.6.13 CREATE\_FILE\_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

### Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
  file_watcher_name      IN VARCHAR2,
  directory_path         IN VARCHAR2,
  file_name              IN VARCHAR2,
  credential_name        IN VARCHAR2,
  destination            IN VARCHAR2 DEFAULT NULL,
  min_file_size          IN PLS_INTEGER DEFAULT 0,
  steady_state_duration  IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments               IN VARCHAR2 DEFAULT NULL,
  enabled                IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 154-25** CREATE\_FILE\_WATCHER Parameters

| Parameter                      | Description                                                                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>file_watcher_name</code> | The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be <code>NULL</code> .                                  |
| <code>directory_path</code>    | Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.                                                      |
| <code>file_name</code>         | Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be <code>NULL</code> .                                                                           |
| <code>credential_name</code>   | Name of a valid credential object.<br><br>The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have <code>EXECUTE</code> privileges on the credential. Cannot be <code>NULL</code> . |

**Table 154-25 (Cont.) CREATE\_FILE\_WATCHER Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination           | Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> for valid external destination names. If this parameter is <code>NULL</code> , the file watcher is created on the local host.                                                                                                                                                                           |
| min_file_size         | Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.                                                                                                                                                                                                                                                                                                                                                                                   |
| steady_state_duration | Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If <code>NULL</code> , an internal value is used. The minimum value is 10 seconds. Oracle recommends similar <code>steady_state_duration</code> values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the <code>steady_state_duration</code> value. |
| comments              | Optional comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| enabled               | If <code>TRUE</code> (the default), the file watcher is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Usage Notes

You must have the `CREATE JOB` system privilege to create a file watcher in your own schema. You require the `CREATE ANY JOB` system privilege to create a file watcher in a schema different from your own (except the `SYS` schema, which is disallowed).

## 154.6.14 CREATE\_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other `DBMS_SCHEDULER` package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the `DESTINATION_NAME` parameter of the job.

### Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (  
    group_name      IN VARCHAR2,  
    group_type      IN VARCHAR2,  
    member         IN VARCHAR2 DEFAULT NULL,  
    comments        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-26 CREATE\_GROUP Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name | The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double quotation marks. |

Table 154-26 (Cont.) CREATE\_GROUP Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_type | <p>The type of members in the group. All members must be of the same type. Possible types are:</p> <ul style="list-style-type: none"> <li>'DB_DEST'<br/>Database destination: Members are database destinations, for running remote database jobs.</li> <li>'EXTERNAL_DEST'<br/>External destination: Members are external destinations, for running remote external jobs.</li> <li>'WINDOW'<br/>Members are Scheduler windows. You must have the <code>MANAGE SCHEDULER</code> privilege to create a group of this type.</li> </ul> <p>Members in database destination and external destination groups have the following format:</p> <pre>[[schema.]credential@][schema.]destination</pre> <p>where:</p> <ul style="list-style-type: none"> <li><i>credential</i> is the name of an existing credential.</li> <li><i>destination</i> is the name of an existing database destination or external destination.</li> </ul> <p>The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.</p> <p>Members in window groups are window names. Because all Scheduler windows reside in the <code>SYS</code> schema, you do not specify a schema name for windows.</p> |
| member     | <p>Optional comma-separated list of group members. The default is <code>NULL</code>. If <code>NULL</code>, use the <code>ADD_GROUP_MEMBER</code> procedure to add members. You can also use <code>ADD_GROUP_MEMBER</code> to add additional members at a later time.</p> <p>The keyword <code>LOCAL</code> can be used as a member in database destination groups and external destination groups.</p> <ul style="list-style-type: none"> <li>In database destination groups, <code>LOCAL</code> represents the source database on which the job is created. It cannot be preceded with a credential.</li> <li>In external destination groups, <code>LOCAL</code> represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| comments   | A text string that describes the group. Scheduler does not use this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Usage Notes

Groups reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a group in a schema other than your own, you must have the `CREATE ANY JOB` privilege. The group name must be unique among all Scheduler objects.

You can grant the `SELECT` or `READ` privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the `ALTER` privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the

group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

### Example

The following PL/SQL block creates a group named `production_dest1`, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP (
    GROUP_NAME    => 'production_dest1',
    GROUP_TYPE    => 'DB_DEST',
    MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS      => 'All sector1 production machines');
END;
```

## 154.6.15 CREATE\_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

### Syntax

```
DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (
  incompatibility_name  IN VARCHAR2,
  object_name          IN VARCHAR2,
  constraint_level      IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  enabled              IN BOOLEAN DEFAULT TRUE,
  comments              IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-27 CREATE\_INCOMPATIBILITY Procedure Parameters**

| Parameter                         | Description                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------|
| <code>incompatibility_name</code> | The name of the incompatibility definition.                                          |
| <code>object_name</code>          | One or more (comma-separated) programs or jobs.                                      |
| <code>constraint_level</code>     | One or more (comma-separated) programs or jobs.                                      |
| <code>enabled</code>              | Specifies whether the constraint is initially enabled (true) or not enabled (false). |
| <code>comments</code>             | Optional descriptive comment.                                                        |

### Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB\_LEVEL'. For programs, `constraint_level` can be either 'JOB\_LEVEL' or 'PROGRAM\_LEVEL'. When set to the default value 'JOB\_LEVEL', only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When

`constraint_level` is set to 'PROGRAM\_LEVEL', the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is 'P1,P2,P3' and `constraint_level` is 'PROGRAM\_LEVEL', many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to 'JOB\_LEVEL', then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

## 154.6.16 CREATE\_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET\\_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

### Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    job_type          IN VARCHAR2,
    job_action        IN VARCHAR2,
    number_of_arguments IN PLS_INTEGER          DEFAULT 0,
    start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval    IN VARCHAR2              DEFAULT NULL,
    end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class          IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
    enabled            IN BOOLEAN               DEFAULT FALSE,
    auto_drop          IN BOOLEAN               DEFAULT TRUE,
    comments           IN VARCHAR2              DEFAULT NULL,
    credential_name    IN VARCHAR2              DEFAULT NULL,
    destination_name   IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    program_name      IN VARCHAR2,
    schedule_name     IN VARCHAR2,
    job_class          IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
    enabled            IN BOOLEAN               DEFAULT FALSE,
    auto_drop          IN BOOLEAN               DEFAULT TRUE,
    comments           IN VARCHAR2              DEFAULT NULL,
    job_style          IN VARCHAR2              DEFAULT 'REGULAR',
    credential_name    IN VARCHAR2              DEFAULT NULL,
    destination_name   IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    program_name      IN VARCHAR2,
    start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval    IN VARCHAR2                DEFAULT NULL,
    end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class         IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
    enabled           IN BOOLEAN                 DEFAULT FALSE,
    auto_drop         IN BOOLEAN                 DEFAULT TRUE,
    comments          IN VARCHAR2                DEFAULT NULL,
    job_style         IN VARCHAR2                DEFAULT 'REGULAR',
    credential_name    IN VARCHAR2                DEFAULT NULL,
    destination_name  IN VARCHAR2                DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    schedule_name     IN VARCHAR2,
    job_type          IN VARCHAR2,
    job_action        IN VARCHAR2,
    number_of_arguments IN PLS_INTEGER           DEFAULT 0,
    job_class         IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
    enabled           IN BOOLEAN                 DEFAULT FALSE,
    auto_drop         IN BOOLEAN                 DEFAULT TRUE,
    comments          IN VARCHAR2                DEFAULT NULL,
    credential_name    IN VARCHAR2                DEFAULT NULL,
    destination_name  IN VARCHAR2                DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    job_type          IN VARCHAR2,
    job_action        IN VARCHAR2,
    number_of_arguments IN PLS_INTEGER           DEFAULT 0,
    start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    event_condition    IN VARCHAR2                DEFAULT NULL,
    queue_spec        IN VARCHAR2,
    end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    job_class         IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
    enabled           IN BOOLEAN                 DEFAULT FALSE,
    auto_drop         IN BOOLEAN                 DEFAULT TRUE,
    comments          IN VARCHAR2                DEFAULT NULL,
    credential_name    IN VARCHAR2                DEFAULT NULL,
    destination_name  IN VARCHAR2                DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
    job_name          IN VARCHAR2,
    program_name      IN VARCHAR2,
    start_date        IN TIMESTAMP WITH TIME ZONE,
    event_condition    IN VARCHAR2,
    queue_spec        IN VARCHAR2,
    end_date          IN TIMESTAMP WITH TIME ZONE,
    job_class         IN VARCHAR2                DEFAULT 'DEFAULT_JOB_CLASS',
    enabled           IN BOOLEAN                 DEFAULT FALSE,
    auto_drop         IN BOOLEAN                 DEFAULT TRUE,
    comments          IN VARCHAR2                DEFAULT NULL,
    job_style         IN VARCHAR2                DEFAULT 'REGULAR',
```

```
credential_name      IN VARCHAR2      DEFAULT NULL,  
destination_name     IN VARCHAR2      DEFAULT NULL);
```

## Parameters

**Table 154-28** *CREATE\_JOB Procedure Parameters*

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | <p>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.</p> <p>If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the <code>GENERATE_JOB_NAME</code> procedure to generate a name and then use the output in the <code>CREATE_JOB</code> procedure. The <code>GENERATE_JOB_NAME</code> procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "<a href="#">GENERATE_JOB_NAME Function</a>" for more information.</p> |

**Table 154-28 (Cont.) CREATE\_JOB Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type  | <p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See <code>job_action</code> in the next row for related information.</p> <p>The supported values are:</p> <ul style="list-style-type: none"> <li>• 'PLSQL_BLOCK'</li> </ul> <p>This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0.</p> <li>• 'STORED_PROCEDURE'</li> <p>This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported.</p> <li>• 'EXECUTABLE'</li> <p>This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. Anydata arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run.</p> <li>• 'CHAIN'</li> <p>This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0.</p> <li>• 'EXTERNAL_SCRIPT'</li> <p>This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is <code>cmd.exe</code> and for UNIX based systems the <code>sh</code> shell, unless a different interpreter is specified by prefixing the first line of the script with <code>#!</code>.</p> <li>• 'SQL_SCRIPT'</li> <p>This specifies that the job is a SQL*Plus script.</p> <p>The job must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by the SQL*Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script.</p> <p>Note that if you choose to use connect credential, you must use <code>set_attribute</code> to specify the <code>Connect_Credential_Name</code> attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.</p> <p>The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.</p> <li>• 'BACKUP_SCRIPT'</li> <p>This specifies that the job is an RMAN backup script.</p> <p>The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user.</p> <p>The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.</p> <p>The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege.</p> |

**Table 154-28 (Cont.) CREATE\_JOB Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_action | <p>This attribute specifies the action of the job. If <code>job_action</code> is not specified for an inline program, then an error is generated when creating the job.</p> <p>The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> <li>For a PL/SQL block: <p>The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>.</p> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.</p> <p>See <a href="#">Table 154-40</a> for details on available metadata attributes.</p> </li> <li>For a stored procedure: <p>The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>job_action=&gt;'\"Schema\".\"Procedure\"'</code>.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_PROCEDURE</code>.</p> </li> <li>For an executable: <p>The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.</p> </li> <li>For a chain: <p>The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.</p> </li> <li>For an external script: <p>The <code>job_action</code> must be either the path to an operating system script or an inline operating system script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on. The <code>job_action</code> may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.</p> </li> <li>For a SQL script:</li> </ul> |

**Table 154-28 (Cont.) CREATE\_JOB Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | <p>The <code>job_action</code> must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the <code>job_action</code> is a path to a script, then the script must reside on every computer that the job runs on.</p> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"> <li>For a backup script:<br/>The <code>job_action</code> is either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on.</li> </ul> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p> |
| <code>number_of_arguments</code> | This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>program_name</code>        | The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>start_date</code>          | <p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</p>                                                                                                                                                                                                                                                                                         |
| <code>event_condition</code>     | This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>queue_spec</code>          | <p>This argument specifies either of the following:</p> <ul style="list-style-type: none"> <li>The source queue where events that start this particular job are enqueued. If it is secure, then the <code>queue_spec</code> argument is a pair of values of the form <code>queue_name, agent_name</code>. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.</li> <li>A file watcher name. For more information on this option, see <i>Oracle Database Administrator's Guide</i>.</li> </ul>                                                                                                                                                                                                                 |
| <code>repeat_interval</code>     | <p>This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions.</p> <p>The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job runs only once at the specified start date. See "<a href="#">Calendaring Syntax</a>" for further information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>schedule_name</code>       | The name of the schedule, window, or window group associated with this job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>job_class</code>           | The class this job is associated with.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 154-28 (Cont.) CREATE\_JOB Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_date        | <p>This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| comments        | This attribute specifies a comment about the job. By default, this attribute is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| job_style       | <p>Style of the job being created. This argument can have one of the following values:</p> <ul style="list-style-type: none"> <li>'REGULAR' creates a regular job. This is the default.</li> <li>'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain.</li> <li>'IN_MEMORY_RUNTIME' creates an in-memory runtime job. These jobs are based on lightweight job structures, so the same rules and restrictions apply; however, they further boost performance by keeping an in-memory cache, so they minimize disk access for pre-run and post-run actions.</li> <li>'IN_MEMORY_FULL' creates an in-memory full job. In-memory full jobs require a program and cannot have a schedule or repeat interval. They run automatically when the job is enabled, and after running they are discarded. They keep all the job information in memory and are not backed up on disk, meaning that they are lost when the instance is rebooted. They are designed to run actions that must be performed immediately with the least amount of overhead possible.</li> </ul> |
| credential_name | <p>The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist.</p> <p>For local database jobs, it must be NULL.</p> <p>For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p> <p>See also: "<a href="#">CREATE_CREDENTIAL Procedure</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 154-28 (Cont.) CREATE\_JOB Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_name | <p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).</p> <p>This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.</p> <p>The following applies to this attribute:</p> <ul style="list-style-type: none"> <li>If it is a database destination, it must have been created by the <a href="#">CREATE_DATABASE_DESTINATION Procedure</a>.</li> <li>If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database.</li> <li>If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "<a href="#">CREATE_GROUP Procedure</a>".</li> </ul> <p>destination_name cannot reference a destination group when:</p> <ul style="list-style-type: none"> <li>The job type is 'CHAIN'</li> <li>The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL',</li> </ul> <p>If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:</p> <p><i>credential.destination</i></p> <p>The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.</p> <p>You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.</p> <p>*** destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.</p> |
| enabled          | <p>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| auto_drop        | <p>This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> <li>Its end date (or the end date of the job schedule) has passed. Note that a job with a Window schedule will not be auto-dropped when the window closes, because this is not considered to be the end of the Window.</li> <li>It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE.</li> <li>It is not a repeating job and has run once.</li> </ul> <p>A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, `JOB_QUEUE_PROCESSES` applies to `DBMS_SCHEDULER` jobs. Setting this parameter to 0 disables `DBMS_SCHEDULER` jobs.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the [SET\\_JOB\\_ARGUMENT\\_VALUE Procedure](#) or the [SET\\_JOB\\_ANYDATA\\_VALUE Procedure](#). Other job attributes, such as `job_priority` and `max_runs`, are set with the [SET\\_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

### Note:

The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

## 154.6.17 CREATE\_JOB\_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

### Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
    job_class_name          IN VARCHAR2,
    resource_consumer_group IN VARCHAR2 DEFAULT NULL,
    service                 IN VARCHAR2 DEFAULT NULL,
    logging_level           IN PLS_INTEGER
                           DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
    log_history             IN PLS_INTEGER DEFAULT NULL,
    comments                IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-29 CREATE\_JOB\_CLASS Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_class_name          | <p>The name to assign to the job class. Job classes can only be created in the SYS schema.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| resource_consumer_group | <p>This attribute specifies the resource consumer group that this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class.</p> <p>If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, job classes are associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p>                                                                                                                                                                                                                                                                                                                    |
| service                 | <p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See <code>DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING</code> for details. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are specified, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p> |
| logging_level           | <p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> <li><code>DBMS_SCHEDULER.LOGGING_OFF</code><br/>No logging is performed for any jobs in this class.</li> <li><code>DBMS_SCHEDULER.LOGGING_RUNS</code><br/>The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</li> <li><code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code><br/>The Scheduler logs only jobs that failed in this class.</li> <li><code>DBMS_SCHEDULER.LOGGING_FULL</code><br/>In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with <code>SET_ATTRIBUTE</code>), stopped, and so, an entry is recorded in the log.</li> </ul>                                                                                                                                                                                                                                                                             |

**Table 154-29 (Cont.) CREATE\_JOB\_CLASS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log_history | This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.<br>The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE). |
| comments    | This attribute is for an optional comment about the job class. By default, this attribute is NULL.                                                                                                                                                                                                                                                                            |

**Usage Notes**

For users to create jobs that belong to a job class, the job owner must have `EXECUTE` privileges on the job class. Therefore, after the job class has been created, `EXECUTE` privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the `EXECUTE` privilege to a role.

Creating a job class requires the `MANAGE SCHEDULER` system privilege.

## 154.6.18 CREATE\_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

**Syntax**

```
DBMS_SCHEDULER.CREATE_JOBS (
    jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

**Parameters****Table 154-30 CREATE\_JOBS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| jobdef_array     | The array of job definitions. See <a href="#">"Data Structures"</a> for a description of the <code>JOB_DEFINITION_ARRAY</code> and <code>JOB_DEFINITION</code> datatypes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"> <li><code>STOP_ON_FIRST_ERROR</code> returns on the first error. Previous successfully created jobs are committed to disk. This is the default.</li> <li><code>TRANSACTIONAL</code> returns on the first error and everything that happened before that error is rolled back.</li> <li><code>ABSORB_ERRORS</code> tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.</li> </ul> |

**Usage Notes**

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size. Calling `CREATE_JOBS` with a small array size may not be much faster than calling `CREATE_JOB` once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the `destination` attribute of the `job_definition` object cannot reference a destination group.

### Examples

See *Oracle Database Administrator's Guide*.

## 154.6.19 CREATE\_PROGRAM Procedure

This procedure creates a program.

### Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (  
    program_name          IN VARCHAR2,  
    program_type          IN VARCHAR2,  
    program_action        IN VARCHAR2,  
    number_of_arguments   IN PLS_INTEGER DEFAULT 0,  
    enabled               IN BOOLEAN DEFAULT FALSE,  
    comments              IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-31** CREATE\_PROGRAM Procedure Parameters

| Parameter                 | Description                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>program_name</code> | The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs. |

**Table 154-31 (Cont.) CREATE\_PROGRAM Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_type | <p>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for program_type:</p> <ul style="list-style-type: none"> <li>• 'PLSQL_BLOCK'</li> </ul> <p>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</p> <li>• 'STORED_PROCEDURE'</li> <p>This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.</p> <li>• 'EXECUTABLE'</li> <p>This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE.</p> <li>• 'EXTERNAL_SCRIPT'</li> <p>This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!.</p> <li>• 'SQL_SCRIPT'</li> <p>This specifies that the program is a SQL*Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL*Plus script is run by SQL*Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL*Plus script.</p> <p>Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.</p> <li>• 'BACKUP_SCRIPT'</li> <p>This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.</p> |

**Table 154-31 (Cont.) CREATE\_PROGRAM Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_action | <p>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> <li>For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon.<br/>For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>.<br/>Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution:<br/><code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See <a href="#">Table 154-40</a> for details on available metadata attributes.<br/>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: job_name, job_owner, job_start, window_start, window_end. For more information, see the "<a href="#">DEFINE_METADATA_ARGUMENT Procedure</a>".</li> <li>For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job.<br/>If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example,<br/><code>program_action=&gt;' "Schema"."Procedure" '.</code></li> <li>For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark (?), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign (@) and the job is local, the at sign is replaced with the SID of the current Oracle instance.</li> <li>For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.<br/>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points to a credential that contains a valid operating system username and password.</li> <li>For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on.<br/>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when</li> </ul> |

Table 154-31 (Cont.) CREATE\_PROGRAM Procedure Parameters

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | <p>the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</p> <ul style="list-style-type: none"><li>For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the <code>program_action</code> is a path to a script, then the script must reside on every computer that the program runs on.</li></ul> <p>The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called.</p> |
| <code>number_of_arguments</code> | <p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p>                                                                                                                                                                                                                                                                                |
| <code>enabled</code>             | <p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>                                                                                                                                         |
| <code>comments</code>            | <p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

## 154.6.20 CREATE\_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

### Syntax

```
DBMS_SCHEDULER.CREATE_RESOURCE (  
  resource_name  IN VARCHAR2,  
  units          IN PLS_INTEGER,  
  status         IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',  
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',  
  comments       IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-32 CREATE\_RESOURCE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resource_name    | The name of the resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| units            | The number of units of this resource that the job or program uses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| status           | The status of the resource. <ul style="list-style-type: none"><li>• 'ENFORCE_CONSTRAINTS'. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached no additional jobs using this resource will get started.</li><li>• 'IGNORE_CONSTRAINTS'. When set, the scheduler will ignore any constraints on this resource.</li><li>• 'BLOCKED_ALL_JOBS'. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.</li></ul> |
| constraint_level | Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code> .<br>For incompatibilities, for <code>JOB_LEVEL</code> , the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs.                                                                                                                                                                                                                                                                                                                                                                                |
| comments         | Descriptive comment about the resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage Notes

The following example creates a new resource.

```
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
```

## 154.6.21 CREATE\_SCHEDULE Procedure

This procedure creates a schedule.

### Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
  schedule_name          IN VARCHAR2,
```

```

start_date          IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
repeat_interval     IN VARCHAR2,
end_date            IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
comments            IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 154-33 CREATE\_SCHEDULE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name   | The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| start_date      | <p>This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for <code>start_date</code> is a reference date. In this case, the start of the schedule is not the <code>start_date</code>; it depends on the repeat interval specified. <code>start_date</code> is used to determine the first instance of the schedule.</p> <p>If <code>start_date</code> is specified in the past and no value for <code>repeat_interval</code> is specified, the schedule is invalid. For a repeating job or window, <code>start_date</code> can be derived from the <code>repeat_interval</code> if it is not specified.</p> <p>If <code>start_date</code> is null, then the date that the job or window is enabled is used. <code>start_date</code> and <code>repeat_interval</code> cannot both be null.</p> |
| repeat_interval | This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " <a href="#">Calendaring Syntax</a> " for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| end_date        | <p>The date and time after which jobs will not run and windows will not open.</p> <p>A non-repeating schedule that has no <code>end_date</code> is valid forever.</p> <p><code>end_date</code> has to be after the <code>start_date</code>. If this is not the case, then an error is generated when the schedule is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| comments        | This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

## 154.6.22 CREATE\_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

## Syntax

Creates a window using a named schedule object:

```

DBMS_SCHEDULER.CREATE_WINDOW (
    window_name          IN VARCHAR2,

```

```
resource_plan      IN VARCHAR2,
schedule_name     IN VARCHAR2,
duration          IN INTERVAL DAY TO SECOND,
window_priority   IN VARCHAR2 DEFAULT 'LOW',
comments         IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
  window_name      IN VARCHAR2,
  resource_plan    IN VARCHAR2,
  start_date       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval  IN VARCHAR2,
  end_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration         IN INTERVAL DAY TO SECOND,
  window_priority  IN VARCHAR2 DEFAULT 'LOW',
  comments         IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-34 CREATE\_WINDOW Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| window_name   | The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the SYS schema, so the preface 'SYS' is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| resource_plan | <p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be NULL or the empty string (''). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p> |
| start_date    | <p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p>                                                                                                                                                                                                                                                                                                     |
| duration      | This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| schedule_name | This attribute specifies the name of the schedule associated with the window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 154-34 (Cont.) CREATE\_WINDOW Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| repeat_interval | <p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See <a href="#">"Calendaring Syntax"</a> for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</p>                                                                                                             |
| end_date        | <p>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever.</p> <p>The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</p> |
| window_priority | <p>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.</p>                                                                                                                     |
| comments        | <p>This attribute specifies an optional comment about the window. By default, this attribute is NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Usage Notes**

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and ["SWITCH\\_PLAN Procedure"](#).

## 154.6.23 DEFINE\_ANYDATA\_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an `ANYDATA` object. A job that references the program can override the default value.

**Syntax**

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_position     IN PLS_INTEGER,
  argument_name         IN VARCHAR2 DEFAULT NULL,
  argument_type         IN VARCHAR2,
```

```
default_value      IN SYS.ANYDATA,  
out_argument      IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-35** DEFINE\_ANYDATA\_ARGUMENT Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name      | The name of the program to be altered. A program with this name must exist.                                                                                                                                                                             |
| argument_position | The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position.   |
| argument_name     | The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the <a href="#">SET_JOB_ANYDATA_VALUE Procedure</a> . |
| argument_type     | The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.                                                               |
| default_value     | The default value to be assigned to the argument encapsulated within an <code>AnyData</code> object. This is optional.                                                                                                                                  |
| out_argument      | This parameter is reserved for future use. It must be set to <code>FALSE</code> .                                                                                                                                                                       |

## Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

## 154.6.24 DEFINE\_CHAIN\_EVENT\_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

## Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_schedule_name IN VARCHAR2,
    timeout              IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_condition      IN VARCHAR2,
    queue_spec           IN VARCHAR2,
    timeout              IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

## Parameters

**Table 154-36** DEFINE\_CHAIN\_EVENT\_STEP Procedure Parameters

| Parameter           | Description                                             |
|---------------------|---------------------------------------------------------|
| chain_name          | The name of the chain that the step is in               |
| step_name           | The name of the step                                    |
| event_schedule_name | The name of the event schedule that the step waits for  |
| timeout             | This parameter is reserved for future use               |
| event_condition     | See the <a href="#">CREATE_EVENT_SCHEDULE Procedure</a> |
| queue_spec          | See the <a href="#">CREATE_EVENT_SCHEDULE Procedure</a> |

## Usage Notes

Defining a chain step requires `ALTER` privileges on the chain either as the owner of the chain, or as a user with the `ALTER` object privilege on the chain or the `CREATE ANY JOB` system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the `queue_spec` parameter, or use a file watcher schedule for the `event_schedule_name` parameter.

## 154.6.25 DEFINE\_CHAIN\_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form `SCHED_RULE${N}`.

## Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
    chain_name          IN VARCHAR2,
    condition            IN VARCHAR2,
    action               IN VARCHAR2,
    rule_name           IN VARCHAR2 DEFAULT NULL,
    comments             IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-37** DEFINE\_CHAIN\_RULE Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name | The name of the chain to alter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| condition  | <p>A boolean expression which must evaluate to <code>TRUE</code> for the action to be performed. Every chain must have a rule that evaluates to <code>TRUE</code> to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> <li><b>Scheduler Chain Condition Syntax</b><br/>See "<a href="#">Scheduler Chain Condition Syntax</a>" and <i>Oracle Database Administrator's Guide</i> for details</li> <li><b>SQL WHERE Clause Syntax</b><br/>Conditions expressed with SQL must use the syntax of a <code>SELECT</code> statement <code>WHERE</code> clause.<br/>You can refer to chain step attributes by using the chain step name as a bind variable.<br/>The bind variable syntax is <code>:step_name.attribute</code>. (<i>step_name</i> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>.<br/>Possible values for the <code>state</code> attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its <code>completed</code> attribute is set to 'TRUE', otherwise <code>completed</code> is 'FALSE'.</li> </ul> |
| action     | <p>The action to be performed when the rule evaluates to <code>TRUE</code>. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> <li><code>[AFTER delay_interval] START step_1[,step_2 ...]</code></li> <li><code>STOP step_1[,step_2 ...]</code></li> <li><code>END [{end_value step_name.error_code}]</code></li> </ul> <p>At the beginning of the <code>START</code> action, a delay clause can specify a delay interval before performing the action. <i>delay_interval</i> is a formatted datetime interval of the form <code>HH:MM:SS</code>.</p> <p>The <code>END</code> action ends the chain with an error code equal to either the supplied <code>end_value</code> or the error code that <i>step_name</i> completes with. The default error code is 0, indicating a successful chain run.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rule_name  | The name of the rule being created. If no <code>rule_name</code> is given, one is generated in the form <code>SCHED_RULE\$_{N}</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 154-37 (Cont.) DEFINE\_CHAIN\_RULE Procedure Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| comments  | An optional comment describing the rule. This is stored in the rule object created. |

### Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.

#### Chain Condition Syntax

The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

These boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

*integer* can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the `NOT` operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

### Usage Notes

Defining a chain rule requires `ALTER` privileges on the chain (either as the owner, or as a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

### Examples

The following are examples of using rule conditions and rule actions.

#### Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

### Rule Conditions Using SQL Syntax

```
:step1.completed = 'TRUE' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

'step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete
```

### Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

## 154.6.26 DEFINE\_CHAIN\_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

### Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);
```

## Parameters

**Table 154-38** DEFINE\_CHAIN\_STEP Procedure Parameters

| Parameter    | Description                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| chain_name   | The name of the chain to alter.                                                                                                |
| step_name    | The name of the step being defined. If a step already exists with this name, the new step replaces the old one.                |
| program_name | The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain. |

## Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

## 154.6.27 DEFINE\_METADATA\_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

## Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (  
    program_name          IN VARCHAR2,  
    metadata_attribute    IN VARCHAR2,  
    argument_position     IN PLS_INTEGER,  
    argument_name         IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-39** DEFINE\_METADATA\_ARGUMENT Procedure Parameters

| Parameter          | Description                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name       | The name of the program to be altered                                                                                                                                                                                                   |
| metadata_attribute | The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'.<br><a href="#">Table 154-40</a> describes these attributes in detail. |
| argument_position  | The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position. |

**Table 154-39 (Cont.) DEFINE\_METADATA\_ARGUMENT Procedure Parameters**

| Parameter     | Description                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| argument_name | The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures. |

**Table 154-40 Metadata Attributes**

| Metadata Attribute  | Datatype                 | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | VARCHAR2                 | Name of the currently running job                                                                                                                                                                                                                                                                                                                                                        |
| job_subname         | VARCHAR2                 | Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.                                                                                                                                                                                                                        |
| job_owner           | VARCHAR2                 | Owner of the currently running job                                                                                                                                                                                                                                                                                                                                                       |
| job_scheduled_start | TIMESTAMP WITH TIME ZONE | When the currently running job was scheduled to start                                                                                                                                                                                                                                                                                                                                    |
| job_start           | TIMESTAMP WITH TIME ZONE | When the currently running job started                                                                                                                                                                                                                                                                                                                                                   |
| window_start        | TIMESTAMP WITH TIME ZONE | If the job was started by a window, the time that the window opened                                                                                                                                                                                                                                                                                                                      |
| window_end          | TIMESTAMP WITH TIME ZONE | If the job was started by a window, the time that the window is scheduled to close                                                                                                                                                                                                                                                                                                       |
| event_message       | (See Description)        | For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See <a href="#">"SCHEDULER_FILEWATCHER_RESULT Object Type"</a> . |

### Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event\_message can be used in PL/SQL blocks that you enter into the job\_action or program\_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

## 154.6.28 DEFINE\_PROGRAM\_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

### Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(  
    program_name      IN VARCHAR2,  
    argument_position IN PLS_INTEGER,  
    argument_name     IN VARCHAR2 DEFAULT NULL,  
    argument_type     IN VARCHAR2,  
    out_argument      IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(  
    program_name      IN VARCHAR2,  
    argument_position IN PLS_INTEGER,  
    argument_name     IN VARCHAR2 DEFAULT NULL,  
    argument_type     IN VARCHAR2,  
    default_value     IN VARCHAR2,  
    out_argument      IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-41** DEFINE\_PROGRAM\_ARGUMENT Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name      | The name of the program to be altered. A program with this name must exist.                                                                                                                                                                        |
| argument_position | The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position.  |
| argument_name     | The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the <a href="#">SET_JOB_ARGUMENT_VALUE Procedure</a> . |
| argument_type     | The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL datatype is allowed.                 |
| default_value     | The default value to be assigned to the argument if none is specified by the job.                                                                                                                                                                  |
| out_argument      | This parameter is reserved for future use. It must be set to <code>FALSE</code> .                                                                                                                                                                  |

## Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

`DEFINE_PROGRAM_ARGUMENT` only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

## 154.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

### Syntax

```
DBMS_SCHEDULER.DISABLE (  
    name             IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE,  
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 154-42** DISABLE Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | The name of the object being disabled. Can be a comma-delimited list.<br>If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled.<br>If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| force            | If <code>TRUE</code> , objects are disabled even if other objects depend on them. See the usage notes for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"><li>• <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default.</li><li>• <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back.<br/>This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>.</li><li>• <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.<br/>This type is only supported when disabling a job or a list of jobs.</li></ul> |

### Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

### Programs

When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue

No arguments that pertain to the program are affected when the program is disabled.

### File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

### Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

### Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.

- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

#### Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

#### Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

#### External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

#### Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

## 154.6.30 DROP\_AGENT\_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE_SCHEDULER` privilege.

#### Note:

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

## Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (  
    destination_name          IN VARCHAR2);
```

## Parameters

**Table 154-43 DROP\_AGENT\_DESTINATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_name | A comma-separated list of external destinations to drop. Because user SYS owns all external destinations, do not prefix them with a schema name.<br>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.<br>Cannot be NULL. |

## Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to NULL.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

## 154.6.31 DROP\_CHAIN Procedure

This procedure drops an existing chain.

## Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (  
    chain_name          IN VARCHAR2,  
    force               IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-44 DROP\_CHAIN Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name | The name of the chain to drop. Can also be a comma-delimited list of chains.                                                                                                                                                                                                                                        |
| force      | If <code>force</code> is set to FALSE, the chain must not be referenced by any job, otherwise an error will occur.<br>If <code>force</code> is set to TRUE, all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped. |

### Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the DBMS\_RULE\_ADM.DROP\_RULE\_SET and DBMS\_RULE\_ADM.DROP\_EVALUATION\_CONTEXT procedures for more information.

If `force` is FALSE, no jobs may be using this chain. If `force` is TRUE, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

## 154.6.32 DROP\_CHAIN\_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

### Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
    chain_name      IN VARCHAR2,
    rule_name       IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-45** DROP\_CHAIN\_RULE Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name | The name of the chain to alter                                                                                                                                                                                                                    |
| rule_name  | The name of the rule to drop                                                                                                                                                                                                                      |
| force      | If <code>force</code> is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <code>force</code> is set to FALSE and the chain is running, an error is generated. |

### Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS\_RULE\_ADM.DROP\_RULE procedure for more information.

## 154.6.33 DROP\_CHAIN\_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

### Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (  
    chain_name          IN VARCHAR2,  
    step_name           IN VARCHAR2,  
    force                IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-46** DROP\_CHAIN\_STEP Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name | The name of the chain to alter                                                                                                                                                                                                        |
| step_name  | The name of the step being dropped. Can be a comma-separated list.                                                                                                                                                                    |
| force      | If <i>force</i> is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If <i>force</i> is set to FALSE and this chain is currently running, an error is thrown. |

### Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

## 154.6.34 DROP\_CREDENTIAL Procedure

This deprecated procedure drops a credential.

### Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the [DBMS\\_CREDENTIAL](#) package, specifically the [DROP\\_CREDENTIAL Procedure](#).

### Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (  
    credential_name      IN VARCHAR2,  
    force                IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-47 DROP\_CREDENTIAL Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| credential_name | The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.                                                                                                                                                                               |
| force           | If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime. |

## Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

## 154.6.35 DROP\_DATABASE\_DESTINATION Procedure

This procedure drops one or more database destinations.

## Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (  
    destination_name      IN VARCHAR2);
```

## Parameters

**Table 154-48 DROP\_DATABASE\_DESTINATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_name | <p>The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name.</p> <p>The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped.</p> <p>Cannot be NULL.</p> |

## Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the \*\_SCHEDULER\_JOB\_DESTS views are also dropped.
- Jobs running against the destination are stopped.

- Members of database destination groups that refer to the destination are removed from the group.

**See Also:**[CREATE\\_DATABASE\\_DESTINATION Procedure](#)

## 154.6.36 DROP\_FILE\_WATCHER Procedure

This procedure drops one or more file watchers.

### Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
    file_watcher_name      IN VARCHAR2,
    force                  IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-49 DROP\_FILE\_WATCHER Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file_watcher_name | The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.                                                                                             |
| force             | If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled. |

### Usage Notes

Only the owner of a file watcher or a user with the `CREATE ANY JOB` system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

**See Also:**["CREATE\\_FILE\\_WATCHER Procedure"](#)

## 154.6.37 DROP\_GROUP Procedure

This procedure drops one or more groups.

### Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name      IN VARCHAR2,  
    force           IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-50** DROP\_GROUP Procedure Parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name | A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name.<br><br>The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped.<br><br>Cannot be NULL.                              |
| force      | If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views. |

### Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

["CREATE\\_FILE\\_WATCHER Procedure"](#)

## 154.6.38 DROP\_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

### Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name  IN VARCHAR2);
```

## Parameters

**Table 154-51 DROP\_INCOMPATIBILITY Procedure Parameters**

| Parameter            | Description                                 |
|----------------------|---------------------------------------------|
| incompatibility_name | The name of the incompatibility definition. |

## Usage Notes

### See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

## 154.6.39 DROP\_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

## Syntax

```
DBMS_SCHEDULER.DROP_JOB (  
    job_name          IN VARCHAR2,  
    force             IN BOOLEAN DEFAULT FALSE,  
    defer             IN BOOLEAN DEFAULT FALSE,  
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

## Parameters

**Table 154-52 DROP\_JOB Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified.<br><br>If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped. |
| force     | If <code>force</code> is set to <code>TRUE</code> , the Scheduler first attempts to stop the running job instances (by issuing the <code>STOP_JOB</code> call with the <code>force</code> flag set to <code>false</code> ), and then drops the jobs.             |
| defer     | If <code>defer</code> is set to <code>TRUE</code> , the Scheduler allows the running jobs to complete and then drops the jobs.                                                                                                                                   |

**Table 154-52 (Cont.) DROP\_JOB Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_semantics | <p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> <li>• <code>STOP_ON_FIRST_ERROR</code> returns on the first error and previous successful drop operations are committed to disk. This is the default.</li> <li>• <code>TRANSACTIONAL</code> returns on the first error. Everything that happened before that error is rolled back. This type is not supported when <code>force</code> is set to <code>TRUE</code>.</li> <li>• <code>ABSORB_ERRORS</code> tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.</li> </ul> <p>Only <code>STOP_ON_FIRST_ERROR</code> is permitted when job classes are included in the <code>job_name</code> list.</p> |

### Usage Notes

If both `force` and `defer` are set to `FALSE` and a job is running at the time of the call, the attempt to drop that job fails. The entire call to `DROP_JOB` may then fail, depending on the setting of `commit_semantics`.

Setting both `force` and `defer` to `TRUE` results in an error.

Dropping a job requires `ALTER` privileges on the job either as the owner of the job or as a user with the `ALTER` object privilege on the job or the `CREATE ANY JOB` system privilege.

## 154.6.40 DROP\_JOB\_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

### Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
    job_class_name    IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-53 DROP\_JOB\_CLASS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_class_name | The name of the job class. Can be a comma-delimited list.                                                                                                                                                                                                                                                                                                                                                    |
| force          | <p>If <code>force</code> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped. Running jobs that belong to the job class are not affected.</p> |

### Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

## 154.6.41 DROP\_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

### Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (  
    program_name          IN VARCHAR2,  
    force                  IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-54** DROP\_PROGRAM Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| program_name | The name of the program to be dropped. Can be a comma-delimited list.                                                                                                                                                                                                                                                                                                           |
| force        | <p>If <i>force</i> is set to <b>FALSE</b>, the program must not be referenced by any job, otherwise an error occurs.</p> <p>If <i>force</i> is set to <b>TRUE</b>, all jobs referencing the program are disabled before the program is dropped.</p> <p>Running jobs that point to the program are not affected by the <b>DROP_PROGRAM</b> call and are allowed to continue.</p> |

### Usage Notes

Dropping a program requires that you be the owner of the program or have **ALTER** privileges on that program. You can also drop a program if you have the **CREATE ANY JOB** privilege.

## 154.6.42 DROP\_PROGRAM\_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

### Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name          IN VARCHAR2,  
    argument_position      IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name          IN VARCHAR2,  
    argument_name         IN VARCHAR2);
```

## Parameters

**Table 154-55 DROP\_PROGRAM\_ARGUMENT Procedure Parameters**

| Parameter         | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| program_name      | The name of the program to be altered. A program with this name must exist. |
| argument_name     | The name of the argument being dropped                                      |
| argument_position | The position of the argument to be dropped                                  |

## Usage Notes

Dropping a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program argument if you have the `CREATE ANY JOB` privilege.

## 154.6.43 DROP\_RESOURCE Procedure

This procedure drops a resource.

## Syntax

```
DBMS_SCHEDULER.DROP_RESOURCE (  
    resource_name  IN VARCHAR2,  
    force          IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-56 DROP\_RESOURCE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resource_name | The name of the resource to be dropped. Can be a comma-delimited list.                                                                                                                                                                                                                          |
| force         | If <code>force</code> is set to <code>FALSE</code> , the resource must not have any existing constraints, otherwise an error occurs.<br><br>If <code>force</code> is set to <code>TRUE</code> , the resource will be dropped and any constraints defined on this resource will also be dropped. |

## Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the resource.

Creating or Dropping a Resource in *Oracle Database Administrator's Guide*

## 154.6.44 DROP\_SCHEDULE Procedure

This procedure drops a schedule.

### Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (  
    schedule_name    IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-57 DROP\_SCHEDULE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_name | The name of the schedule. Can be a comma-delimited list.                                                                                                                                                                                                                                                                                                                          |
| force         | If <code>force</code> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur.<br><br>If <code>force</code> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped<br><br>Running jobs and open windows that point to the schedule are not affected. |

### Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

## 154.6.45 DROP\_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

### Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (  
    window_name      IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 154-58 DROP\_WINDOW Procedure Parameters**

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| window_name | The name of the window. Can be a comma-delimited list. |

**Table 154-58 (Cont.) DROP\_WINDOW Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force</code> | <p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p> |

### Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

## 154.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the `job RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

### Syntax

```
DBMS_SCHEDULER.ENABLE (  
    name                IN VARCHAR2,  
    commit_semantics    IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 154-59 ENABLE Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code> | <p>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</p> <p>If a job class name is specified, then all the jobs in the job class are enabled.</p> <p>If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</p> |

**Table 154-59 (Cont.) ENABLE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_semantics | <p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"><li>• <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default.</li><li>• <code>TRANSACTIONAL</code> - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs.</li><li>• <code>ABSORB_ERRORS</code> - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when enabling a job or a list of jobs.</li></ul> |

### Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

## 154.6.47 END\_DETACHED\_JOB\_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`.

A detached job run does not end until this procedure or the [STOP\\_JOB Procedure](#) is called.

### Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (  
    job_name          IN VARCHAR2,  
    error_number       IN PLS_INTEGER DEFAULT 0,  
    additional_info    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-60 END\_DETACHED\_JOB\_RUN Procedure Parameters**

| Parameter    | Description                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name     | The name of the job to end. Must be a detached job that is running.                                                                                                                  |
| error_number | If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number. |

**Table 154-60 (Cont.) END\_DETACHED\_JOB\_RUN Procedure Parameters**

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| additional_info | This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run. |

#### Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

#### See Also:

*Oracle Database Administrator's Guide* for information about detached jobs.

## 154.6.48 EVALUATE\_CALENDAR\_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next\_run\_date returned by one invocation as the return\_date\_after argument of the next invocation.

See the calendaring syntax described in "[Operational Notes](#)".

#### Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
  calendar_string   IN  VARCHAR2,
  start_date        IN  TIMESTAMP WITH TIME ZONE,
  return_date_after IN  TIMESTAMP WITH TIME ZONE,
  next_run_date     OUT TIMESTAMP WITH TIME ZONE);
```

#### Parameters

**Table 154-61 EVALUATE\_CALENDAR\_STRING Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| calendar_string   | The calendar expression to be evaluated. The string must be in the calendaring syntax described in " <a href="#">Operational Notes</a> ".                                                                                                                                                                                   |
| start_date        | The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.                                                                                                                                           |
| return_date_after | The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string.<br><br>When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value. |

**Table 154-61 (Cont.) EVALUATE\_CALENDAR\_STRING Procedure Parameters**

| Parameter     | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| next_run_date | The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument. |

### Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date          TIMESTAMP;
return_date_after   TIMESTAMP;
next_run_date       TIMESTAMP;
BEGIN
start_date :=
    to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
        'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
        start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
```

### Usage Notes

No specific Scheduler privileges are required.

## 154.6.49 EVALUATE\_RUNNING\_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN\_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE\_RUNNING\_CHAIN is performed on each of the nested running chains.

## Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (  
    job_name          IN VARCHAR2);
```

## Parameters

**Table 154-62 EVALUATE\_RUNNING\_CHAIN Procedure Parameter**

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| job_name  | The name of the running job (pointing to a chain) to reevaluate the rules for |

## Usage Notes

Running `EVALUATE_RUNNING_CHAIN` on a job requires alter privileges on the job (either as the owner, or as a user with `ALTER` privileges on the job or the `CREATE ANY JOB` system privilege).

### Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. `EVALUATE_RUNNING_CHAIN` should be used only under the following circumstances:

- After manual intervention of a running chain with the `ALTER_RUNNING_CHAIN` procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, `EVALUATE_RUNNING_CHAIN` may not be needed if you set the `evaluation_interval` attribute when you created the chain.

## 154.6.50 GENERATE\_JOB\_NAME Function

This function returns a unique name for a job.

The name will be of the form `{prefix}N` where `N` is a number from a sequence. If no prefix is specified, the generated name will, by default, be `JOB$_1`, `JOB$_2`, `JOB$_3`, and so on. If `'SCOTT'` is specified as the prefix, the name will be `SCOTT1`, `SCOTT2`, and so on.

## Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (  
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

## Parameters

**Table 154-63** GENERATE\_JOB\_NAME Function Parameter

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| prefix    | The prefix to use when generating the job name |

## Usage Notes

If the prefix is explicitly set to `NULL`, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the `DBMS_SCHEDULER` calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the `GENERATE_JOB_NAME` function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

## 154.6.51 GET\_AGENT\_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

## Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (  
    agent_name      IN VARCHAR2,  
    attribute       IN VARCHAR2) RETURN VARCHAR2;
```

## Parameters

**Table 154-64** GET\_AGENT\_INFO Function Parameter

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agent_name | The name of an external destination where the agent is running                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| attribute  | <p>Possible Attributes values</p> <ul style="list-style-type: none"><li>• <code>VERSION:</code> Returns the agent version number. Requires the <code>CREATE JOB</code> system privilege.</li><li>• <code>UPTIME:</code> Returns the time the agent has been up and running. Requires the <code>CREATE JOB</code> system privilege.</li><li>• <code>NUMBER_OF_RUNNING_JOBS:</code> Returns the number of jobs that the agent is currently running. Requires the <code>CREATE JOB</code> system privilege.</li><li>• <code>TOTAL_JOBS_RUN:</code> Returns the number of jobs run by the agent since it was started. Requires the <code>CREATE JOB</code> system privilege.</li><li>• <code>RUNNING_JOBS:</code> Returns a comma-separated list of the names of the jobs running currently. Requires the <code>MANAGE SCHEDULER</code> system privilege.</li><li>• <code>ALL:</code> Returns all the information the previous options return. It requires the <code>MANAGE SCHEDULER</code> system privilege.</li></ul> |

## Usage Notes

This function returns the same information as the `schagent` utility status option. See *Oracle Database Administrator's Guide*.

## 154.6.52 GET\_AGENT\_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

### Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host      IN VARCHAR2) RETURN VARCHAR2;
```

### Parameters

**Table 154-65** GET\_AGENT\_VERSION Function Parameter

| Parameter               | Description                                                                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>agent_host</code> | Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database. |

### Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

## 154.6.53 GET\_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

### Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                        TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                        INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT VARCHAR2,
    value2         OUT VARCHAR2);
```

## Parameters

**Table 154-66 GET\_ATTRIBUTE Procedure Parameters**

| Parameter | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| name      | The name of the object                                                                                                                   |
| attribute | The attribute being retrieved. See the <a href="#">SET_ATTRIBUTE Procedure</a> for tables of attribute values.                           |
| value     | The existing value of the attribute                                                                                                      |
| value2    | The value2 argument is for an optional second value.<br>Most attributes have only one value associated with them, but some can have two. |

## Usage Notes

To run `GET_ATTRIBUTE` for a job class, you must have the `MANAGE_SCHEDULER` privilege or have `EXECUTE` privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have `ALTER` or `EXECUTE` privileges on that object or have the `CREATE ANY JOB` privilege.

See the [SET\\_ATTRIBUTE Procedure](#) for tables of attribute values that you can retrieve for the various Scheduler object types.

## 154.6.54 GET\_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

## Syntax

```
DBMS_SCHEDULER.GET_FILE (  
    source_file           IN VARCHAR2,  
    source_host           IN VARCHAR2,  
    credential_name       IN VARCHAR2,  
    file_contents         IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (  
    source_file           IN VARCHAR2,  
    source_host           IN VARCHAR2,  
    credential_name       IN VARCHAR2,  
    destination_file_name IN VARCHAR2,  
    destination_directory_object IN VARCHAR2,  
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-67 GET\_FILE Procedure Parameters**

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>source_file</code>                  | <p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <code>external_log_id_stdout</code>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <code>external_log_id_stderr</code>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <code>external_log_id</code> from the <code>ADDITIONAL_INFO</code> column of the <code>*_SCHEDULER_JOB_RUN_DETAILS</code> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <code>external_log_id</code> name/value pair, and then append either <code>"_stdout"</code> or <code>"_stderr"</code> to its value.</p> <p>The external job must have an associated credential. The <code>credential_name</code> parameter of <code>GET_FILE</code> must name the same credential that is used by the job, and the <code>source_host</code> parameter must be the same as the <code>destination</code> attribute of the job.</p> |
| <code>source_host</code>                  | <p>If the file is to be retrieved from a remote host, then this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views <code>*_SCHEDULER_EXTERNAL_DESTS</code>.)</p> <p>If <code>source_host</code> is <code>NULL</code> or set to <code>'localhost'</code>, then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>credential_name</code>              | The name of the credential to use for accessing the file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>file_contents</code>                | The variable into which the file contents is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>destination_file_name</code>        | The file to which the file contents is written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>destination_directory_object</code> | The directory object that specifies the path to the destination file, when <code>destination_file_name</code> is used. The caller must have the necessary privileges on the directory object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>destination_permissions</code>      | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

## 154.6.55 GET\_SCHEDULER\_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

### Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (  
    attribute      IN VARCHAR2,  
    value          OUT VARCHAR2);
```

### Parameters

**Table 154-68** GET\_SCHEDULER\_ATTRIBUTE Procedure Parameters

| Parameter | Description                         |
|-----------|-------------------------------------|
| attribute | The name of the attribute           |
| value     | The existing value of the attribute |

### Usage Notes

To run `GET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE SCHEDULER` privilege.

[Table 154-69](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 154-101](#) and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

**Table 154-69** Scheduler Attributes Retrievable with GET\_SCHEDULER\_ATTRIBUTE

| Scheduler Attribute     | Description                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| current_open_window     | Name of the currently open window                                                                                                                                               |
| default_timezone        | Default time zone used by the Scheduler for repeat intervals and windows                                                                                                        |
| email_sender            | The default e-mail address of the sender for job state e-mail notifications                                                                                                     |
| email_server            | The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is <code>NULL</code> . |
| event_expiry_time       | Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be <code>NULL</code> .                                      |
| log_history             | Retention period in days for job and window logs. The range of valid values is 0 through 1000000.                                                                               |
| max_job_slave_processes | This Scheduler attribute is not used.                                                                                                                                           |

## 154.6.56 OPEN\_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

## Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
    window_name          IN VARCHAR2,
    duration              IN INTERVAL DAY TO SECOND,
    force                 IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 154-70 OPEN\_WINDOW Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| window_name | The name of the window                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| duration    | The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| force       | <p>If <code>force</code> is set to FALSE, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to TRUE:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p> |

## Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

## 154.6.57 PURGE\_LOG Procedure

The `PURGE_LOG` procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

### Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER  DEFAULT 0,
    which_log            IN VARCHAR2      DEFAULT 'JOB_AND_WINDOW_LOG',
    job_name              IN VARCHAR2      DEFAULT NULL);
```

### Parameters

**Table 154-71** PURGE\_LOG Procedure Parameters

| Parameter   | Description                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| log_history | This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.                                                                                                                                |
| which_log   | This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.                                                                                                                                                        |
| job_name    | This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log. |

### Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

### Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

## 154.6.58 PUT\_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

### Syntax

```
DBMS_SCHEDULER.PUT_FILE (
    destination_file      IN VARCHAR2,
    destination_host       IN VARCHAR2,
    credential_name        IN VARCHAR2,
```

```

file_contents          IN {BLOB|CLOB},
destination_permissions IN VARCHAR2 DEFAULT NULL);

DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  source_file_name      IN VARCHAR2,
  source_directory_object IN VARCHAR2,
  destination_permissions IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 154-72 PUT\_FILE Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination_file        | Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.                                              |
| destination_host        | If NULL or set to 'localhost', the file is saved to the file system of the local computer.<br><br>To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.) |
| credential_name         | The name of the credential to use for accessing the destination file system.                                                                                                                                                                                                                                                                                              |
| file_contents           | The variable from which the file contents is read.                                                                                                                                                                                                                                                                                                                        |
| source_file_name        | The file from which the file contents is written                                                                                                                                                                                                                                                                                                                          |
| source_directory_object | The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.                                                                                                                                                                                                    |
| destination_permissions | Reserved for future use                                                                                                                                                                                                                                                                                                                                                   |

## Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

## 154.6.59 REMOVE\_EVENT\_QUEUE\_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$\_EVENT\_QUEUE.

### Syntax

```

DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
  subscriber_name      IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 154-73 REMOVE\_EVENT\_QUEUE\_SUBSCRIBER Procedure Parameters**

| Parameter       | Description                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| subscriber_name | Name of the Oracle Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used. |

## Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

## 154.6.60 REMOVE\_FROM\_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

### Syntax

```
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (  
    incompatibility_name    IN VARCHAR2,  
    object_name             IN VARCHAR2);
```

## Parameters

**Table 154-74 REMOVE\_FROM\_INCOMPATIBILITY Procedure Parameters**

| Parameter            | Description                                    |
|----------------------|------------------------------------------------|
| incompatibility_name | The name of the incompatibility definition.    |
| object_name          | One or more (comma-separated) programs or jobs |

## Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

### See Also:

Using Incompatibility Definitions in *Oracle Database Administrator's Guide*

## 154.6.61 REMOVE\_GROUP\_MEMBER Procedure

This procedure removes one or more members from an existing group.

### Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (  
    group_name    IN VARCHAR2,  
    member        IN VARCHAR2);
```

## Parameters

**Table 154-75 REMOVE\_GROUP\_MEMBER Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name  | The name of the group.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| member_name | <p>The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group.</p> <p>A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.</p> |

## Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

## 154.6.62 REMOVE\_JOB\_EMAIL\_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

## Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (  
    job_name          IN VARCHAR2,  
    recipients        IN VARCHAR2 DEFAULT NULL,  
    events             IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-76 ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters**

| Parameter  | Description                                                                                 |
|------------|---------------------------------------------------------------------------------------------|
| job_name   | Name of the job to remove e-mail notifications for. Cannot be NULL.                         |
| recipients | E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses. |

**Table 154-76 (Cont.) ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters**

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| events    | Job state event to remove e-mail notification for. Comma-separate list of job state events. |

### Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is `NULL`, e-mail notifications for the specified events are removed for all existing recipients. If `events` is `NULL`, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are `NULL`, all e-mail notifications are removed for the job.

For example, if `recipients` is `'jsmith@example.com,rjones@example.com'` and `events` is `'JOB_FAILED,JOB_BROKEN'`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both `jsmith` and `rjones`. If `recipients` is `NULL`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for `jsmith`, `rjones`, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the `CREATE ANY JOB` system privilege or `ALTER` object privilege on the job.

## 154.6.63 RESET\_JOB\_ARGUMENT\_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

`RESET_JOB_ARGUMENT_VALUE` is overloaded.

### Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (  
    job_name           IN VARCHAR2,  
    argument_position  IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (  
    job_name           IN VARCHAR2,  
    argument_name      IN VARCHAR2);
```

## Parameters

**Table 154-77 RESET\_JOB\_ARGUMENT\_VALUE Procedure Parameters**

| Parameter         | Description                                      |
|-------------------|--------------------------------------------------|
| job_name          | The name of the job being altered                |
| argument_position | The position of the program argument being reset |
| argument_name     | The name of the program argument being reset     |

## Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires **ALTER** privileges on that job. Arguments can be specified by position or by name.

**RESET\_JOB\_ARGUMENT\_VALUE** requires that you be the owner of the job or have **ALTER** privileges on that job. You can also reset a job argument value if you have the **CREATE ANY JOB** privilege.

**RESET\_JOB\_ARGUMENT\_VALUE** only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

## 154.6.64 RUN\_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no **job\_name** is given, one is generated of the form **RUN\_CHAIN\$\_chainnameN**, where *chainname* is the first 8 characters of the chain name and *N* is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If **start\_steps** is **NULL**, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

## Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    step_state_list     IN SYS.SCHEDULER$_STEP_TYPE_LIST,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 154-78 RUN\_CHAIN Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_name      | The name of the chain to run                                                                                                                                                                                                                                                                    |
| job_name        | The name of the job to create to run the chain                                                                                                                                                                                                                                                  |
| start_steps     | Comma-separated list of the steps to start when the chain starts running                                                                                                                                                                                                                        |
| step_state_list | List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each.<br>Set the attributes of sys.scheduler\$_step_type as follows:<br>step_name The name of the step<br>step_type 'SUCCEEDED' or 'FAILED'<br>error_number<br>where error_number is a positive or negative integer. |

## Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the `EXECUTE` privilege on the chain or the `EXECUTE ANY PROGRAM` system privilege).

## Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

## 154.6.65 RUN\_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call `RUN_JOB` to run a job according to its schedule. Use `RUN_JOB` to run a job outside of its normal schedule.

## Syntax

```
DBMS_SCHEDULER.RUN_JOB (
  job_name          IN VARCHAR2,
  use_current_session IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 154-79 RUN\_JOB Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name            | <p>A job name or a comma-separate list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| use_current_session | <p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> <li>You can test a job and see any possible errors on the command line.</li> <li>state, run_count, last_start_date, last_run_duration, and failure_count of *_scheduler_jobs are not updated.</li> <li>RUN_JOB can be run in parallel with a regularly scheduled job run.</li> </ul> <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> <li>You need to check the job log to find error information.</li> <li>All relevant fields in *_scheduler_jobs are updated.</li> <li>RUN_JOB fails if a regularly scheduled job is running.</li> </ul> <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE.</p> |

## Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use\_current\_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination\_name attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

above bug fix 1261887 6.12.11

When use\_current\_session is TRUE, the call to RUN\_JOB blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the RUN\_JOB procedure.

Using `RUN_JOB` with `use_current_session=TRUE` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185117 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

### Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME      => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

## 154.6.66 SET\_AGENT\_REGISTRATION\_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

### Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password  IN VARCHAR2,
  expiration_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  max_uses               IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 154-80 SET\_AGENT\_REGISTRATION\_PASS Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>registration_password</code> | This is the password that remote agents must specify in order to successfully register with the database. If this is <code>NULL</code> , then no agents will be able to register with the database.                                                                                                                                                                                           |
| <code>expiration_date</code>       | If this is set to a non- <code>NULL</code> value, then the <code>registration_password</code> is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.                                                                                                                                                              |
| <code>max_uses</code>              | This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to <code>NULL</code> , then there will be no limit on the number of successful registrations. |

## Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE_SCHEDULER` system privilege.

By default, `max_uses` is set to `NULL`, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to `NULL` if no new agents are being registered.

## 154.6.67 SET\_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to `NULL`, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

### Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute       IN VARCHAR2,
    value           IN {BOOLEAN|DATE|TIMESTAMP|
                       TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                       INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute       IN VARCHAR2,
    value           IN VARCHAR2,
    value2          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 154-81 SET\_ATTRIBUTE Procedure Parameters**

| Parameter              | Description                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>      | The name of the object.                                                                                                                                                           |
| <code>attribute</code> | See <a href="#">Table 154-83</a> through <a href="#">Table 154-93</a> .                                                                                                           |
| <code>value</code>     | The new value being set for the attribute. This cannot be <code>NULL</code> . To set an attribute value to <code>NULL</code> , use the <code>SET_ATTRIBUTE_NULL</code> procedure. |
| <code>value2</code>    | The <code>value2</code> argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.                                |

[Table 154-82](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

**Table 154-82 Attribute Tables for Scheduler Object Types**

| Scheduler Object Type | Table of Attributes          |
|-----------------------|------------------------------|
| Job                   | <a href="#">Table 154-83</a> |
| Program               | <a href="#">Table 154-85</a> |
| Schedule              | <a href="#">Table 154-86</a> |
| File Watcher          | <a href="#">Table 154-87</a> |
| Job Class             | <a href="#">Table 154-88</a> |
| Window                | <a href="#">Table 154-89</a> |
| Chain                 | <a href="#">Table 154-90</a> |
| Database Destination  | <a href="#">Table 154-91</a> |
| External Destination  | <a href="#">Table 154-92</a> |
| Group                 | <a href="#">Table 154-93</a> |
| Credential            | <a href="#">Table 154-94</a> |
| Resource              | <a href="#">Table 154-95</a> |

### Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run `SET ATTRIBUTE` for a window, a group of type `WINDOW`, or job class, you must have the `MANAGE SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

#### Job

If there is a running instance of the job when the `SET ATTRIBUTE` call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

#### Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

#### Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

#### File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

#### Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet. Job Class names must be preceded by `SYS`.

#### Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan. Window names must be preceded by `SYS`.

#### Job Attribute Values

[Table 154-83](#) lists attribute values for jobs.

#### Note:

See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

**Table 154-83 Job Attribute Values**

| Name                                       | Description                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>allow_runs_in_restricted_mode</code> | If <code>TRUE</code> , the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. <code>FALSE</code> by default. |

**Table 154-83 (Cont.) Job Attribute Values**

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_drop               | <p>This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> <li>• Its end date (or the end date of the schedule) has passed.</li> <li>• It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE.</li> <li>• It is not a repeating job and has run once.</li> </ul> <p>A job is automatically disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p> |
| comments                | An optional comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| connect_credential_name | <p>This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails.</p> <p>Using a connect_credential_name is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script.</p>                                                                                                                                                                                                                                                                     |
| credential_name         | <p>This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p>                                                                                                                                                                                                                                                                                                             |
| database_role           | <p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p> <p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</p>                                                                                  |
| destination             | <p><b>*** Deprecated in Oracle Database 11g Release 2. Use destination_name instead.</b></p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to NULL by default.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| destination_name        | <p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL.</p> <p>See <a href="#">Table 154-28</a> for details about this attribute.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 154-83 (Cont.) Job Attribute Values**

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_date                | <p>Specifies the date and time after which the job expires and is no longer run. After the end_date, if is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</p>                                                                                                                                                                                                                                                                         |
| event_spec              | <p>This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the "CREATE_JOB Procedure".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| follow_default_timezone | <p>If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job start_date is not null, then the time zone for the run date and time for the job is always specified by the time zone of the start_date.</p> <p>If FALSE, the next start date and time for the job is not recomputed when the default_timezone scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p> |
| instance_id             | <p>Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| instance_stickiness     | <p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to TRUE. If you set instance_stickiness to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, instance_stickiness is ignored and the job is handled as if it were a non-sticky job.</p> <p>If instance_stickiness is set to FALSE, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p>                                                                  |
| job_action              | <p>The action that the job performs, depending on the job_type attribute. For example, if job_type is 'STORED_PROCEDURE', job_action contains the name of the stored procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| job_class               | <p>The class this job is associated with.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| job_priority            | <p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 154-83 (Cont.) Job Attribute Values**

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type            | <p>The type of this job. Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT'.</p> <p>If this is set, program_name must be NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| job_weight          | <p>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| logging_level       | <p>This attribute specifies how much information is logged. The possible options are:</p> <p>DBMS_SCHEDULER.LOGGING_OFF</p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_RUNS</p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_FULL</p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.</p> |
| max_failures        | <p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.</p> <p>max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| max_run_duration    | <p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| max_runs            | <p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.</p> <p>max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it repeats forever or until end_date or max_failures is reached.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| number_of_arguments | <p>The number of arguments if the program is inlined. If this is set, program_name should be NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parallel_instances | <p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p> |
| program_name       | The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| raise_events       | <p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> <li>• job_started CONSTANT PLS_INTEGER := 1</li> <li>• job_succeeded CONSTANT PLS_INTEGER := 2</li> <li>• job_failed CONSTANT PLS_INTEGER :=4</li> <li>• job_broken CONSTANT PLS_INTEGER :=8</li> <li>• job_completed CONSTANT PLS_INTEGER :=16</li> <li>• job_stopped CONSTANT PLS_INTEGER :=32</li> <li>• job_sch_lim_reached CONSTANT PLS_INTEGER :=64</li> <li>• job_disabled CONSTANT PLS_INTEGER :=128</li> <li>• job_chain_stalled CONSTANT PLS_INTEGER :=256</li> <li>• job_all_events CONSTANT PLS_INTEGER := 511</li> <li>• job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped</li> </ul> <p><a href="#">Table 154-84</a> describes these event types in detail.</p>                                                                                                                                                                                                                                             |
| repeat_interval    | <p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "<a href="#">Calendaring Syntax</a>" for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| restartable    | <p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to <code>FALSE</code>. Setting this to <code>TRUE</code> means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is <code>TRUE</code>, the chain is restarted from the beginning after an application failure. If this attribute is <code>FALSE</code>, or if there has been a database failure, the chain is restarted at the last running step. The <code>restart_on_recovery</code> attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to <code>TRUE</code> might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> <li>• One of the retries succeeds.</li> <li>• All of its six retries have failed.</li> <li>• The next retry would occur after the next regularly scheduled run of the job.</li> </ul> <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p> |
| schedule_limit | <p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| schedule_name  | <p>The name of a schedule, window, or group of type <code>WINDOW</code> to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| start_date     | <p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 154-83 (Cont.) Job Attribute Values**

| Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stop_on_window_close | <p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to <code>TRUE</code> implies that the job should stop once the associated window is closed. The job is stopped using the <code>stop_job</code> procedure with force set to <code>FALSE</code>.</p> <p>By default, <code>stop_on_window_close</code> is set to <code>FALSE</code>. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p> |
| store_output         | <p>This is a boolean attribute. If set to <code>TRUE</code>, then for job runs that are logged, all job output and error messages are stored in the <code>*_JOB_RUN_DETAILS</code> views. If set to <code>FALSE</code>, then the output and messages are not stored. For new jobs, this is set, by default, to <code>TRUE</code>.</p>                                                                                                                                                                                                                                                                                                                                           |

The following event types are valid values for the `raise_events` attribute in [Table 154-83](#).

**Table 154-84 Event Types Raised by the Scheduler**

| Event Type          | Description                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_all_events      | Not an event, but a constant that provides an easy way for you to enable all events                                                                                                                                                                                                                    |
| job_broken          | The job has been disabled and has changed to the <code>BROKEN</code> state because it exceeded the number of failures defined by the <code>max_failures</code> job attribute                                                                                                                           |
| job_chain_stalled   | A job running a chain is in the <code>CHAIN_STALLED</code> state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain <code>evaluation_interval</code> is set to <code>NULL</code> . No progress is made in the chain unless there is manual intervention. |
| job_completed       | The job completed because it reached its <code>max_runs</code> or <code>end_date</code>                                                                                                                                                                                                                |
| job_disabled        | The job was disabled by the Scheduler or by a call to <code>SET_ATTRIBUTE</code>                                                                                                                                                                                                                       |
| job_failed          | The job failed, either due to an error or an unusual termination.                                                                                                                                                                                                                                      |
| job_over_max_dur    | The job exceeded the maximum run duration specified by its <code>max_run_duration</code> attribute. (Note: you do not need to enable this event with the <code>raise_events</code> job attribute; it is always enabled.)                                                                               |
| job_run_completed   | A job run either failed, succeeded, or was stopped                                                                                                                                                                                                                                                     |
| job_sch_lim_reached | The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the <code>schedule_limit</code> job attribute.                                                                                                                          |
| job_started         | The job started                                                                                                                                                                                                                                                                                        |
| job_stopped         | The job was stopped by a call to <code>STOP_JOB</code>                                                                                                                                                                                                                                                 |
| job_succeeded       | The job completed successfully                                                                                                                                                                                                                                                                         |

#### Program Attribute Values

[Table 154-85](#) lists program attribute values.

**Note:**

See the "[CREATE\\_PROGRAM Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-85 Program Attribute Values**

| Name                | Description                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comments            | An optional comment. This can describe what the program does or give usage details.                                                                                                                                                 |
| detached            | If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.                                                                             |
| number_of_arguments | The number of arguments required by the stored procedure or other executable that the program invokes                                                                                                                               |
| program_action      | The action that the program performs, indicated by the <code>program_type</code> attribute. For example, if <code>program_type</code> is 'STORED_PROCEDURE', <code>program_action</code> contains the name of the stored procedure. |
| program_type        | The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.                                                                                                        |

## Schedule Attribute Values

[Table 154-86](#) lists schedule attribute values.

**Note:**

See "[CREATE\\_SCHEDULE Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-86 Schedule Attribute Values**

| Name            | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comments        | An optional comment.                                                                                                                                                                                                                                                                                                                                |
| end_date        | The cutoff date and time after which the schedule does not specify any dates.                                                                                                                                                                                                                                                                       |
| event_spec      | This attribute takes two values: the <code>value</code> argument should contain the event condition and the <code>value2</code> argument should contain the queue specification. For more details, see the descriptions for the <code>event_condition</code> and <code>queue_spec</code> arguments to the " <a href="#">CREATE_JOB Procedure</a> ". |
| repeat_interval | An attribute specifying how often the schedule should repeat, using the calendaring syntax. See " <a href="#">Calendaring Syntax</a> " for more information.                                                                                                                                                                                        |
| start_date      | The start or reference date and time used by the calendaring syntax.                                                                                                                                                                                                                                                                                |

## File Watcher Attribute Values

[Table 154-87](#) lists file watcher attribute values.

**Table 154-87 File Watcher Attribute Values**

| Parameter             | Description                                                                                                                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination           | Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.                                                                                                                                            |
| directory_path        | Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.                       |
| file_name             | Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.                                                     |
| credential_name       | Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL. |
| min_file_size         | Minimum file size in bytes before the file watcher considers the file found. Default is 0.                                                                                                                                                              |
| steady_state_duration | Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used. The lower limit for this attribute is 10 seconds.                                                       |
| comments              | Optional comment.                                                                                                                                                                                                                                       |

**Job Class Attribute Values**

[Table 154-88](#) lists job class attribute values.

**Note:**

See the "[CREATE\\_JOB\\_CLASS Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-88 Job Class Attribute Values**

| Name        | Description                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comments    | An optional comment about the class.                                                                                                                                                                                                                                                                                                                         |
| log_history | This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE). |

**Table 154-88 (Cont.) Job Class Attribute Values**

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logging_level           | <p>This attribute specifies how much information is logged. The valid values are:</p> <ul style="list-style-type: none"><li>DBMS_SCHEDULER.LOGGING_OFF<br/>No logging is performed for any jobs in this class.</li><li>DBMS_SCHEDULER.LOGGING_FAILED_RUNS<br/>The Scheduler logs only jobs in the class that failed, with the reason for failure.</li><li>DBMS_SCHEDULER.LOGGING_RUNS<br/>The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</li><li>DBMS_SCHEDULER.LOGGING_FULL<br/>The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with <code>SET_ATTRIBUTE</code>), stopped, and so on, an entry is recorded in the log.</li></ul> |
| resource_consumer_group | <p>The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| service                 | <p>The database service that the jobs in the job class have affinity to. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are set for a job class, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

#### Window Attribute Values

[Table 154-89](#) lists window attribute values.

**Note:**

See the "[CREATE\\_WINDOW Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-89 Window Attribute Values**

| Name            | Description                                                                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comments        | An optional comment about the window.                                                                                                                                                                                                                        |
| duration        | The duration of the window.                                                                                                                                                                                                                                  |
| end_date        | The date after which the window no longer opens. If this is set, <code>schedule_name</code> must be NULL.                                                                                                                                                    |
| repeat_interval | An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, <code>schedule_name</code> must be NULL. See " <a href="#">Calendaring Syntax</a> " for more information. |

**Table 154-89 (Cont.) Window Attribute Values**

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resource_plan   | <p>The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the <code>force</code> option, no resource plan switch occurs.</p> <p>Only one resource plan can be associated with a window. It may be <code>NULL</code> or the empty string (''). When it is <code>NULL</code>, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> |
| schedule_name   | The name of a schedule to use with this window. If this is set, <code>start_date</code> , <code>end_date</code> , and <code>repeat_interval</code> must all be <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| start_date      | The next date and time on which this window is scheduled to open. If this is set, <code>schedule_name</code> must be <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| window_priority | The priority of the window. Must be either 'LOW' (default) or 'HIGH'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### Chain Attribute Values

Table 154-90 lists chain attribute values.

#### Note:

See the "[CREATE\\_CHAIN Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-90 Chain Attribute Values**

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comments            | An optional comment describing the purpose of the chain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| evaluation_interval | <p>If not <code>NULL</code>, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives)</p> <p>This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| rule_set_name       | <p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code></p> |

#### Database Destination Attribute Values

Table 154-91 lists database destination attribute values.

**Note:**

See the "[CREATE\\_DATABASE\\_DESTINATION Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-91 Database Destination Attribute Values**

| Name         | Description                                                                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agent        | The name of the external destination (also known as agent destination) that is used to connect to the remote database.<br><br>You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> .                                                               |
| connect_info | The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in <code>tnsnames.ora</code> that resolves to the connect descriptor.<br><br>Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code> . |
| enabled      | If <code>TRUE</code> , the database destination is enabled.                                                                                                                                                                                                                                           |
| comments     | An optional comment about the database destination.                                                                                                                                                                                                                                                   |

#### External Destination Attribute Values

Table 154-92 lists external destination attribute values.

**Note:**

External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

**Table 154-92 External Destination Attribute Values**

| Name       | Description                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| hostname   | ( <code>GET_ATTRIBUTE</code> only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides. |
| port       | ( <code>GET_ATTRIBUTE</code> only) The TCP port number on which the agent listens.                                                                      |
| ip_address | ( <code>GET_ATTRIBUTE</code> only) The IP address of the host on which the agent resides.                                                               |
| enabled    | If <code>TRUE</code> , the external destination is enabled.                                                                                             |
| comments   | An optional comment about the external destination.                                                                                                     |

#### Group Attribute Values

Table 154-93 lists group attribute values.

**Note:**

See the "[CREATE\\_GROUP Procedure](#)" for more complete descriptions of the attributes in this table.

**Table 154-93 Group Attribute Values**

| Name              | Description                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_type        | (GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).                                                                                                                                                         |
| member_name       | Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER.<br>Note: this attribute corresponds to the <code>member</code> argument of CREATE_GROUP. |
| enabled           | If TRUE, the group is enabled.                                                                                                                                                                                                          |
| comments          | An optional comment about the group.                                                                                                                                                                                                    |
| number_of_members | (GET_ATTRIBUTE only) The number of members in the group.                                                                                                                                                                                |

## Credential Attribute Values

[Table 154-94](#) lists credential attribute values.

**Note:**

Credential attribute values for the SET\_ATTRIBUTE and GET\_ATTRIBUTE procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the [DBMS\\_CREDENTIAL](#) package, specifically the attribute parameter in the [UPDATE\\_CREDENTIAL Procedure](#).

**Table 154-94 Credential Attribute Values**

| Name           | Description                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username       | The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.                                                                       |
| password       | The password for the user name. Maximum length is 128.                                                                                                                             |
| comments       | A description of the credential. Maximum length is 240.                                                                                                                            |
| windows_domain | For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.                                                               |
| database_role  | The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job.<br>Valid values are: SYSDBA and SYSOPER. |

## Resource Attribute Values

[Table 154-95](#) lists resource attribute values.

**Table 154-95 Resource Attribute Values**

| Name             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resource_name    | The name of the resource                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| units            | The number of units of this resource that the job or program uses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| status           | The status of the resource.<br><br>ENFORCE_CONSTRAINTS. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started.<br><br>IGNORE_CONSTRAINTS. When set, the scheduler will ignore any constraints on this resource.<br><br>BLOCKED_ALL_JOBS. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states. |
| constraint_level | Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL<br><br>For incompatibilities, for JOB_LEVEL, the incompatibility members must be jobs; for PROGRAM_LEVEL the incompatibility members must be programs.                                                                                                                                                                                                                                                                                                                                                                             |
| comments         | Descriptive comment about the resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 154.6.68 SET\_ATTRIBUTE\_NULL Procedure

This procedure sets an attribute of an object to `NULL`.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

### Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name          IN VARCHAR2,
    attribute      IN VARCHAR2);
```

### Parameters

**Table 154-96 SET\_ATTRIBUTE\_NULL Procedure Parameters**

| Parameter | Description                 |
|-----------|-----------------------------|
| name      | The name of the object      |
| attribute | The attribute being changed |

### Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type `WINDOW`, or job class, you must have the `MANAGE SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

## 154.6.69 SET\_JOB\_ANYDATA\_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object.

It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE\\_ANYDATA\\_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

### Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (  
    job_name           IN VARCHAR2,  
    argument_position  IN PLS_INTEGER,  
    argument_value     IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (  
    job_name           IN VARCHAR2,  
    argument_name      IN VARCHAR2,  
    argument_value     IN SYS.ANYDATA);
```

### Parameters

**Table 154-97 SET\_JOB\_ANYDATA\_VALUE Procedure Parameters**

| Parameter                      | Description                                                                                          |
|--------------------------------|------------------------------------------------------------------------------------------------------|
| <code>job_name</code>          | The name of the job to be altered                                                                    |
| <code>argument_name</code>     | The name of the program argument being set                                                           |
| <code>argument_position</code> | The position of the program argument being set                                                       |
| <code>argument_value</code>    | The new value to be assigned to the program argument, encapsulated in an <code>AnyData</code> object |

### Usage Notes

`SET_JOB_ANYDATA_VALUE` requires that you own the job or have `ALTER` privileges on that job. You can also set a job argument value if you have the `CREATE ANY JOB` privilege.

`SET_JOB_ANYDATA_VALUE` does not apply to lightweight jobs because lightweight jobs cannot take `AnyData` arguments.

**See Also:**

- ["SET\\_JOB\\_ARGUMENT\\_VALUE Procedure"](#)
- ["DEFINE\\_ANYDATA\\_ARGUMENT Procedure"](#)

## 154.6.70 SET\_JOB\_ARGUMENT\_VALUE Procedure

This procedure sets the value of an argument for a job.

It overrides any default value set for the corresponding program or stored procedure argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE\\_PROGRAM\\_ARGUMENT Procedure](#) or the [DEFINE\\_METADATA\\_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET\_JOB\_ARGUMENT\_VALUE is overloaded.

### Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (  
    job_name          IN VARCHAR2,  
    argument_position IN PLS_INTEGER,  
    argument_value    IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (  
    job_name          IN VARCHAR2,  
    argument_name     IN VARCHAR2,  
    argument_value    IN VARCHAR2);
```

### Parameters

**Table 154-98 SET\_JOB\_ARGUMENT\_VALUE Procedure Parameters**

| Parameter         | Description                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------|
| job_name          | The name of the job to be altered                                                                                      |
| argument_name     | The name of the program argument being set                                                                             |
| argument_position | The position of the program argument being set                                                                         |
| argument_value    | The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure. |

### Usage Notes

SET\_JOB\_ARGUMENT\_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET\_JOB\_ARGUMENT\_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET\_JOB\_ARGUMENT\_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

## 154.6.71 SET\_JOB\_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

### Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (  
    jobattr_array    IN JOBATTR_ARRAY,  
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 154-99** SET\_JOB\_ATTRIBUTES Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| jobattr_array    | The array of job attribute changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| commit_semantics | The commit semantics. The following types are supported: <ul style="list-style-type: none"><li>• STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default.</li><li>• TRANSACTIONAL returns on the first error and rolls back everything that happened before that error.</li><li>• ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</li></ul> |

### Usage Notes

Calling SET\_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET\_JOB\_ATTRIBUTES changes the attribute values in the context of a single transaction.

## 154.6.72 SET\_RESOURCE\_CONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

### Syntax

```
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (  
    object_name      IN VARCHAR2,
```

```
resource_name    IN VARCHAR2,  
units            IN NUMBER DEFAULT 1);
```

### Parameters

**Table 154-100 SET\_RESOURCE\_CONSTRAINT Procedure Parameters**

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| object_name   | The name of a program or a job, or a comma separated list of these objects. |
| resource_name | The name of the resource.                                                   |
| units         | The number of units of this resource that the job or program uses.          |

### Usages Notes

`object_name` can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

`units` specifies the number of units of the resource that the program or job can use. If `units` is set to 0, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting `units` to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

## 154.6.73 SET\_SCHEDULER\_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

[Table 154-101](#) provides short attribute descriptions for the `SET_SCHEDULER_ATTRIBUTE` procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

### Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
  attribute    IN VARCHAR2,  
  value        IN VARCHAR2);
```

## Parameters

**Table 154-101 SET\_SCHEDULER\_ATTRIBUTE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute | <p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> <li>'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when <code>start_date</code> is not specified. See "<a href="#">Calendaring Syntax</a>" for more information.</li> <li>'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.</li> <li>'email_sender': The default e-mail address of the sender of job state e-mail notifications.</li> <li>'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications.</li> <li>'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> <li>NONE: the default, indicating no encryption used</li> <li>SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection</li> <li>STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption</li> </ul> </li> <li>'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours.</li> <li>'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000.</li> <li>'max_job_slave_processes': This Scheduler attribute is not used.</li> </ul> |
| value     | The new value of the attribute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage Notes

To run SET\_SCHEDULER\_ATTRIBUTE, you must have the `MANAGE SCHEDULER` privilege.

### See Also:

*Oracle Database Administrator's Guide* for more detailed descriptions of Scheduler attributes

## 154.6.74 STOP\_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to `STOPPED`, whereas the state of a repeating job is set to `SCHEDULED` or `COMPLETED`, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, `STOP_JOB` stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, `STOP_JOB` uses the `instance_id` attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same `job_name` can in some conditions be used for different jobs on different instances.)

## Syntax

```
DBMS_SCHEDULER.STOP_JOB (
    job_name          IN VARCHAR2
    force             IN BOOLEAN DEFAULT FALSE
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

## Parameters

**Table 154-102 STOP\_JOB Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>job_name</code>         | <p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> <li>Job name: the name of an existing job, optionally preceded by a schema name and dot separator.</li> <li>Job destination ID: a number, obtained from the <code>JOB_DEST_ID</code> column of the <code>*_SCHEDULER_JOB_DESTS</code> views, that represents the unique combination of a job, a credential, and a destination.</li> <li>Job class: the name of a job class. Must be preceded by the <code>SYS</code> schema name and a dot separator.</li> </ul> <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its <code>destination_name</code> attribute, all job instances on all destinations are stopped.</p> |
| <code>force</code>            | <p>If <code>force</code> is set to <code>FALSE</code>, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the Scheduler immediately terminates the job slave. Oracle recommends that <code>STOP_JOB</code> with <code>force</code> set to <code>TRUE</code> be used only after a <code>STOP_JOB</code> with <code>force</code> set to <code>FALSE</code> has failed.</p> <p>Use of the <code>force</code> option requires the <code>MANAGE SCHEDULER</code> system privilege.</p>                                                                                                                                             |
| <code>commit_semantics</code> | <p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none"> <li><code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.</li> <li><code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.</li> </ul>                                                                                                                                                                                                                                               |

### Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

### Example

The following is an example of using `STOP_JOB`.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB', 984, 1223, SYS.ETL_JOBCLASS');
END;
```

# DBMS\_SERVER\_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)
- [Summary of DBMS\\_SERVER\\_ALERT Subprograms](#)

## 155.1 DBMS\_SERVER\_ALERT Security Model

The user needs `DBA` or `IMP_FULL_DATABASE` roles to use the `DBMS_SERVER_ALERT` package.

## 155.2 DBMS\_SERVER\_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

**Table 155-1 Object Types Defined as Constants**

| Constant                             | Description                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>OBJECT_TYPE_SYSTEM</code>      | Metrics collected on the system level for each instance.                                                                                                                                                                                                     |
| <code>OBJECT_TYPE_FILE</code>        | Metrics collected on the file level. These are used for <code>AVG_FILE_READ_TIME</code> and <code>AVG_FILE_WRITE_TIME</code> metrics.                                                                                                                        |
| <code>OBJECT_TYPE_SERVICE</code>     | Metrics collected on the service level. Currently <code>ELAPSED_TIME_PER_CALL</code> and <code>CPU_TIME_PER_CALL</code> are collected.                                                                                                                       |
| <code>OBJECT_TYPE_TABLESPACE</code>  | Metrics collected on the tablespace level.<br><b>Note:</b> Dictionary managed tablespaces are not supported.                                                                                                                                                 |
| <code>OBJECT_TYPE_EVENT_CLASS</code> | Metrics collected on wait event class level. Currently supported metrics are <code>AVG_USERS_WAITING</code> and <code>DB_TIME_WAITING</code> .                                                                                                               |
| <code>OBJECT_TYPE_SESSION</code>     | Metrics collected on the session level. Currently only <code>BLOCKED_USERS</code> is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric. |
| <code>OBJECT_TYPE_WRCCLIENT</code>   | Refers to a group of metrics ( <code>WCR_ . . .</code> ) used during replay to monitor the replay clients' performance                                                                                                                                       |

## 155.3 DBMS\_SERVER\_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

**Table 155-2 Relational Operators Defined as Constants**

| Constant              | Description                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| OPERATOR_CONTAINS     | A metric value matching an entry in a list of threshold values is considered a violation.                                               |
| OPERATOR_DO_NOT_CHECK | The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric. |
| OPERATOR_EQ           | A metric value equal to the threshold value is considered a violation.                                                                  |
| OPERATOR_GE           | A metric value greater than or equal to the threshold value is considered a violation.                                                  |
| OPERATOR_GT           | A metric value greater than the threshold value is considered a violation.                                                              |
| OPERATOR_LE           | A metric value less than or equal to the threshold value is considered a violation.                                                     |
| OPERATOR_LT           | A metric value less than the threshold value is considered a violation.                                                                 |
| OPERATOR_NE           | A metric value not equal to the threshold value is considered a violation.                                                              |

## 155.4 DBMS\_SERVER\_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

**Table 155-3 List of Supported Metrics**

| Metric Name (Internal) | Metric Name (External)                                    | Units                        |
|------------------------|-----------------------------------------------------------|------------------------------|
| AVG_FILE_READ_TIME     | Average File Read Time                                    | Microseconds                 |
| AVG_FILE_WRITE_TIME    | Average File Write Time                                   | Microseconds                 |
| AVG_USERS_WAITING      | Average Number of Users Waiting on a Class of Wait Events | Count of sessions            |
| BLOCKED_USERS          | Number of Users blocked by some Session                   | Number of Users              |
| BRANCH_NODE_SPLITS_SEC | Branch Node Splits (for each second)                      | Splits for each Second       |
| BRANCH_NODE_SPLITS_TXN | Branch Node Splits (for each transaction)                 | Splits for each Transaction  |
| BUFFER_CACHE_HIT       | Buffer Cache Hit (%)                                      | % of cache accesses          |
| CONSISTENT_CHANGES_SEC | Consistent Changes (for each second)                      | Changes for each Second      |
| CONSISTENT_CHANGES_TXN | Consistent Changes (for each transaction)                 | Changes for each Transaction |
| CONSISTENT_GETS_SEC    | Consistent Gets (for each second)                         | Gets for each Second         |

**Table 155-3 (Cont.) List of Supported Metrics**

| Metric Name (Internal) | Metric Name (External)                                           | Units                          |
|------------------------|------------------------------------------------------------------|--------------------------------|
| CONSISTENT_GETS_TXN    | Consistent Gets (for each transaction)                           | Gets for each Transaction      |
| CR_BLOCKS_CREATED_SEC  | CR Blocks Created (for each second)                              | Blocks for each Second         |
| CR_BLOCKS_CREATED_TXN  | CR Blocks Created (for each transaction)                         | Blocks for each Transaction    |
| CR_RECORDS_APPLIED_SEC | CR Undo Records Applied (for each second)                        | Records for each Second        |
| CR_RECORDS_APPLIED_TXN | CR Undo Records Applied (for each transaction)                   | Records for each Transaction   |
| CURSOR_CACHE_HIT       | Cursor Cache Hit (%)                                             | % of soft parses               |
| DATABASE_WAIT_TIME     | Database Wait Time (%)                                           | % of all database time         |
| DATABASE_CPU_TIME      | Database CPU Time (%)                                            | % of all database time         |
| DB_BLKGETS_SEC         | DB Block Gets (for each second)                                  | Gets for each Second           |
| DB_BLKGETS_TXN         | DB Block Gets (for each transaction)                             | Gets for each Transaction      |
| DB_TIME_WAITING        | Percent of Database Time Spent Waiting on a Class of Wait Events | % of Database Time             |
| DBWR_CKPT_SEC          | DBWR Checkpoints (for each second)                               | Checkpoints for each Second    |
| DISK_SORT_SEC          | Sorts to Disk (for each second)                                  | Sorts for each Second          |
| DISK_SORT_TXN          | Sorts to Disk (for each transaction)                             | Sorts for each Transaction     |
| ELAPSED_TIME_PER_CALL  | Elapsed time for each user call for each service                 | Microseconds for each call     |
| ENQUEUE_DEADLOCKS_SEC  | Enqueue Deadlocks (for each second)                              | Deadlocks for each Second      |
| ENQUEUE_DEADLOCKS_TXN  | Enqueue Deadlocks (for each transaction)                         | Deadlocks for each Transaction |
| ENQUEUE_REQUESTS_SEC   | Enqueue Requests (for each second)                               | Requests for each Second       |
| ENQUEUE_REQUESTS_TXN   | Enqueue Requests (for each transaction)                          | Requests for each Transaction  |
| ENQUEUE_TIMEOUTS_SEC   | Enqueue Timeouts (for each second)                               | Timeouts for each Second       |
| ENQUEUE_TIMEOUTS_TXN   | Enqueue Timeouts (for each transaction)                          | Timeouts for each Transaction  |
| ENQUEUE_WAITS_SEC      | Enqueue Waits (for each second)                                  | Waits for each Second          |
| ENQUEUE_WAITS_TXN      | Enqueue Waits (for each transaction)                             | Waits for each Transaction     |
| EXECUTE_WITHOUT_PARSE  | Executes Performed Without Parsing                               | % of all executes              |
| FULL_INDEX_SCANS_SEC   | Fast Full Index Scans (for each second)                          | Scans for each Second          |
| FULL_INDEX_SCANS_TXN   | Fast Full Index Scans (for each transaction)                     | Scans for each Transaction     |
| GC_AVG_CR_GET_TIME     | Global Cache CR Request                                          | Milliseconds                   |
| GC_AVG_CUR_GET_TIME    | Global Cache Current Request                                     | Milliseconds                   |
| GC_BLOCKS_CORRUPT      | Global Cache Blocks Corrupt                                      | Blocks                         |
| GC_BLOCKS_LOST         | Global Cache Blocks Lost                                         | Blocks                         |
| HARD_PARSSES_SEC       | Hard Parses (for each second)                                    | Parses for each Second         |

**Table 155-3 (Cont.) List of Supported Metrics**

| Metric Name (Internal)  | Metric Name (External)                           | Units                        |
|-------------------------|--------------------------------------------------|------------------------------|
| HARD_PARSSES_TXN        | Hard Parses (for each transaction)               | Parses for each Transaction  |
| LEAF_NODE_SPLITS_SEC    | Leaf Node Splits (for each second)               | Splits for each Second       |
| LEAF_NODE_SPLITS_TXN    | Leaf Node Splits (for each transaction)          | Splits for each Transaction  |
| LIBRARY_CACHE_HIT       | Library Cache Hit (%)                            | % of cache accesses          |
| LIBRARY_CACHE_MISS      | Library Cache Miss (%)                           | % of cache accesses          |
| LOGONS_CURRENT          | Current Number of Logons                         | Number of Logons             |
| LOGONS_SEC              | Cumulative Logons (for each second)              | Logons for each Second       |
| LOGONS_TXN              | Cumulative Logons (for each transaction)         | Logons for each Transaction  |
| LONG_TABLE_SCANS_SEC    | Scans on Long Tables (for each second)           | Scans for each Second        |
| LONG_TABLE_SCANS_TXN    | Scans on Long Tables (for each transaction)      | Scans for each Transaction   |
| OPEN_CURSORS_SEC        | Cumulative Open Cursors (for each second)        | Cursors for each Second      |
| MEMORY_SORTS_PCT        | Sorts in Memory (%)                              | % of sorts                   |
| NETWORK_BYTES_SEC       | Network Bytes, for each second                   | Bytes for each Second        |
| OPEN_CURSORS_CURRENT    | Current Number of Cursors                        | Number of Cursors            |
| OPEN_CURSORS_TXN        | Cumulative Open Cursors (for each transaction)   | Cursors for each Transaction |
| OS_SCHED_CPU_WAIT_TIME  | Operating System Scheduler CPU Wait (by time)    | Microseconds                 |
| PARSE_FAILURES_SEC      | Parse Failures (for each second)                 | Parses for each Second       |
| PARSE_FAILURES_TXN      | Parse Failures (for each transaction)            | Parses for each Transaction  |
| PGA_CACHE_HIT           | PGA Cache Hit (%)                                | % bytes processed in PGA     |
| PHYS_DESGN_WAIT_SCT     | Physical Design Wait (by session count)          | Count of sessions            |
| PHYSICAL_READS_SEC      | Physical Reads (for each second)                 | Reads for each Second        |
| PHYSICAL_READS_TXN      | Physical Reads (for each transaction)            | Reads for each Transaction   |
| PHYSICAL_WRITES_SEC     | Physical Writes (for each second)                | Writes for each Second       |
| PHYSICAL_WRITES_TXN     | Physical Writes (for each transaction)           | Writes for each Transaction  |
| PHYSICAL_READS_DIR_SEC  | Direct Physical Reads (for each second)          | Reads for each Second        |
| PHYSICAL_READS_DIR_TXN  | Direct Physical Reads (for each transaction)     | Reads for each Transaction   |
| PHYSICAL_WRITES_DIR_SEC | Direct Physical Writes (for each second)         | Writes for each Second       |
| PHYSICAL_WRITES_DIR_TXN | Direct Physical Writes (for each transaction)    | Writes for each Transaction  |
| PHYSICAL_READS_LOB_SEC  | Direct LOB Physical Reads (for each second)      | Reads for each Second        |
| PHYSICAL_READS_LOB_TXN  | Direct LOB Physical Reads (for each transaction) | Reads for each Transaction   |
| PHYSICAL_WRITES_LOB_SEC | Direct LOB Physical Writes (for each second)     | Writes for each Second       |

**Table 155-3 (Cont.) List of Supported Metrics**

| Metric Name (Internal)  | Metric Name (External)                               | Units                             |
|-------------------------|------------------------------------------------------|-----------------------------------|
| PHYSICAL_WRITES_LOB_TXN | Direct LOB Physical Writes (for each transaction)    | Writes for each Transaction       |
| PROCESS_LIMIT_PCT       | Process Limit Usage (%)                              | % of maximum value                |
| PX_DOWNGRADED_SEC       | Downgraded Parallel Operations (for each second)     | Operations for each Second        |
| PX_DOWNGRADED_25_SEC    | Downgraded to 25% and more (for each second)         | Operations for each Second        |
| PX_DOWNGRADED_50_SEC    | Downgraded to 50% and more (for each second)         | Operations for each Second        |
| PX_DOWNGRADED_75_SEC    | Downgraded to 75% and more (for each second)         | Operations for each Second        |
| PX_DOWNGRADED_SER_SEC   | Downgraded to serial (for each second)               | Operations for each Second        |
| RB_RECORDS_APPLIED_SEC  | Rollback Undo Records Applied (for each second)      | Records for each Second           |
| RB_RECORDS_APPLIED_TXN  | Rollback Undo Records Applied (for each transaction) | Records for each Transaction      |
| REDO_ALLOCATION_HIT     | Redo Log Allocation Hit                              | % of redo allocations             |
| REDO_GENERATED_SEC      | Redo Generated (for each second)                     | Redo Bytes for each Second        |
| REDO_GENERATED_TXN      | Redo Generated (for each transaction)                | Redo Bytes for each Transaction   |
| REDO_WRITES_SEC         | Redo Writes (for each second)                        | Writes for each Second            |
| REDO_WRITES_TXN         | Redo Writes (for each transaction)                   | Writes for each Transaction       |
| RECURSIVE_CALLS_SEC     | Recursive Calls (for each second)                    | Calls for each Second             |
| RECURSIVE_CALLS_TXN     | Recursive Calls (for each transaction)               | Calls for each Transaction        |
| RESPONSE_TXN            | Response (for each transaction)                      | Seconds for each Transaction      |
| ROWS_PER_SORT           | Rows Processed for each Sort                         | Rows for each Sort                |
| SESS_LOGICAL_READS_SEC  | Session Logical Reads (for each second)              | Reads for each Second             |
| SESS_LOGICAL_READS_TXN  | Session Logical Reads (for each transaction)         | Reads for each Transaction        |
| SESSION_CPU_SEC         | Database CPU (for each second)                       | Microseconds for each Second      |
| SESSION_CPU_TXN         | Database CPU (for each transaction)                  | Microseconds for each Transaction |
| SESSION_LIMIT_PCT       | Session Limit Usage (%)                              | % of maximum value                |
| SHARED_POOL_FREE_PCT    | Shared Pool Free(%)                                  | % of shared pool                  |
| SOFT_PARSE_PCT          | Soft Parse (%)                                       | % of all parses                   |
| SQL_SRV_RESPONSE_TIME   | Service Response (for each execution)                | Seconds                           |
| TABLESPACE_PCT_FULL     | Tablespace space usage                               | % full                            |
| TABLESPACE_BYT_FREE     | Tablespace bytes space usage                         | Kilobytes free                    |
| TOTAL_TABLE_SCANS_SEC   | Total Table Scans (for each second)                  | Scans for each Second             |
| TOTAL_TABLE_SCANS_TXN   | Total Table Scans (for each transaction)             | Scans for each Transaction        |
| TOTAL_INDEX_SCANS_SEC   | Total Index Scans (for each second)                  | Scans for each Second             |

**Table 155-3 (Cont.) List of Supported Metrics**

| Metric Name (Internal) | Metric Name (External)                                    | Units                          |
|------------------------|-----------------------------------------------------------|--------------------------------|
| TOTAL_INDEX_SCANS_TXN  | Total Index Scans (for each transaction)                  | Scans for each Transaction     |
| TOTAL_PARSSES_SEC      | Total Parses (for each second)                            | Parses for each Second         |
| TOTAL_PARSSES_TXN      | Total Parses (for each transaction)                       | Parses for each Transaction    |
| USER_COMMITS_SEC       | User Commits (for each second)                            | Commits for each Second        |
| USER_COMMITS_TXN       | User Commits (for each transaction)                       | Commits for each Transaction   |
| USER_ROLLBACKS_SEC     | User Rollbacks (for each second)                          | Rollbacks for each Second      |
| USER_ROLLBACKS_TXN     | User Rollbacks (for each transaction)                     | Rollbacks for each Transaction |
| USER_CALLS_SEC         | User Calls (for each second)                              | Calls for each Second          |
| USER_CALLS_TXN         | User Calls (for each transaction)                         | Calls for each Transaction     |
| USER_CALLS_PCT         | User Calls (%)                                            | % of all calls                 |
| USER_LIMIT_PCT         | User Limit Usage (%)                                      | % of maximum value             |
| WCR_AVG_IO_LAT         | Average IO response time (for a WRC client)               | Milliseconds                   |
| WCR_PCPU               | Percentage of replay threads on CPU (for a WRC client)    | % of total replay threads      |
| WCR_PIO                | Percentage of replay threads doing IOs (for a WRC client) | % of total replay threads      |

## 155.5 Summary of DBMS\_SERVER\_ALERT Subprograms

This table lists the DBMS\_SERVER\_ALERT subprograms and briefly describes them.

**Table 155-4 DBMS\_SERVER\_ALERT Package Subprograms**

| Subprogram                              | Description                                                     |
|-----------------------------------------|-----------------------------------------------------------------|
| <a href="#">EXPAND_MESSAGE Function</a> | Expands alert messages                                          |
| <a href="#">GET_THRESHOLD Procedure</a> | Gets the current threshold settings for a specified metric      |
| <a href="#">SET_THRESHOLD Procedure</a> | Sets the warning and critical thresholds for a specified metric |

### 155.5.1 EXPAND\_MESSAGE Function

This function expands alert messages.

#### Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
    user_language      IN   VARCHAR2,
    message_id         IN   NUMBER,
    argument_1         IN   VARCHAR2,
    argument_2         IN   VARCHAR2,
    argument_3         IN   VARCHAR2,
    argument_4         IN   VARCHAR2,
    argument_5         IN   VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 155-5** *EXPAND\_MESSAGE Function Parameters*

| Parameter     | Description                               |
|---------------|-------------------------------------------|
| user_language | The language of the current session.      |
| message_id    | Id of the alert message                   |
| argument_1    | The first argument in the alert message.  |
| argument_2    | The second argument in the alert message. |
| argument_3    | The third argument in the alert message.  |
| argument_4    | The fourth argument in the alert message. |
| argument_5    | The fifth argument in the alert message.  |

## 155.5.2 GET\_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

### Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(  
    metrics_id          IN  BINARY_INTEGER,  
    warning_operator    OUT BINARY_INTEGER,  
    warning_value       OUT VARCHAR2,  
    critical_operator   OUT BINARY_INTEGER,  
    critical_value      OUT VARCHAR2,  
    observation_period  OUT BINARY_INTEGER,  
    consecutive_occurrences OUT BINARY_INTEGER,  
    instance_name       IN  VARCHAR2,  
    object_type         IN  BINARY_INTEGER,  
    object_name         IN  VARCHAR2);
```

## Parameters

**Table 155-6** *GET\_THRESHOLD Procedure Parameters*

| Parameter               | Description                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|
| metrics_id              | The internal name of the metric. See " <a href="#">Supported Metrics</a> ".                                       |
| warning_operator        | The operator for the comparing the actual value with the warning threshold.                                       |
| warning_value           | The warning threshold value.                                                                                      |
| critical_operator       | The operator for the comparing the actual value with the critical threshold.                                      |
| critical_value          | The critical threshold value.                                                                                     |
| observation_period      | The period at which the metric values are computed and verified against the threshold setting.                    |
| consecutive_occurrences | The number of observation periods the metric value should violate the threshold value before the alert is issued. |

**Table 155-6 (Cont.) GET\_THRESHOLD Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instance_name | The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View. |
| object_type   | Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.                                                                                                                                                                                   |
| object_name   | The name of the object.                                                                                                                                                                                                             |

### Usage Notes

Note that this subprogram does not check if the value of the instance\_name parameter is meaningful or valid.

## 155.5.3 SET\_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

### Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
    metrics_id          IN    BINARY_INTEGER,
    warning_operator    IN    BINARY_INTEGER,
    warning_value       IN    VARCHAR2,
    critical_operator   IN    BINARY_INTEGER,
    critical_value      IN    VARCHAR2,
    observation_period  IN    BINARY_INTEGER,
    consecutive_occurrences IN BINARY_INTEGER,
    instance_name       IN    VARCHAR2,
    object_type         IN    BINARY_INTEGER,
    object_name         IN    VARCHAR2);
```

### Parameters

**Table 155-7 SET\_THRESHOLD Procedure Parameters**

| Parameter               | Description                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| metrics_id              | The internal name of the metric. See " <a href="#">Supported Metrics</a> ".                                                                     |
| warning_operator        | The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See " <a href="#">Relational Operators</a> ". |
| warning_value           | The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.              |
| critical_operator       | The operator for the comparing the actual value with the critical threshold. See " <a href="#">Relational Operators</a> ".                      |
| critical_value          | The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.                                 |
| observation_period      | The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.              |
| consecutive_occurrences | The number of observation periods the metric value should violate the threshold value before the alert is issued.                               |

**Table 155-7 (Cont.) SET\_THRESHOLD Procedure Parameters**

| Parameter                  | Description                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------|
| <code>instance_name</code> | The name of the instance for which the threshold is set. This is NULL for database-wide alerts. |
| <code>object_type</code>   | See " <a href="#">Object Types</a> ".                                                           |
| <code>object_name</code>   | The name of the object. This is NULL for SYSTEM.                                                |

**Usage Notes**

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database\_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

# DBMS\_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Procedures](#)
- [Exceptions](#)
- [Summary of DBMS\\_SERVICE Subprograms](#)

 **See Also:**

*Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

## 156.1 DBMS\_SERVICE Overview

`DBMS_SERVICE` supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through `SRVCTL`. The `DBMS_SERVICE` package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

 **See Also:**

For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

## 156.2 DBMS\_SERVICE Security Model

The `DBMS_SERVICE` package has certain security requirements.

### Privileges

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

### Schemas

This package must be installed under `SYS` schema.

### Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

## 156.3 DBMS\_SERVICE Constants

The `DBMS_SERVICE` package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in [Table 156-1](#)
- Constants used in connection balancing goal arguments are described in [Table 156-2](#)
- Constants used in TAF failover attribute arguments are described in [Table 156-3](#)

**Table 156-1 Constants Used in Calling Arguments**

| Name                           | Type   | Value | Description                                                                                                                |
|--------------------------------|--------|-------|----------------------------------------------------------------------------------------------------------------------------|
| <code>GOAL_NONE</code>         | NUMBER | 0     | Disables Load Balancing Advisory                                                                                           |
| <code>GOAL_SERVICE_TIME</code> | NUMBER | 1     | Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service      |
| <code>GOAL_THROUGHPUT</code>   | NUMBER | 2     | Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service |

**Table 156-2 Constants Used in Connection Balancing Goal Arguments**

| Name                        | Type   | Value | Description                                                                                                                                                                                                                                                                                                     |
|-----------------------------|--------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CLB_GOAL_SHORT</code> | NUMBER | 1     | Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either <code>goal_service_time</code> or <code>goal_throughput</code> ). When <code>GOAL=NONE</code> (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization. |

**Table 156-2 (Cont.) Constants Used in Connection Balancing Goal Arguments**

| Name          | Type   | Value | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLB_GOAL_LONG | NUMBER | 2     | Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design. |

**Table 156-3 Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF**

| Name                   | Type                 | Value  | Description                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAILOVER_METHOD_NONE   | VARCHAR2             | 0      | Server side TAF is not enabled for this service                                                                                                                                                                                                                                                            |
| FAILOVER_METHOD_BASIC  | VARCHAR2             | 1      | Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.                                                                                                                                                             |
| FAILOVER_TYPE_NONE     | VARCHAR              |        | Server side TAF type is NONE                                                                                                                                                                                                                                                                               |
| FAILOVER_TYPE_SESSION  | VARCHAR              |        | Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.                                        |
| FAILOVER_TYPE_SELECT   | VARCHAR              |        | Server side TAF failover type is SELECT                                                                                                                                                                                                                                                                    |
| FAILOVER_RETRIES       | NUMBER               |        | Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30. |
| FAILOVER_RESTORE_NONE  | CONSTANT<br>VARCHAR2 | NONE   | The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.                                                                            |
| FAILOVER_RESTORE_BASIC | VARCHAR2             | LEVEL1 | This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.                                                      |

**Table 156-3 (Cont.) Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF**

| Name                      | Type    | Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|---------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAILOVER_DELAY            | NUMBER  |       | Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using <code>FAILOVER_DELAY</code> the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes). |
| STOP_OPTION_NONE          | VARCHAR |       | Sessions are not disconnected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| STOP_OPTION_IMMEDIATE     | VARCHAR |       | Sessions are disconnected immediately after the <code>drain_timeout</code> expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STOP_OPTION_TRANSACTIONAL |         |       | Sessions are disconnected after the transactions during the <code>drain_timeout</code> . The sessions disconnect immediately when <code>drain_timeout</code> expires.                                                                                                                                                                                                                                                                                                                                                                                 |
| DYNAMIC                   | NUMBER  |       | For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of <code>DYNAMIC</code> is recommended for all applications. If you are in any doubt, or the application can be customized, you must use <code>DYNAMIC</code> .                                                                                                                                                                                                              |

**Usage Notes**

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of `OCI_FO_RETRY`. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to `BASIC`. Delay and retries are optional and may be specified independently.

## 156.4 DBMS\_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- [CREATE\\_SERVICE Procedure](#)
- [DELETE\\_SERVICE Procedure](#)
- [MODIFY\\_SERVICE Procedure](#)
- [START\\_SERVICE Procedure](#)

- [STOP\\_SERVICE Procedure](#)
- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service -related subprograms.
- If you wish to use DBMS\_SERVICE on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

## 156.5 DBMS\_SERVICE Exceptions

This table lists the exceptions raised by the DBMS\_SERVICE package.

**Table 156-4 DBMS\_SERVICE Exceptions**

| Exception               | Error Code | Description                                                                             |
|-------------------------|------------|-----------------------------------------------------------------------------------------|
| NULL_SERVICE_NAME       | 44301      | Service name argument was found to be NULL                                              |
| NULL_NETWORK_NAME       | 44302      | Network name argument was found to be NULL                                              |
| SERVICE_EXISTS          | 44303      | Service name already exists                                                             |
| SERVICE_DOES_NOT_EXIST  | 44304      | Specified service does not exist                                                        |
| SERVICE_IN_USE          | 44305      | Specified service was running                                                           |
| SERVICE_NAME_TOO_LONG   | 44306      | Service name was too long                                                               |
| NETWORK_PREFIX_TOO_LONG | 44307      | Network name, excluding the domain, was too long                                        |
| NOT_INITIALIZED         | 44308      | Services layer was not yet initialized                                                  |
| GENERAL_FAILURE         | 44309      | An unknown failure                                                                      |
| MAX_SERVICES_EXCEEDED   | 44310      | Maximum number of services has been reached                                             |
| SERVICE_NOT_RUNNING     | 44311      | Specified service was not running                                                       |
| DATABASE_CLOSED         | 44312      | Database was closed                                                                     |
| INVALID_INSTANCE        | 44313      | Instance name argument was not valid                                                    |
| NETWORK_EXISTS          | 44314      | Network name already exists                                                             |
| NULL_ATTRIBUTES         | 44315      | All attributes specified were NULL                                                      |
| INVALID_ARGUMENT        | 44316      | Invalid argument supplied                                                               |
| DATABASE_READONLY       | 44317      | Database is open read-only                                                              |
| MAX_SN_LENGTH           | 44318      | Total length of all running service network names exceeded the maximum allowable length |
| ERR_AQ_SERVICE          | 44319      | Cannot delete AQ service                                                                |
| ERR_GLB_SERVICE         | 44320      | Cannot delete global service                                                            |
| ERR_INVALID_PDB_NAME    | 44771      | Invalid name for a pluggable database                                                   |
| ERR_CRS_API             | 44772      | Cluster ready services (CRS) operation failed                                           |
| ERR_PDB_CLOSED          | 44773      | Cannot perform requested service operation                                              |

**Table 156-4 (Cont.) DBMS\_SERVICE Exceptions**

| Exception       | Error Code | Description                                    |
|-----------------|------------|------------------------------------------------|
| ERR_PDB_INVALID | 44774      | Pluggable database attribute cannot be changed |
| ERR_PDB_NAME    | 44775      | Pluggable database service cannot be created   |
| ERR_PDB_EXP     | 44776      | Pluggable database service cannot be deleted   |
| ERR_PDB_FAIL    | 44777      | Pluggable database service cannot be started   |

## 156.6 Summary of DBMS\_SERVICE Subprograms

This table lists the DBMS\_SERVICE subprograms and briefly describes them.

**Table 156-5 DBMS\_SERVICE Package Subprograms**

| Subprogram                                   | Description                                     |
|----------------------------------------------|-------------------------------------------------|
| <a href="#">CREATE_SERVICE Procedure</a>     | Creates service                                 |
| <a href="#">DELETE_SERVICE Procedure</a>     | Deletes service                                 |
| <a href="#">DISCONNECT_SESSION Procedure</a> | Disconnects sessions running under this service |
| <a href="#">MODIFY_SERVICE Procedure</a>     | Modifies service                                |
| <a href="#">START_SERVICE Procedure</a>      | Activates service                               |
| <a href="#">STOP_SERVICE Procedure</a>       | Stops service                                   |

### 156.6.1 CREATE\_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

 **Note:**

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

## Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
    service_name          IN VARCHAR2,
    network_name          IN VARCHAR2,
    parameter_array       IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.CREATE_SERVICE(
    service_name          IN VARCHAR2,
    network_name          IN VARCHAR2,
    goal                  IN NUMBER DEFAULT NULL,
    dtp                   IN BOOLEAN DEFAULT NULL,
    aq_ha_notifications   IN BOOLEAN DEFAULT NULL,
    failover_method        IN VARCHAR2 DEFAULT NULL,
    failover_type          IN VARCHAR2 DEFAULT NULL,
    failover_retries       IN NUMBER DEFAULT NULL,
    failover_delay         IN NUMBER DEFAULT NULL,
    clb_goal               IN NUMBER DEFAULT NULL,
    edition                IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 156-6 CREATE\_SERVICE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name    | Name of the service, limited to 64 characters in the Data Dictionary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| network_name    | Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see <i>Oracle Database Net Services Reference</i> ).                                                                                                                                                                                                                                                                                                                                                                                     |
| parameter_array | <p>Associative array with name-value pairs of the service attributes. Supported names:</p> <ul style="list-style-type: none"> <li>goal</li> <li>dtp</li> <li>aq_ha_notifications</li> <li>failover_method</li> <li>failover_type</li> <li>failover_retries</li> <li>failover_restore</li> <li>failover_delay</li> <li>clb_goal</li> <li>edition</li> <li>commit_outcome</li> <li>retention_timeout</li> <li>replay_initiation_timeout</li> <li>session_state_consistency</li> <li>sql_translation_profile</li> <li>drain_timeout</li> <li>stop_option</li> <li>placement_policy</li> </ul> |

**Table 156-6 (Cont.) CREATE\_SERVICE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| goal                | Workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> <li>DBMS_SERVICE.GOAL_SERVICE_TIME</li> <li>DBMS_SERVICE.GOAL_THROUGHPUT</li> <li>DBMS_SERVICE.GOAL_NONE</li> </ul>                                                                                                                                                                                                                                                                                                   |
| ntp                 | Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)                                                                                                                                                                                                                                                                                                                                                                                              |
| aq_ha_notifications | Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity                                                                                                                                                                                                                  |
| failover_method     | Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.                                                                                                 |
| failover_type       | TRANSACTION for Application Continuity. SELECT or BASIC for TAF.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| failover_retries    | Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.                                                                                                                                                                                        |
| failover_delay      | Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.                                                                                                                                                       |
| edition             | <p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</p> |
| drain_timeout       | If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, so stopping and relocating drains for this time by default.                                                                                                                                                                                                                                                            |

**Table 156-6 (Cont.) CREATE\_SERVICE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stop_option               | <p>Provides options to terminate a session. The supported values are:</p> <ul style="list-style-type: none"> <li>TRANSACTIONAL<br/>drain_timeout applies to the transactions. After the drain_timeout expire, the sessions are immediately killed.</li> <li>IMMEDIATE<br/>The sessions are killed after drain_timeout expires.</li> <li>NONE<br/>Sessions are not terminated.</li> </ul> <p>However, these parameter values can be overridden using the command line.</p>                                                                                                                                                                                                                                                                                                          |
| commit_outcome            | <p>Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> <li>Invoking the <a href="#">GET_LTXID_OUTCOME Procedure</a> of the <a href="#">DBMS_APP_CONT</a> package requires that the commit_outcome attribute be set.</li> <li>commit_outcome has no effect on active Data Guard and read-only databases.</li> <li>commit_outcome is only allowed on the database service and on user-defined database services</li> </ul> |
| retention_timeout         | <p>Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| replay_initiation_timeout | <p>For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.</p>                                                                                                                                                                                                                                                                                                             |
| session_state_consistency | <p>Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.</p>                                                                                                                                                                                                                                     |
| sql_translation_name      | Name of SQL translation unit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| clb_goal                  | Method used for Connection Load Balancing (see <a href="#">Table 156-2</a> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 156-6 (Cont.) CREATE\_SERVICE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| placement_policy | <p>NUMBER</p> <p>Placement policy for the service. Possible values:</p> <ul style="list-style-type: none"> <li>• 0: PDB-NONE</li> <li>• 1: PDB-SINGLETON</li> <li>• 2: PDB-UNIFORM</li> </ul> |

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

### Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE')           := 'TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT') := 1800;
  params('RETENTION_TIMEOUT')       := 86400;
  params('FAILOVER_DELAY')           := 10;
  params('FAILOVER_RETRIES')         := 30;
  params('DRAIN_TIMEOUT')            := 60;
  params('STOP_OPTION')              := 'DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
  params('FAILOVER_RESTORE')         := 'DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
  params('commit_outcome')           := 'true';
  params('aq_ha_notifications')      := 'true';
  DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

## 156.6.2 DELETE\_SERVICE Procedure

This procedure deletes a service from the data dictionary.

 **Note:**

Starting with Oracle Database 19c, customer use of the `SERVICE_NAME` parameter is deprecated. It can be desupported in a future release. It must not be used for high availability (HA) deployments. It is not supported to use service name parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.

## Syntax

```
DBMS_SERVICE.DELETE_SERVICE(  
    service_name    IN VARCHAR2);
```

## Parameters

**Table 156-7** DELETE\_SERVICE Procedure Parameters

| Parameter    | Description                                                          |
|--------------|----------------------------------------------------------------------|
| service_name | Name of the service, limited to 64 characters in the Data Dictionary |

## Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');
```

## 156.6.3 DISCONNECT\_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

## Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(  
    service_name      IN VARCHAR2,  
    disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);
```

## Parameters

**Table 156-8** DISCONNECT\_SESSION Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name      | Name of the service, limited to 64 characters in the Data Dictionary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| disconnect_option | <p>The options, package constants, are expressed as NUMBER:</p> <ul style="list-style-type: none"><li>• POST_TRANSACTION = 0: session disconnects after the current transaction commits or rolls back</li><li>• IMMEDIATE = 1: session disconnects immediately</li><li>• NOREPLAY = 2: session disconnects immediately and be flagged to not be replayed by application continuity, that is IMMEDIATE and NOREPLAY together</li></ul> <p><b>Note:</b> IMMEDIATE or POST_TRANSACTION and NOREPLAY is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.</p> |

## Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS\_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

## Examples

This disconnects sessions with `service_name` 'ernie.example.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');
```

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

```
EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);
```

## 156.6.4 MODIFY\_SERVICE Procedure

This procedure modifies an existing service.

### Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

## Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(  
    service_name          IN VARCHAR2,  
    parameter_array       IN svc_parameter_array);
```

This overload is maintained for backward compatibility:

```
DBMS_SERVICE.MODIFY_SERVICE(  
    service_name          IN VARCHAR2,  
    goal                  IN NUMBER DEFAULT NULL,  
    dtp                   IN BOOLEAN DEFAULT NULL,  
    aq_ha_notifications   IN BOOLEAN DEFAULT NULL,  
    failover_method        IN VARCHAR2 DEFAULT NULL,  
    failover_type          IN VARCHAR2 DEFAULT NULL,  
    failover_retries       IN NUMBER DEFAULT NULL,  
    failover_delay         IN NUMBER DEFAULT NULL,  
    clb_goal              IN NUMBER DEFAULT NULL,  
    edition                IN VARCHAR2 DEFAULT NULL,  
    modify_edition         IN BOOLEAN DEFAULT FALSE;
```

## Parameters

**Table 156-9** MODIFY\_SERVICE Procedure Parameters

| Parameter                 | Description                                                          |
|---------------------------|----------------------------------------------------------------------|
| <code>service_name</code> | Name of the service, limited to 64 characters in the Data Dictionary |

**Table 156-9 (Cont.) MODIFY\_SERVICE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter_array     | <p>Associative array with name/value pairs of the service attributes. | goal                | <p>Workload management goal directive for the service. Valid values:</p> <ul style="list-style-type: none"> <li>DBMS_SERVICE.GOAL_SERVICE_TIME</li> <li>DBMS_SERVICE.GOAL_THROUGHPUT</li> <li>DBMS_SERVICE.GOAL_NONE</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| dtp                 | <p>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| aq_ha_notifications | <p>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</p>                                                                                                                                                                                                                                                         |
| failover_method     | <p>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</p>                                                                                                                                        |
| failover_type       | <p>Failover TYPE for the service for Application Continuity and TAF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| failover_restore    | <p>For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state.</p>                                                                                                                                                                                                                                                                                                                          |
| failover_retries    | <p>For AC OCI, use NONE for applications that are not STATIC.</p> <p>Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.</p>                                                                                                                                                             |

**Table 156-9 (Cont.) MODIFY\_SERVICE Procedure Parameters**

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>failover_delay</code>            | Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>drain_timeout</code>             | When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, to stop and relocate drains for this time by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>edition</code>                   | <p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p>                                                                                                                                                                                                                                                                                              |
| <code>commit_outcome</code>            | <p>Determines whether transaction <code>COMMIT</code> outcome is accessible after the <code>COMMIT</code> has executed. While the database guarantees that <code>COMMIT</code> is durable, this ensures that the outcome of the <code>COMMIT</code> is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:</p> <ul style="list-style-type: none"> <li>Invoking the <a href="#">GET_LTXID_OUTCOME Procedure</a> of the <a href="#">DBMS_APP_CONT</a> package requires that the <code>commit_outcome</code> attribute be set.</li> <li><code>commit_outcome</code> has no effect on active Data Guard and read-only databases.</li> <li><code>commit_outcome</code> is allowed only on user-defined database services</li> </ul> |
| <code>retention_timeout</code>         | Used in conjunction with <code>commit_outcome</code> , it determines the amount of time (in seconds) that the <code>COMMIT_OUTCOME</code> is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>replay_initiation_timeout</code> | For Application Continuity, <code>replay_initiation_timeout</code> is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.                                                                                                                                                                                                                                                                                                                                                                      |
| <code>session_state_consistency</code> | Describes how nontransactional is changed during a request (values are <code>DYNAMIC</code> or <code>STATIC</code> ). This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to <code>DYNAMIC</code> (default). Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.                                                                                                                                                                                                               |
| <code>sql_translation_profile</code>   | Name of SQL translation profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 156-9 (Cont.) MODIFY\_SERVICE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| modify_edition   | If TRUE, the edition service attribute is updated to use the edition argument value. If FALSE or NULL, the edition attribute is not updated.                                   |
| clb_goal         | Method used for Connection Load Balancing (see <a href="#">Table 156-2</a> )                                                                                                   |
| placement_policy | NUMBER<br>Placement policy for the service. Possible values: <ul style="list-style-type: none"><li>• 0: PDB-NONE</li><li>• 1: PDB-SINGLETON</li><li>• 2: PDB-UNIFORM</li></ul> |

 **Note:**

Values other than 0 are applicable only in the ATP-Dedicated Cloud in an Oracle RAC environment.

**Usage Notes**

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` are lost unless they are also made with the corresponding `srvctl` command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by `srvctl`.
- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

## 156.6.5 START\_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

 **Note:**

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

## Syntax

```
DBMS_SERVICE.START_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2);
```

## Parameters

**Table 156-10** *START\_SERVICE Procedure Parameters*

| Parameter     | Description                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name  | Name of the service limited to 64 characters in the Data Dictionary                                                                                                                                                                                                                         |
| instance_name | Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances. |

## Examples

```
DBMS_SERVICE.START_SERVICE('ernie.example.com');
```

## 156.6.6 STOP\_SERVICE Procedure

This procedure stops a service.

### Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

## Syntax

```
DBMS_SERVICE.STOP_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2 DEFAULT NULL,  
    stop_option IN VARCHAR2 DEFAULT NULL,  
    drain_timeout IN NUMBER DEFAULT NULL,  
    replay IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 156-11** *STOP\_SERVICE Procedure Parameters*

| Parameter     | Description                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| service_name  | Name of the service limited to 64 characters in the Data Dictionary                                                                                                                                                                                                                                                              |
| instance_name | Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances. |

**Table 156-11 (Cont.) STOP\_SERVICE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stop_option   | <p>To specify how sessions are stopped with draining. The possible values are as follows:</p> <ul style="list-style-type: none"><li>• IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout.</li><li>• TRANASCTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated.</li><li>• NONE: sessions are not terminated.</li></ul> <p>These values can be overridden on the command line using SRVCTL.</p> |
| drain_timeout | The time in seconds for the session to drain.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| replay        | Enable application continuity replay.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Examples**

```
DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
```

# DBMS\_SESSION

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_SESSION Subprograms](#)

## 157.1 DBMS\_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

## 157.2 DBMS\_SESSION Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

## 157.3 DBMS\_SESSION Data Structures

The `DBMS_SESSION` package defines `TABLE` types.

### Table Types

- [INTEGER\\_ARRAY Table Type](#)
- [LNAME\\_ARRAY Table Type](#)

### 157.3.1 DBMS\_SERVICE INTEGER\_ARRAY Table Type

`INTEGER_ARRAY` is a table type of `BINARY_INTEGER`.

#### Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

### 157.3.2 DBMS\_SERVICE LNAME\_ARRAY Table Type

`LNAME_ARRAY` is a table type of `VARCHAR2`.

#### Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## 157.4 Summary of DBMS\_SESSION Subprograms

This table lists the DBMS\_SESSION subprograms in alphabetical order and briefly describes them.

**Table 157-1 DBMS\_SESSION Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                      |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLEAR_ALL_CONTEXT Procedure</a>              | Clears all context information                                                                                                                                   |
| <a href="#">CLEAR_CONTEXT Procedure</a>                  | Clears the context                                                                                                                                               |
| <a href="#">CLEAR_IDENTIFIER Procedure</a>               | Clears the identifier                                                                                                                                            |
| <a href="#">CLOSE_DATABASE_LINK Procedure</a>            | Closes database link                                                                                                                                             |
| <a href="#">CURRENT_IS_ROLE_ENABLED Function</a>         | Determines if the named role is currently enabled.                                                                                                               |
| <a href="#">FREE_UNUSED_USER_MEMORY Procedure</a>        | Lets you reclaim unused memory after performing operations requiring large amounts of memory                                                                     |
| <a href="#">GET_PACKAGE_MEMORY_UTILIZATION Procedure</a> | Describes static package memory usage                                                                                                                            |
| <a href="#">IS_ROLE_ENABLED Function</a>                 | Determines if the named role is enabled for the session.                                                                                                         |
| <a href="#">IS_SESSION_ALIVE Function</a>                | Determines if the specified session is active                                                                                                                    |
| <a href="#">LIST_CONTEXT Procedures</a>                  | Returns a list of active namespace and context for the current session                                                                                           |
| <a href="#">MODIFY_PACKAGE_STATE Procedure</a>           | Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session |
| <a href="#">RESET_PACKAGE Procedure</a>                  | De-instantiates all packages in the session                                                                                                                      |
| <a href="#">SESSION_IS_ROLE_ENABLED Function</a>         | Determines if the named role is enabled at the session level.                                                                                                    |
| <a href="#">SESSION_TRACE_DISABLE Procedure</a>          | Resets the session-level SQL trace for the session from which it was called.                                                                                     |
| <a href="#">SESSION_TRACE_ENABLE Procedure</a>           | Enables session-level SQL trace for the invoking session                                                                                                         |
| <a href="#">SET_CONTEXT Procedure</a>                    | Sets or resets the value of a context attribute                                                                                                                  |
| <a href="#">SET_EDITION_DEFERRED Procedure</a>           | Requests a switch to the specified edition                                                                                                                       |
| <a href="#">SET_IDENTIFIER Procedure</a>                 | Sets the identifier                                                                                                                                              |
| <a href="#">SET-NLS Procedure</a>                        | Sets Globalization Support (NLS)                                                                                                                                 |
| <a href="#">SET_ROLE Procedure</a>                       | Sets role                                                                                                                                                        |
| <a href="#">SET_SQL_TRACE Procedure</a>                  | Turns tracing on or off                                                                                                                                          |
| <a href="#">SLEEP Procedure</a>                          | Suspends the session for a specified period of time.                                                                                                             |
| <a href="#">SWITCH_CURRENT_CONSUMER_GROUP Procedure</a>  | Facilitates changing the current resource consumer group of a user's current session                                                                             |
| <a href="#">UNIQUE_SESSION_ID Function</a>               | Returns an identifier that is unique for all sessions currently connected to this database                                                                       |

### 157.4.1 ADD\_SQL\_CONNECTION\_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered

by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

### Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
    connection_test      IN VARCHAR2
    service_name         IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 157-2 ADD\_SQL\_CONNECTION\_TEST Procedure Parameters**

| Parameter       | Description                                      |
|-----------------|--------------------------------------------------|
| CONNECTION_TEST | The SQL text used to test and drain connections. |
| SERVICE_NAME    | Optional service name qualifier.                 |

### Usage Notes

The `ADD_SQL_CONNECTION_TEST` Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

## 157.4.2 CLEAR\_ALL\_CONTEXT Procedure

This procedure clears application context information in the specified namespace.

### Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
    namespace      VARCHAR2);
```

### Parameters

**Table 157-3 CLEAR\_ALL\_CONTEXT Procedure Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| namespace | The namespace where the application context information is to be cleared. Required. |

### Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.

- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

## 157.4.3 CLEAR\_CONTEXT Procedure

This procedure clears application context in the specified namespace.

### Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
(namespace          VARCHAR2,
 client_identifier  VARCHAR2,
 attribute          VARCHAR2);
```

### Parameters

**Table 157-4** CLEAR\_CONTEXT Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace         | Namespace in which the application context is to be cleared. Required.<br>For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context.<br>For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT. |
| client_identifier | Applies to a global context and is optional for other types of contexts; 64-byte maximum                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| attribute         | Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.                                                                                                                                                                                                                  |

### Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

## 157.4.4 CLEAR\_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

### Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

### Usage Notes

This procedure is executable by public.

## 157.4.5 CLOSE\_DATABASE\_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:  
`ALTER SESSION CLOSE DATABASE LINK <name>`

### Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (  
    dblink VARCHAR2);
```

### Parameters

**Table 157-5 CLOSE\_DATABASE\_LINK Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| dblink    | Name of the database link to close |

## 157.4.6 CURRENT\_IS\_ROLE\_ENABLED Function

This function determines if the named role is currently enabled.

### Syntax

```
DBMS_SESSION.CURRENT_IS_ROLE_ENABLED (  
    rolename VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 157-6 CURRENT\_IS\_ROLE\_ENABLED Function Parameters**

| Parameter | Description       |
|-----------|-------------------|
| rolename  | Name of the role. |

### Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

## 157.4.7 FREE\_UNUSED\_USER\_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

**Note:**

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

**Syntax**

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

**Return Values**

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

**Usage Notes**

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed

tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

### Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;    -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

## 157.4.8 GET\_PACKAGE\_MEMORY\_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE\\_UNUSED\\_USER\\_MEMORY Procedure](#) is invoked.

### Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
  owner_names      OUT NOCOPY LNAME_ARRAY,
  unit_names       OUT NOCOPY LNAME_ARRAY,
  unit_types       OUT NOCOPY INTEGER_ARRAY,
  used_amounts     OUT NOCOPY INTEGER_ARRAY,
  free_amounts     OUT NOCOPY INTEGER_ARRAY);
```

## Parameters

**Table 157-7 GET\_PACKAGE\_MEMORY\_UTILIZATION Function Parameters**

| Parameter    | Description                                              |
|--------------|----------------------------------------------------------|
| owner_name   | Owner of package                                         |
| unit_name    | Name of package                                          |
| unit_types   | Value of the type# columns of the dictionary table obj\$ |
| used_amounts | Amount of allocated memory specified in bytes            |
| free_amounts | Amount of available memory specified in bytes            |

## 157.4.9 IS\_ROLE\_ENABLED Function

This function determines if the named role is enabled for this session.

### Note:

This function is deprecated starting in Oracle Database 19c. Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` instead.

## Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
RETURN BOOLEAN;
```

## Parameters

**Table 157-8 IS\_ROLE\_ENABLED Function Parameters**

| Parameter | Description        |
|-----------|--------------------|
| rolename  | Name of the role.\ |

## Return Values

**Table 157-9 IS\_ROLE\_ENABLED Function Return Values**

| Return          | Description                                             |
|-----------------|---------------------------------------------------------|
| is_role_enabled | TRUE or FALSE, depending on whether the role is enabled |

## 157.4.10 IS\_SESSION\_ALIVE Function

This function determines if the specified session is active.

### Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (  
    uniqueid VARCHAR2)  
    RETURN BOOLEAN;
```

### Parameters

**Table 157-10 IS\_SESSION\_ALIVE Function Parameters**

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| uniqueid  | Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID. |

### Return Values

**Table 157-11 IS\_SESSION\_ALIVE Function Return Values**

| Return           | Description                                               |
|------------------|-----------------------------------------------------------|
| is_session_alive | TRUE or FALSE, depending on whether the session is active |

## 157.4.11 LIST\_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

### Syntax

```
TYPE AppCtxRecTyp IS RECORD (  
    namespace VARCHAR2(30),  
    attribute VARCHAR2(30),  
    value      VARCHAR2(256));  
  
TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;  
  
DBMS_SESSION.LIST_CONTEXT (  
    list OUT AppCtxTabTyp,  
    size OUT NUMBER);
```

### Parameters

**Table 157-12 LIST\_CONTEXT Procedure Parameters**

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| list      | Buffer to store a list of application context set in the current session |

## Return Values

**Table 157-13 LIST\_CONTEXT Procedure Return Values**

| Return            | Description                                                     |
|-------------------|-----------------------------------------------------------------|
| <code>list</code> | A list of (namespace, attribute, values) set in current session |
| <code>size</code> | Returns the number of entries in the buffer returned            |

## Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

## 157.4.12 MODIFY\_PACKAGE\_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the `DBMS_SESSION` constants listed in [Table 157-15](#).

## Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(  
    action_flags IN PLS_INTEGER);
```

## Parameters

**Table 157-14** MODIFY\_PACKAGE\_STATE Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action_flags | <p>Bit flags that determine the action taken on PL/SQL program units:</p> <p>DBMS_SESSION.FREE_ALL_RESOURCES (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking MODIFY_PACKAGE_STATE with the DBMS_SESSION.FREE_ALL_RESOURCES parameter provides functionality identical to the DBMS_SESSION.RESET_PACKAGE() interface.</p> <p>DBMS_SESSION.REINITIALIZE (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the DBMS_SESSION.REINITIALIZE flag is similar to the DBMS_SESSION.FREE_ALL_RESOURCES flag in that both have the effect of reinitializing all packages.</p> <p>However, DBMS_SESSION.REINITIALIZE should exhibit better performance than the DBMS_SESSION.FREE_ALL_RESOURCES option because:</p> <ul style="list-style-type: none"><li>• Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused.</li><li>• Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use.</li><li>• The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.</li></ul> |

## Usage Notes

See the parameter descriptions in [Table 157-17](#) for the differences between the flags and why DBMS\_SESSION.REINITIALIZE exhibits better performance than DBMS\_SESSION.FREE\_ALL\_RESOURCES.

**Table 157-15** Action\_flags Constants for MODIFY\_PACKAGE\_STATE

| Constant           | Description     |
|--------------------|-----------------|
| FREE_ALL_RESOURCES | PLS_INTEGER:= 1 |
| REINITIALIZE       | PLS_INTEGER:= 2 |

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
```

```

        cursor c is select * from emp;
        procedure bar;
    end P;
/
package body P is
    v    varchar2(20) := 'hello';
    procedure bar is
    begin
        ...
    end;
    procedure init_pkg is
    begin
        ....
    end;
begin
    -- initialization block
    init_pkg;
    ...
    ...
end P;
/

```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using FREE\_ALL\_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS\_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE\_ALL\_RESOURCES flag or the RESET\_PACKAGE procedure had been used. For instance, after performing  
DBMS\_SESSION.MODIFY\_PACKAGE\_STATE(DBMS\_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS\_SESSION.RESET\_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS\_SESSION.MODIFY\_PACKAGE\_STATE(DBMS\_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS\_SESSION.REINITIALIZE.  
Instead, use DBMS\_SESSION.MODIFY\_PACKAGE\_STATE(2) on the client, because the argument is explicitly provided.

## Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```
create or replace package P is
    cnt    number := 0;
    cursor c is select * from emp;
    procedure print_status;
end P;
/
show errors;

create or replace package body P is
    procedure print_status is
    begin
        dbms_output.put_line('P.cnt = ' || cnt);
        if c%ISOPEN then
            dbms_output.put_line('P.c is OPEN');
        else
            dbms_output.put_line('P.c is CLOSED');
        end if;
    end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
    2  P.cnt := 111;
    3  open p.c;
    4  P.print_status;
    5  end;
    6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
    2  dbms_session.modify_package_state(dbms_session.reinitialize);
    3  end;
    4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
    2  P.print_status;
    3  end;
    4  /
P.cnt = 0
```

P.c is CLOSED

PL/SQL procedure successfully completed.

## 157.4.13 RESET\_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

### Note:

See "[SESSION\\_TRACE\\_ENABLE Procedure](#)". The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

### Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

### Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

### Note:

`RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls `RESET_PACKAGE`. The `RESET_PACKAGE` effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

### Examples

This SQL\*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

## 157.4.14 SESSION\_IS\_ROLE\_ENABLED Function

This function determines if the named role is enabled for the login user session.

### Syntax

```
DBMS_SESSION.SESSION_IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 157-16** SESSION\_IS\_ROLE\_ENABLED Function Parameters

| Parameter | Description       |
|-----------|-------------------|
| rolename  | Name of the role. |

### Return Values

- TRUE-if the role is enabled.
- FALSE-if the role is not enabled.

## 157.4.15 SESSION\_TRACE\_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

### Syntax

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

## 157.4.16 SESSION\_TRACE\_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

### Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(  
    waits      IN   BOOLEAN DEFAULT TRUE,  
    binds      IN   BOOLEAN DEFAULT FALSE,  
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 157-17** SESSION\_TRACE\_ENABLE Procedure Parameters

| Parameter | Description                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| waits     | Specifies if wait information is to be traced                                                                                          |
| binds     | Specifies if bind information is to be traced                                                                                          |
| plan_stat | Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'. |

## 157.4.17 SET\_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of the five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

### Syntax

```
DBMS_SESSION.SET_CONTEXT (  
    namespace VARCHAR2,  
    attribute  VARCHAR2,  
    value      VARCHAR2,  
    username   VARCHAR2,  
    client_id  VARCHAR2 );
```

### Parameters

**Table 157-18** SET\_CONTEXT Procedure Parameters

| Parameter | Description                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| namespace | The namespace of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure. |
| attribute | The attribute of the application context to be set, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure. |
| value     | Value of the application context to be set, limited to 4 kilobytes.                                                                                                               |

**Table 157-18 (Cont.) SET\_CONTEXT Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | Database username attribute of the application context, limited to 128 bytes. Exceeding the maximum permissible length will result in an error during the execution of the procedure.<br>The default value is NULL. |
| client_id | Application-specific client_id attribute of the application context, limited to 64 bytes.<br>The default value is NULL.                                                                                             |

### Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
- The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.
- If the namespace parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET\_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.
- If the value of the parameter in the namespace has been set, SET\_CONTEXT overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS\_CONTEXT return the most recent value.

### See Also:

*Oracle Database Security Guide* for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

## 157.4.18 SET\_EDITION\_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

### Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (  
    edition    IN    VARCHAR2);
```

### Parameters

**Table 157-19 SET\_EDITION\_DEFERRED Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| edition   | Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double quotation marks are not used, the contents are set in uppercase. The caller must have <code>USE</code> privilege on the named edition. |

## 157.4.19 SET\_IDENTIFIER Procedure

This procedure sets the client ID in the session.

### Syntax

```
DBMS_SESSION.SET_IDENTIFIER (  
    client_id VARCHAR2);
```

### Parameters

**Table 157-20 SET\_IDENTIFIER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_id | Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, the additional bytes are truncated. |

### Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

## 157.4.20 SET\_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

### Syntax

```
DBMS_SESSION.SET_NLS (  
    param VARCHAR2,  
    value VARCHAR2);
```

### Parameters

**Table 157-21 SET\_NLS Procedure Parameters**

| Parameter | Description                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| param     | Globalization Support parameter. The parameter name must begin with 'NLS'.                                                                                |
| value     | Parameter value.<br><br>If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls ('nls_date_format','DD-MON-YY')". |

## 157.4.21 SET\_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

### Syntax

```
DBMS_SESSION.SET_ROLE (  
    role_cmd VARCHAR2);
```

### Parameters

**Table 157-22 SET\_ROLE Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| role_cmd  | Text is appended to "set role" and then run as SQL |

### Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

## 157.4.22 SET\_SQL\_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE ....`

### Syntax

```
DBMS_SESSION.SET_SQL_TRACE (  
    sql_trace boolean);
```

## Parameters

**Table 157-23 SET\_SQL\_TRACE Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| sql_trace | TRUE turns tracing on, FALSE turns tracing off |

## 157.4.23 SLEEP Procedure

This procedure suspends the session for a specified period of time.

### Syntax

```
DBMS_SESSION.SLEEP (  
    seconds IN NUMBER);
```

## Parameters

**Table 157-24 SLEEP Procedure Parameters**

| Parameter | Description                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| seconds   | Amount of time, in seconds, to suspend the session.<br><br>The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value. |

## 157.4.24 SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

### Syntax

```
DBMS_SESSION.switch_current_consumer_group (  
    new_consumer_group IN VARCHAR2,  
    old_consumer_group OUT VARCHAR2,  
    initial_group_on_error IN BOOLEAN);
```

## Parameters

**Table 157-25 SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure Parameters**

| Parameter              | Description                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------|
| new_consumer_group     | Name of consumer group to which you want to switch                                                                     |
| old_consumer_group     | Name of the consumer group from which you just switched out                                                            |
| initial_group_on_error | If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error |

## Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

### Note:

- The `old_consumer_group` parameter returns the name of old consumer group only if it were set explicitly. That is, you might get NULL if the old consumer group was set by some mapping rules.
- You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

## Exceptions

**Table 157-26 SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure Exceptions**

| Exception | Description                                  |
|-----------|----------------------------------------------|
| 29368     | Non-existent consumer group                  |
| 1031      | Insufficient privileges                      |
| 29396     | Cannot switch to OTHER_GROUPS consumer group |

## Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, `SWITCH_CURRENT_CONSUMER_GROUP` puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

## Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
    old_group varchar2(30);
    prev_group varchar2(30);
    curr_user varchar2(30);
BEGIN
    -- switch invoker to privileged consumer group. If we fail to do so, an
    -- error is thrown, but the consumer group does not change
    -- because 'initial_group_on_error' is set to FALSE

    dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
    -- set up exception handler (in the event of an error, we do not want to
    -- return to caller while leaving the session still in the privileged
    -- group)

    BEGIN
```

```

-- perform some operations while under privileged group

EXCEPTION
  WHEN OTHERS THEN
    -- It is possible that the procedure owner does not have privileges
    -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
    -- that the user is moved out of the privileged group in such a
    -- situation

    dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
    RAISE;
  END;

-- we've succeeded. Now switch to old_group, or if cannot do so, switch
-- to caller's initial consumer group

dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/

```

## 157.4.25 UNIQUE\_SESSION\_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

### Syntax

```

DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;

```

### Pragmas

```

pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);

```

### Return Values

**Table 157-27** UNIQUE\_SESSION\_ID Function Return Values

| Return            | Description            |
|-------------------|------------------------|
| unique_session_id | Returns up to 24 bytes |

## 157.4.26 USE\_DEFAULT\_EDITION\_ALWAYS procedure

This procedure turns a mode 'on' or 'off' that disassociates the session from an edition at the end of each and every client call.

Following each call and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

### Syntax

```

DBMS_SESSION.USE_DEFAULT_EDITION_ALWAYS (
    mode_on IN BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 157-28 USE\_DEFAULT\_EDITION\_ALWAYS Procedure Parameters**

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| mode_on   | TRUE to turn on this mode, FALSE to turn off this mode. |

## Usage Notes

- A choice of session edition that might otherwise occur due to use of ALTER SESSION SET EDITION, SET\_EDITION\_DEFERRED, USE\_DEFAULT\_EDITION\_DEFERRED, or the edition-choosing aspect of ALTER SESSION SET CONTAINER will be overridden by this mode.
- Turn this mode off before invoking the above mechanisms to avoid the overriding effect.

## 157.4.27 USE\_DEFAULT\_EDITION\_DEFERRED procedure

This procedure disassociates the session from an edition.

The reset takes effect at the end of the current client call. Following this call, and before the next top level call, no edition will be in use by the session. The session will use the reigning database default edition on its next operation.

## Syntax

```
DBMS_SESSION.USE_DEFAULT_EDITION_DEFERRED
```

## DBMS\_SFW\_ACL\_ADMIN

The DBMS\_SFW\_ACL\_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- [DBMS\\_SFW\\_ACL\\_ADMIN Security Model](#)
- [DBMS\\_SFW\\_ACL\\_ADMIN Operational Notes](#)
- [DBMS\\_SFW\\_ACL\\_ADMIN Examples](#)
- [Summary of DBMS\\_SFW\\_ACL\\_ADMIN Subprograms](#)

### 158.1 DBMS\_SFW\_ACL\_ADMIN Security Model

This package is owned by the DBSFUSER schema. The procedures in this package can be run only by the DBSFUSER user.

### 158.2 DBMS\_SFW\_ACL\_ADMIN Operational Notes

These operation notes apply to DBMS\_SFW\_ACL\_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the [IP\\_ADD\\_ACE Procedure](#) and [IP\\_ADD\\_PDB\\_ACE Procedure](#). After calling these procedures, you call the [COMMIT\\_ACL Procedure](#) to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the [IP\\_REMOVE\\_ACE Procedure](#), [IP\\_REMOVE\\_ACL Procedure](#), [IP\\_REMOVE\\_PDB\\_ACE Procedure](#), or [IP\\_REMOVE\\_PDB\\_ACL Procedure](#), you need to call the [COMMIT\\_ACL Procedure](#) to update the ACL on the listeners.
- Access control must be enabled using the new `FIREWALL` endpoint attribute and the new `LOCAL_REGISTRATION_ADDRESS_listenerName` parameter. The configuration can be done manually in `listener.ora` or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the `IP_ACL` table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the `V$IP_ACL` or `GV$IP_ACL` view. The `IP_ACL` table can contain ACLs that are not in `[G]V$IP_ACL` because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the `COMMIT_ACL` procedure again to send the committed ACLs in the `IP_ACL` table to the local listeners.

In an Oracle RAC environment, `GV$IP_ACL` can be used to query ACLs across the database cluster, and `V$IP_ACL` to query ACLs in the connected instance.

## 158.3 DBMS\_SFW\_ACL\_ADMIN Examples

These three examples show how DBMS\_SFW\_ACL\_ADMIN can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```
## Connect to DBSFUSER
SQL> connect dbsfuser/<password>
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```
SQL> select * from ip_acl;
SERVICE_NAME          HOST
-----
"SVC1.EXAMPLE.COM"      192.168.12.1
"SVC1.EXAMPLE.COM"      192.168.12.2
"SVC1.EXAMPLE.COM"      TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME          HOST          CON_ID
-----
SVC1.EXAMPLE.COM      192.168.12.1      1

```

The following example adds access control entries for pluggable database "PDB1" using various host formats.

```
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

## 158.4 Summary of DBMS\_SFW\_ACL\_ADMIN Subprograms

This table lists the DBMS\_SFW\_ACL\_ADMIN subprograms and briefly describes them.

**Table 158-1 DBMS\_SFW\_ACL\_ADMIN Package Subprograms**

| Subprogram                                  | Description                                                                                                  |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <a href="#">COMMIT_ACL Procedure</a>        | Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances. |
| <a href="#">IP_ADD_ACE Procedure</a>        | Adds an access control entry to the ACL for a database service.                                              |
| <a href="#">IP_ADD_PDB_ACE Procedure</a>    | Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).         |
| <a href="#">IP_REMOVE_ACE Procedure</a>     | Removes an entry from the ACL for a database service.                                                        |
| <a href="#">IP_REMOVE_ACL Procedure</a>     | Removes all entries from the ACL for a database service.                                                     |
| <a href="#">IP_REMOVE_PDB_ACE Procedure</a> | Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).    |
