## Parameters

**Table 221-3 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name      | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p> |
| source_queue_name | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                   |

**Table 221-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>destination_queue_name</code> | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <code>include_tagged_lcr</code>     | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> |

**Table 221-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the source database. The source database is where the changes originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| dml_rule_name   | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ddl_rule_name   | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| inclusion_rule  | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| and_condition   | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p> |

**Table 221-3 (Cont.) ADD\_GLOBAL\_PROPAGATION\_RULES Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_to_queue | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul> |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.3 ADD\_GLOBAL\_RULES Procedure

This procedure adds rules to an XStream clients rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.  
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying all logical change records (LCRs) it receives. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

#### Note:

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
    streams_type          IN   VARCHAR2,
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    queue_name            IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name         OUT  VARCHAR2,
    ddl_rule_name         OUT  VARCHAR2,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    source_root_name      IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN   VARCHAR2  DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_GLOBAL_RULES(
    streams_type          IN   VARCHAR2,
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    queue_name            IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    source_root_name      IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN   VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 221-4 ADD\_GLOBAL\_RULES Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>streams_type</code> | The type of XStream client: <ul style="list-style-type: none"> <li>Specify <code>capture</code> for a capture process.</li> <li>Specify <code>apply</code> for an apply process.</li> </ul> |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as [<i>schema_name</i>.]<i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| include_dml  | <p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| include_ddl  | <p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If TRUE, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</p> |
| source_database    | <p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>                                                                                                                                                                                                                                                         |
| dml_rule_name      | <p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ddl_rule_name      | <p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| inclusion_rule     | <p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 221-4 (Cont.) ADD\_GLOBAL\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| and_condition         | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p> |
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Usage Notes

This procedure creates DML and DDL rules automatically based on include\_dml and include\_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process or apply process uses the rules for filtering.

#### See Also:

- ["Operational Notes"](#)
- ["Security Model"](#)

### Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.4 ADD\_OUTBOUND Procedure

This procedure creates an XStream outbound server that dequeues LCRs from the specified queue. The outbound server streams out the LCRs to an XStream client application.

This procedure creates neither a capture process nor a queue. To create an outbound server, a capture process, and a queue with one procedure call, use the [CREATE\\_OUTBOUND Procedure](#).

To create the capture process individually, use one of the following packages:

- DBMS\_XSTREAM\_ADM
- DBMS\_CAPTURE\_ADM

To create a queue individually, use the SET\_UP\_QUEUE procedure in the DBMS\_XSTREAM\_ADM package.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the lists of tables and schemas in different ways and are mutually exclusive.

#### Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- This procedure enables the outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name`, `start_scn`, and `start_time` parameters are included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_OUTBOUND(  
    server_name          IN VARCHAR2,
```

```

queue_name          IN  VARCHAR2  DEFAULT NULL,
source_database     IN  VARCHAR2  DEFAULT NULL,
table_names        IN  DBMS_UTILITY.UNCL_ARRAY,
schema_names       IN  DBMS_UTILITY.UNCL_ARRAY,
connect_user       IN  VARCHAR2  DEFAULT NULL,
comment            IN  VARCHAR2  DEFAULT NULL,
capture_name       IN  VARCHAR2  DEFAULT NULL,
start_scn          IN  NUMBER     DEFAULT NULL,
start_time         IN  TIMESTAMP  DEFAULT NULL,
include_dml        IN  BOOLEAN    DEFAULT TRUE,
include_ddl        IN  BOOLEAN    DEFAULT FALSE,
source_root_name   IN  VARCHAR2  DEFAULT NULL,
source_container_name IN VARCHAR2  DEFAULT NULL,
lcrld_version      IN  NUMBER     DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_OUTBOUND(
server_name         IN  VARCHAR2,
queue_name         IN  VARCHAR2  DEFAULT NULL,
source_database     IN  VARCHAR2  DEFAULT NULL,
table_names        IN  VARCHAR2  DEFAULT NULL,
schema_names       IN  VARCHAR2  DEFAULT NULL,
connect_user       IN  VARCHAR2  DEFAULT NULL,
comment            IN  VARCHAR2  DEFAULT NULL,
capture_name       IN  VARCHAR2  DEFAULT NULL,
start_scn          IN  NUMBER     DEFAULT NULL,
start_time         IN  TIMESTAMP  DEFAULT NULL,
include_dml        IN  BOOLEAN    DEFAULT TRUE,
include_ddl        IN  BOOLEAN    DEFAULT FALSE,
source_root_name   IN  VARCHAR2  DEFAULT NULL,
source_container_name IN VARCHAR2  DEFAULT NULL,
lcrld_version      IN  NUMBER     DEFAULT NULL);

```

## Parameters

**Table 221-5 ADD\_OUTBOUND Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | <p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>                                                                                                                 |
| queue_name  | <p>The name of the local queue from which the outbound server dequeues LCRs, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If NULL, the procedure raises an error.</p> |

**Table 221-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>                                                                                    |
| table_names     | <p>The tables for which data manipulation language (DML) and data definition language (DDL) changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [schema_name.]table_name. For example, you can specify hr.employees. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p> |
| schema_names    | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. Specify the first schema in position 1. The last position must be NULL.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the schema_names parameter with the table_names parameter. To specify tables, enter fully qualified table names in the table_names parameter (schema_name.table_name).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>          |
| connect_user    | <p>The user who can attach to the specified outbound server to retrieve the LCR stream. The client application must attach to the outbound server as the specified connect user. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p> <p>If NULL, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| comment         | <p>An optional comment associated with the outbound server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| capture_name    | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process for another outbound server, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If the specified name matches the name of an existing capture process for an apply process, then an error is raised.</p> <p>If the specified name does not match the name of an existing capture process, then an error is raised.</p> <p>If NULL, then the outbound server is created without a capture process.</p>                                                  |

**Table 221-5 (Cont.) ADD\_OUTBOUND Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| source_root_name      | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| lcrld_version         | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If <code>NULL</code>, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p>                                                                                                                                                                                                                                                                           |

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.

This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.

- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schemas.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

#### Note:

An empty array includes one `NULL` entry.

## 221.4.5 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
    schema_name          IN   VARCHAR2,
    streams_name         IN   VARCHAR2 DEFAULT NULL,
    source_queue_name    IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml          IN   BOOLEAN DEFAULT TRUE,
    include_ddl          IN   BOOLEAN DEFAULT FALSE,
    include_tagged_lcr   IN   BOOLEAN DEFAULT FALSE,
    source_database      IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name        OUT  VARCHAR2,
    ddl_rule_name        OUT  VARCHAR2,
    inclusion_rule       IN   BOOLEAN DEFAULT TRUE,
    and_condition        IN   VARCHAR2 DEFAULT NULL,
    queue_to_queue      IN   BOOLEAN DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_PROPAGATION_RULES (
    schema_name          IN   VARCHAR2,
    streams_name         IN   VARCHAR2 DEFAULT NULL,
    source_queue_name    IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml          IN   BOOLEAN DEFAULT TRUE,
    include_ddl          IN   BOOLEAN DEFAULT FALSE,
    include_tagged_lcr   IN   BOOLEAN DEFAULT FALSE,
```

```

source_database      IN  VARCHAR2  DEFAULT NULL,
inclusion_rule        IN  BOOLEAN    DEFAULT TRUE,
and_condition        IN  VARCHAR2  DEFAULT NULL,
queue_to_queue       IN  BOOLEAN    DEFAULT NULL);

```

## Parameters

**Table 221-6 ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name            | The name of the schema. For example, hr.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| streams_name           | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>                                                                                                                                                                                                                                                                      |
| source_queue_name      | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                        |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_dml            | If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| include_ddl            | If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 221-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a logical change record (LCR) has a non-<b>NULL</b> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if an LCR has a <b>NULL</b> Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <b>NULL</b> tag.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p> |
| source_database    | <p>The global name of the source database. The source database is where the change originated. If <b>NULL</b>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <b>DBS1</b> and the domain is <b>.NET</b>, then the procedure specifies <b>DBS1.NET</b> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dml_rule_name      | <p>If <code>include_dml</code> is <b>TRUE</b>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <b>FALSE</b>, then this parameter contains a <b>NULL</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 221-6 (Cont.) ADD\_SCHEMA\_PROPAGATION\_RULES Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>and_condition</code>  | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPEs</a></p> |
| <code>queue_to_queue</code> | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul>                                                                                                    |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number

is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a schema rule condition created for DML changes:

```
( (:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.6 ADD\_SCHEMA\_RULES Procedure

This procedure adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Note:

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Replication. Query the `DBA_XSTREAM_OUT_SUPPORT_MODE` data dictionary view to determine which database objects are not supported by Oracle Replication. If unsupported database objects are not excluded, then capture errors will result.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
  schema_name          IN   VARCHAR2,
  streams_type          IN   VARCHAR2,
  streams_name          IN   VARCHAR2  DEFAULT NULL,
  queue_name            IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml            IN   BOOLEAN   DEFAULT TRUE,
  include_ddl            IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr     IN   BOOLEAN   DEFAULT FALSE,
  source_database        IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name          OUT  VARCHAR2,
  ddl_rule_name          OUT  VARCHAR2,
  inclusion_rule         IN   BOOLEAN   DEFAULT TRUE,
  and_condition          IN   VARCHAR2  DEFAULT NULL,
  source_root_name       IN   VARCHAR2  DEFAULT NULL,
```

```

source_container_name IN VARCHAR2 DEFAULT NULL);

DBMS_XSTREAM_ADM.ADD_SCHEMA_RULES(
  schema_name          IN VARCHAR2,
  streams_type         IN VARCHAR2,
  streams_name        IN VARCHAR2 DEFAULT NULL,
  queue_name          IN VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN BOOLEAN DEFAULT TRUE,
  include_ddl         IN BOOLEAN DEFAULT FALSE,
  include_tagged_lcr   IN BOOLEAN DEFAULT FALSE,
  source_database      IN VARCHAR2 DEFAULT NULL,
  inclusion_rule       IN BOOLEAN DEFAULT TRUE,
  and_condition        IN VARCHAR2 DEFAULT NULL,
  source_root_name     IN VARCHAR2 DEFAULT NULL,
  source_container_name IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 221-7 ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name  | <p>The name of the schema. For example, hr.</p> <p>You can specify a schema that does not yet exist, because Oracle Replication does not validate the existence of the schema.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| streams_type | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If NULL, if streams_type is capture, and if one relevant capture process for the queue exists, then the relevant XStream client is used. If no relevant XStream client exists for the queue, then an XStream client is created automatically with a system-generated name. If NULL and multiple XStream clients of the specified streams_type for the queue exist, then the procedure raises an error.</p> <p>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</li> <li>If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</li> </ul> <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |

**Table 221-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name         | <p>The name of the local queue, specified as [<i>schema_name</i>.]<i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| include_dml        | <p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| include_ddl        | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| include_tagged_lcr | <p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Replication tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>Usually, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> |

**Table 221-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name   | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ddl_rule_name   | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| inclusion_rule  | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| and_condition   | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPES</a></p>             |

**Table 221-7 (Cont.) ADD\_SCHEMA\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process or apply process uses the rules for filtering.

- "Operational Notes"
- "Security Model"

### Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.7 ADD\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure adds subset rules to an outbound server configuration. Subset rules instruct the outbound server to stream out a subset of the changes to the specified tables. Outbound servers can stream out a subset of both rows and columns.

This procedure is overloaded. One `column_list` parameter is type `VARCHAR2` and the other `column_list` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

#### Note:

This procedure does not add rules to the outbound server's capture process.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN DBMS_UTILITY.LNAME_ARRAY,
    keep             IN BOOLEAN   DEFAULT TRUE,
    source_database  IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_OUTBOUND_RULES (
    server_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    condition        IN VARCHAR2  DEFAULT NULL,
    column_list      IN VARCHAR2  DEFAULT NULL,
    keep             IN BOOLEAN   DEFAULT TRUE,
    source_database  IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 221-8 ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | The name of the outbound server to which rules are being added. Specify an existing outbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| table_name  | <p>The name of the table specified as <i>[schema_name.]object_name</i>. For example, you can specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>If the outbound server configuration uses a local capture process, then the table must exist at the local source database. If the outbound server configuration uses a downstream capture process, then the table must exist at both the source database and at the downstream capture database.</p> <p>The specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</p> |
| condition   | <p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p>If NULL, then the procedure raises an error.</p> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p>                                                                           |

**Table 221-8 (Cont.) ADD\_SUBSET\_OUTBOUND\_RULES Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>column_list</code>     | <p>The list of columns either to include in the outbound server configuration or to exclude from the outbound server configuration. Whether the columns are included or excluded depends on the setting for the <code>keep</code> parameter.</p> <p>The columns can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>• A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. Specify the first column in position 1. The last position must be <code>NULL</code>.</li> </ul> <p>To include or exclude all of the columns in a table, specify each column in the table in the list or array.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>                                                                                                                                                                                               |
| <code>keep</code>            | <p>If <code>TRUE</code>, then the columns specified in the <code>column_list</code> parameter are kept as part of the outbound server configuration. Therefore, changes to these columns that satisfy the condition in the <code>condition</code> parameter are streamed to the outbound server's client application.</p> <p>If <code>FALSE</code>, then the columns specified in the <code>column_list</code> parameter are excluded from the outbound server configuration. Therefore, changes to these columns are not streamed to the outbound server's client application.</p> <p><b>See Also:</b> "Usage Notes"</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>source_database</code> | <p>The global name of the container where the specified <code>table_names</code> and <code>schema_names</code> are located.</p> <p>If non-<code>NULL</code>, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> |

### Usage Notes

When the `keep` parameter is set to `TRUE`, this procedure creates a keep columns declarative rule-based transformation for the columns listed in `column_list`.

When the `keep` parameter is set to `FALSE`, this procedure creates a delete column declarative rule-based transformation for each column listed in `column_list`.

#### See Also:

*Oracle Database XStream Guide* for information about declarative rule-based transformations

## 221.4.8 ADD\_SUBSET\_PROPAGATION\_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three **OUT** parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
    table_name          IN    VARCHAR2,
    dml_condition       IN    VARCHAR2,
    streams_name        IN    VARCHAR2  DEFAULT NULL,
    source_queue_name   IN    VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_tagged_lcr  IN    BOOLEAN  DEFAULT FALSE,
    source_database     IN    VARCHAR2  DEFAULT NULL,
    insert_rule_name    OUT   VARCHAR2,
    update_rule_name    OUT   VARCHAR2,
    delete_rule_name   OUT   VARCHAR2,
    queue_to_queue     IN    BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_PROPAGATION_RULES (
    table_name          IN    VARCHAR2,
    dml_condition       IN    VARCHAR2,
    streams_name        IN    VARCHAR2  DEFAULT NULL,
    source_queue_name   IN    VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_tagged_lcr  IN    BOOLEAN  DEFAULT FALSE,
    source_database     IN    VARCHAR2  DEFAULT NULL,
    queue_to_queue     IN    BOOLEAN  DEFAULT NULL);
```

### Parameters

**Table 221-9 ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name    | <p>The name of the table specified as <i>[schema_name.]object_name</i>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>                                                                                                                 |
| dml_condition | <p>The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p> |

**Table 221-9 (Cont.) ADD\_SUBSET\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_name           | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>                                                                                                                                                                                                                                                                      |
| source_queue_name      | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                        |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_tagged_lcr     | <p>If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| source_database        | <p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                    |
| insert_rule_name       | <p>Contains the system-generated INSERT rule name. This rule handles inserts and updates that must be converted into inserts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <code>update_rule_name</code> | Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>delete_rule_name</code> | Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>queue_to_queue</code>   | <p>If <code>TRUE</code> or <code>NULL</code>, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If <code>TRUE</code> and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>FALSE</code> and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If <code>NULL</code>, then the procedure does not change the queue to queue property of the propagation.</li> </ul> |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the

propagation are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

#### Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

### Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## 221.4.9 ADD\_SUBSET\_RULES Procedure

This procedure adds rules to an XStream client.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.

This procedure creates the specified capture process if it does not exist.

- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an

outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type       IN   VARCHAR2 DEFAULT 'apply',
    streams_name       IN   VARCHAR2 DEFAULT NULL,
    queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
    source_database    IN   VARCHAR2 DEFAULT NULL,
    insert_rule_name   OUT  VARCHAR2,
    update_rule_name   OUT  VARCHAR2,
    delete_rule_name  OUT  VARCHAR2,
    source_root_name   IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN VARCHAR2  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type       IN   VARCHAR2 DEFAULT 'apply',
    streams_name       IN   VARCHAR2 DEFAULT NULL,
    queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
    include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
    source_database    IN   VARCHAR2 DEFAULT NULL,
    source_root_name   IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 221-10** ADD\_SUBSET\_RULES Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name    | <p>The name of the table specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the capture process or apply process. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.</p>                                                                                      |
| dml_condition | <p>The subset condition. Specify this condition similar to the way you specify conditions in a <code>WHERE</code> clause in SQL.</p> <p>For example, to specify rows in the <code>hr.employees</code> table where the salary is greater than 4000 and the <code>job_id</code> is <code>SA_MAN</code>, enter the following as the condition:</p> <pre>' salary &gt; 4000 and job_id = 'SA_MAN' '</pre> <p><b>Note:</b> The quotation marks in the preceding example are all single quotation marks.</p> |
| streams_type  | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify apply for an apply process.</li> </ul>                                                                                                                                                                                                                                                                                                                               |

**Table 221-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>streams_name</code>       | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>• If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| <code>queue_name</code>         | <p>The name of the local queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>include_tagged_lcr</code> | <p>If <code>TRUE</code>, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<code>NULL</code> tag.</li> <li>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-<code>NULL</code> tag.</li> </ul> <p>If <code>FALSE</code>, then an XStream client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li>• A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag.</li> <li>• An LCR is considered for apply by an apply process only if the LCR contains a <code>NULL</code> tag.</li> </ul> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 221-10 (Cont.) ADD\_SUBSET\_RULES Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database       | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| insert_rule_name      | Contains the system-generated <code>INSERT</code> rule name. This rule handles inserts and updates that must be converted into inserts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| update_rule_name      | Contains the system-generated <code>UPDATE</code> rule name. This rule handles updates that remain updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| delete_rule_name      | Contains the system-generated <code>DELETE</code> rule name. This rule handles deletes and updates that must be converted into deletes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| source_root_name      | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Usage Notes

Running this procedure generates three rules for the specified capture process or apply process: one for `INSERT` statements, one for `UPDATE` statements, and one for `DELETE` statements. For `INSERT` and `DELETE` statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured or applied. For `UPDATE` statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured or applied without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured or applied.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process or apply process uses the rules for filtering. If the XStream client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

#### Note:

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

## Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

## 221.4.10 ADD\_TABLE\_PROPAGATION\_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    source_queue_name    IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
    source_database      IN   VARCHAR2 DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
    and_condition       IN   VARCHAR2 DEFAULT NULL,
    queue_to_queue      IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name        IN   VARCHAR2 DEFAULT NULL,
    source_queue_name    IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml         IN   BOOLEAN  DEFAULT TRUE,
    include_ddl         IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
    source_database      IN   VARCHAR2 DEFAULT NULL,
    inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
    and_condition       IN   VARCHAR2 DEFAULT NULL,
    queue_to_queue      IN   BOOLEAN  DEFAULT NULL);
```

### Parameters

**Table 221-11 ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | The name of the table specified as <code>[schema_name.] table_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                          |
| streams_name | <p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p> |

**Table 221-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_queue_name      | <p>The name of the source queue, specified as <code>[schema_name.]queue_name</code>. The current database must contain the source queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                        |
| destination_queue_name | <p>The name of the destination queue, including a database link, specified as <code>[schema_name.]queue_name[@dblink_name]</code>, if the destination queue is in a remote database. The queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>dbs2.net</code>, enter <code>strmadmin.streams_queue@dbs2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p><b>Note:</b> Connection qualifiers are not allowed.</p> |
| include_dml            | <p>If <code>TRUE</code>, then the procedure creates a rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| include_ddl            | <p>If <code>TRUE</code>, then the procedure creates a rule for DDL changes. If <code>FALSE</code>, then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.</p> <p>The generated rule evaluates to <code>TRUE</code> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <code>FALSE</code> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <code>FALSE</code> for changes that create synonyms or views based on the table. The rule also evaluates to <code>FALSE</code> for a change to a PL/SQL subprogram that refers to the table.</p>                                                |

**Table 221-11 (Cont.) ADD\_TABLE\_PROPAGATION\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_tagged_lcr | <p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a logical change record (LCR) has a non-<b>NULL</b> tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-<b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if an LCR has a <b>NULL</b> Oracle Replication tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a <b>NULL</b> tag. If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a <b>NULL</b> tag.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p> |
| source_database    | <p>The global name of the source database. The source database is where the change originated. If <b>NULL</b>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <b>DBS1</b> and the domain is <b>.NET</b>, then the procedure specifies <b>DBS1.NET</b> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dml_rule_name      | <p>If <code>include_dml</code> is <b>TRUE</b>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <b>FALSE</b>, then this parameter contains a <b>NULL</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>and_condition</code>  | <p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Replication tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p><b>See Also:</b> <a href="#">Logical Change Record TYPEs</a></p> |
| <code>queue_to_queue</code> | <p>If TRUE or NULL, then a new propagation created by this procedure is a queue-to-queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> <li>• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.</li> <li>• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.</li> <li>• If NULL, then the procedure does not change the queue to queue property of the propagation.</li> </ul>                                                                                                   |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is

used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

### Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.11 ADD\_TABLE\_RULES Procedure

This procedure adds rules to an XStream client rule set.

It adds rules to a rule set of one of the following types of XStream clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table.  
This procedure creates the specified capture process if it does not exist.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, outbound server, or inbound server, this procedure adds apply rules for applying logical change records (LCRs) that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates an apply process if no apply process, outbound server, or inbound server exists with the specified `streams_name`. This procedure can add rules to an outbound server or inbound server, but it cannot create an outbound server or inbound server.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

### Syntax

```
DBMS_XSTREAM_ADM.ADD_TABLE_RULES (
    table_name          IN   VARCHAR2,
    streams_type        IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN   DEFAULT TRUE,
    include_ddl         IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL,
    source_root_name    IN   VARCHAR2  DEFAULT NULL,
    source_container_name IN  VARCHAR2  DEFAULT NULL);
```

| streams_name | <p>The name of the capture process or apply process. Do not specify an owner.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>capture</code>, and if one relevant capture process for the queue exists, then the procedure uses the relevant XStream client. If no relevant XStream client exists for the queue, then the procedure creates an XStream client automatically with a system-generated name. If <code>NULL</code> and multiple XStream clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If <code>NULL</code>, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> <li>If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> <li>If <code>source_database</code> is <code>NULL</code> and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process.</li> </ul> <p>If <code>NULL</code> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</p> <p>If <code>NULL</code> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>Each apply process must have a unique name.</p> |
| queue_name   | <p>The name of the local queue, specified as <i>[schema_name.]queue_name</i>. The current database must contain the queue, and the queue must be <code>ANYDATA</code> type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For outbound server rules, this is the queue from which the outbound server dequeues LCRs. For inbound server rules, this is the queue into which an inbound server enqueues error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| include_dml  | <p>If <code>TRUE</code>, then the procedure creates a DML rule for DML changes. If <code>FALSE</code>, then the procedure does not create a DML rule. <code>NULL</code> is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 221-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_ddl        | <p>If <b>TRUE</b>, then the procedure creates a DDL rule for DDL changes. If <b>FALSE</b>, then the procedure does not create a DDL rule. <b>NULL</b> is not permitted.</p> <p>The generated rule evaluates to <b>TRUE</b> for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to <b>FALSE</b> for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to <b>FALSE</b> for changes that create synonyms or views based on the table. The rule also evaluates to <b>FALSE</b> for a change to a PL/SQL subprogram that refers to the table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| include_tagged_lcr | <p>If <b>TRUE</b>, then the procedure does not add a condition regarding Oracle Replication tags to the generated rules. Therefore, these rules can evaluate to <b>TRUE</b> regardless of whether a redo entry, session, or LCR has a non-<b>NULL</b> tag. If the rules are added to the positive rule set for the XStream client, then the XStream client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> <li>• A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<b>NULL</b> tag.</li> <li>• An LCR is always considered for apply by an apply process, regardless of whether redo entry or LCR has a non-<b>NULL</b> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <b>TRUE</b> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the XStream client, then whether a database change is discarded does not depend on the tag.</p> <p>If <b>FALSE</b>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <b>TRUE</b> only if a redo entry, session, or LCR has a <b>NULL</b> Oracle Replication tag. If the rules are added to the positive rule set for an XStream client, then the XStream client performs its action only when the tag is <b>NULL</b>:</p> <ul style="list-style-type: none"> <li>• A redo entry is considered for capture by a capture process only when the redo entry contains a <b>NULL</b> tag.</li> <li>• An LCR is considered for apply by an apply process only if the LCR contains a <b>NULL</b> tag.</li> </ul> <p>If the rules are added to a positive rule set, then setting this parameter to <b>FALSE</b> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the XStream client, then a database change can be discarded only if it has a <b>NULL</b> tag.</p> <p>A setting of <b>FALSE</b> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>Usually, specify <b>TRUE</b> for this parameter if the <code>inclusion_rule</code> parameter is set to <b>FALSE</b>.</p> |

**Table 221-12 (Cont.) ADD\_TABLE\_RULES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database | <p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured LCRs, then the apply process can apply LCRs from only one capture process at one source database.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, <code>mycdb.example.com</code> or <code>hrpdb.example.com</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> |
| dml_rule_name   | <p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ddl_rule_name   | <p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| inclusion_rule  | <p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the XStream client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| and_condition   | <p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Replication tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p>                                                                     |

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_root_name      | <p>The global name of the root in the source CDB. For example, mycdb.example.com.</p> <p>If this parameter is NULL, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-NULL value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process or apply process uses the rules for filtering.

### Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))  
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

## 221.4.12 ALTER\_INBOUND Procedure

This procedure modifies an XStream inbound server.

### Syntax

```
DBMS_XSTREAM_ADM.ALTER_INBOUND(  
    server_name IN VARCHAR2,  
    apply_user  IN VARCHAR2  DEFAULT NULL,  
    comment     IN VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 221-13 ALTER\_INBOUND Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | The name of the inbound server being altered. Specify an existing inbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| apply_user  | <p>The user who applies all DML and DDL changes that satisfy the inbound server rule sets, who runs user-defined apply handlers, and who runs custom rule-based transformations configured for inbound server rules.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>Specify a user to change the apply user. In this case, the user who invokes the ALTER_INBOUND procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.</p> <p>If NULL, then the apply user is not changed.</p> <p>See "CREATE_INBOUND Procedure" for information about the required privileges for an apply user.</p> |
| comment     | <p>An optional comment associated with the inbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 221.4.13 ALTER\_OUTBOUND Procedure

This procedure modifies an XStream outbound server configuration.

This procedure always alters the specified outbound server. This procedure can also alter the outbound server's capture process when either of the following conditions is met:

- The capture process was created by the CREATE\_OUTBOUND procedure in this package.
- The queue used by the capture process was created by the CREATE\_OUTBOUND procedure.

To check whether this procedure can alter the outbound server's capture process, query the CAPTURE\_NAME column in the ALL\_XSTREAM\_OUTBOUND view. When the name of the capture process appears in the CAPTURE\_NAME column of this view, the ALTER\_OUTBOUND procedure can manage the capture process's rules or change the capture user for the capture process. When the CAPTURE\_NAME column of this view is NULL, the ALTER\_OUTBOUND procedure cannot manage the capture process.

This procedure is overloaded. One table\_names parameter is type VARCHAR2 and the other table\_names parameter is type DBMS\_UTILITY.UNCL\_ARRAY. Also, one schema\_names parameter is type VARCHAR2 and the other schema\_names parameter is type DBMS\_UTILITY.UNCL\_ARRAY. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

### Note:

Starting with Oracle Database 11g Release 2 (11.2.0.2), the start\_scn and start\_time parameters are included in this procedure.

## Syntax

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND (
    server_name          IN VARCHAR2,
    table_names          IN DBMS_UTILITY.UNCL_ARRAY,
    schema_names         IN DBMS_UTILITY.UNCL_ARRAY,
    add                  IN BOOLEAN    DEFAULT TRUE,
    capture_user         IN VARCHAR2   DEFAULT NULL,
    connect_user         IN VARCHAR2   DEFAULT NULL,
    comment              IN VARCHAR2   DEFAULT NULL,
    inclusion_rule       IN BOOLEAN    DEFAULT TRUE,
    start_scn            IN NUMBER     DEFAULT NULL,
    start_time           IN TIMESTAMP  DEFAULT NULL,
    include_dml          IN BOOLEAN    DEFAULT TRUE,
    include_ddl          IN BOOLEAN    DEFAULT FALSE,
    source_database      IN VARCHAR2   DEFAULT NULL,
    source_container_name IN VARCHAR2   DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.ALTER_OUTBOUND (
    server_name          IN VARCHAR2,
    table_names          IN VARCHAR2   DEFAULT NULL,
    schema_names         IN VARCHAR2   DEFAULT NULL,
    add                  IN BOOLEAN    DEFAULT TRUE,
    capture_user         IN VARCHAR2   DEFAULT NULL,
    connect_user         IN VARCHAR2   DEFAULT NULL,
    comment              IN VARCHAR2   DEFAULT NULL,
    inclusion_rule       IN BOOLEAN    DEFAULT TRUE,
    start_scn            IN NUMBER     DEFAULT NULL,
    start_time           IN TIMESTAMP  DEFAULT NULL,
    include_dml          IN BOOLEAN    DEFAULT TRUE,
    include_ddl          IN BOOLEAN    DEFAULT FALSE,
    source_database      IN VARCHAR2   DEFAULT NULL,
    source_container_name IN VARCHAR2   DEFAULT NULL);
```

## Parameters

**Table 221-14 ALTER\_OUTBOUND Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name | The name of the outbound server being altered. Specify an existing outbound server. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| table_names | <p>The tables that are either added to or removed from the XStream Out configuration. Whether the tables are added or removed depends on the setting for the add parameter.</p> <p>The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type VARCHAR2.</li> <li>A PL/SQL associative array of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. Specify the first table in position 1. The last position must be NULL.</li> </ul> <p>Each table should be specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p> |

**Table 221-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_names | <p>The schemas that are either added to or removed from the XStream Out configuration. Whether the schemas are added or removed depends on the setting for the <code>add</code> parameter.</p> <p>The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>                                                                                                                                                                                                                                                                    |
| add          | <p>If <code>TRUE</code>, then the procedure adds to the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p> <p>If <code>FALSE</code>, then the procedure removes from the XStream Out configuration the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules.</p> <p>Specify a user to change the capture user. In this case, the user who invokes the <code>ALTER_OUTBOUND</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>If <code>NULL</code>, then the capture user is not changed.</p> <p>If you change the capture user, then this procedure grants the new capture user <code>enqueue</code> privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>Ensure that the capture user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a capture user.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using <code>DROP USER . . . CASCADE</code>, then the capture process is also dropped automatically.</p> |
| connect_user | <p>The user who can attach to the specified outbound server to retrieve the change stream. The XStream client application must attach to the outbound server as the specified connect user.</p> <p>Specify a user to change the connect user. In this case, the user who invokes the <code>ALTER_OUTBOUND</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>connect_user</code> to <code>SYS</code>.</p> <p>If <code>NULL</code>, then the connect user is not changed.</p> <p>If you change the connect user, then this procedure grants the new connect user <code>dequeue</code> privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>Ensure that the connect user is granted the other required privileges. See "CREATE_OUTBOUND Procedure" for information about the privileges required by a connect user.</p>                                                                                                                                                                                                                                                                                    |

**Table 221-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <code>comment</code>        | <p>An optional comment associated with the outbound server.</p> <p>If non-NULL, then the specified comment replaces the existing comment.</p> <p>If NULL, then the existing comment is not changed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>inclusion_rule</code> | <p>If TRUE and the <code>add</code> parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the positive rule sets in the XStream Out configuration. When rules for tables and schemas are in positive rule sets, the XStream Out configuration streams DML and DDL changes to the tables and schemas out to the client application.</p> <p>If TRUE and the <code>add</code> parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the positive rule sets in the XStream Out configuration.</p> <p>If FALSE and the <code>add</code> parameter is set to TRUE, then the procedure adds rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter to the negative rule sets in the XStream Out configuration. When rules for tables and schemas are in negative rule sets, the XStream Out configuration does not stream changes to the tables and schemas out to the client application.</p> <p>If FALSE and the <code>add</code> parameter is set to FALSE, then the procedure removes rules for the tables specified in the <code>table_names</code> parameter and the schemas specified in the <code>schema_names</code> parameter from the negative rule sets in the XStream Out configuration.</p> |
| <code>start_scn</code>      | <p>A valid SCN for the database from which the capture process starts capturing changes. To be valid, the SCN value must be greater than or equal to the first SCN for the capture process.</p> <p>If a valid SCN is specified, then the capture process captures changes from the specified SCN when it is restarted.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>If NULL and the <code>start_time</code> parameter is NULL, then the start SCN is not changed.</p> <p>If NULL and the <code>start_time</code> parameter is non-NULL, then the start SCN is changed to match the specified start time.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the <code>start_scn</code> parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the <code>start_scn</code> parameter is non-NULL.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 221-14 (Cont.) ALTER\_OUTBOUND Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time            | <p>A valid time from which the capture process starts capturing changes. To be valid, the time must correspond to an SCN value that is greater than or equal to the first SCN for the capture process.</p> <p>If a valid time is specified, then the capture process captures changes from the specified time when it is restarted.</p> <p>An error is returned if an invalid time is specified.</p> <p>If NULL and the start_scn parameter is NULL, then the start time is not changed.</p> <p>If NULL and the start_scn parameter is non-NULL, then the start time is changed to match the specified start SCN.</p> <p>The start_scn and start_time parameters are mutually exclusive.</p> <p><b>Note:</b> If the capture process is enabled, then the ALTER_OUTBOUND procedure automatically stops and restarts the capture process when the start_time parameter is non-NULL. If the capture process is disabled, then the ALTER_OUTBOUND procedure automatically starts the capture process when the start_time parameter is non-NULL.</p> |
| include_dml           | <p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| include_ddl           | <p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| source_database       | <p>The global name of the container where the specified table_names and schema_names are located.</p> <p>If source_database is non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| source_container_name | <p>The short name of the source container. The container can be the root or a PDB. For example, CDB\$ROOT or hrpdb. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the table\_names and schema\_names parameters:

- If both the table\_names and schema\_names parameters are NULL or empty, then no rules are changed for the XStream Out configuration.  
This procedure is overloaded. The table\_names and schema\_names parameters are defaulted to NULL. Do not specify NULL for both table\_names and schema\_names in the same call; otherwise, error PLS-00307 is returned.
- If both the table\_names and schema\_names parameters are specified, then the rules for the tables and schemas are added to or removed from the XStream Out configuration, depending on the setting of the add parameter.
- If the table\_names parameter is specified and the schema\_names parameter is NULL or empty, then the rules for the tables are added to or removed from the XStream Out configuration, depending on the setting of the add parameter. The existing rules for schemas are not changed for the XStream Out configuration.

- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the rules for the schemas are added to or removed from the XStream Out configuration, depending on the setting of the `add` parameter. The existing rules for tables are not changed for the XStream Out configuration.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the `schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

#### Note:

An empty array includes one `NULL` entry.

## 221.4.14 CREATE\_INBOUND Procedure

This procedure creates an XStream inbound server and its queue.

#### Note:

A client application can create multiple sessions. Each session can attach to only one inbound server, and each inbound server can serve only one session at a time. However, different client application sessions can connect to different inbound servers. See *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an inbound server.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_INBOUND (
  server_name IN VARCHAR2,
  queue_name  IN VARCHAR2,
  apply_user  IN VARCHAR2  DEFAULT NULL,
  comment     IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 221-15 CREATE\_INBOUND Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | <p>The name of the inbound server being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The <code>server_name</code> setting cannot exceed 30 bytes, and it cannot be altered after the inbound server is created.</p> |

**Table 221-15 (Cont.) CREATE\_INBOUND Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name | <p>The name of the local queue used by the inbound server, specified as <code>[schema_name.] queue_name</code>.</p> <p>If the specified queue exists, then it is used. If the specified queue does not exist, then the procedure creates it.</p> <p>For example, to specify a queue named <code>xstream_queue</code> in the <code>xstrmadmin</code> schema, enter <code>xstrmadmin.xstream_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> An inbound server's queue is used only to store error transactions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| apply_user | <p>The apply user. If <code>NULL</code>, then the current user is the default.</p> <p>The client application must attach to the inbound server as the apply user.</p> <p>The apply user is the user in whose security domain an inbound server evaluates whether LCRs satisfy its rule sets, applies DML and DDL changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to perform these actions. This procedure grants the apply user dequeue privileges on the queue used by the inbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, you must grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>• The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>• <code>EXECUTE</code> privilege on the rule sets used by the inbound server</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> <li>• <code>EXECUTE</code> privilege on all apply handler procedures</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the apply user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the inbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p><b>Note:</b> If the apply user for an inbound server is dropped using <code>DROP USER . . . CASCADE</code>, then the inbound server is also dropped automatically.</p> |
| comment    | An optional comment associated with the inbound server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Usage Notes

By default, an inbound server does not use rules or rule sets. Therefore, an inbound server applies all of the LCRs sent to it by an XStream client application. However, to filter the LCRs sent to an inbound server, you can add rules and rule sets to an inbound server using the `DBMS_XSTREAM_ADM` and `DBMS_RULE_ADM` packages.

In a CDB, you can execute the `CREATE_INBOUND` procedure from either the root or a PDB. The inbound server is restricted to receiving LCRs from one source database and only applying the changes to its local container. If the inbound server is at the root level, then the apply user must be a common user.

## 221.4.15 CREATE\_OUTBOUND Procedure

This procedure creates an XStream outbound server, queue, and capture process to enable client applications to stream out Oracle database changes.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. Also, one `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables and schemas in different ways and are mutually exclusive.

### Note:

- A client application can create multiple sessions. Each session can attach to only one outbound server, and each outbound server can serve only one session at a time. However, different client application sessions can connect to different outbound servers. See "OCIXStreamOutAttach()" in the *Oracle Call Interface Programmer's Guide* and *Oracle Database XStream Java API Reference* for information about attaching to an outbound server.
- If the `capture_name` parameter is `NULL`, then this procedure automatically generates a name for the capture process that it creates.
- This procedure automatically generates a name for the queue that it creates.
- This procedure enables both the capture process and outbound server that it creates.
- Starting with Oracle Database 11g Release 2 (11.2.0.2), the `capture_name` parameter is included in this procedure.

### Syntax

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND (
  server_name          IN VARCHAR2,
  source_database      IN VARCHAR2  DEFAULT NULL,
  table_names          IN DBMS_UTILITY.UNCL_ARRAY,
  schema_names         IN DBMS_UTILITY.UNCL_ARRAY,
  capture_user         IN VARCHAR2  DEFAULT NULL,
  connect_user         IN VARCHAR2  DEFAULT NULL,
  comment              IN VARCHAR2  DEFAULT NULL,
  capture_name         IN VARCHAR2  DEFAULT NULL,
  include_dml          IN BOOLEAN    DEFAULT TRUE,
  include_ddl          IN BOOLEAN    DEFAULT FALSE,
  source_root_name     IN VARCHAR2  DEFAULT NULL,
  source_container_name IN VARCHAR2  DEFAULT NULL,
  lcrid_version        IN NUMBER     DEFAULT NULL);
```

```
DBMS_XSTREAM_ADM.CREATE_OUTBOUND (
  server_name          IN VARCHAR2,
```

```

source_database      IN VARCHAR2  DEFAULT NULL,
table_names          IN VARCHAR2  DEFAULT NULL,
schema_names         IN VARCHAR2  DEFAULT NULL,
capture_user         IN VARCHAR2  DEFAULT NULL,
connect_user         IN VARCHAR2  DEFAULT NULL,
comment              IN VARCHAR2  DEFAULT NULL,
capture_name         IN VARCHAR2  DEFAULT NULL,
include_dml          IN BOOLEAN   DEFAULT TRUE,
include_ddl          IN BOOLEAN   DEFAULT FALSE,
source_root_name     IN VARCHAR2  DEFAULT NULL,
source_container_name IN VARCHAR2  DEFAULT NULL,
lcrld_version        IN NUMBER    DEFAULT NULL);

```

## Parameters

**Table 221-16 CREATE\_OUTBOUND Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_name     | <p>The name of the outbound server being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing outbound server, inbound server, apply process, or messaging client.</p> <p><b>Note:</b> The server_name setting cannot exceed 30 bytes, and it cannot be altered after the outbound server is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| source_database | <p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If non-NULL, then a condition is added to the outbound server's rules to filter the LCRs based on the global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>In a CDB, specify the global name of the container to which the rules pertain. The container can be the root or a PDB. For example, mycdb.example.com or hrpdb.example.com. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>In a non-CDB, if non-NULL and the specified name is different from the global name of the current database, then downstream capture is assumed. In this case, configure the transmission of redo data from the source database to the downstream database before running the CREATE_OUTBOUND procedure. See <i>Oracle Database XStream Guide</i> for instructions.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> |

**Table 221-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_names  | <p>The tables for which DML and DDL changes are streamed out to the XStream client application. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a table. Specify the first table in position 1. The last position must be <code>NULL</code>.</li> </ul> <p>Each table should be specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| schema_names | <p>The schemas for which DML and DDL changes are streamed out to the XStream client application. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>Comma-delimited list of type <code>VARCHAR2</code>.</li> <li>A PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a schema. Specify the first schema in position 1. The last position must be <code>NULL</code>.</li> </ul> <p><b>Note:</b> This procedure does not concatenate the <code>schema_names</code> parameter with the <code>table_names</code> parameter. To specify tables, enter fully qualified table names in the <code>table_names</code> parameter (<code>schema_name.table_name</code>).</p> <p><b>See Also:</b> "Usage Notes" for more information about this parameter</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| capture_user | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the current user is the default.</p> <p>This procedure grants the capture user <code>enqueue</code> privilege on the queue used by the capture process and configures the user as a secure queue user.</p> <p>In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <li><code>EXECUTE</code> privilege on the rule sets used by the capture process</li> <li><code>EXECUTE</code> privilege on all rule-based transformation functions used in the positive rule set</li> </ul> <p>You can grant these privileges directly to the apply user, or you can grant them through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Only a user who is granted the <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>A capture user does not require privileges on a database object to capture changes made to it. The capture process can pass these changes to a custom rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.</p> |

**Table 221-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>connect_user</code> | <p>The user who can attach to the specified outbound server to retrieve the change stream. The client application must attach to the outbound server as the specified connect user.</p> <p>If <code>NULL</code>, then the current user is the default.</p> <p>The connect user is the user in whose security domain an outbound server evaluates LCRs against its rule sets and runs custom rule-based transformations configured for outbound server rules. This user must have the necessary privileges to perform these actions. This procedure grants the connect user dequeue privileges on the queue used by the outbound server and configures the user as a secure queue user.</p> <p>In addition to the privileges granted by this procedure, grant the following privileges to the connect user:</p> <ul style="list-style-type: none"> <li>• <code>EXECUTE</code> privilege on the rule sets used by the outbound server</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>You can grant these privileges directly to the connect user, or you can grant them through roles.</p> <p>In addition, the connect user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle supplied packages, that are invoked in subprograms run by the outbound server. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> |
| <code>comment</code>      | An optional comment associated with the outbound server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>capture_name</code> | <p>The name of the capture process configured to capture changes for the outbound server. Do not specify an owner.</p> <p>The capture process must not exist. If the specified name matches the name of an existing capture process, then an error is raised.</p> <p>If the name does not match the name of an existing capture process, then the procedure creates a new capture process with the specified name.</p> <p>If <code>NULL</code>, then the system creates a new capture process with a system-generated name.</p> <p><b>Note:</b> The capture process name cannot be altered after the capture process is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>include_dml</code>  | If <code>TRUE</code> , then the procedure creates a DML rule for DML changes. If <code>FALSE</code> , then the procedure does not create a DML rule. <code>NULL</code> is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>include_ddl</code>  | If <code>TRUE</code> , then the procedure creates a DDL rule for DDL changes. If <code>FALSE</code> , then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 221-16 (Cont.) CREATE\_OUTBOUND Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>source_root_name</code>      | <p>The global name of the root in the source CDB. For example, <code>mycdb.example.com</code>.</p> <p>If this parameter is <code>NULL</code>, then the global name of the root in the local CDB is used. If you are configuring downstream capture, then this parameter must be a non-<code>NULL</code> value, and it must specify the global name of the root in the remote source CDB. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |
| <code>source_container_name</code> | <p>The short name of the source container. The container can be the root or a PDB. For example, <code>CDB\$ROOT</code> or <code>hrpdb</code>. See <i>Oracle Database XStream Guide</i> for more information about setting this parameter in a CDB.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>lcrld_version</code>         | <p>The LCRID version for captured LCRs, either 1 or 2.</p> <p>If 2, then the LCRs are compatible with a database with its compatibility level at 12.2.0 or higher.</p> <p>If 1, then the LCRs are compatible with a database with its compatibility level at 12.1.0 or lower.</p> <p>If <code>NULL</code>, the default, and the database compatibility level is 12.2.0 or higher, then the <code>lcrld_version</code> is set to 2 internally. If the database compatibility level is 12.1.0 or lower, then the <code>lcrld_version</code> is set to 1 internally.</p>                                                                                                                                                                                                                                                                           |

### Usage Notes

The following list describes the behavior of the outbound server for various combinations of the `table_names` and `schema_names` parameters:

- If both the `table_names` and `schema_names` parameters are `NULL` or empty, then the outbound server streams all DML and DDL changes to the client application.  
This procedure is overloaded. The `table_names` and `schema_names` parameters are defaulted to `NULL`. Do not specify `NULL` for both `table_names` and `schema_names` in the same call; otherwise, error `PLS-00307` is returned.
- If both the `table_names` and `schema_names` parameters are specified, then the outbound server streams DML and DDL changes for the specified tables and schemas.
- If the `table_names` parameter is specified and the `schema_names` parameter is `NULL` or empty, then the outbound server streams DML and DDL changes for the specified tables.
- If the `table_names` parameter is `NULL` or empty and the `schema_names` parameter is specified, then the outbound server streams DML and DDL changes for the specified schema.

For the procedure that uses the `DBMS_UTILITY.UNCL_ARRAY` type for the `table_names` and `schema_names` parameters, both parameters must be specified. To specify only tables, the

`schema_names` parameter must be specified and empty. To specify only schemas, the `table_names` parameter must be specified and empty.

**Note:**

An empty array includes one `NULL` entry.

## 221.4.16 DELETE\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

**Note:**

- The `DELETE_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- The `DELETE_COLUMN` procedure is useful when you want to delete a relatively small number of columns in a row LCR. To delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the `KEEP_COLUMNS` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by capture processes
- [KEEP\\_COLUMNS Procedure](#)

### Syntax

```
DBMS_XSTREAM_ADM.DELETE_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  value_type     IN  VARCHAR2  DEFAULT '*',
  step_number    IN  NUMBER    DEFAULT 0,
  operation      IN  VARCHAR2  DEFAULT 'ADD');
```

## Parameters

**Table 221-17 DELETE\_COLUMN Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name   | The name of the rule, specified as <code>[schema_name.] rule_name</code> . If NULL, then the procedure raises an error.<br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| table_name  | The name of the table from which the column is deleted in the row LCR, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                       |
| column_name | The name of the column deleted from each row LCR that satisfies the rule.                                                                                                                                                                                                                                                          |
| value_type  | Specify 'NEW' to delete the column from the new values in the row LCR.<br>Specify 'OLD' to delete the column from the old values in the row LCR.<br>Specify '*' to delete the column from both the old and new values in the row LCR.                                                                                              |
| step_number | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                          |
| operation   | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                               |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `DELETE_COLUMN` procedure when one or more of these parameters is NULL:

| table_name | column_name | step_number | Result                                                                                                                                    |
|------------|-------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL        | NULL        | Remove all delete column transformations for the specified rule.                                                                          |
| NULL       | NULL        | non-NULL    | Remove all delete column transformations with the specified <code>step_number</code> for the specified rule.                              |
| NULL       | non-NULL    | non-NULL    | Remove all delete column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule. |
| non-NULL   | NULL        | non-NULL    | Remove all delete column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.  |
| NULL       | non-NULL    | NULL        | Remove all delete column transformations with the specified <code>column_name</code> for the specified rule.                              |

| table_name | column_name | step_number | Result                                                                                                                       |
|------------|-------------|-------------|------------------------------------------------------------------------------------------------------------------------------|
| non-NULL   | non-NULL    | NULL        | Remove all delete column transformations with the specified table_name and column_name for the specified rule.               |
| non-NULL   | NULL        | NULL        | Remove all delete column transformations with the specified table_name for the specified rule.                               |
| non-NULL   | non-NULL    | non-NULL    | Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule. |

## 221.4.17 DROP\_INBOUND Procedure

This procedure removes an inbound server configuration.

This procedure always removes the specified inbound server. This procedure also removes the queue for the inbound server if all of the following conditions are met:

- One call to the `CREATE_INBOUND` procedure created the queue.
- The inbound server is the only subscriber to the queue.

**See Also:**

"[CREATE\\_INBOUND Procedure](#)"

### Syntax

```
DBMS_XSTREAM_ADM.DROP_INBOUND (
    server_name IN VARCHAR2);
```

### Parameters

**Table 221-18 DROP\_INBOUND Procedure Parameters**

| Parameter   | Description                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------|
| server_name | The name of the inbound server being removed. Specify an existing inbound server. Do not specify an owner. |

## 221.4.18 DROP\_OUTBOUND Procedure

This procedure removes an outbound server configuration.

This procedure always drops the specified outbound server. This procedure also drops the queue used by the outbound server if both of the following conditions are met:

- The queue was created by the `CREATE_OUTBOUND` procedure in this package.
- The outbound server is the only subscriber to the queue.

If either one of the preceding conditions is not met, then the `DROP_OUTBOUND` procedure only drops the outbound server. It does not drop the queue.

This procedure also drops the capture process for the outbound server if both of the following conditions are met:

- The procedure can drop the outbound server's queue.
- The capture process was created by the `CREATE_OUTBOUND` procedure.

If the procedure can drop the queue but cannot manage the capture process, then it drops the queue without dropping the capture process.

#### See Also:

- ["CREATE\\_OUTBOUND Procedure"](#)

### Syntax

```
DBMS_XSTREAM_ADM.DROP_OUTBOUND(  
    server_name IN VARCHAR2);
```

### Parameters

**Table 221-19 DROP\_OUTBOUND Procedure Parameters**

| Parameter                | Description                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | The name of the outbound server being removed. Specify an existing outbound server. Do not specify an owner. |

## 221.4.19 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure

This procedure enables XStream optimizations and performance optimizations for Oracle Replication components.

This procedure is intended for users of Oracle Replication who want to enable XStream optimizations and optimizations. For example, you can enable the optimizations for an Oracle Replication configuration that uses capture processes and apply processes to replicate changes between Oracle databases.

These capabilities and optimizations are enabled automatically for XStream components, such as outbound servers, inbound servers, and capture processes that send changes to outbound servers. It is not necessary to run this procedure for XStream components.

When XStream optimizations are enabled, Oracle Replication components can stream ID key LCRs and sequence LCRs. The XStream performance optimizations improve efficiency in various areas, including:

- LCR processing
- Handling large transactions
- DML execution during apply
- Dependency computation and scheduling

- Capture process parallelism

### Syntax

```
DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS (
    enable IN BOOLEAN TRUE);
```

### Parameters

**Table 221-20 ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure Parameters**

| Parameter | Description                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable    | If TRUE, then enable XStream performance optimizations for Oracle Replication components.<br>If FALSE, then disable XStream performance optimizations for Oracle Replication components. |

### Usage Notes

The following usage notes apply to this procedure:

- When you run this procedure, all capture processes and apply processes are restarted.
- After you run this procedure, the `PURPOSE` column in the following views displays XStream Streams:
  - `ALL_APPLY`
  - `DBA_APPLY`
  - `ALL_CAPTURE`
  - `DBA_CAPTURE`
- A license for the Oracle GoldenGate product is required to enable XStream performance optimizations for Oracle Replication components.

- *Oracle Database XStream Guide, Chapter 1, Prerequisites for XStream"*

## 221.4.20 GET\_MESSAGE\_TRACKING Function

The `GET_MESSAGE_TRACKING` Function returns the tracking label for the current session.

#### See Also:

[SET\\_MESSAGE\\_TRACKING Procedure](#)

## Syntax

```
DBMS_XSTREAM_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

## 221.4.21 GET\_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

### See Also:

"SET\_TAG Procedure"

## Syntax

```
DBMS_XSTREAM_ADM.GET_TAG
RETURN RAW;
```

## Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_XSTREAM_ADM.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_XSTREAM_ADM.GET_TAG FROM DUAL;
```

## 221.4.22 IS\_GG\_XSTREAM\_FOR\_STREAMS Function

This function returns **TRUE** if XStream performance optimizations are enabled for Oracle Replication components, or this function returns **FALSE** if XStream performance optimizations are disabled for Oracle Replication components.

### See Also:

"ENABLE\_GG\_XSTREAM\_FOR\_STREAMS Procedure"

## Syntax

```
DBMS_XSTREAM_ADM.IS_GG_XSTREAM_FOR_STREAMS
RETURN BOOLEAN;
```

## 221.4.23 KEEP\_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

### Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Replication capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. To keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

- *Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes
- [DELETE\\_COLUMN Procedure](#)

### Syntax

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_list    IN  VARCHAR2,
  value_type     IN  VARCHAR2 DEFAULT '*',
  step_number    IN  NUMBER DEFAULT 0,
  operation      IN  VARCHAR2 DEFAULT 'ADD');
```

```
DBMS_XSTREAM_ADM.KEEP_COLUMNS (
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_table   IN  DBMS_UTILITY.LNAME_ARRAY,
  value_type     IN  VARCHAR2 DEFAULT '*',
```

```

step_number    IN  NUMBER DEFAULT 0,
operation      IN  VARCHAR2 DEFAULT 'ADD');

```

## Parameters

**Table 221-21 KEEP\_COLUMNS Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name    | <p>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code>, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                          |
| table_name   | <p>The name of the table for which the columns are kept in the row LCR, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                     |
| column_list  | <p>The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type <code>VARCHAR2</code>. The transformation removes columns that are not in the list from the row LCR.</p> <p>If this parameter is set to NULL, and the <code>column_table</code> parameter is also set to NULL, then the procedure raises an error.</p>                                                                                                                                           |
| column_table | <p>The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code>, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL.</p> <p>The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the <code>column_list</code> parameter is also set to NULL, then the procedure raises an error.</p> |
| value_type   | <p>Specify 'NEW' to keep the columns in the new values in the row LCR.</p> <p>Specify 'OLD' to keep the columns in the old values in the row LCR.</p> <p>Specify '*' to keep the columns in both the old and new values in the row LCR.</p>                                                                                                                                                                                                                                                                        |
| step_number  | <p>The order of execution of the transformation.</p> <p><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering</p>                                                                                                                                                                                                                                                                                                                                               |
| operation    | <p>Specify 'ADD' to add the transformation to the rule.</p> <p>Specify 'REMOVE' to remove the transformation from the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_list`, `column_table`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `KEEP_COLUMNS` procedure when one or more of these parameters is NULL:

| table_name | column_list/<br>column_table | step_number | Result                                                          |
|------------|------------------------------|-------------|-----------------------------------------------------------------|
| NULL       | NULL                         | NULL        | Remove all keep columns transformations for the specified rule. |

| table_name | column_list/<br>column_table | step_number | Result                                                                                                                                                                            |
|------------|------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL                         | non-NULL    | Remove all keep columns transformations with the specified <code>step_number</code> for the specified rule.                                                                       |
| NULL       | non-NULL                     | non-NULL    | Remove all keep columns transformations with the specified <code>column_list/column_table</code> and <code>step_number</code> for the specified rule.                             |
| non-NULL   | NULL                         | non-NULL    | Remove all keep columns transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.                                           |
| NULL       | non-NULL                     | NULL        | Remove all keep columns transformations with the specified <code>column_list/column_table</code> for the specified rule.                                                          |
| non-NULL   | non-NULL                     | NULL        | Remove all keep columns transformations with the specified <code>table_name</code> and <code>column_list/column_table</code> for the specified rule.                              |
| non-NULL   | NULL                         | NULL        | Remove all keep columns transformations with the specified <code>table_name</code> for the specified rule.                                                                        |
| non-NULL   | non-NULL                     | non-NULL    | Remove all keep columns transformations with the specified <code>table_name</code> , <code>column_list/column_table</code> , and <code>step_number</code> for the specified rule. |

## 221.4.24 MERGE\_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.

- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$XSTREAM_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
  - The acknowledged SCN of the cloned propagation.
  - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

### Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS (
    cloned_propagation_name IN VARCHAR2,
    propagation_name       IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    perform_actions         IN BOOLEAN  DEFAULT TRUE,
    script_name             IN VARCHAR2 DEFAULT NULL,
    script_directory_object IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 221-22 MERGE\_STREAMS Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cloned_propagation_name | The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| propagation_name        | <p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> <li>The queue specified in the <code>queue_name</code> parameter does not exist.</li> <li>The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.</li> </ul> |
| queue_name              | <p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>                                                                                                                                                                                                                                                                                         |
| perform_actions         | <p>If <code>TRUE</code>, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li><code>script_name</code></li> <li><code>script_directory_object</code></li> </ul>                                                                                                                                                                                                                                                                                     |

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>script_name</code>             | <p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p> |
| <code>script_directory_object</code> | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

### Usage Notes

You can use the `MERGE_STREAMS` procedure to merge two streams that were not split using the `SPLIT_STREAMS` procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

## 221.4.25 MERGE\_STREAMS\_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the

MERGE\_STREAMS\_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT\_STREAMS procedure.

If the auto\_merge\_threshold parameter was set to NULL or 0 (zero) in the SPLIT\_STREAMS procedure that split the streams, then you can run the MERGE\_STREAMS\_JOB procedure manually. In this case, it is not run automatically.

## Syntax

```
DBMS_XSTREAM_ADM.MERGE_STREAMS_JOB (
    cloned_propagation_name IN VARCHAR2,
    propagation_name       IN VARCHAR2 DEFAULT NULL,
    queue_name              IN VARCHAR2 DEFAULT NULL,
    merge_threshold         IN NUMBER,
    schedule_name           IN VARCHAR2 DEFAULT NULL,
    merge_job_name          IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 221-23 MERGE\_STREAMS\_JOB Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cloned_propagation_name | The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.<br>You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| propagation_name        | The name of the propagation that is merged back to the original stream.<br>If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.<br>Specify a non-NULL value to use a name that is different from the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure.<br>If a non-NULL value is specified, then an error is raised under either of the following conditions: <ul style="list-style-type: none"> <li>• The queue specified in the queue_name parameter does not exist.</li> <li>• The queue specified in the queue_name parameter exists but is not used by a capture process.</li> </ul> |

**Table 221-23 (Cont.) MERGE\_STREAMS\_JOB Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name      | <p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream.</p>                                                                                                          |
| merge_threshold | <p>The merge threshold in seconds.</p> <p>The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines whether the streams are merged.</p> <p>Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p> |
| schedule_name   | <p>The name of the schedule for the merge job.</p> <p>If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>                                                                                                                                                                                                                                                                                                         |
| merge_job_name  | <p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>                                                                                                                                                                                                                                                                                                       |

### Usage Notes

You can use the MERGE\_STREAMS\_JOB procedure to merge two streams that were not split using the SPLIT\_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE\_STREAMS\_JOB procedure completes, you can query the DBA\_CAPTURE and DBA\_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule\_name and merge\_job\_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

## 221.4.26 PURGE\_SOURCE\_CATALOG Procedure

This procedure removes all Oracle Replication data dictionary information at the local database for the specified object.

You can use this procedure to remove Oracle Replication metadata that is not needed currently and will not be needed in the future.

### Syntax

```
DBMS_XSTREAM_ADM.PURGE_SOURCE_CATALOG (
    source_database      IN  VARCHAR2,
    source_object_name   IN  VARCHAR2,
    source_object_type   IN  VARCHAR2,
    source_root_name     IN  VARCHAR2);
```

### Parameters

**Table 221-24 PURGE\_SOURCE\_CATALOG Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database    | <p>In a non-CDB, specify the global name of the source database containing the database object.</p> <p>In a CDB, specify the global name of the container containing the database object. The container can be the root or a PDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>                                                                                                |
| source_object_name | The name of the object specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                  |
| source_object_type | Type of the object. Currently, TABLE is the only possible object type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| source_root_name   | <p>The global name of the source root containing the object in a CDB. The source root is where the changes being captured originated in a CDB.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically.</p> <p>If the source_root_name parameter is NULL, then the global name of the local root is the default.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |

### Usage Notes

The global name of the source database containing the object must be specified for the source\_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source\_database for this table results in an error. However, specifying dbs1.net as the

`source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions is true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

 **Note:**

These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

## 221.4.27 RECOVER\_OPERATION Procedure

This procedure provides options for split and merge operations that stopped because they encountered an errors.

This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. Split and merge operations might be run in an XStream Out environment in which multiple outbound servers use the same capture process.

This procedure only can perform these actions for split and merge operations using the `split_threshold` and `merge_threshold` capture process parameters set to non-NULL values to enable automatic split and merge.

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database that contains the capture process.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database that contains the capture process.

#### Note:

To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

#### See Also:

- ["SPLIT\\_STREAMS Procedure"](#)
- ["MERGE\\_STREAMS Procedure"](#)
- ["MERGE\\_STREAMS\\_JOB Procedure"](#)

### Syntax

```
DBMS_XSTREAM_ADM.RECOVER_OPERATION(
    script_id      IN RAW,
    operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

### Parameters

**Table 221-25 RECOVER\_OPERATION Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>script_id</code>      | The operation id of the operation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DBA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>operation_mode</code> | <p>If <code>FORWARD</code>, then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation.</p> <p>If <code>ROLLBACK</code>, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view. The other views retain information about the operation for 30 days.</p> <p>If <code>PURGE</code>, then the procedure moves the metadata about the operation from the <code>DBA_RECOVERABLE_SCRIPT</code> view to the <code>DBA_RECOVERABLE_SCRIPT_HIST</code> view without rolling the operation back. The other views retain information about the operation for 30 days.</p> |

## 221.4.28 REMOVE\_QUEUE Procedure

This procedure removes the specified `ANYDATA` queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.

3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the XStream clients that are using the queue.

 **Note:**

The specified queue must be a `ANYDATA` queue.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_QUEUE (
    queue_name          IN  VARCHAR2,
    cascade              IN  BOOLEAN  DEFAULT FALSE,
    drop_unused_queue_table IN  BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 221-26 REMOVE\_QUEUE Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>queue_name</code>              | The name of the queue to remove, specified as <code>[schema_name.]queue_name</code> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default.                                                                                                                                                              |
| <code>cascade</code>                 | If <code>TRUE</code> , then the procedure drops any XStream clients that use the queue.<br><br>If <code>FALSE</code> , then the procedure raises an error if there are any XStream clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no XStream clients are using the queue currently. |
| <code>drop_unused_queue_table</code> | If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue.<br><br>If <code>FALSE</code> , then the procedure does not drop the queue table.                                                                                    |

## 221.4.29 REMOVE\_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.

 **Note:**

If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

## Syntax

```
DBMS_XSTREAM_ADM.REMOVE_RULE(
    rule_name          IN  VARCHAR2,
    streams_type       IN  VARCHAR2,
    streams_name       IN  VARCHAR2,
    drop_unused_rule   IN  BOOLEAN DEFAULT TRUE,
    inclusion_rule     IN  BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 221-27 REMOVE\_RULE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name        | <p>The name of the rule to remove, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure removes all rules from the specified capture process, apply process, or propagation rule set.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>                                                                               |
| streams_type     | <p>The type of XStream client:</p> <ul style="list-style-type: none"> <li>Specify capture for a capture process.</li> <li>Specify propagation for a propagation.</li> <li>Specify apply for an apply process.</li> </ul>                                                                                                                                                                                                                                                                                     |
| streams_name     | <p>The name of the XStream client, which can be a capture process, propagation, or apply process. Do not specify an owner.</p> <p>If the specified XStream client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</p> <p>If the specified XStream client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</p> |
| drop_unused_rule | <p>If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database.</p> <p>If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database.</p> <p>If FALSE, then the procedure does not drop the rule from the database.</p>                                                                                                                                                                                                      |
| inclusion_rule   | <p>If <code>inclusion_rule</code> is TRUE, then the procedure removes the rule from the positive rule set for the XStream client.</p> <p>If <code>inclusion_rule</code> is FALSE, then the procedure removes the rule from the negative rule set for the XStream client.</p>                                                                                                                                                                                                                                 |

## 221.4.30 REMOVE\_SUBSET\_OUTBOUND\_RULES Procedure

This procedure removes subset rules from an outbound server configuration.

The names of the specified insert, update, and delete rules must match those generated by the `ADD_SUBSET_OUTBOUND_RULES` procedure. To view the rule names for subset rules, run the following query:

```
SELECT RULE_OWNER, SUBSETTING_OPERATION, RULE_NAME
FROM ALL_XSTREAM_RULES
WHERE SUBSETTING_OPERATION IS NOT NULL;
```

#### Note:

- This procedure removes the declarative rule-based transformation associated with each rule it removes.
- This procedure does not remove rules from the outbound server's capture process.

#### See Also:

"[ADD\\_SUBSET\\_OUTBOUND\\_RULES Procedure](#)"

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_SUBSET_OUTBOUND_RULES (
    server_name      IN VARCHAR2,
    insert_rule_name IN VARCHAR2,
    update_rule_name IN VARCHAR2,
    delete_rule_name IN VARCHAR2);
```

## 221.4.31 REMOVE\_XSTREAM\_CONFIGURATION Procedure

This procedure removes the XStream configuration at the local database.

### Syntax

```
DBMS_XSTREAM_ADM.REMOVE_XSTREAM_CONFIGURATION (
    container IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 221-28 REMOVE\_XSTREAM\_CONFIGURATION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container | <p>If CURRENT, then the XStream configuration is removed from the current container. CURRENT can be specified while connected to the root or to a PDB in a CDB.</p> <p>If ALL, then the XStream configuration is removed from all of the containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the XStream configuration is removed from the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to a CDB.</p> |

### Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the ABORT\_TABLE\_INSTANTIATION procedure in the DBMS\_CAPTURE\_ADM package

- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_XSTREAM_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_XSTREAM_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_XSTREAM_ADM` package.
- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the `DBMS_XSTREAM_ADM` package or the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the `DBMS_RULE_ADM` package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

#### Note:

Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire XStream configuration at a database. If an Oracle Replication configuration exists at the database, then this procedure also removes the entire Oracle Replication configuration.

#### Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

## 221.4.32 RENAME\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

#### Note:

- The `RENAME_COLUMN` procedure supports the same data types supported by Oracle Replication capture processes.
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

#### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations and about the data types supported by Oracle Replication capture processes

### Syntax

```
DBMS_XSTREAM_ADM.RENAME_COLUMN (
  rule_name          IN  VARCHAR2,
  table_name         IN  VARCHAR2,
  from_column_name   IN  VARCHAR2,
  to_column_name     IN  VARCHAR2,
  value_type         IN  VARCHAR2  DEFAULT '*',
```

```

step_number      IN  NUMBER      DEFAULT 0,
operation        IN  VARCHAR2    DEFAULT 'ADD';

```

## Parameters

**Table 221-29 RENAME\_COLUMN Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name        | The name of the rule, specified as <i>[schema_name.] rule_name</i> . If NULL, then the procedure raises an error.<br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default. |
| table_name       | The name of the table in which the column is renamed in the row LCR, specified as <i>[schema_name.] object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                         |
| from_column_name | The name of the column to be renamed in each row LCR that satisfies the rule.                                                                                                                                                                                                                                                |
| to_column_name   | The new name of the column in each row LCR that satisfies the rule.                                                                                                                                                                                                                                                          |
| value_type       | Specify 'NEW' to rename the column in the new values in the row LCR.<br>Specify 'OLD' to rename the column in the old values in the row LCR.<br>Specify '*' to rename the column in both the old and new values in the row LCR.                                                                                              |
| step_number      | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                    |
| operation        | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                         |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

| table_name | from_column_name | to_column_name | step_number | Result                                                                                                                                       |
|------------|------------------|----------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL             | NULL           | NULL        | Remove all rename column transformations for the specified rule.                                                                             |
| NULL       | NULL             | NULL           | non-NULL    | Remove all rename column transformations with the specified <code>step_number</code> for the specified rule.                                 |
| NULL       | NULL             | non-NULL       | non-NULL    | Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule. |

| table_name | from_column_name | to_column_name | step_number | Result                                                                                                                       |
|------------|------------------|----------------|-------------|------------------------------------------------------------------------------------------------------------------------------|
| NULL       | non-NULL         | non-NULL       | non-NULL    | Remove all rename column transformations with the specified table_name and step_number for the specified rule.               |
| NULL       | NULL             | non-NULL       | NULL        | Remove all rename column transformations with the specified column_name for the specified rule.                              |
| non-NULL   | NULL             | non-NULL       | NULL        | Remove all rename column transformations with the specified table_name and column_name for the specified rule.               |
| NULL       | non-NULL         | NULL           | NULL        | Remove all rename column transformations with the specified table_name for the specified rule.                               |
| NULL       | non-NULL         | non-NULL       | NULL        | Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule. |
| non-NULL   | NULL             | non-NULL       | NULL        | Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule. |
| non-NULL   | non-NULL         | non-NULL       | NULL        | Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule. |
| non-NULL   | non-NULL         | non-NULL       | non-NULL    | Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule. |

## 221.4.33 RENAME\_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to **TRUE**, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

### Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

## Syntax

```
DBMS_XSTREAM_ADM.RENAME_SCHEMA(
    rule_name          IN  VARCHAR2,
    from_schema_name   IN  VARCHAR2,
    to_schema_name     IN  VARCHAR2,
    step_number        IN  NUMBER    DEFAULT 0,
    operation          IN  VARCHAR2  DEFAULT 'ADD');
```

## Parameters

**Table 221-30 RENAME\_SCHEMA Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name        | The name of the rule, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the <i>hr</i> schema named <i>employees12</i> , enter <i>hr.employees12</i> . If the schema is not specified, then the current user is the default. |
| from_schema_name | The name of the schema to be renamed in each row LCR that satisfies the rule.                                                                                                                                                                                                                                           |
| to_schema_name   | The new name of the schema in each row LCR that satisfies the rule.                                                                                                                                                                                                                                                     |
| step_number      | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                               |
| operation        | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                    |

## Usage Notes

When 'REMOVE' is specified for the *operation* parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified *from\_schema\_name*, *to\_schema\_name*, and *step\_number* parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the *RENAME\_SCHEMA* procedure when one or more of these parameters is NULL:

| from_schema_name | to_schema_name | step_number | Result                                                                                                 |
|------------------|----------------|-------------|--------------------------------------------------------------------------------------------------------|
| NULL             | NULL           | NULL        | Remove all rename schema transformations for the specified rule.                                       |
| NULL             | NULL           | non-NULL    | Remove all rename schema transformations with the specified <i>step_number</i> for the specified rule. |

| from_schema_name | to_schema_name | step_number | Result                                                                                                                                |
|------------------|----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| NULL             | non-NULL       | non-NULL    | Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.                    |
| non-NULL         | NULL           | non-NULL    | Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.                  |
| NULL             | non-NULL       | NULL        | Remove all rename schema transformations with the specified to_schema_name for the specified rule.                                    |
| non-NULL         | non-NULL       | NULL        | Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.               |
| non-NULL         | NULL           | NULL        | Remove all rename schema transformations with the specified from_schema_name for the specified rule.                                  |
| non-NULL         | non-NULL       | non-NULL    | Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule. |

## 221.4.34 RENAME\_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to **TRUE**, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

### Note:

Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

### See Also:

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

## Syntax

```
DBMS_XSTREAM_ADM.RENAME_TABLE (
    rule_name          IN  VARCHAR2,
    from_table_name    IN  VARCHAR2,
    to_table_name      IN  VARCHAR2,
    step_number        IN  NUMBER    DEFAULT 0,
    operation          IN  VARCHAR2  DEFAULT 'ADD');
```

## Parameters

**Table 221-31 RENAME\_TABLE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name       | The name of the rule, specified as <code>[schema_name.] rule_name</code> . If NULL, then the procedure raises an error.<br><br>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.      |
| from_table_name | The name of the table to be renamed in each row LCR that satisfies the rule, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                          |
| to_table_name   | The new name of the table in each row LCR that satisfies the rule, specified as <code>[schema_name.] object_name</code> . For example, <code>humres.staff</code> .<br><br>The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default. |
| step_number     | The order of execution of the transformation.<br><br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering                                                                                                                                                                               |
| operation       | Specify 'ADD' to add the transformation to the rule.<br><br>Specify 'REMOVE' to remove the transformation from the rule.                                                                                                                                                                                                                    |

## Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified `from_table_name`, `to_table_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_TABLE` procedure when one or more of these parameters is NULL:

| from_table_name | to_table_name | step_number | Result                                                          |
|-----------------|---------------|-------------|-----------------------------------------------------------------|
| NULL            | NULL          | NULL        | Remove all rename table transformations for the specified rule. |

| from_table_name | to_table_name | step_number | Result                                                                                                                             |
|-----------------|---------------|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| NULL            | NULL          | non-NULL    | Remove all rename table transformations with the specified step_number for the specified rule.                                     |
| NULL            | non-NULL      | non-NULL    | Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.                   |
| non-NULL        | NULL          | non-NULL    | Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.                 |
| NULL            | non-NULL      | NULL        | Remove all rename table transformations with the specified to_table_name for the specified rule.                                   |
| non-NULL        | non-NULL      | NULL        | Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.               |
| non-NULL        | NULL          | NULL        | Remove all rename table transformations with the specified from_table_name for the specified rule.                                 |
| non-NULL        | non-NULL      | non-NULL    | Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule. |

## 221.4.35 SET\_MESSAGE\_TRACKING Procedure

This procedure sets the tracking label for logical change records (LCRs) produced by the current session.

This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

### Note:

The tracking label set by this procedure does not track non-LCR messages.

**See Also:**

KAWGET\_MESSAGE\_TRACKING

**Syntax**

```
DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING(  
    tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',  
    actions        IN NUMBER   DEFAULT DBMS_XSTREAM_ADM.ACTION_MEMORY);
```

**Parameters****Table 221-32 SET\_MESSAGE\_TRACKING Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tracking_label | The label used to track the LCRs produced by the session.<br>Set this parameter to NULL to stop message tracking in the current session.<br>The size limit for a label is 4,000 bytes.                                                                                                                         |
| actions        | When DBMS_XSTREAM_ADM.ACTION_MEMORY is specified, the LCRs are tracked in memory.<br>Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for this parameter.<br>The value specified for this parameter is an enumerated constant. Enumerated constants must be prefixed with the package name. |

## 221.4.36 SET\_PARAMETER Procedure

This procedure sets a parameter for an outbound server, an inbound server, or an outbound server's capture process.

**Syntax**

```
DBMS_XSTREAM_ADM.SET_PARAMETER(  
    streams_name IN VARCHAR2,  
    streams_type IN VARCHAR2,  
    parameter    IN VARCHAR2,  
    value        IN VARCHAR2 DEFAULT NULL,  
    no_wait      IN BOOLEAN   DEFAULT FALSE,  
    source_database IN VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 221-33 SET\_PARAMETER Procedure Parameters**

| Parameter    | Description                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| streams_type | The type of XStream client: <ul style="list-style-type: none"><li>Specify capture for a capture process.</li><li>Specify apply for an outbound server or inbound server.</li></ul> |
| streams_name | The name of the capture process, outbound server, or inbound server. Do not specify an owner.                                                                                      |

**Table 221-33 (Cont.) SET\_PARAMETER Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter       | <p>The name of the parameter you are setting.</p> <p>See "<a href="#">Capture Process Parameters</a>" for information about capture process parameters.</p> <p>See "<a href="#">Apply Component Parameters</a>" for information about outbound server and inbound server parameters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| value           | <p>The value to which the parameter is set.</p> <p>If NULL, then the parameter is set to its default value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| no_wait         | <p>If TRUE, then the parameter is set immediately.</p> <p>If FALSE, then the parameter is set after synchronizing with the running capture process, inbound server, or outbound server.</p> <p>When you modify multiple parameters for the same process consecutively, setting this parameter to TRUE speeds up each call. However, if the process is currently running, you must set this parameter to FALSE in the last to the procedure to ensure that the process uses the modified parameter values. If the no_wait parameter is set to TRUE for the last call to the procedure, the running process might not detect the parameter changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| source_database | <p>If CURRENT, then the parameter is set only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then the parameter is set in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then the parameter is set in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs. Also, a non-null value can be specified only for the following parameters:</p> <ul style="list-style-type: none"> <li>include_objects capture parameter</li> <li>excludetag capture or apply parameter</li> <li>excludetrans capture or apply parameter</li> <li>excludeuser capture or apply parameter</li> <li>excludeuserid capture or apply parameter</li> <li>getreplicates capture or apply parameter</li> <li>getapplops capture or apply parameter</li> </ul> |

## 221.4.37 SET\_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

### Syntax

```
DBMS_XSTREAM_ADM.SET_TAG(
    tag IN RAW DEFAULT NULL);
```

## Parameters

**Table 221-34 SET\_TAG Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tag       | The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits.<br>By default, the tag for a session is NULL.<br>The size limit for a tag value is 2000 bytes. |

## Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_XSTREAM_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET\_TAG procedure:

- This procedure is not transactional. That is, the effects of SET\_TAG cannot be rolled back.
- If the SET\_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET\_TAG procedure in a session. A data dictionary build happens when the DBMS\_CAPTURE\_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

**See Also:**

[BUILD Procedure](#)

## 221.4.38 SET\_UP\_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

### Syntax

```
DBMS_XSTREAM_ADM.SET_UP_QUEUE (
  queue_table      IN  VARCHAR2  DEFAULT 'streams_queue_table',
  storage_clause   IN  VARCHAR2  DEFAULT NULL,
  queue_name       IN  VARCHAR2  DEFAULT 'streams_queue',
  queue_user       IN  VARCHAR2  DEFAULT NULL,
  comment         IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 221-35 SET\_UP\_QUEUE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_table    | <p>The name of the queue table specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</p> <p>Queue table names can be a maximum of 24 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| storage_clause | <p>The storage clause for queue table</p> <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If <code>NULL</code>, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p><b>See Also:</b> <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p> |
| queue_name     | <p>The name of the queue that will function as the <code>ANYDATA</code> queue, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <code>queue_table</code>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>                                                                                                                                                         |
| queue_user     | <p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>                                                                                                                                                                                                                                                                                                                        |
| comment        | The comment for the queue                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the `CREATE_QUEUE_TABLE` procedure in the `DBMS_AQADM` package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer `ANYDATA` queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `commit_time`. If the database is a release before Oracle Database 10g release 2, the `sort_list` setting in `CREATE_QUEUE_TABLE` is set to `enq_time`.

- If the specified queue table exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the `CREATE_QUEUE` procedure in the `DBMS_AQADM` package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants `ENQUEUE` and `DEQUEUE` privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not exist. If an agent with this name exists and is associated with the queue user only, then it is used. `SET_UP_QUEUE` then runs the `ENABLE_DB_ACCESS` procedure in the `DBMS_AQADM` package, specifying the agent and the user.

#### Note:

If the agent that `SET_UP_QUEUE` tries to create exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

## 221.4.39 SPLIT\_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill LCRs to the hard disk, degrading the performance of the Oracle Replication environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates LCRs from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.

5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the queried acknowledged SCN. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

#### Note:

If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

### Syntax

```
DBMS_XSTREAM_ADM.SPLIT_STREAMS (
    propagation_name      IN      VARCHAR2,
    cloned_propagation_name IN    VARCHAR2 DEFAULT NULL,
    cloned_queue_name     IN      VARCHAR2 DEFAULT NULL,
    cloned_capture_name   IN      VARCHAR2 DEFAULT NULL,
    perform_actions       IN      BOOLEAN  DEFAULT TRUE,
    script_name           IN      VARCHAR2 DEFAULT NULL,
    script_directory_object IN    VARCHAR2 DEFAULT NULL,
    auto_merge_threshold  IN      NUMBER   DEFAULT NULL,
    schedule_name         IN OUT  VARCHAR2,
    merge_job_name        IN OUT  VARCHAR2);
```

## Parameters

**Table 221-36 SPLIT\_STREAMS Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>propagation_name</code>        | The name of the propagation that cannot send LCRs to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>cloned_propagation_name</code> | The name of the new propagation created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a propagation name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>cloned_queue_name</code>       | The name of the new queue created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a queue name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>cloned_capture_name</code>     | The name of the new capture process created by this procedure for the stream that is split off. If <code>NULL</code> , then the system generates a capture process name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>perform_actions</code>         | <p>If <code>TRUE</code>, then the procedure performs the necessary actions to split the stream directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> <li><code>script_name</code></li> <li><code>script_directory_object</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>script_name</code>             | <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-<code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>TRUE</code>, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If <code>NULL</code> and the <code>perform_actions</code> parameter is <code>FALSE</code>, then the procedure raises an error.</p> |
| <code>script_directory_object</code> | <p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is <code>NULL</code>, then the procedure ignores this parameter and does not generate a script.</p> <p>If <code>NULL</code> and the <code>script_name</code> parameter is non-<code>NULL</code>, then the procedure raises an error.</p> <p><b>Note:</b> The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 221-36 (Cont.) SPLIT\_STREAMS Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_merge_threshold | <p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV\$XSTREAM_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process.</p> <p>The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.</p> |
| schedule_name        | <p>The Oracle Scheduler schedule name, specified as [schema_name.]schedule_name. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default.</p> <p>If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name to adhere to naming conventions or to track the schedule more easily.</p> <p>If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name.</p> <p>If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 221-36 (Cont.) SPLIT\_STREAMS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| merge_job_name | <p>The Oracle Scheduler job name, specified as <code>[schema_name.]merge_job_name</code>. For example, <code>strmadmin.merge_job</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>auto_merge_threshold</code> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name to adhere to naming conventions or to track the job more easily.</p> <p>If NULL and <code>auto_merge_threshold</code> is a non-NULL positive number, then the system generates a job name.</p> <p>If <code>auto_merge_threshold</code> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p> |

## 221.4.40 START\_OUTBOUND Procedure

This procedure starts an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.START_OUTBOUND (
    server_name      IN  VARCHAR2);
```

### Parameters

**Table 221-37 START\_OUTBOUND Procedure Parameters**

| Parameter   | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| server_name | The name of the outbound server being started. A NULL specification is not allowed. Do not specify an owner. |

## 221.4.41 STOP\_OUTBOUND Procedure

This procedure stops an XStream outbound server. The outbound server streams out the LCRs to an XStream client application.

### Syntax

```
DBMS_XSTREAM_ADM.STOP_OUTBOUND (
    server_name  IN  VARCHAR2,
    force        IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 221-38 STOP\_OUTBOUND Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server_name</code> | The name of the outbound server being stopped. A <code>NULL</code> specification is not allowed. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                   |
| <code>force</code>       | <p>If <code>TRUE</code>, then the procedure stops the outbound server and its capture process as soon as possible.</p> <p>If <code>FALSE</code>, then the procedure stops the outbound server after ensuring that there are no gaps in the set of applied transactions.</p> <p>The behavior of the apply component depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply component parameter.</p> |

## DBMS\_XSTREAM\_AUTH

The `DBMS_XSTREAM_AUTH` package provides subprograms for granting privileges to and revoking privileges from XStream administrators.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XSTREAM\\_AUTH Subprograms](#)

**See Also:**

[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)

### 222.1 DBMS\_XSTREAM\_AUTH Overview

This package provides subprograms for granting privileges to XStream administrators and revoking privileges from XStream administrators.

### 222.2 DBMS\_XSTREAM\_AUTH Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

The user executing the subprograms in the `DBMS_XSTREAM_AUTH` package must have `SYSDBA` administrative privilege, and the user must exercise the privilege using `AS SYSDBA` at connect time.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

### 222.3 Summary of DBMS\_XSTREAM\_AUTH Subprograms

This table lists the `DBMS_XSTREAM_AUTH` subprograms and briefly describes them.

**Table 222-1 DBMS\_XSTREAM\_AUTH Package Subprograms**

| Subprogram                                           | Description                                                                                                                                       |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GRANT_ADMIN_PRIVILEGE Procedure</a>      | Either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges         |
| <a href="#">GRANT_REMOTE_ADMIN_ACCESS Procedure</a>  | Enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link |
| <a href="#">REVOKE_ADMIN_PRIVILEGE Procedure</a>     | Either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges                         |
| <a href="#">REVOKE_REMOTE_ADMIN_ACCESS Procedure</a> | Disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link                 |

**Note:**

All subprograms commit unless specified otherwise.

## 222.3.1 GRANT\_ADMIN\_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an XStream administrator directly, or generates a script that grants these privileges.

**See Also:**

"[GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)"

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee              IN  VARCHAR2,
  privilege_type       IN  VARCHAR2  DEFAULT '*',
  grant_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_grants            IN  BOOLEAN  DEFAULT TRUE,
  file_name            IN  VARCHAR2  DEFAULT NULL,
  directory_name       IN  VARCHAR2  DEFAULT NULL,
  grant_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container            IN  VARCHAR2  DEFAULT 'CURRENT');
```

### Parameters

**Table 222-2 GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| grantee   | The user to whom privileges are granted |

**Table 222-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege_type            | <p>Specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>CAPTURE</b><br/>Specifying <b>CAPTURE</b> grants the minimum privileges required by the user to administer capture processes.</li> <li><b>APPLY</b><br/>Specifying <b>APPLY</b> grants the minimum privileges required by the user to administer outbound servers, inbound servers, and apply processes.</li> <li><b>*</b><br/>Specifying <b>*</b> grants the minimum privileges required by the user to administer capture processes, outbound servers, inbound servers, and apply processes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                        |
| grant_select_privileges   | <p>If <b>TRUE</b>, then the procedure grants a set of privileges, including <b>SELECT_CATALOG_ROLE</b>, to the user.</p> <p>If <b>FALSE</b>, then the procedure does not grant the set of privileges to the user. <b>SELECT_CATALOG_ROLE</b> enables the user to select from the data dictionary. Set this parameter to <b>TRUE</b> for the XStream trusted user model. Set this parameter to <b>FALSE</b> for the XStream untrusted user model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| do_grants                 | <p>If <b>TRUE</b>, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the <b>DBA_XSTREAM_ADMINISTRATOR</b> data dictionary view with <b>YES</b> for both the <b>LOCAL_PRIVILEGES</b> column and the <b>ACCESS_FROM_REMOTE</b> column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If <b>TRUE</b> and any of the grant statements fails, then the procedure raises an error.</p> <p>If <b>FALSE</b>, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the <b>DBA_XSTREAM_ADMINISTRATOR</b> data dictionary view.</p> <p>You specify <b>FALSE</b> when the procedure is generating a file that you will run later. If you specify <b>FALSE</b> and either the <b>file_name</b> or <b>directory_name</b> parameter is <b>NULL</b>, then the procedure raises an error.</p> |
| file_name                 | <p>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</p> <p>If <b>NULL</b>, then the procedure does not generate a file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| directory_name            | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement <b>CREATE DIRECTORY</b>. If you specify a directory, then the user who invokes the procedure must have the <b>WRITE</b> privilege on the directory object.</p> <p>If the <b>file_name</b> parameter is <b>NULL</b>, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If <b>NULL</b> and the <b>file_name</b> parameter is non-<b>NULL</b>, then the procedure raises an error.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| grant_optional_privileges | <p>A comma-separated list of optional privileges to grant to the grantee, such as the <b>DV_XSTREAM_ADMIN</b> and <b>DV_GOLDENGATE_ADMIN</b> privileges</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 222-2 (Cont.) GRANT\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container | <p>If <b>CURRENT</b>, then grants privileges to the grantee only in the container where the procedure is invoked. <b>CURRENT</b> can be specified while connected to the root or to a PDB.</p> <p>If <b>ALL</b>, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify <b>ALL</b>, the procedure must be invoked in the root.</p> <p>If a container name, then grants privileges to the grantee only in the specified container. To specify root, use <b>CDB\$ROOT</b> while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p> |

### Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The **RESTRICTED SESSION** system privilege
- **EXECUTE** on the following packages:
  - **DBMS\_APPLY\_ADM**
  - **DBMS\_AQ**
  - **DBMS\_AQADM**
  - **DBMS\_AQIN**
  - **DBMS\_AQELM**
  - **DBMS\_CAPTURE\_ADM**
  - **DBMS\_FLASHBACK**
  - **DBMS\_LOCK**
  - **DBMS\_PROPAGATION\_ADM**
  - **DBMS\_RULE\_ADM**
  - **DBMS\_TRANSFORM**
  - **DBMS\_XSTREAM\_ADM**
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

In addition, the grantee can grant these privileges to other users.

- `SELECT_CATALOG_ROLE`
- `SELECT` or `READ` privilege on data dictionary views related to XStream and Oracle Replication
- The ability to allow a remote XStream administrator to perform administrative actions through a database link by connecting to the grantee

This ability is enabled by running the `GRANT_REMOTE_ADMIN_ACCESS` procedure in this package.

#### Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure grants only the privileges necessary to configure and administer an XStream environment. You can grant additional privileges to the grantee if necessary.

#### See Also:

- "[GRANT\\_REMOTE\\_ADMIN\\_ACCESS Procedure](#)"

## 222.3.2 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure enables a remote XStream administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

### Syntax

```
DBMS_XSTREAM_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
    grantee IN VARCHAR2);
```

### Parameters

**Table 222-3 GRANT\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee   | The user who allows remote access. The procedure adds the grantee to the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view with <code>YES</code> for the <code>ACCESS_FROM_REMOTE</code> column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the <code>ACCESS_FROM_REMOTE</code> column to <code>YES</code> . |

### Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The

XStream administrator at a downstream capture database administers the source database using this connection.

**Note:**

The `GRANT_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

**See Also:**

["GRANT\\_ADMIN\\_PRIVILEGE Procedure"](#)

### 222.3.3 REVOKE\_ADMIN\_PRIVILEGE Procedure

This procedure either revokes XStream administrator privileges from a user directly, or generates a script that revokes these privileges.

**Syntax**

```
DBMS_XSTREAM_AUTH.REVOKE_ADMIN_PRIVILEGE (
  grantee              IN  VARCHAR2,
  privilege_type       IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges IN  BOOLEAN  DEFAULT FALSE,
  do_revokes          IN  BOOLEAN  DEFAULT TRUE,
  file_name            IN  VARCHAR2  DEFAULT NULL,
  directory_name       IN  VARCHAR2  DEFAULT NULL,
  revoke_optional_privileges IN  VARCHAR2  DEFAULT NULL,
  container            IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameters**

**Table 222-4** *REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters*

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee        | The user from whom privileges are revoked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 222-4 (Cont.) REVOKE\_ADMIN\_PRIVILEGE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| revoke_select_privileges   | <p>If TRUE, then the procedure revokes a set of privileges, including SELECT_CATALOG_ROLE, to the user.</p> <p>If FALSE, then the procedure does not revoke the set of privileges to the user.</p> <p>SELECT_CATALOG_ROLE enables the user to select from the data dictionary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| do_revokes                 | <p>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked.</p> <p>If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</p> |
| file_name                  | <p>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| directory_name             | <p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| revoke_optional_privileges | <p>A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| container                  | <p>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.</p> <p>If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root.</p> <p>If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB\$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.</p> <p><b>Note:</b> This parameter only applies to CDBs.</p>                                                                                                                                                                                                                                                                                                   |

### Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT\_ADMIN\_PRIVILEGE procedure in this package.

#### Note:

To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

#### See Also:

- ["GRANT\\_ADMIN\\_PRIVILEGE Procedure"](#)
- *Oracle Database SQL Language Reference* for information about the `CREATE DIRECTORY` SQL statement

## 222.3.4 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure

This procedure disables a remote XStream administrator from performing administrative actions by connecting to the grantee using a database link.

#### Note:

The `REVOKE_ADMIN_PRIVILEGE` procedure in this package runs this procedure.

#### See Also:

["REVOKE\\_ADMIN\\_PRIVILEGE Procedure"](#)

### Syntax

```
DBMS_XSTREAM_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (
    grantee IN VARCHAR2);
```

### Parameters

**Table 222-5 REVOKE\_REMOTE\_ADMIN\_ACCESS Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grantee   | <p>The user for whom access from a remote XStream administrator is disabled.</p> <p>If a row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure updates the <code>ACCESS_FROM_REMOTE</code> column for the grantee to <code>NO</code>. If, after this update, both the <code>LOCAL_PRIVILEGES</code> column and the <code>ACCESS_FROM_REMOTE</code> column are <code>NO</code> for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the <code>DBA_XSTREAM_ADMINISTRATOR</code> data dictionary view, then the procedure does not update the view and does not raise an error.</p> |

# DEBUG\_EXTPROC

The `DEBUG_EXTPROC` package enables you to start up the `extproc` agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of `DEBUG\_EXTPROC` Subprograms](#)

## 223.1 `DEBUG_EXTPROC` Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

## 223.2 `DEBUG_EXTPROC` Operational Notes

These operational notes apply to `DEBUG_EXTPROC`.

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package `DEBUG_EXTPROC`  

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```
- You can install this package as any other user, as long as you have `EXECUTE` privileges on the package.

### Note:

These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL\*Plus or OCI program by connecting to `ORACLE`.
- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the `extproc` agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the `extproc` agent.

- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

## 223.3 Rules and Limits

`DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

## 223.4 Summary of `DEBUG_EXTPROC` Subprograms

The `STARTUP_EXTPROC_AGENT` procedure is the only `DEBUG_EXTPROC` subprogram.

**Table 223-1** `DEBUG_EXTPROC` Package Subprograms

| Subprogram                                      | Description                                        |
|-------------------------------------------------|----------------------------------------------------|
| <a href="#">STARTUP_EXTPROC_AGENT Procedure</a> | Starts up the extproc agent process in the session |

### 223.4.1 `STARTUP_EXTPROC_AGENT` Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

#### Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

# 224

## HTF

The `HTF` (hypertext functions) and `HTP` (hypertext procedures) packages generate HTML tags. For example, the `HTF.ANCHOR` function generates the HTML anchor tag, `<A>`.

### See Also:

For more information about implementation of this package:

This chapter contains the following topics:

- [Deprecated Subprograms](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

## 224.1 HTF Deprecated Subprograms

The `ESCAPE_URL` function is deprecated with Oracle Database 10g.

### Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

### Related Topics

- [ESCAPE\\_URL Function](#)  
This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

## 224.2 HTF Operational Notes

These operational notes apply to the `HTF` package.

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the `HTF.PRINT` function. It then prints its parameters to the generated Web page.

## 224.3 Rules and Limits

If you use values of the LONG datatype in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the function.

## 224.4 HTF Examples

The commands in this example generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.P (HTF.HTMLOPEN); -- generates <HTML>
    HTP.P (HTF.HEADOPEN); -- generates <HEAD>
    HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
    HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
    HTP.P (HTF.BODYOPEN); -- generates <BODY>
    HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
    HTP.P (HTF.BODYCLOSE); -- generates </BODY>
    HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

## 224.5 Summary of Tags

This list summarizes the HTML tags generated by the HTF package.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate `<HTML>` and `</HTML>`

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate `<HEAD>` and `</HEAD>`

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate `<BODY>` and `</BODY>`

### Comment Tag

[COMMENT Function](#) - generates `<!--` and `-->`

[http://www.w3.org.BASE Function](#) - generates `<BASE>`

[LINKREL Function](#) - generates `<LINK>` with the `REL` attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

### **Applet Tags**

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

### **List Tags**

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate <OL> and </OL>

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate <UL> and </UL>

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates <LI>

### **Form Tags**

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates <INPUT TYPE="IMAGE">

[FORMPASSWORD Function](#) - generates <INPUT TYPE="PASSWORD">

[FORMRADIO Function](#) - generates <INPUT TYPE="RADIO">

[FORMSELECTOPEN Function](#), [FORMSELECTCLOSE Function](#) - generate <SELECT> and </SELECT>

[FORMSELETOPTION Function](#) - generates <OPTION>

[FORMTEXT Function](#) - generates <INPUT TYPE="TEXT">

[FORMTEXTAREA Function](#) - generate <TEXTAREA>

[FORMTEXTAREAOPEN Function](#), [FORMTEXTAREACLOSE Function](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Function](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Function](#) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Function](#), [TABLECLOSE Function](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Function](#) - generates `<CAPTION>`

[TABLEROWOPEN Function](#), [TABLEROWCLOSE Function](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Function](#) - generates `<TH>`

[TABLEDATA Function](#) - generates `<TD>`

### IMG, HR, and A Tags

[HR Function](#), [LINE Function](#) - generate `<HR>`

[IMG Function](#), [IMG2 Function](#) - generate `<IMG>`

[ANCHOR Function](#), [ANCHOR2 Function](#) - generate `<A>`

[MAPOPEN Function](#), [MAPCLOSE Function](#) - generate `<MAP>` and `</MAP>`

### Paragraph Formatting Tags

[HEADER Function](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Function](#), [PARAGRAPH Function](#) - generate `<P>`

[PRN Functions](#), [PRINT Functions](#) - generate any text that is passed in

[PRN Functions](#), [S Function](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Function](#), [PRECLOSE Function](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Function](#), [BLOCKQUOTECLOSE Function](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Function](#) - generates `<DIV>`

[NL Function](#), [BR Function](#) - generate `<BR>`

[NOBR Function](#) - generates `<NOBR>`

[WBR Function](#) - generates `<WBR>`

[PLAINTEXT Function](#) - generates `<PLAINTEXT>`

[ADDRESS Function](#) - generates `<ADDRESS>`

[MAILTO Function](#) - generates `<A>` with the `MAILTO` attribute

[AREA Function](#) - generates `<AREA>`

[BGSOUND Function](#) - generates `<BGSOUND>`

### Character Formatting Tags

**BASEFONT Function** - generates <BASEFONT>

**BIG Function** - generates <BIG>

**BOLD Function** - generates <B>

**CENTER Function** - generates <CENTER> and </CENTER>

**CENTEROPEN Function, CENTERCLOSE Function** - generate <CENTER> and </CENTER>

**CITE Function** - generates <CITE>

**CODE Function** - generates <CODE>

**DFN Function** - generates <DFN>

**EM Function, EMPHASIS Function** - generate <EM>

**FONTOPEN Function, FONTCLOSE Function** - generate <FONT> and </FONT>

**ITALIC Function** - generates <I>

**KBD Function, KEYBOARD Function** - generate <KBD> and </KBD>

**S Function** - generates <S>

**SAMPLE Function** - generates <SAMP>

**SMALL Function** - generates <SMALL>

**STRIKE Function** - generates <STRIKE>

**STRONG Function** - generates <STRONG>

**SUB Function** - generates <SUB>

**SUP Function** - generates <SUP>

**TELETYPE Function** - generates <TT>

**UNDERLINE Function** - generates <U>

**VARIABLE Function** - generates <VAR>

### Frame Tags

**FRAME Function** - generates <FRAME>

**FRAMESETOPEN Function, FRAMESETCLOSE Function** - generate <FRAMESET> and </FRAMESET>

**NOFRAMESOPEN Function, NOFRAMESCLOSE Function** - generate <NOFRAMES> and </NOFRAMES>

## 224.6 Summary of HTF Subprograms

This table lists the HTF subprograms and briefly describes them.

**Table 224-1 HTF Package Subprograms**

| Subprogram                               | Description                                                                                                                                    |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDRESS Function</a>         | Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document                                      |
| <a href="#">ANCHOR Function</a>          | Generates the <A> and </A> tags which specify the source or destination of a hypertext link                                                    |
| <a href="#">ANCHOR2 Function</a>         | Generates the <A> and </A> tags which specify the source or destination of a hypertext link                                                    |
| <a href="#">APPLETCLOSE Function</a>     | Closes the applet invocation with the </APPLET> tag                                                                                            |
| <a href="#">APPLETOPEN Function</a>      | Generates the <APPLET> tag which begins the invocation of a Java applet                                                                        |
| <a href="#">AREA Function</a>            | Generates the <AREA> tag, which defines a client-side image map                                                                                |
| <a href="#">BASE Function</a>            | Generates the <BASE> tag which records the URL of the document                                                                                 |
| <a href="#">BASEFONT Function</a>        | Generates the <BASEFONT> tag which specifies the base font size for a Web page                                                                 |
| <a href="#">BGSOUND Function</a>         | Generates the <BGSOUND> tag which includes audio for a Web page                                                                                |
| <a href="#">BIG Function</a>             | Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font                                               |
| <a href="#">BLOCKQUOTECLOSE Function</a> | Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text                                                                 |
| <a href="#">BLOCKQUOTEOPEN Function</a>  | Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text                                                          |
| <a href="#">BODYCLOSE Function</a>       | Generates the </BODY> tag which marks the end of a body section of an HTML document                                                            |
| <a href="#">BODYOPEN Function</a>        | Generates the <BODY> tag which marks the beginning of the body section of an HTML document                                                     |
| <a href="#">BOLD Function</a>            | Generates the <B> and </B> tags which direct the browser to display the text in boldface                                                       |
| <a href="#">BR Function</a>              | Generates the <BR> tag which begins a new line of text                                                                                         |
| <a href="#">CENTER Function</a>          | Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page                                                     |
| <a href="#">CENTERCLOSE Function</a>     | Generates the </CENTER> tag which marks the end of a section of text to center                                                                 |
| <a href="#">CENTEROPEN Function</a>      | Generates the <CENTER> tag which mark the beginning of a section of text to center                                                             |
| <a href="#">CITE Function</a>            | Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation                                                |
| <a href="#">CODE Function</a>            | Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically |
| <a href="#">COMMENT Function</a>         | Generates the comment tags <!-- ctext -->                                                                                                      |
| <a href="#">DFN Function</a>             | Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically      |
| <a href="#">DIRLISTCLOSE Function</a>    | Generates the </DIR> tag which ends a directory list section                                                                                   |
| <a href="#">DIRLISTOPEN Function</a>     | Generates the <DIR> which starts a directory list section                                                                                      |

**Table 224-1 (Cont.) HTF Package Subprograms**

| Subprogram                               | Description                                                                                                                            |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DIV Function</a>             | Generates the <DIV> tag which creates document divisions                                                                               |
| <a href="#">DLISTCLOSE Function</a>      | Generates the </DL> tag which ends a definition list                                                                                   |
| <a href="#">DLISTDEF Function</a>        | Generates the <DD> tag, which inserts definitions of terms                                                                             |
| <a href="#">DLISTOPEN Function</a>       | Generates the <DL> tag which starts a definition list                                                                                  |
| <a href="#">DLISTTERM Function</a>       | Generates the <DT> tag which defines a term in a definition list <DL>                                                                  |
| <a href="#">EM Function</a>              | Generates the <EM> and </EM> tags, which define text to be emphasized                                                                  |
| <a href="#">EMPHASIS Function</a>        | Generates the <EM> and </EM> tags, which define text to be emphasized                                                                  |
| <a href="#">ESCAPE_SC Function</a>       | Replaces characters that have special meaning in HTML with their escape sequences                                                      |
| <a href="#">ESCAPE_URL Function</a>      | Replaces characters that have special meaning in HTML and HTTP with their escape sequences                                             |
| <a href="#">FONTCLOSE Function</a>       | Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics                             |
| <a href="#">FONTOPEN Function</a>        | Generates the <FONT> which marks the beginning of section of text with the specified font characteristics                              |
| <a href="#">FORMAT_CELL Function</a>     | formats column values inside an HTML table using the <a href="#">TABLEDATA Function</a>                                                |
| <a href="#">FORMCHECKBOX Function</a>    | Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form                                              |
| <a href="#">FORMCLOSE Function</a>       | Generates the </FORM> tag which marks the end of a form section in an HTML document                                                    |
| <a href="#">FORMFILE Function</a>        | Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page          |
| <a href="#">FORMHIDDEN Function</a>      | Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element                                                       |
| <a href="#">FORMIMAGE Function</a>       | Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately           |
| <a href="#">FORMOPEN Function</a>        | Generates the <FORM> tag which marks the beginning of a form section in an HTML document                                               |
| <a href="#">FORMPASSWORD Function</a>    | Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field                                            |
| <a href="#">FORMRADIO Function</a>       | Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form                                             |
| <a href="#">FORMRESET Function</a>       | Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values |
| <a href="#">FORMSELECTCLOSE Function</a> | Generates the </SELECT> tag which marks the end of a Select form element                                                               |
| <a href="#">FORMSELECTOPEN Function</a>  | Generates the </SELECT> tag which marks the beginning of a Select form element                                                         |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram                 | Description                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| FORMSELECTOPTION Function  | Generates the <OPTION> tag which represents one choice in a Select element                                                                          |
| FORMSUBMIT Function        | Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form                                            |
| FORMTEXT Function          | Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text                                                         |
| FORMTEXTAREA Function      | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area                                               |
| FORMTEXTAREA2 Function     | Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style      |
| FORMTEXTAREACLOSE Function | Generates the </TEXTAREA> tag which ends a text area form element                                                                                   |
| FORMTEXTAREAOPEN Function  | Generates the <TEXTAREA> which marks the beginning of a text area form element                                                                      |
| FORMTEXTAREAOPEN2 Function | Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style                             |
| FRAME Function             | Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag                                                  |
| FRAMESETCLOSE Function     | Generates the </FRAMESET> tag which ends a frameset section                                                                                         |
| FRAMESETOPEN Function      | Generates the </FRAMESET> tag which begins a frameset section                                                                                       |
| HEADCLOSE Function         | Generates the </HEAD> tag which marks the end of an HTML document head section                                                                      |
| HEADER Function            | Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)                                                 |
| HEADOPEN Function          | Generates the <HEAD> tag which marks the beginning of the HTML document head section                                                                |
| HR Function                | Generates the <HR> tag, which generates a line in the HTML document                                                                                 |
| HTMLCLOSE Function         | Generates the </HTML> tag which marks the end of an HTML document                                                                                   |
| HTMLOPEN Function          | Generates the <HTML> tag which marks the beginning of an HTML document                                                                              |
| IMG Function               | Generates the <IMG> tag which directs the browser to load an image onto the HTML page                                                               |
| IMG2 Function              | Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute |
| ISINDEX Function           | Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program                  |
| ITALIC Function            | Generates the <I> and </I> tags which direct the browser to render the text in italics                                                              |
| KBD Function               | Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font                                                   |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram                             | Description                                                                                                                                     |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">KEYBOARD Function</a>      | Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font                                              |
| <a href="#">LINE Function</a>          | Generates the <HR> tag, which generates a line in the HTML document                                                                             |
| <a href="#">LINKREL Function</a>       | Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target |
| <a href="#">LINKREV Function</a>       | Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor |
| <a href="#">LISTHEADER Function</a>    | Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list                                                          |
| <a href="#">LISTINGCLOSE Function</a>  | Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page                                  |
| <a href="#">LISTINGOPEN Function</a>   | Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page                              |
| <a href="#">LISTITEM Function</a>      | Generates the <LI> tag, which indicates a list item                                                                                             |
| <a href="#">MAILTO Function</a>        | Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument                                                      |
| <a href="#">MAPCLOSE Function</a>      | Generates the </MAP> tag which marks the end of a set of regions in a client-side image map                                                     |
| <a href="#">MAPOPEN Function</a>       | Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map                                                 |
| <a href="#">MENULISTCLOSE Function</a> | Generates the </MENU> tag which ends a list that presents one line for each item                                                                |
| <a href="#">MENULISTOPEN Function</a>  | Generates the <MENU> tag which begins a list that presents one line for each item                                                               |
| <a href="#">META Function</a>          | Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers                           |
| <a href="#">NL Function</a>            | Generates the <BR> tag which begins a new line of text                                                                                          |
| <a href="#">NOBR Function</a>          | Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text                                                         |
| <a href="#">NOFRAMESCLOSE Function</a> | Generates the </NOFRAMES> tag which marks the end of a no-frames section                                                                        |
| <a href="#">NOFRAMESOPEN Function</a>  | Generates the <NOFRAMES> tag which mark the beginning of a no-frames section                                                                    |
| <a href="#">OLISTCLOSE Function</a>    | Generates the </OL> tag which defines the end of an ordered list                                                                                |
| <a href="#">OLISTOPEN Function</a>     | Generates the <OL> tag which marks the beginning of an ordered list                                                                             |
| <a href="#">PARA Function</a>          | Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph                                  |
| <a href="#">PARAGRAPH Function</a>     | Adds attributes to the <P> tag                                                                                                                  |
| <a href="#">PARAM Function</a>         | Generates the <PARAM> tag which specifies parameter values for Java applets                                                                     |

Table 224-1 (Cont.) HTF Package Subprograms

| Subprogram                             | Description                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PLAINTEXT Function</a>     | Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type                                  |
| <a href="#">PRECLOSE Function</a>      | Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page                                                    |
| <a href="#">PREOPEN Function</a>       | Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page                                               |
| <a href="#">PRINT Functions</a>        | Generates the specified parameter as a string terminated with the \n newline character                                                                         |
| <a href="#">PRN Functions</a>          | Generates the specified parameter as a string                                                                                                                  |
| <a href="#">S Function</a>             | Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type                                                |
| <a href="#">SAMPLE Function</a>        | Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically |
| <a href="#">SCRIPT Function</a>        | Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBScript                                          |
| <a href="#">SMALL Function</a>         | Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font                                          |
| <a href="#">STRIKE Function</a>        | Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type                                      |
| <a href="#">STRONG Function</a>        | Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically       |
| <a href="#">STYLE Function</a>         | Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page                                                                              |
| <a href="#">SUB Function</a>           | Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript                                                     |
| <a href="#">SUP Function</a>           | Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript                                                   |
| <a href="#">TABLECAPTION Function</a>  | Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table                                                                             |
| <a href="#">TABLECLOSE Function</a>    | Generates the </TABLE> tag which marks the end of an HTML table                                                                                                |
| <a href="#">TABLEDATA Function</a>     | Generates the <TD> and </TD> tags which insert data into a cell of an HTML table                                                                               |
| <a href="#">TABLEHEADER Function</a>   | Generates the <TH> and </TH> tags which insert a header cell in an HTML table.                                                                                 |
| <a href="#">TABLEOPEN Function</a>     | Generates the <TABLE> tag which marks the beginning of an HTML table                                                                                           |
| <a href="#">TABLEROWCLOSE Function</a> | Generates the </TR> tag which marks the end of a new row in an HTML table                                                                                      |
| <a href="#">TABLEROWOPEN Function</a>  | Generates the <TR> tag which marks the beginning of a new row in an HTML table                                                                                 |

**Table 224-1 (Cont.) HTF Package Subprograms**

| Subprogram                          | Description                                                                                                                                                 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">TELETYPE Function</a>   | Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font |
| <a href="#">TITLE Function</a>      | Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window                                             |
| <a href="#">ULISTCLOSE Function</a> | Generates the </UL> tag which marks the end of an unordered list                                                                                            |
| <a href="#">ULISTOPEN Function</a>  | Generates the <UL> tag which marks the beginning of an unordered list                                                                                       |
| <a href="#">UNDERLINE Function</a>  | Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline                                                |
| <a href="#">VARIABLE Function</a>   | Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.    |
| <a href="#">WBR Function</a>        | Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text                                                                      |

## 224.6.1 ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTF.ADDRESS (
    cvalue      IN      VARCHAR2
    cnowrap     IN      VARCHAR2   DEFAULT NULL
    cclear      IN      VARCHAR2   DEFAULT NULL
    cattributes IN      VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-2 ADDRESS Function Parameters**

| Parameter   | Description                                                                              |
|-------------|------------------------------------------------------------------------------------------|
| cvalue      | The string that goes between the <ADDRESS> and </ADDRESS> tags.                          |
| cnowrap     | If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag |
| cclear      | The value for the CLEAR attribute.                                                       |
| cattributes | The other attributes to be included as-is in the tag                                     |

### Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 224.6.2 ANCHOR Function

Like the ANCHOR2 function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR (  
    curl           IN          VARCHAR2,  
    ctext          IN          VARCHAR2,  
    cname          IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-3 ANCHOR Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| curl        | The value for the HREF attribute.                     |
| ctext       | The string that goes between the <A> and </A> tags.   |
| cname       | The value for the NAME attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

### Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

## 224.6.3 ANCHOR2 Function

Like the ANCHOR function, this function generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this and the ANCHOR function is that this function provides a target and therefore can be used for a frame.

### Syntax

```
HTF.ANCHOR2 (  
    curl           IN          VARCHAR2,  
    ctext          IN          VARCHAR2,  
    cname          IN          VARCHAR2    DEFAULT NULL,  
    ctarget        IN          varchar2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-4 ANCHOR2 Function Parameters**

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| curl        | The value for the HREF attribute.                    |
| ctext       | The string that goes between the <A> and </A> tags.  |
| cname       | The value for the NAME attribute                     |
| ctarget     | The value for the TARGET attribute.                  |
| cattributes | The other attributes to be included as-is in the tag |

## Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

## 224.6.4 APPLCLOSE Function

This function closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using [APPLETOPEN Function](#)

### Syntax

```
HTF.APPLCLOSE  
RETURN VARCHAR2;
```

## 224.6.5 APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLCLOSE Function](#) which generates the </APPLET> tag.

### Syntax

```
HTF.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight        IN          NUMBER,  
    cwidth         IN          NUMBER,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-5 APPLETOPEN Function Parameters**

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| ccode     | The value for the CODE attribute which specifies the name of the applet class. |
| cheight   | The value for the HEIGHT attribute.                                            |
| cwidth    | The value for the WIDTH attribute.                                             |

**Table 224-5 (Cont.) APPLETOPEN Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

**Usage Notes**

- Specify parameters to the Java applet using the [PARAM Function](#) function.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 224.6.6 AREA Function

This function generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

**Syntax**

```
HTF.AREA (
    ccoords          IN          VARCHAR2
    cshape           IN          VARCHAR2    DEFAULT NULL,
    chref            IN          VARCHAR2    DEFAULT NULL,
    cnohref          IN          VARCHAR2    DEFAULT NULL,
    ctarget          IN          VARCHAR2    DEFAULT NULL,
    cattributes      IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

**Parameters****Table 224-6 AREA Function Parameters**

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| ccords    | The value for the <code>COORDS</code> attribute.                                                                  |
| cshape    | The value for the <code>SHAPE</code> attribute.                                                                   |
| chref     | The value for the <code>HREF</code> attribute.                                                                    |
| cnohref   | If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag. |
| ctarget   | The value for the <code>TARGET</code> attribute.                                                                  |

**Table 224-6 (Cont.) AREA Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

## 224.6.7 BASE Function

This function generates the <BASE> tag which records the URL of the document.

**Syntax**

```
HTF.BASE (  
    ctarget      IN      VARCHAR2    DEFAULT NULL,  
    cattributes  IN      VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters****Table 224-7 BASE Function Parameters**

| Parameter   | Description                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------|
| ctarget     | The value for the TARGET attribute which establishes a window name to which all links in this document are targeted. |
| cattributes | The other attributes to be included as-is in the tag.                                                                |

**Examples**

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## 224.6.8 BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

**Syntax**

```
HTF.BASEFONT (  
    nsize  IN  INTEGER)  
RETURN VARCHAR2;
```

**Parameters****Table 224-8 BASEFONT Function Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| nsize     | The value for the SIZE attribute. |

## Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

## 224.6.9 BGSOUND Function

This function generates the `<BGSOUND>` tag which includes audio for a Web page.

### Syntax

```
HTF.BGSOUND (  
    csrc          IN          VARCHAR2,  
    cloop         IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-9 BGSOUND Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| csrc        | The value for the SRC attribute.                      |
| cloop       | The value for the LOOP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

## 224.6.10 BIG Function

This function generates the `<BIG>` and `</BIG>` tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTF.BIG (  
    ctext         IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-10 BIG Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text that goes between the tags.                  |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

## 224.6.11 BLOCKQUOTECLOSE Function

This function generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

### Syntax

```
HTF.BLOCKQUOTECLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</BLOCKQUOTE>
```

## 224.6.12 BLOCKQUOTEOPEN Function

This function generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

### Syntax

```
HTF.BLOCKQUOTEOPEN (  
    cnowrap          IN          VARCHAR2    DEFAULT NULL,  
    cclear           IN          VARCHAR2    DEFAULT NULL,  
    cattributes      IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-11 BLOCKQUOTEOPEN Function Parameters**

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| cnowrap     | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear      | The value for the CLEAR attribute.                                                     |
| cattributes | The other attributes to be included as-is in the tag.                                  |

### Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 224.6.13 BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Function](#).

### Syntax

```
HTF.BODYCLOSE  
  RETURN VARCHAR2;
```

### Examples

This function generates

```
</BODY>
```

## 224.6.14 BODYOPEN Function

This function generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Function](#).

### Syntax

```
HTF.BODYOPEN (  
  cbackground    IN      VARCHAR2    DEFAULT NULL,  
  cattributes    IN      VARCHAR2    DEFAULT NULL)  
  RETURN VARCHAR2;
```

### Parameters

**Table 224-12 BODYOPEN Function Parameters**

| Parameter   | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| cbackground | The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document. |
| cattributes | The other attributes to be included as-is in the tag.                                                                         |

### Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')  
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

## 224.6.15 BOLD Function

This function generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

### Syntax

```
HTF.BOLD (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-13 BOLD Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text that goes between the tags.                  |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<B cattributes>ctext</B>
```

## 224.6.16 BR Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [NL Function](#).

### Syntax

```
HTF.BR(  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-14 BR Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the <code>CLEAR</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 224.6.17 CENTER Function

This function generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

### Syntax

```
HTF.CENTER (  
    ctext          IN      VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-15** CENTER Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| ctext     | The text that goes between the tags. |

### Examples

This function generates

```
<CENTER>ctext</CENTER>
```

## 224.6.18 CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Function](#).

### Syntax

```
HTF.CENTERCLOSE  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
</CENTER>
```

## 224.6.19 CENTEROPEN Function

This function generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a section of text to center with the [CENTERCLOSE Function](#).

### Syntax

```
HTF.CENTEROPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

&lt;CENTER&gt;

## 224.6.20 CITE Function

This function generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

### Syntax

```
HTF.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-16** CITE Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render as citation.                       |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

## 224.6.21 CODE Function

This function generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

### Syntax

```
HTF.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-17** CODE Function Parameters

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| ctext       | The text to render as code.                          |
| cattributes | The other attributes to be included as-is in the tag |

### Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

## 224.6.22 COMMENT Function

This function generates the comment tags.

### Syntax

```
HTF.COMMENT (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-18** COMMENT Function Parameters

| Parameter | Description  |
|-----------|--------------|
| ctext     | The comment. |

### Examples

This function generates

```
<!-- ctext -->
```

## 224.6.23 DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

### Syntax

```
HTF.DFN (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-19** DFN Function Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| ctext     | The text to render in italics. |

### Examples

This function generates

```
<DFN>ctext</DFN>
```

## 224.6.24 DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

### Syntax

```
HTF.DIRLISTCLOSE  
RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
</DIR>
```

### Related Topics

- [DIRLISTOPEN Function](#)  
This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

## 224.6.25 DIRLISTOPEN Function

This function generates the `<DIR>` which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

### Syntax

```
HTF.DIRLISTOPEN  
RETURN VARCHAR2;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Function](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

### Examples

This function generates

```
<DIR>
```

### Related Topics

- [DIRLISTCLOSE Function](#)  
This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

## 224.6.26 DIV Function

This function generates the `<DIV>` tag which creates document divisions.

### Syntax

```
HTF.DIV (  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-20** DIV Function Parameters

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>calign</code>      | The value for the <code>ALIGN</code> attribute.       |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

## 224.6.27 DLISTCLOSE Function

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Function.

### Syntax

```
HTF.DLISTCLOSE  
RETURN VARCHAR2;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

### Examples

This function generates

```
</DL>
```

### Related Topics

- [DLISTOPEN Function](#)  
This function generates the `<DL>` tag which starts a definition list. You end a definition list by means of the `DLISTCLOSE` Function.

## 224.6.28 DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

### Syntax

```
HTF.DLISTDEF (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-21** DLISTDEF Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The definition of the term.                           |
| cclear      | The value for the CLEAR attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 224.6.29 DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

### Syntax

```
HTF.DLISTOPEN (  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-22** DLISTOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

## Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

## Related Topics

- [DLISTCLOSE Function](#)

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the `DLISTOPEN` Function.

## 224.6.30 DLISTTERM Function

This function generates the `<DT>` tag which defines a term in a definition list `<DL>`.

### Syntax

```
HTF.DLISTTERM (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-23 DLISTTERM Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The term.                                             |
| cclear      | The value for the <code>CLEAR</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 224.6.31 EM Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Function](#).

### Syntax

```
HTF.EM(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-24 EM Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to emphasize.                                |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<EM cattributes>ctext</EM>
```

## 224.6.32 EMPHASIS Function

This function generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EM Function](#).

## Syntax

```
HTF.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-25 EMPHASIS Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to emphasize.                                |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<EM cattributes>ctext</EM>
```

## 224.6.33 ESCAPE\_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`;
- `"` to `&quot;`;
- `<` to `&lt;`;
- `>` to `&gt;`;

This function performs the same operation as HTP. [PRINTS Procedure](#) and HTP. [PS Procedure](#).

### Syntax

```
HTF.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

### Parameters

**Table 224-26** ESCAPE\_SC Function Parameters

| Parameter | Description                 |
|-----------|-----------------------------|
| ctest     | The text string to convert. |

## 224.6.34 ESCAPE\_URL Function

This deprecated function replaces characters that have special meaning in HTML and HTTP with their escape sequences.

### Note:

This procedure, deprecated in Release 10g, and provided here only for reasons of backward compatibility, does not comply with the Internet Engineering Task Force (IETF) Request for Comments (RFC) standards of URL encoding. If you need to encode URLs, it is recommended you use the [ESCAPE Function](#) in the [UTL\\_URL](#) package.

The following characters are converted:

- & to &amp;
- " to &quot;
- < to &lt;
- > to &gt;
- % to &25

### Syntax

```
HTF.ESCAPE_URL(  
    p_url          IN          VARCHAR2);
```

### Parameters

**Table 224-27** ESCAPE\_URL Function Parameters

| Parameter | Description            |
|-----------|------------------------|
| p_url     | The string to convert. |

## 224.6.35 FONTCLOSE Function

This function generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Function](#).

### Syntax

```
HTF.FONTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FONT>
```

## 224.6.36 FONTOPEN Function

This function generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Function](#).

### Syntax

```
HTF.FONTOPEN(  
    ccolor      IN      VARCHAR2  DEFAULT NULL,  
    cface       IN      VARCHAR2  DEFAULT NULL,  
    csize       IN      VARCHAR2  DEFAULT NULL,  
    cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-28 FONTOPEN Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ccolor      | The value for the COLOR attribute.                    |
| cface       | The value for the FACE attribute                      |
| csize       | The value for the SIZE attribute                      |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

## 224.6.37 FORMAT\_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

### Syntax

```
HTF.FORMAT_CELL(  
    columnValue      IN      VARCHAR2  
    format_numbers   IN      VARCHAR2  DEFAULT NULL  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-29** FORMAT\_CELL Function Parameters

| Parameter      | Description                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| columnValue    | The value that needs to be formatted in an HTML table.                                                                                                             |
| format_numbers | The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places. |

### Examples

This function generates

```
<TD >columnValue</TD>
```

### Related Topics

- [TABLEDATA Function](#)  
This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

## 224.6.38 FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

### Syntax

```
HTF.FORMCHECKBOX(  
    cname      IN      VARCHAR2,  
    cvalue     IN      VARCHAR2  DEFAULT 'ON',  
    cchecked   IN      VARCHAR2  DEFAULT NULL,  
    cattributes IN      VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-30** FORMCHECKBOX Function Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| cname     | The value for the NAME attribute. |

**Table 224-30 (Cont.) FORMCHECKBOX Function Parameters**

| Parameter   | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| cvalue      | The value for the VALUE attribute.                                                      |
| cchecked    | If the value for this parameter is not NULL, the CHECKED attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag.                                   |

### Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 224.6.39 FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Function](#).

### Syntax

```
HTF.FORMCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</FORM>
```

## 224.6.40 FORMFILE Function

This function generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

### Syntax

```
HTF.FORMFILE(  
    cname          IN          VARCHAR2,  
    caccept        IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-31 FORMFILE Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| caccept     | A comma-delimited list of MIME types for upload.      |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 224.6.41 FORMHIDDEN Function

This function generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

### Syntax

```
HTF.FORMHIDDEN(  
    cname          IN          VARCHAR2,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-32 FORMHIDDEN Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 224.6.42 FORMIMAGE Function

This function generates the `<INPUT>` tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

### Syntax

```
HTF.FORMIMAGE(  
    cname          IN          VARCHAR2,  
    csrc           IN          VARCHAR2,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-33 FORMIMAGE Function Parameters**

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| cname       | The value for the NAME attribute.                              |
| csrc        | The value for the SRC attribute that specifies the image file. |
| calign      | The value for the ALIGN attribute.                             |
| cattributes | The other attributes to be included as-is in the tag.          |

## Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 224.6.43 FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Function](#).

## Syntax

```
HTF.FORMOPEN(  
    curl           IN          VARCHAR2,  
    cmethod        IN          VARCHAR2  DEFAULT 'POST',  
    ctarget        IN          VARCHAR2  DEFAULT NULL,  
    cenctype       IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-34 FORMOPEN Function Parameters**

| Parameter   | Description                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| curl        | The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required. |
| cmethod     | The value for the METHOD attribute. The value can be "GET" or "POST".                                               |
| ctarget     | The value for the TARGET attribute.                                                                                 |
| cenctype    | The value for the ENCTYPE attribute.                                                                                |
| cattributes | The other attributes to be included as-is in the tag.                                                               |

## Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

## 224.6.44 FORMPASSWORD Function

This function generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field.

When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTF.FORMPASSWORD(  
    cname          IN          VARCHAR2,  
    csize          IN          VARCHAR2,  
    cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-35 FORMPASSWORD Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| csize       | The value for the SIZE attribute.                     |
| cmmaxlength | The value for the MAXLENGTH attribute.                |
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"  
cattributes>
```

## 224.6.45 FORMRADIO Function

This function generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTF.FORMRADIO(  
    cname          IN          VARCHAR2,  
    cvalue         IN          VARCHAR2,  
    cchecked       IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-36 FORMRADIO Function Parameters**

| Parameter   | Description                                                                             |
|-------------|-----------------------------------------------------------------------------------------|
| cname       | The value for the NAME attribute.                                                       |
| cvalue      | The value for the VALUE attribute.                                                      |
| cchecked    | If the value for this parameter is not NULL, the CHECKED attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag.                                   |

## Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 224.6.46 FORMRESET Function

This function generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

## Syntax

```
HTF.FORMRESET(  
    cvalue          IN          VARCHAR2    DEFAULT 'Reset',  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-37 FORMRESET Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 224.6.47 FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELECTOPTION Function](#).

## Syntax

```
HTF.FORMSELECTCLOSE  
    RETURN VARCHAR2;
```

## Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

## 224.6.48 FORMSELECTOPEN Function

This function generates the <SELECT> tags which begins a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELECTOPTION Function](#).

## Syntax

```
HTF.FORMSELECTOPEN(  
    cname          IN      VARCHAR2,  
    cprompt        IN      VARCHAR2  DEFAULT NULL,  
    nsize          IN      INTEGER    DEFAULT NULL,  
    cattributes    IN      VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

## Parameters

**Table 224-38 FORMSELECTOPEN Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| cprompt     | The string preceding the list box.                    |
| nsize       | The value for the SIZE attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>  
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';  
    'Pick the greatest player:');  
HTF.FORMSELECTOPTION('Messier');  
HTF.FORMSELECTOPTION('Howe');  
HTF.FORMSELECTOPTION('Gretzky');.  
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

## 224.6.49 FORMSELETOPTION Function

This function generates the `<OPTION>` tag which represents one choice in a Select element.

### Syntax

```
HTF.FORMSELETOPTION (
    cvalue          IN          VARCHAR2,
    cselected       IN          VARCHAR2  DEFAULT NULL,
    cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-39 FORMSELETOPTION Function Parameters**

| Parameter   | Description                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------|
| cvalue      | The text for the option                                                                               |
| cvalue      | If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag.                                                 |

### Examples

This function generates `<OPTION SELECTED cattributes>cvalue` as shown under the Examples section of the [FORMSELETOPTION Function](#).

## 224.6.50 FORMSUBMIT Function

This function generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTF.FORMSUBMIT (
    cname          IN          VARCHAR2  DEFAULT NULL,
    cvalue         IN          VARCHAR2  DEFAULT 'Submit',
    cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-40 FORMSUBMIT Function Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| cname     | The value for the <code>NAME</code> attribute. |

**Table 224-40 (Cont.) FORMSUBMIT Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 224.6.51 FORMTEXT Function

This function generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

### Syntax

```
HTF.FORMTEXT (  
    cname          IN          VARCHAR2,  
    csize          IN          VARCHAR2  DEFAULT NULL,  
    cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-41 FORMTEXT Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| csize       | The value for the SIZE attribute.                     |
| cmaxlength  | The value for the MAXLENGTH attribute.                |
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"  
cattributes>
```

## 224.6.52 FORMTEXTAREA Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

## Syntax

```
HTF.FORMTEXTAREA(  
    cname          IN          VARCHAR2,  
    nrows          IN          INTEGER,  
    ncolumns       IN          INTEGER,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-42 FORMTEXTAREA Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></  
TEXTAREA>
```

## 224.6.53 FORMTEXTAREA2 Function

This function generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

## Syntax

```
HTF.FORMTEXTAREA2(  
    cname          IN          VARCHAR2,  
    nrows          IN          INTEGER,  
    ncolumns       IN          INTEGER,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cwrap          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-43 FORMTEXTAREA2 Function Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| cname     | The value for the NAME attribute. |

**Table 224-43 (Cont.) FORMTEXTAREA2 Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 224.6.54 FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

### Syntax

```
HTF.FORMTEXTAREACLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</TEXTAREA>
```

## 224.6.55 FORMTEXTAREAOPEN Function

This function generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

### Syntax

```
HTF.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 224-44 FORMTEXTAREAOPEN Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 224.6.56 FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

## Syntax

```
HTF.FORMTEXTAREAOPEN2 (  
    cname          IN          VARCHAR2,  
    nrows          IN          INTEGER,  
    ncolumns       IN          INTEGER,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cwrap          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-45 FORMTEXTAREAOPEN2 Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## 224.6.57 FRAME Function

This function generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

### Syntax

```
HTF.FRAME (
    csrc          IN          VARCHAR2,
    cname         IN          VARCHAR2  DEFAULT NULL,
    cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
    cmarginheight IN          VARCHAR2  DEFAULT NULL,
    cscrolling    IN          VARCHAR2  DEFAULT NULL,
    cnoresize     IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-46** FRAME Function Parameters

| Parameter    | Description                                                                              |
|--------------|------------------------------------------------------------------------------------------|
| csrc         | The URL to display in the frame.                                                         |
| cname        | The value for the NAME attribute.                                                        |
| cmarginwidth | The value for the MARGINWIDTH attribute.                                                 |
| cscrolling   | The value for the SCROLLING attribute.                                                   |
| cnoresize    | If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag. |
| cattributes  | The other attributes to be included as-is in the tag.                                    |

## Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth" MARGINHEIGHT="cmarginheight"
SCROLLING="cscrolling" NORESIZE cattributes>
```

## 224.6.58 FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

### Syntax

```
HTF.FRAMESETCLOSE
RETURN VARCHAR2;
```

## Examples

This function generates

```
</FRAMESET>
```

## 224.6.59 FRAMESETOPEN Function

This function generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.FRAMESETOPEN (  
    crows          IN          VARCHAR2    DEFAULT NULL,  
    ccols          IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-47** FRAMESETOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| crows       | The value for the ROWS attribute.                     |
| ccols       | The value for the COLS attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<FRAMESET ROWS="rows" COLS="ccols" cattributes>
```

## 224.6.60 HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

### Syntax

```
HTF.HEADCLOSE  
RETURN VARCHAR2;
```

## Examples

This function generates

```
</HEAD>
```

## 224.6.61 HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

### Syntax

```
HTF.HEADER(  
    nsize          IN          INTEGER,  
    cheader        IN          VARCHAR2,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cnowrap        IN          VARCHAR2  DEFAULT NULL,  
    cclear         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-48** HEADER Function Parameters

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| nsize       | The heading level. This is an integer between 1 and 6. |
| cheader     | The text to display in the heading.                    |
| calign      | The value for the ALIGN attribute.                     |
| cnowrap     | The value for the NOWRAP attribute.                    |
| cclear      | The value for the CLEAR attribute.                     |
| cattributes | The other attributes to be included as-is in the tag.  |

### Examples

```
HTF.header (1,'Overview')  
RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

## 224.6.62 HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

### Syntax

```
HTF.HEADOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<HEAD>
```

## 224.6.63 HR Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Function](#).

### Syntax

```
HTF.HR(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    csrc            IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-49** HR Function Parameters

| Parameter   | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                                                        |
| csrc        | The value for the SRC attribute which specifies a custom image as the source of the line. |
| cattributes | The other attributes to be included as-is in the tag.                                     |

### Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 224.6.64 HTMLCLOSE Function

This function generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

### Syntax

```
HTF.HTMLCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</HTML>
```

## 224.6.65 HTMLOPEN Function

This function generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

### Syntax

```
HTF.HTMLOPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
<HTML>
```

## 224.6.66 IMG Function

This function generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

### Syntax

```
HTF.IMG (  
    curl            IN          VARCHAR2    DEFAULT NULL,  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    calt            IN          VARCHAR2    DEFAULT NULL,  
    cismap          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
    RETURN VARCHAR2;
```

### Parameters

**Table 224-50** IMG Function Parameters

| Parameter   | Description                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| curl        | The value for the SRC attribute.                                                                                                             |
| calign      | The value for the ALIGN attribute.                                                                                                           |
| calt        | The value for the ALT attribute which specifies alternative text to display if the browser does not support images.                          |
| cismap      | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| cattributes | The other attributes to be included as-is in the tag.                                                                                        |

### Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

## 224.6.67 IMG2 Function

This function generates the `<IMG>` tag, which directs the browser to load an image onto the HTML page.

The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

## Syntax

```
HTF.IMG2(  
    curl           IN          VARCHAR2  DEFAULT NULL,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    calt           IN          VARCHAR2  DEFAULT NULL,  
    cismap         IN          VARCHAR2  DEFAULT NULL,  
    cusemap        IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-51** IMG2 Function Parameters

| Parameter   | Description                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| curl        | The value for the SRC attribute.                                                                                                             |
| calign      | The value for the ALIGN attribute.                                                                                                           |
| calt        | The value for the ALT attribute which specifies alternative text to display if the browser does not support images.                          |
| cismap      | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| cusemap     | The value for the USEMAP attribute which specifies a client-side image map.                                                                  |
| cattributes | The other attributes to be included as-is in the tag.                                                                                        |

## Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

## 224.6.68 ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

## Syntax

```
HTF.ISINDEX(  
    cprompt        IN          VARCHAR2  DEFAULT NULL,  
    curl           IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-52** ISINDEX Function Parameters

| Parameter | Description                         |
|-----------|-------------------------------------|
| cprompt   | The value for the PROMPT attribute. |
| curl      | The value for the HREF attribute.   |

## Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 224.6.69 ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

### Syntax

```
HTF.ITALIC(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-53** ITALIC Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in italics.                   |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<I cattributes>ctext</I>
```

## 224.6.70 KBD Function

This function generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Function](#).

### Syntax

```
HTF.KBD(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-54** KBD Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in monospace.                 |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 224.6.71 KEYBOARD Function

This function generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Function](#).

## Syntax

```
HTF.KEYBOARD(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-55** KEYBOARD Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in monospace.                 |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

## 224.6.72 LINE Function

This function generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Function](#).

## Syntax

```
HTF.LINE(  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    csrc            IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-56** LINE Function Parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| cclear    | The value for the CLEAR attribute. |

**Table 224-56 (Cont.) LINE Function Parameters**

| Parameter   | Description                                                                               |
|-------------|-------------------------------------------------------------------------------------------|
| csrc        | The value for the SRC attribute which specifies a custom image as the source of the line. |
| cattributes | The other attributes to be included as-is in the tag.                                     |

**Examples**

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 224.6.73 LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present.

This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

**Syntax**

```
HTF.LINKREL(  
    crel          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle        IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters****Table 224-57 LINKREL Function Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| crel      | The value for the REL attribute.   |
| curl      | The value for the URL attribute.   |
| ctitle    | The value for the TITLE attribute. |

**Examples**

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 224.6.74 LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

## Syntax

```
HTF.LINKREV(  
    crev          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle        IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-58 LINKREV Function Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| crev      | The value for the REV attribute.   |
| curl      | The value for the URL attribute.   |
| ctitle    | The value for the TITLE attribute. |

## Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 224.6.75 LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

## Syntax

```
HTF.LISTHEADER(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-59 LISTHEADER Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to place between <LH> and </LH>.             |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<LH cattributes>ctext</LH>
```

## 224.6.76 LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

### Syntax

```
HTF.LISTINGCLOSE  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
</LISTING>
```

## 224.6.77 LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

### Syntax

```
HTF.LISTINGOPEN  
    RETURN VARCHAR2;
```

### Examples

This function generates

```
<LISTING>
```

## 224.6.78 LISTITEM Function

This function generates the `<LI>` tag, which indicates a list item.

### Syntax

```
HTF.LISTITEM(  
    ctext          IN          VARCHAR2  DEFAULT NULL,  
    cclear         IN          VARCHAR2  DEFAULT NULL,  
    cdingbat       IN          VARCHAR2  DEFAULT NULL,  
    csrc           IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

## Parameters

**Table 224-60 LISTITEM Function Parameters**

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text for the list item.                           |
| c <code>clear</code>      | The value for the <code>CLEAR</code> attribute.       |
| c <code>dingbat</code>    | The value for the <code>DINGBAT</code> attribute.     |
| c <code>src</code>        | The value for the <code>SRC</code> attribute.         |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 224.6.79 MAILTO Function

This function generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

## Syntax

```
HTF.MAILTO(  
  caddress      IN      VARCHAR2,  
  ctext         IN      VARCHAR2,  
  cname         IN      VARCHAR2,  
  cattributes   IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-61 MAILTO Function Parameters**

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>address</code>    | The email address of the recipient.                   |
| c <code>text</code>       | The clickable portion of the link.                    |
| c <code>name</code>       | The value for the <code>NAME</code> attribute.        |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

## 224.6.80 MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map

. To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#).

### Syntax

```
HTF.MAPCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</MAP>
```

## 224.6.81 MAPOPEN Function

This function generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

### Syntax

```
HTF.MAPOPEN (  
    cname           IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-62** MAPOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

## 224.6.82 MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</MENU>
```

## 224.6.83 MENULISTOPEN Function

This function generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

### Syntax

```
HTF.MENULISTOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<MENU>
```

## 224.6.84 META Function

This function generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTF.META(  
    chttp_equiv    IN      VARCHAR2,  
    cname          IN      VARCHAR2,  
    ccontent       IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-63 META Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| chttp_equiv | The value for the <code>CHTTP_EQUIV</code> attribute. |
| cname       | The value for the <code>NAME</code> attribute.        |
| ccontent    | The value for the <code>CONTENT</code> attribute.     |

### Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 224.6.85 NL Function

This function generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [BR Function](#).

### Syntax

```
HTF.NL(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-64 NL Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the <code>CLEAR</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

## 224.6.86 NOBR Function

This function generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

### Syntax

```
HTF.NOBR(  
    ctext          IN          VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-65 NOBR Function Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| ctext     | The text that is to be rendered on one line. |

### Examples

This function generates

```
<NOBR>ctext</NOBR>
```

## 224.6.87 NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.NOFRAMESCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

```
</NOFRAMES>
```

## 224.6.88 NOFRAMESOPEN Function

This function generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

### Syntax

```
HTF.NOFRAMESOPEN  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<NOFRAMES>
```

## 224.6.89 OLISTCLOSE Function

This function generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTCLOSE  
RETURN VARCHAR2;
```

### Examples

This function generates

&lt;/OL&gt;

## 224.6.90 OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

### Syntax

```
HTF.OLISTOPEN(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cwrap           IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-66** OLISTOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 224.6.91 PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Function](#).

### Syntax

```
HTF.PARA  
RETURN VARCHAR2;
```

### Examples

This function generates

```
<P>
```

## 224.6.92 PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

### Syntax

```
HTF.PARAGRAPH(  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cnowrap         IN          VARCHAR2    DEFAULT NULL,  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-67 PARAGRAPH Function Parameters**

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| calign      | The value for the ALIGN attribute.                                                     |
| cnowrap     | If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear      | The value for the CLEAR attribute.                                                     |
| cattributes | The other attributes to be included as-is in the tag.                                  |

### Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

### Related Topics

- [PARA Function](#)  
This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 224.6.93 PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

### Syntax

```
HTF.PARAM(  
    cname          IN          VARCHAR2  
    cvalue         IN          VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-68** PARAM Function Parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| cname     | The value for the NAME attribute.  |
| cvalue    | The value for the VALUE attribute. |

## Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 224.6.94 PLAINTEXT Function

This function generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

## Syntax

```
HTF.PLAINTEXT(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-69** PLAINTEXT Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in fixed-width font.          |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 224.6.95 PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

## Syntax

```
HTF.PRECLOSE  
RETURN VARCHAR2;
```

## Examples

This function generates

```
</PRE>
```

## 224.6.96 PREOPEN Function

This function generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

### Syntax

```
HTF.PREOPEN (
    cclear          IN          VARCHAR2    DEFAULT NULL,
    cwidth          IN          VARCHAR2    DEFAULT NULL,
    cattributes     IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-70** PREOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                    |
| cwidth      | The value for the WIDTH attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 224.6.97 PRINT Functions

These functions generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

### Syntax

```
HTF.PRINT (
    cbuf          IN          VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRINT (
    dbuf          IN          DATE)
RETURN VARCHAR2;
```

```
HTF.PRINT (
```

```
    nbuf      IN      NUMBER)
RETURN VARCHAR2;
```

### Parameters

**Table 224-71 PRINT Function Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| cbuf      | The string to generate terminated by a newline. |
| dbuf      | The string to generate terminated by a newline. |
| nbuf      | The string to generate terminated by a newline. |

### Usage Notes

- The `\n` character is not the same as `<BR>`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `<BR>` to control how the browser renders the HTML source.
- These functions do not have function equivalents.

## 224.6.98 PRN Functions

These functions generate the specified parameter as a string.

Unlike the [PRINT Functions](#) the string is not terminated with the `\n` newline character.

### Syntax

```
HTF.PRN (
    cbuf      IN      VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRN (
    dbuf      IN      DATE)
RETURN VARCHAR2;
```

```
HTF.PRN (
    nbuf      IN      NUMBER)
RETURN VARCHAR2;
```

### Parameters

**Table 224-72 PRN Function Parameters**

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| cbuf      | The string to generate (not terminated by a newline). |
| dbuf      | The string to generate (not terminated by a newline). |
| nbuf      | The string to generate (not terminated by a newline). |

### Usage Notes

These functions do not have function equivalents.

## 224.6.99 S Function

This function generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Function](#).

### Syntax

```
HTF.S (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-73 S Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in strikethrough type.        |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<S cattributes>ctext</S>
```

## 224.6.100 SAMPLE Function

This function generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

### Syntax

```
HTF.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-74 SAMPLE Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in monospace font.            |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

## 224.6.101 SCRIPT Function

This function generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBScript.

### Syntax

```
HTF.SCRIPT (  
    cscript          IN          VARCHAR2,  
    clanguage        IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-75    SCRIPT Function Parameters**

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| cscript   | The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.          |
| clanguage | The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language. |

### Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 224.6.102 SMALL Function

This function generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

### Syntax

```
HTF.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-76 SMALL Function Parameters**

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text to be rendered in small font.                |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

## 224.6.103 STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Function](#).

## Syntax

```
STRIKE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-77 STRIKE Function Parameters**

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text to be rendered in strikethrough type.        |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 224.6.104 STRONG Function

This function generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

## Syntax

```
HTF.STRONG(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-78** STRONG Function Parameters

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text to be emphasized.                            |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

## 224.6.105 STYLE Function

This function generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

## Syntax

```
HTF.STYLE(  
    cstyle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

## Parameters

**Table 224-79** STYLE Function Parameters

| Parameter            | Description                       |
|----------------------|-----------------------------------|
| c <code>style</code> | The style information to include. |

## Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

## 224.6.106 SUB Function

This function generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

## Syntax

```
HTF.SUB(  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
    RETURN VARCHAR2;
```

## Parameters

**Table 224-80 SUB Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render in subscript.                      |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

## 224.6.107 SUP Function

This function generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

## Syntax

```
HTF.SUP(  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-81 SUP Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render in superscript.                    |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

## 224.6.108 TABLECAPTION Function

This function generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

## Syntax

```
HTF.TABLECAPTION(  
    ccaption       IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,
```

```
    cattributes    IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-82** TABLECAPTION Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text for the caption.                             |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 224.6.109 TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Function](#).

### Syntax

```
HTF.TABLECLOSE
RETURN VARCHAR2;
```

### Examples

This function generates

```
</TABLE>
```

## 224.6.110 TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

### Syntax

```
HTF.TABLEDATA (
    cvalue          IN          VARCHAR2    DEFAULT NULL,
    calign          IN          VARCHAR2    DEFAULT NULL,
    cdp             IN          VARCHAR2    DEFAULT NULL,
    cnowrap         IN          VARCHAR2    DEFAULT NULL,
    crowspan        IN          VARCHAR2    DEFAULT NULL,
    ccolspan        IN          VARCHAR2    DEFAULT NULL,
    cattributes     IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 224-83** TABLEDATA Function Parameters

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| cvalue      | The data for the cell in the table.                                                   |
| calign      | The value for the ALIGN attribute.                                                    |
| cdp         | The value for the DP attribute.                                                       |
| nowrap      | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| ccolspan    | The value for the COLSPAN attribute.                                                  |
| cattributes | The other attributes to be included as-is in the tag.                                 |

## Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP  
cattributes>cvalue</TD>
```

## 224.6.111 TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table.

The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

## Syntax

```
HTF.TABLEHEADER(  
  cvalue      IN      VARCHAR2  DEFAULT NULL,  
  calign      IN      VARCHAR2  DEFAULT NULL,  
  cdp         IN      VARCHAR2  DEFAULT NULL,  
  nowrap      IN      VARCHAR2  DEFAULT NULL,  
  crowspan    IN      VARCHAR2  DEFAULT NULL,  
  ccolspan    IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 224-84** TABLEHEADER Function Parameters

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| cvalue      | The data for the cell in the table.                                                   |
| calign      | The value for the ALIGN attribute.                                                    |
| cdp         | The value for the DP attribute.                                                       |
| nowrap      | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| crispen     | The value for the ROWSPAN attribute.                                                  |
| ccolspan    | The value for the COLSPAN attribute.                                                  |
| cattributes | The other attributes to be included as-is in the tag.                                 |

## Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

## 224.6.112 TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Function](#).

### Syntax

```
HTF.TABLEOPEN (
    cborder          IN          VARCHAR2    DEFAULT NULL
    calign           IN          VARCHAR2    DEFAULT NULL,
    cnowrap          IN          VARCHAR2    DEFAULT NULL,
    cclear           IN          VARCHAR2    DEFAULT NULL
    cattributes      IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 224-85** TABLEOPEN Function Parameters

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| border      | The value for the BORDER attribute.                                                   |
| calign      | The value for the ALIGN attribute.                                                    |
| cnowrap     | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cclear      | The value for the CLEAR attribute.                                                    |
| cattributes | The other attributes to be included as-is in the tag.                                 |

## Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## 224.6.113 TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

### Syntax

```
HTF.TABLEROWCLOSE
RETURN VARCHAR2;
```

## Examples

This function generates

```
</TABLE>
```

## 224.6.114 TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

### Syntax

```
HTF.TABLEROWOPEN (  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cvalign         IN          VARCHAR2    DEFAULT NULL,  
    cdp             IN          VARCHAR2    DEFAULT NULL,  
    cnowrap         IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-86** TABLEROWOPEN Function Parameters

| Parameter   | Description                                                                           |
|-------------|---------------------------------------------------------------------------------------|
| calign      | The value for the ALIGN attribute.                                                    |
| cvalign     | The value for the VALIGN attribute.                                                   |
| cdp         | The value for the DP attribute.                                                       |
| cnowrap     | If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag.                                 |

### Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 224.6.115 TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

### Syntax

```
HTF.TELETYPE (  
    ctext          IN          VARCHAR2,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-87** TELETYPE Function Parameters

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| ctext     | The text to render in a fixed width typewriter font. |

**Table 224-87 (Cont.) TELETYPE Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

This function generates

```
<TT cattributes>ctext</TT>
```

## 224.6.116 TITLE Function

This function generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

**Syntax**

```
HTF.TITLE(  
    ctitle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

**Parameters****Table 224-88 TITLE Function Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| ctitle    | The text to display in the titlebar of the browser window. |

**Examples**

This function generates

```
<TITLE>ctitle</TITLE>
```

## 224.6.117 ULISTCLOSE Function

This function generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

**Syntax**

```
HTF.ULISTCLOSE  
    RETURN VARCHAR2;
```

**Examples**

This function generates

```
</UL>
```

## 224.6.118 ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

### Syntax

```
HTF.ULISTOPEN(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cwrap           IN          VARCHAR2    DEFAULT NULL,  
    cdingbat        IN          VARCHAR2    DEFAULT NULL,  
    csrc            IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-89** ULISTOPEN Function Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cdingbat    | The value for the DINGBAT attribute.                  |
| csrc        | The value for the SRC attribute.                      |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 224.6.119 UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

### Syntax

```
HTF.UNDERLINE(  
    ctext          IN          VARCHAR2,  
    cattributes     IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 224-90** UNDERLINE Function Parameters

| Parameter | Description                           |
|-----------|---------------------------------------|
| ctext     | The text to render with an underline. |

**Table 224-90 (Cont.) UNDERLINE Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

This function generates

```
<U cattributes>ctext</U>
```

## 224.6.120 VARIABLE Function

This function generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

**Syntax**

```
HTF.VARIABLE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters****Table 224-91 VARIABLE Function Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render in italics.                        |
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

This function generates

```
<VAR cattributes>ctext</VAR>
```

## 224.6.121 WBR Function

This function generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

**Syntax**

```
HTF.WBR  
RETURN VARCHAR2;
```

**Examples**

This function generates

```
<WBR>
```

# 225

## HTP

The `HTP` (hypertext procedures) and `HTF` (hypertext functions) packages generate HTML tags. For example, the `HTP.ANCHOR` procedure generates the HTML anchor tag, `<A>`.

This chapter contains the following topics:

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

### See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for `mod_plsql`*

## 225.1 HTP Operational Notes

Certain operational notes apply to the `HTP` package.

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE\\_SC Function](#) or the [ESCAPE\\_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE\\_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE\\_URL Function](#).
- The [FORMAT\\_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT\\_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the `HTP.PRINT` procedure. It then prints its parameters to the generated Web page.

## 225.2 HTP Rules and Limits

If you use values of the LONG datatype in procedures such as `HTP.PRINT`, `HTP.PRN`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 datatype in the procedure.

## 225.3 HTP Examples

These commands generate a simple HTML document.

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

## 225.4 HTP Summary of Tags

HTP tags can be grouped by type, to make understanding them easier.

### HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate `<HTML>` and `</HTML>`

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate `<HEAD>` and `</HEAD>`

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate `<BODY>` and `</BODY>`

### Comment Tag

[COMMENT Procedure](#) - generates `<!--` and `-->`

### Tags in the <HEAD> Area

[BASE Procedure](#) - generates `<BASE>`

[LINKREL Procedure](#) - generates `<LINK>` with the `REL` attribute

[LINKREV Procedure](#) - generates `<LINK>` with the `REV` attribute

[TITLE Procedure](#) - generates `<TITLE>`

[META Procedure](#) - generates `<META>`

[SCRIPT Procedure](#) - generates `<SCRIPT>`

[STYLE Procedure](#) - generates `<STYLE>`

[ISINDEX Procedure](#) - generates `<ISINDEX>`

### Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate `<APPLET>` and `</APPLET>`

[PARAM Procedure](#) - generates `<PARAM>`

### List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate `<OL>` and `</OL>`

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate `<UL>` and `</UL>`

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate `<DL>` and `</DL>`

[DLISTTERM Procedure](#) - generates `<DT>`

[DLISTDEF Procedure](#) - generates `<DD>`

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate `<DIR>` and `</DIR>`

[LISTHEADER Procedure](#) - generates `<LH>`

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate `<LISTING>` and `</LISTING>`

[MENULISTOPEN Procedure](#) - generate `<MENU>` and `</MENU>`

[LISTITEM Procedure](#) - generates `<LI>`

### Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate `<FORM>` and `</FORM>`

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`

[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`

[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`

[FORMSELECHOPTION Procedure](#) - generates `<OPTION>`

[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

### Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Procedure](#) - generates <CAPTION>

[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate <TR> and </TR>

[TABLEHEADER Procedure](#) - generates <TH>

[TABLEDATA Procedure](#) - generates <TD>

### **IMG, HR, and A Tags**

[HR Procedure](#), [LINE Procedure](#) - generate <HR>

[IMG Procedure](#), [IMG2 Procedure](#) - generate <IMG>

[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate <A>

[MAPOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate <MAP> and </MAP>

### **Paragraph Formatting Tags**

[HEADER Procedure](#) - generates heading tags (<H1> to <H6>)

[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate <P>

[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in

[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate <PRE> and </PRE>

[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate <BLOCKQUOTE> and </BLOCKQUOTE>

[DIV Procedure](#) - generates <DIV>

[NL Procedure](#), [BR Procedure](#) - generate <BR>

[NOBR Procedure](#) - generates <NOBR>

[WBR Procedure](#) - generates <WBR>

[PLAINTEXT Procedure](#) - generates <PLAINTEXT>

[ADDRESS Procedure](#) - generates <ADDRESS>

[MAILTO Procedure](#) - generates <A> with the MAILTO attribute

[AREA Procedure](#) - generates <AREA>

[BGSOUND Procedure](#) - generates <BGSOUND>

### **Character Formatting Tags**

[BASEFONT Procedure](#) - generates <BASEFONT>

[BIG Procedure](#) - generates <BIG>

[BOLD Procedure](#) - generates <B>

[CENTER Procedure](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Procedure](#), [CENTERCLOSE Procedure](#) - generate <CENTER> and </CENTER>

[CITE Procedure](#) - generates <CITE>

[CODE Procedure](#) - generates <CODE>

[DFN Procedure](#) - generates <DFN>

[EM Procedure](#), [EMPHASIS Procedure](#) - generate <EM>

[FONTOPEN Procedure](#), [FONTCLOSE Procedure](#) - generate <FONT> and </FONT>

[ITALIC Procedure](#) - generates <I>

[KBD Procedure](#), [KEYBOARD Procedure](#) - generate <KBD> and </KBD>

[S Procedure](#) - generates <S>

[SAMPLE Procedure](#) - generates <SAMP>

[SMALL Procedure](#) - generates <SMALL>

[STRIKE Procedure](#) - generates <STRIKE>

[STRONG Procedure](#) - generates <STRONG>

[SUB Procedure](#) - generates <SUB>

[SUP Procedure](#) - generates <SUP>

[TELETYPE Procedure](#) - generates <TT>

[UNDERLINE Procedure](#) - generates <U>

[VARIABLE Procedure](#) - generates <VAR>

### Frame Tags

[FRAME Procedure](#) - generates <FRAME>

[FRAMESETOPEN Procedure](#), [FRAMESETCLOSE Procedure](#) - generate <FRAMESET> and </FRAMESET>

[NOFRAMESOPEN Procedure](#), [NOFRAMESCLOSE Procedure](#) - generate <NOFRAMES> and </NOFRAMES>

## 225.5 Summary of HTP Subprograms

This table lists the HTP subprograms and briefly describes them.

**Table 225-1 HTP Package Subprograms**

| Subprogram                            | Description                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <a href="#">ADDRESS Procedure</a>     | Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document |
| <a href="#">ANCHOR Procedure</a>      | Generates the <A> and </A> tags which specify the source or destination of a hypertext link               |
| <a href="#">ANCHOR2 Procedure</a>     | Generates the <A> and </A> tags which specify the source or destination of a hypertext link               |
| <a href="#">APPLETCLOSE Procedure</a> | Closes the applet invocation with the </APPLET> tag                                                       |

**Table 225-1 (Cont.) HTP Package Subprograms**

| Subprogram                                | Description                                                                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">APPLETOPEN Procedure</a>      | Generates the <APPLET> tag which begins the invocation of a Java applet                                                                        |
| <a href="#">AREA Procedure</a>            | Generates the <AREA> tag, which defines a client-side image map                                                                                |
| <a href="#">BASE Procedure</a>            | Generates the <BASE> tag which records the URL of the document                                                                                 |
| <a href="#">BASEFONT Procedure</a>        | Generates the <BASEFONT> tag which specifies the base font size for a Web page                                                                 |
| <a href="#">BGSOUND Procedure</a>         | Generates the <BGSOUND> tag which includes audio for a Web page                                                                                |
| <a href="#">BIG Procedure</a>             | Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font                                               |
| <a href="#">BLOCKQUOTECLOSE Procedure</a> | Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text                                                                 |
| <a href="#">BLOCKQUOTEOPEN Procedure</a>  | Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text                                                          |
| <a href="#">BODYCLOSE Procedure</a>       | Generates the </BODY> tag which marks the end of a body section of an HTML document                                                            |
| <a href="#">BODYOPEN Procedure</a>        | Generates the <BODY> tag which marks the beginning of the body section of an HTML document                                                     |
| <a href="#">BOLD Procedure</a>            | Generates the <B> and </B> tags which direct the browser to display the text in boldface                                                       |
| <a href="#">BR Procedure</a>              | Generates the <BR> tag which begins a new line of text                                                                                         |
| <a href="#">CENTER Procedure</a>          | Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page                                                     |
| <a href="#">CENTERCLOSE Procedure</a>     | Generates the </CENTER> tag which marks the end of a section of text to center                                                                 |
| <a href="#">CENTEROPEN Procedure</a>      | Generates the <CENTER> tag which mark the beginning of a section of text to center                                                             |
| <a href="#">CITE Procedure</a>            | Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation                                                |
| <a href="#">CODE Procedure</a>            | Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically |
| <a href="#">COMMENT Procedure</a>         | Generates procedure generates the comment tags <!-- ctext -->                                                                                  |
| <a href="#">DFN Procedure</a>             | Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically      |
| <a href="#">DIRLISTCLOSE Procedure</a>    | Generates the </DIR> tag which ends a directory list section                                                                                   |
| <a href="#">DIRLISTOPEN Procedure</a>     | Generates the <DIR> which starts a directory list section                                                                                      |
| <a href="#">DIV Procedure</a>             | Generates the <DIV> tag which creates document divisions                                                                                       |
| <a href="#">DLISTCLOSE Procedure</a>      | Generates the </DL> tag which ends a definition list                                                                                           |
| <a href="#">DLISTDEF Procedure</a>        | Generates the <DD> tag, which inserts definitions of terms                                                                                     |
| <a href="#">DLISTOPEN Procedure</a>       | Generates the <DL> tag which starts a definition list                                                                                          |
| <a href="#">DLISTTERM Procedure</a>       | Generates the <DT> tag which defines a term in a definition list <DL>                                                                          |

**Table 225-1 (Cont.) HTP Package Subprograms**

| Subprogram                                 | Description                                                                                                                                                            |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EM Procedure</a>               | Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized                                                            |
| <a href="#">EMPHASIS Procedure</a>         | Generates the <code>&lt;EM&gt;</code> and <code>&lt;/EM&gt;</code> tags, which define text to be emphasized                                                            |
| <a href="#">ESCAPE_SC Procedure</a>        | Replaces characters that have special meaning in HTML with their escape sequences                                                                                      |
| <a href="#">FONTCLOSE Procedure</a>        | Generates the <code>&lt;/FONT&gt;</code> tag which marks the end of a section of text with the specified font characteristics                                          |
| <a href="#">FONTOPEN Procedure</a>         | Generates the <code>&lt;FONT&gt;</code> which marks the beginning of section of text with the specified font characteristics                                           |
| <a href="#">FORMCHECKBOX Procedure</a>     | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="checkbox"</code> which inserts a checkbox element in a form                                              |
| <a href="#">FORMCLOSE Procedure</a>        | Generates the <code>&lt;/FORM&gt;</code> tag which marks the end of a form section in an HTML document                                                                 |
| <a href="#">FORMOPEN Procedure</a>         | Generates the <code>&lt;FORM&gt;</code> tag which marks the beginning of a form section in an HTML document                                                            |
| <a href="#">FORMFILE Procedure</a>         | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="file"</code> which inserts a file form element, and is used for file uploading for a given page          |
| <a href="#">FORMHIDDEN Procedure</a>       | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="hidden"</code> which inserts a hidden form element                                                       |
| <a href="#">FORMIMAGE Procedure</a>        | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="image"</code> which creates an image field that the user clicks to submit the form immediately           |
| <a href="#">FORMPASSWORD Procedure</a>     | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="password"</code> which creates a single-line text entry field                                            |
| <a href="#">FORMRADIO Procedure</a>        | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="radio"</code> , which creates a radio button on the HTML form                                            |
| <a href="#">FORMRESET Procedure</a>        | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="reset"</code> which creates a button that, when selected, resets the form fields to their initial values |
| <a href="#">FORMSELECTCLOSE Procedure</a>  | Generates the <code>&lt;/SELECT&gt;</code> tag which marks the end of a Select form element                                                                            |
| <a href="#">FORMSELECTOPEN Procedure</a>   | Generates the <code>&lt;/SELECT&gt;</code> tag which marks the beginning of a Select form element                                                                      |
| <a href="#">FORMSELECTOPTION Procedure</a> | Generates the <code>&lt;OPTION&gt;</code> tag which represents one choice in a Select element                                                                          |
| <a href="#">FORMSUBMIT Procedure</a>       | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="submit"</code> which creates a button that, when clicked, submits the form                               |
| <a href="#">FORMTEXT Procedure</a>         | Generates the <code>&lt;INPUT&gt;</code> tag with <code>TYPE="text"</code> , which creates a field for a single line of text                                           |
| <a href="#">FORMTEXTAREA Procedure</a>     | Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area                                               |
| <a href="#">FORMTEXTAREA2 Procedure</a>    | Generates the <code>&lt;TEXTAREA&gt;</code> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style      |

Table 225-1 (Cont.) HTP Package Subprograms

| Subprogram                  | Description                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FORMTEXTAREACLOSE Procedure | Generates the <code>&lt;/TEXTAREA&gt;</code> tag which ends a text area form element                                                                                                |
| FORMTEXTAREAOPEN Procedure  | Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element                                                                                   |
| FORMTEXTAREAOPEN2 Procedure | Generates the <code>&lt;TEXTAREA&gt;</code> which marks the beginning of a text area form element with the ability to specify a wrap style                                          |
| FRAME Procedure             | Generates the <code>&lt;FRAME&gt;</code> tag which begins the characteristics of a frame created by a <code>&lt;FRAMESET&gt;</code> tag                                             |
| FRAMESETCLOSE Procedure     | Generates the <code>&lt;/FRAMESET&gt;</code> tag which ends a frameset section                                                                                                      |
| FRAMESETOPEN Procedure      | Generates the <code>&lt;/FRAMESET&gt;</code> tag which begins a frameset section                                                                                                    |
| HEADCLOSE Procedure         | Generates the <code>&lt;/HEAD&gt;</code> tag which marks the end of an HTML document head section                                                                                   |
| HEADER Procedure            | Generates opening heading tags ( <code>&lt;H1&gt;</code> to <code>&lt;H6&gt;</code> ) and their corresponding closing tags ( <code>&lt;/H1&gt;</code> to <code>&lt;/H6&gt;</code> ) |
| HEADOPEN Procedure          | Generates the <code>&lt;HEAD&gt;</code> tag which marks the beginning of the HTML document head section                                                                             |
| HR Procedure                | Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document                                                                                              |
| HTMLCLOSE Procedure         | Generates the <code>&lt;/HTML&gt;</code> tag which marks the end of an HTML document                                                                                                |
| HTMLOPEN Procedure          | Generates the <code>&lt;HTML&gt;</code> tag which marks the beginning of an HTML document                                                                                           |
| IMG Procedure               | Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page                                                                            |
| IMG2 Procedure              | Generates the <code>&lt;IMG&gt;</code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute |
| ISINDEX Procedure           | Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program                                                  |
| ITALIC Procedure            | Generates the <code>&lt;I&gt;</code> and <code>&lt;/I&gt;</code> tags which direct the browser to render the text in italics                                                        |
| KBD Procedure               | Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags which direct the browser to render the text in monospace font                                             |
| KEYBOARD Procedure          | Generates the <code>&lt;KBD&gt;</code> and <code>&lt;/KBD&gt;</code> tags, which direct the browser to render the text in monospace font                                            |
| LINE Procedure              | Generates the <code>&lt;HR&gt;</code> tag, which generates a line in the HTML document                                                                                              |
| LINKREL Procedure           | Generates the <code>&lt;LINK&gt;</code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target     |
| LINKREV Procedure           | Generates the <code>&lt;LINK&gt;</code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor     |
| LISTHEADER Procedure        | Generates the <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> tags which print an HTML tag at the beginning of the list                                                        |

**Table 225-1 (Cont.) HTP Package Subprograms**

| Subprogram                              | Description                                                                                                                                                         |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LISTINGCLOSE Procedure</a>  | Generates the <code>&lt;/LISTING&gt;</code> tags which marks the end of a section of fixed-width text in the body of an HTML page                                   |
| <a href="#">LISTINGOPEN Procedure</a>   | Generates the <code>&lt;LISTING&gt;</code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page                               |
| <a href="#">LISTITEM Procedure</a>      | Generates the <code>&lt;LI&gt;</code> tag, which indicates a list item                                                                                              |
| <a href="#">MAILTO Procedure</a>        | Generates the <code>&lt;A&gt;</code> tag with the <code>HREF</code> set to 'mailto' prepended to the mail address argument                                          |
| <a href="#">MAPCLOSE Procedure</a>      | Generates the <code>&lt;/MAP&gt;</code> tag which marks the end of a set of regions in a client-side image map                                                      |
| <a href="#">MAPOPEN Procedure</a>       | Generates the <code>&lt;MAP&gt;</code> tag which mark the beginning of a set of regions in a client-side image map                                                  |
| <a href="#">MENULISTCLOSE Procedure</a> | Generates the <code>&lt;/MENU&gt;</code> tag which ends a list that presents one line for each item                                                                 |
| <a href="#">MENULISTOPEN Procedure</a>  | Generates the <code>&lt;MENU&gt;</code> tag which begins a list that presents one line for each item                                                                |
| <a href="#">META Procedure</a>          | Generates the <code>&lt;META&gt;</code> tag, which embeds meta-information about the document and also specifies values for HTTP headers                            |
| <a href="#">NL Procedure</a>            | Generates the <code>&lt;BR&gt;</code> tag which begins a new line of text                                                                                           |
| <a href="#">NOBR Procedure</a>          | Generates the <code>&lt;NOBR&gt;</code> and <code>&lt;/NOBR&gt;</code> tags which turn off line-breaking in a section of text                                       |
| <a href="#">NOFRAMESCLOSE Procedure</a> | Generates the <code>&lt;/NOFRAMES&gt;</code> tag which marks the end of a no-frames section                                                                         |
| <a href="#">NOFRAMESOPEN Procedure</a>  | Generates the <code>&lt;NOFRAMES&gt;</code> tag which mark the beginning of a no-frames section                                                                     |
| <a href="#">OLISTCLOSE Procedure</a>    | Generates the <code>&lt;/OL&gt;</code> tag which defines the end of an ordered list                                                                                 |
| <a href="#">OLISTOPEN Procedure</a>     | Generates the <code>&lt;OL&gt;</code> tag which marks the beginning of an ordered list                                                                              |
| <a href="#">PARA Procedure</a>          | Generates the <code>&lt;P&gt;</code> tag which indicates that the text that comes after the tag is to be formatted as a paragraph                                   |
| <a href="#">PARAGRAPH Procedure</a>     | Adds attributes to the <code>&lt;P&gt;</code> tag                                                                                                                   |
| <a href="#">PARAM Procedure</a>         | Generates the <code>&lt;PARAM&gt;</code> tag which specifies parameter values for Java applets                                                                      |
| <a href="#">PLAINTEXT Procedure</a>     | Generates the <code>&lt;PLAINTEXT&gt;</code> and <code>&lt;/PLAINTEXT&gt;</code> tags which direct the browser to render the text they surround in fixed-width type |
| <a href="#">PRECLOSE Procedure</a>      | Generates the <code>&lt;/PRE&gt;</code> tag which marks the end of a section of preformatted text in the body of the HTML page                                      |
| <a href="#">PREOPEN Procedure</a>       | Generates the <code>&lt;PRE&gt;</code> tag which marks the beginning of a section of preformatted text in the body of the HTML page                                 |
| <a href="#">PRINT Procedures</a>        | Generates the specified parameter as a string terminated with the <code>\n</code> newline character                                                                 |
| <a href="#">PRINTS Procedure</a>        | Generates a string and replaces the following characters with the corresponding escape sequence                                                                     |
| <a href="#">PRN Procedures</a>          | Generates the specified parameter as a string                                                                                                                       |

**Table 225-1 (Cont.) HTP Package Subprograms**

| Subprogram                              | Description                                                                                                                                                    |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PS Procedure</a>            | Generates a string and replaces the following characters with the corresponding escape sequence.                                                               |
| <a href="#">S Procedure</a>             | Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type                                                |
| <a href="#">SAMPLE Procedure</a>        | Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically |
| <a href="#">SCRIPT Procedure</a>        | Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript                                          |
| <a href="#">SMALL Procedure</a>         | Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font                                          |
| <a href="#">STRIKE Procedure</a>        | Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type                                      |
| <a href="#">STRONG Procedure</a>        | Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically       |
| <a href="#">STYLE Procedure</a>         | Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page                                                                              |
| <a href="#">SUB Procedure</a>           | Generates the <SUB> and </SUB> tags which direct the browser to render the text they surround as subscript                                                     |
| <a href="#">SUP Procedure</a>           | Generates the <SUP> and </SUP> tags which direct the browser to render the text they surround as superscript                                                   |
| <a href="#">TABLECAPTION Procedure</a>  | Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table                                                                             |
| <a href="#">TABLECLOSE Procedure</a>    | Generates the </TABLE> tag which marks the end of an HTML table                                                                                                |
| <a href="#">TABLEDATA Procedure</a>     | Generates the <TD> and </TD> tags which insert data into a cell of an HTML table                                                                               |
| <a href="#">TABLEHEADER Procedure</a>   | Generates the <TH> and </TH> tags which insert a header cell in an HTML table.                                                                                 |
| <a href="#">TABLEOPEN Procedure</a>     | Generates the <TABLE> tag which marks the beginning of an HTML table                                                                                           |
| <a href="#">TABLEROWCLOSE Procedure</a> | Generates the </TR> tag which marks the end of a new row in an HTML table                                                                                      |
| <a href="#">TABLEROWOPEN Procedure</a>  | Generates the <TR> tag which marks the beginning of a new row in an HTML table                                                                                 |
| <a href="#">TELETYPE Procedure</a>      | Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font    |
| <a href="#">TITLE Procedure</a>         | Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window                                                |
| <a href="#">ULISTCLOSE Procedure</a>    | Generates the </UL> tag which marks the end of an unordered list                                                                                               |
| <a href="#">ULISTOPEN Procedure</a>     | Generates the <UL> tag which marks the beginning of an unordered list                                                                                          |

**Table 225-1 (Cont.) HTP Package Subprograms**

| Subprogram                          | Description                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">UNDERLINE Procedure</a> | Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline                                             |
| <a href="#">VARIABLE Procedure</a>  | Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically. |
| <a href="#">WBR Procedure</a>       | Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text                                                                   |

## 225.5.1 ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

### Syntax

```
HTP.ADDRESS (  
    cvalue          IN          VARCHAR2  
    cnowrap         IN          VARCHAR2    DEFAULT NULL  
    cclear          IN          VARCHAR2    DEFAULT NULL  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-2 ADDRESS Procedure Parameters**

| Parameter   | Description                                                                              |
|-------------|------------------------------------------------------------------------------------------|
| cvalue      | The string that goes between the <ADDRESS> and </ADDRESS> tags.                          |
| cnowrap     | If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag |
| cclear      | The value for the CLEAR attribute.                                                       |
| cattributes | The other attributes to be included as-is in the tag                                     |

### Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

## 225.5.2 ANCHOR Procedure

Like the ANCHOR2 procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

## Syntax

```
HTP.ANCHOR (  
    curl          IN          VARCHAR2,  
    ctext         IN          VARCHAR2,  
    cname         IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-3 ANCHOR Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| curl        | The value for the HREF attribute.                     |
| ctext       | The string that goes between the <A> and </A> tags.   |
| cname       | The value for the NAME attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

## Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

## 225.5.3 ANCHOR2 Procedure

Like the ANCHOR procedure, this procedure generates the <A> and </A> HTML tags which specify the source or destination of a hypertext link.

The difference between this procedure and the ANCHOR procedure is that this procedure provides a target and therefore can be used for a frame.

## Syntax

```
HTP.ANCHOR2 (  
    curl          IN          VARCHAR2,  
    ctext         IN          VARCHAR2,  
    cname         IN          VARCHAR2  DEFAULT NULL,  
    ctarget       in          varchar2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-4 ANCHOR2 Procedure Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| curl      | The value for the HREF attribute.                   |
| ctext     | The string that goes between the <A> and </A> tags. |

**Table 225-4 (Cont.) ANCHOR2 Procedure Parameters**

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| cname       | The value for the NAME attribute                     |
| ctarget     | The value for the TARGET attribute.                  |
| cattributes | The other attributes to be included as-is in the tag |

**Examples**

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

## 225.5.4 APPLCLOSE Procedure

This procedure closes the applet invocation with the </APPLET> tag.

You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

**Syntax**

```
HTP.APPLCLOSE;
```

## 225.5.5 APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet.

You close the applet invocation with [APPLCLOSE Procedure](#) which generates the </APPLET> tag.

**Syntax**

```
HTP.APPLETOPEN (  
    ccode          IN          VARCHAR2,  
    cheight        IN          NUMBER,  
    cwidth         IN          NUMBER,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 225-5 APPLETOPEN Procedure Parameters**

| Parameter   | Description                                                                        |
|-------------|------------------------------------------------------------------------------------|
| ccode       | The the value for the CODE attribute which specifies the name of the applet class. |
| cheight     | The value for the HEIGHT attribute.                                                |
| cwidth      | The value for the WIDTH attribute.                                                 |
| cattributes | The other attributes to be included as-is in the tag.                              |

**Examples**

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

### Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#).
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

## 225.5.6 AREA Procedure

This procedure generates the `<AREA>` tag, which defines a client-side image map. The `<AREA>` tag defines areas within the image and destinations for the areas.

### Syntax

```
HTP.AREA (
    ccoords      IN      VARCHAR2
    cshape       IN      VARCHAR2  DEFAULT NULL,
    chref        IN      VARCHAR2  DEFAULT NULL,
    cnohref      IN      VARCHAR2  DEFAULT NULL,
    ctarget      IN      VARCHAR2  DEFAULT NULL,
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-6 AREA Procedure Parameters**

| Parameter                | Description                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>ccords</code>      | The the value for the <code>COORDS</code> attribute.                                                              |
| <code>cshape</code>      | The value for the <code>SHAPE</code> attribute.                                                                   |
| <code>chref</code>       | The value for the <code>HREF</code> attribute.                                                                    |
| <code>cnohref</code>     | If the value for this parameter is not <code>NULL</code> , the <code>NOHREF</code> attribute is added to the tag. |
| <code>ctarget</code>     | The value for the <code>TARGET</code> attribute.                                                                  |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                             |

### Examples

This procedure generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget" cattributes>
```

## 225.5.7 BASE Procedure

This procedure generates the `<BASE>` tag which records the URL of the document.

### Syntax

```
HTP.BASE (  
    ctarget      IN      VARCHAR2  DEFAULT NULL,  
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-7 BASE Procedure Parameters**

| Parameter                | Description                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>ctarget</code>     | The value for the <code>TARGET</code> attribute which establishes a window name to which all links in this document are targeted. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                                             |

### Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

## 225.5.8 BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

### Syntax

```
HTP.BASEFONT (  
    nsize      IN      INTEGER);
```

### Parameters

**Table 225-8 BASEFONT Procedure Parameters**

| Parameter          | Description                                    |
|--------------------|------------------------------------------------|
| <code>nsize</code> | The value for the <code>SIZE</code> attribute. |

### Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

## 225.5.9 BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

### Syntax

```
HTP.BGSOUND (  
    csrc          IN          VARCHAR2,  
    cloop         IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-9 BGSOUND Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| csrc        | The value for the SRC attribute.                      |
| cloop       | The value for the LOOP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

## 225.5.10 BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

### Syntax

```
HTP.BIG (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-10 BIG Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The the text that goes between the tags.              |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

## 225.5.11 BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text.

You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

### Syntax

```
HTP.BLOCKQUOTECLOSE;
```

### Examples

This procedure generates

```
</BLOCKQUOTE>
```

## 225.5.12 BLOCKQUOTEOPEN Procedure

This procedure generates the `<BLOCKQUOTE>` tag, which marks the beginning of a section of quoted text.

You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

### Syntax

```
HTP.BLOCKQUOTEOPEN (
    cnowrap      IN      VARCHAR2  DEFAULT NULL,
    cclear       IN      VARCHAR2  DEFAULT NULL,
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-11 BLOCKQUOTEOPEN Procedure Parameters**

| Parameter                | Description                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <code>cnowrap</code>     | If the value for this parameter is not NULL, the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.                                                     |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                               |

### Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

## 225.5.13 BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document.

You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

**Syntax**

```
HTP.BODYCLOSE;
```

**Examples**

This procedure generates

```
</BODY>
```

## 225.5.14 BODYOPEN Procedure

This procedure generates the `<BODY>` tag which marks the beginning of the body section of an HTML document.

You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

**Syntax**

```
HTP.BODYOPEN (
    cbackground      IN      VARCHAR2      DEFAULT NULL,
    cattributes      IN      VARCHAR2      DEFAULT NULL);
```

**Parameters**

**Table 225-12 BODYOPEN Procedure Parameters**

| Parameter   | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| cbackground | The value for the <code>BACKGROUND</code> attribute which specifies a graphic file to use for the background of the document. |
| cattributes | The other attributes to be included as-is in the tag.                                                                         |

**Examples**

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

## 225.5.15 BOLD Procedure

This procedure generates the `<B>` and `</B>` tags which direct the browser to display the text in boldface.

**Syntax**

```
HTP.BOLD (
    ctext            IN      VARCHAR2,
    cattributes      IN      VARCHAR2      DEFAULT NULL);
```

## Parameters

**Table 225-13 BOLD Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sub>text</sub></code>       | The text that goes between the tags.                  |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<B cattributes>ctext</B>
```

## 225.5.16 BR Procedure

This procedure generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [NL Procedure](#).

## Syntax

```
HTP.BR(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-14 BR Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sub>clear</sub></code>      | The value for the <code>CLEAR</code> attribute.       |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 225.5.17 CENTER Procedure

This procedure generates the `<CENTER>` and `</CENTER>` tags which center a section of text within a Web page.

## Syntax

```
HTP.CENTER (  
    ctext          IN          VARCHAR2);
```

## Parameters

**Table 225-15** CENTER Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| ctext     | The text that goes between the tags. |

## Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

## 225.5.18 CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center.

You mark the beginning of a section of text to center with the [CENTEROPEN Procedure](#).

## Syntax

```
HTP.CENTERCLOSE;
```

## Examples

This procedure generates

```
</CENTER>
```

## 225.5.19 CENTEROPEN Procedure

This procedure generates the `<CENTER>` tag which mark the beginning of a section of text to center.

You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

## Syntax

```
HTP.CENTEROPEN;
```

## Examples

This procedure generates

```
<CENTER>
```

## 225.5.20 CITE Procedure

This procedure generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation.

## Syntax

```
HTP.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-16 CITE Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to render as citation.                       |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

## 225.5.21 CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

## Syntax

```
HTP.CODE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-17 CODE Procedure Parameters**

| Parameter                | Description                                          |
|--------------------------|------------------------------------------------------|
| <code>ctext</code>       | The text to render as code.                          |
| <code>cattributes</code> | The other attributes to be included as-is in the tag |

## Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

## 225.5.22 COMMENT Procedure

This procedure generates the comment tags.

## Syntax

```
HTP.COMMENT (  
    ctext          IN          VARCHAR2);
```

## Parameters

**Table 225-18 COMMENT Procedure Parameters**

| Parameter          | Description  |
|--------------------|--------------|
| <code>ctext</code> | The comment. |

## Examples

This procedure generates

```
<!-- ctext -->
```

## 225.5.23 DFN Procedure

This procedure generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

## Syntax

```
HTP.DFN (
    ctext          IN          VARCHAR2);
```

## Parameters

**Table 225-19 DFN Procedure Parameters**

| Parameter          | Description                    |
|--------------------|--------------------------------|
| <code>ctext</code> | The text to render in italics. |

## Examples

This procedure generates

```
<DFN>ctext</DFN>
```

## 225.5.24 DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

## Syntax

```
HTP.DIRLISTCLOSE;
```

## Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `<LI>` tag directly or invoke the [LISTITEM Procedure](#) so that the `<LI>` tag appears directly after the `</DIR>` tag to define the items as a list.

## Examples

This procedure generates

</DIR>

### Related Topics

- [DIRLISTOPEN Procedure](#)

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

## 225.5.25 DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

### Syntax

```
HTP.DIRLISTOPEN;
```

### Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the [LISTITEM Procedure](#) so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

### Examples

This procedure generates

<DIR>

### Related Topics

- [DIRLISTCLOSE Procedure](#)

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

## 225.5.26 DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

### Syntax

```
HTP.DIV (  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-20** DIV Procedure Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

## 225.5.27 DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Procedure](#).

### Syntax

```
HTP.DLISTCLOSE;
```

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
</DL>
```

### Related Topics

- [DLISTOPEN Procedure](#)

This procedure generates the `<DL>` tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Procedure](#).

## 225.5.28 DLISTDEF Procedure

This procedure generates the `<DD>` tag, which inserts definitions of terms. Use this tag for a definition list `<DL>`. Terms are tagged `<DT>` and definitions are tagged `<DD>`.

### Syntax

```
HTP.DLISTDEF (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-21 DLISTDEF Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The definition of the term.                           |
| cclear      | The value for the <code>CLEAR</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

## 225.5.29 DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

### Syntax

```
HTP.DLISTOPEN (  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-22 DLISTOPEN Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cclear      | The value for the CLEAR attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

### Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

### Related Topics

- [DLISTCLOSE Procedure](#)  
This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

## 225.5.30 DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

### Syntax

```
HTP.DLISTTERM (  
    ctext           IN          VARCHAR2    DEFAULT NULL,  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-23 DLISTTERM Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| ctext     | The term.                          |
| cclear    | The value for the CLEAR attribute. |

**Table 225-23 (Cont.) DLISTTERM Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

**Examples**

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

## 225.5.31 EM Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EMPHASIS Procedure](#).

**Syntax**

```
HTP.EM(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 225-24 EM Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to emphasize.                                |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

**Examples**

This procedure generates

```
<EM cattributes>ctext</EM>
```

## 225.5.32 EMPHASIS Procedure

This procedure generates the `<EM>` and `</EM>` tags, which define text to be emphasized.

It performs the same task as the [EM Procedure](#).

**Syntax**

```
HTP.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-25 EMPHASIS Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sub>text</sub></code>       | The text to emphasize.                                |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

## 225.5.33 ESCAPE\_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences.

The following characters are converted:

- `&` to `&amp;`;
- `"` to `&quot;`;
- `<` to `&lt;`;
- `>` to `&gt;`;

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

## Syntax

```
HTP.ESCAPE_SC(  
    ctext          IN      VARCHAR2);
```

## Parameters

**Table 225-26 ESCAPE\_SC Procedure Parameters**

| Parameter                     | Description                 |
|-------------------------------|-----------------------------|
| <code>c<sub>text</sub></code> | The text string to convert. |

## 225.5.34 FONTCLOSE Procedure

This procedure generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics.

You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

## Syntax

```
HTP.FONTCLOSE;
```

## Examples

This procedure generates

```
</FONT>
```

## 225.5.35 FONTOPEN Procedure

This procedure generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics.

You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

## Syntax

```
HTP.FONTOPEN (
    ccolor      IN      VARCHAR2    DEFAULT NULL,
    cface       IN      VARCHAR2    DEFAULT NULL,
    csize       IN      VARCHAR2    DEFAULT NULL,
    cattributes  IN      VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-27 FONTOPEN Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ccolor      | The value for the COLOR attribute.                    |
| cface       | The value for the FACE attribute                      |
| csize       | The value for the SIZE attribute                      |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

## 225.5.36 FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form.

A checkbox element is a button that the user toggles on or off.

## Syntax

```
HTP.FORMCHECKBOX (
    cname      IN      VARCHAR2,
    cvalue     IN      VARCHAR2    DEFAULT 'ON',
    cchecked   IN      VARCHAR2    DEFAULT NULL,
    cattributes IN      VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-28 FORMCHECKBOX Procedure Parameters**

| Parameter                | Description                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>cname</code>       | The value for the <code>NAME</code> attribute.                                                                     |
| <code>cvalue</code>      | The value for the <code>VALUE</code> attribute.                                                                    |
| <code>cchecked</code>    | If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                              |

## Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 225.5.37 FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.

You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

## Syntax

```
HTP.FORMCLOSE;
```

## Examples

This procedure generates

```
</FORM>
```

## 225.5.38 FORMOPEN Procedure

This procedure generates the `<FORM>` tag which marks the beginning of a form section in an HTML document.

You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

## Syntax

```
HTP.FORMOPEN(  
    curl           IN          VARCHAR2,  
    cmethod        IN          VARCHAR2  DEFAULT 'POST',  
    ctarget        IN          VARCHAR2  DEFAULT NULL,  
    cenctype       IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-29 FORMOPEN Procedure Parameters**

| Parameter                | Description                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------|
| <code>curl</code>        | The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required. |
| <code>cmethod</code>     | The value for the <code>METHOD</code> attribute. The value can be "GET" or "POST".                   |
| <code>ctarget</code>     | The value for the <code>TARGET</code> attribute.                                                     |
| <code>cenctype</code>    | The value for the <code>ENCTYPE</code> attribute.                                                    |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                |

## Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype" cattributes>
```

## 225.5.39 FORMFILE Procedure

This procedure generates the `<INPUT>` tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

## Syntax

```
HTP.FORMFILE (  
    cname          IN          VARCHAR2,  
    caccept        IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-30 FORMFILE Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cname</code>       | The value for the <code>NAME</code> attribute.        |
| <code>caccept</code>     | A comma-delimited list of MIME types for upload.      |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

## 225.5.40 FORMHIDDEN Procedure

This procedure generates the `<INPUT>` tag with `TYPE="hidden"`, which inserts a hidden form element.

This element is not seen by the user. It submits additional values to the script.

## Syntax

```
HTP.FORMHIDDEN(  
    cname          IN          VARCHAR2,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-31 FORMHIDDEN Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

## 225.5.41 FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately.

The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

## Syntax

```
HTP.FORMIMAGE(  
    cname          IN          VARCHAR2,  
    csrc           IN          VARCHAR2,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-32 FORMIMAGE Procedure Parameters**

| Parameter   | Description                                                    |
|-------------|----------------------------------------------------------------|
| cname       | The value for the NAME attribute.                              |
| csrc        | The value for the SRC attribute that specifies the image file. |
| calign      | The value for the ALIGN attribute.                             |
| cattributes | The other attributes to be included as-is in the tag.          |

## Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

## 225.5.42 FORMPASSWORD Procedure

This procedure generates the `<INPUT>` tag with `TYPE="password"` which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

### Syntax

```
HTP.FORMPASSWORD(  
    cname          IN          VARCHAR2,  
    csize          IN          VARCHAR2,  
    cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-33 FORMPASSWORD Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cname</code>       | The value for the <code>NAME</code> attribute.        |
| <code>csize</code>       | The value for the <code>SIZE</code> attribute.        |
| <code>cmmaxlength</code> | The value for the <code>MAXLENGTH</code> attribute.   |
| <code>cvalue</code>      | The value for the <code>VALUE</code> attribute.       |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"  
cattributes>
```

## 225.5.43 FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

### Syntax

```
HTP.FORMRADIO(  
    cname          IN          VARCHAR2,  
    cvalue         IN          VARCHAR2,  
    cchecked       IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-34 FORMRADIO Procedure Parameters**

| Parameter                | Description                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>cname</code>       | The value for the <code>NAME</code> attribute.                                                                     |
| <code>cvalue</code>      | The value for the <code>VALUE</code> attribute.                                                                    |
| <code>cchecked</code>    | If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                              |

## Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

## 225.5.44 FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

## Syntax

```
HTP.FORMRESET(  
    cvalue          IN          VARCHAR2    DEFAULT 'Reset',  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-35 FORMRESET Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cvalue</code>      | The value for the <code>VALUE</code> attribute.       |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

## 225.5.45 FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

## Syntax

```
HTP.FORMSELECTCLOSE;
```

## Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

## 225.5.46 FORMSELECTOPEN Procedure

This procedure generates the `<SELECT>` tags which creates a Select form element.

A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELECTOPTION Procedure](#).

## Syntax

```
FORMSELECTOPEN(  
    cname          IN          VARCHAR2,  
    cprompt        IN          VARCHAR2  DEFAULT NULL,  
    nsize          IN          INTEGER   DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-36 FORMSELECTOPEN Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| cprompt     | The string preceding the list box.                    |
| nsize       | The value for the SIZE attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>  
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';  
    'Pick the greatest player:');  
HTP.FORMSELECTOPTION('Messier');  
HTP.FORMSELECTOPTION('Howe');  
HTP.FORMSELECTOPTION('Gretzky');  
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:  
<SELECT NAME="greatest_player">  
<OPTION>Messier  
<OPTION>Howe
```

```
<OPTION>Gretzky  
</SELECT>
```

## 225.5.47 FORMSELETOPTION Procedure

This procedure generates the `<OPTION>` tag which represents one choice in a Select element.

### Syntax

```
HTP.FORMSELETOPTION(  
    cvalue          IN          VARCHAR2,  
    cselected       IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-37 FORMSELETOPTION Procedure Parameters**

| Parameter   | Description                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------|
| cvalue      | The text for the option.                                                                              |
| cvalue      | If the value for this parameter is not NULL, the <code>SELECTED</code> attribute is added to the tag. |
| cattributes | The other attributes to be included as-is in the tag.                                                 |

### Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELETOPTION Procedure](#).

## 225.5.48 FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

### Syntax

```
HTP.FORMSUBMIT(  
    cname           IN          VARCHAR2  DEFAULT NULL,  
    cvalue          IN          VARCHAR2  DEFAULT 'Submit',  
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-38 FORMSUBMIT Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the <code>NAME</code> attribute.        |
| cvalue      | The value for the <code>VALUE</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

## 225.5.49 FORMTEXT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="text"`, which creates a field for a single line of text.

### Syntax

```
HTP.FORMTEXT(  
    cname          IN          VARCHAR2,  
    csize          IN          VARCHAR2  DEFAULT NULL,  
    cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
    cvalue         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-39 FORMTEXT Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| csize       | The value for the SIZE attribute.                     |
| cmmaxlength | The value for the MAXLENGTH attribute.                |
| cvalue      | The value for the VALUE attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"  
cattributes>
```

## 225.5.50 FORMTEXTAREA Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

### Syntax

```
HTP.FORMTEXTAREA(  
    cname          IN          VARCHAR2,  
    nrows          IN          INTEGER,  
    ncolumns       IN          INTEGER,  
    calign         , IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-40 FORMTEXTAREA Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes></TEXTAREA>
```

## 225.5.51 FORMTEXTAREA2 Procedure

This procedure generates the `<TEXTAREA>` tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.

The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

## Syntax

```
HTP.FORMTEXTAREA2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap          IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-41 FORMTEXTAREA2 Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

## 225.5.52 FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element.

You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

### Syntax

```
HTP.FORMTEXTAREACLOSE;
```

### Examples

This procedure generates

```
</TEXTAREA>
```

## 225.5.53 FORMTEXTAREAOPEN Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

### Syntax

```
HTP.FORMTEXTAREAOPEN (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolumns       IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-42 FORMTEXTAREAOPEN Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolumns    | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

## 225.5.54 FORMTEXTAREAOPEN2 Procedure

This procedure generates the `<TEXTAREA>` which marks the beginning of a text area form element.

The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

### Syntax

```
HTP.FORMTEXTAREAOPEN2 (
    cname          IN          VARCHAR2,
    nrows          IN          INTEGER,
    ncolums        IN          INTEGER,
    calign         IN          VARCHAR2  DEFAULT NULL,
    cwrap          IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-43 FORMTEXTAREAOPEN2 Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cname       | The value for the NAME attribute.                     |
| nrows       | The value for the ROWS attribute. This is an integer. |
| ncolums     | The value for the COLS attribute. This is an integer. |
| calign      | The value for the ALIGN attribute.                    |
| cwrap       | The value for the WRAP attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolums" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

## 225.5.55 FRAME Procedure

This procedure generates the `<FRAME>` tag which begins the characteristics of a frame created by a `<FRAMESET>` tag.

### Syntax

```
HTP.FRAME (
    csrc          IN          VARCHAR2,
    cname         IN          VARCHAR2  DEFAULT NULL,
    cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
    cmarginheight IN          VARCHAR2  DEFAULT NULL,
    cscrolling    IN          VARCHAR2  DEFAULT NULL,
    cnoresize     IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-44** FRAME Procedure Parameters

| Parameter                 | Description                                                                              |
|---------------------------|------------------------------------------------------------------------------------------|
| <code>csrc</code>         | The URL to display in the frame.                                                         |
| <code>cname</code>        | The value for the NAME attribute.                                                        |
| <code>cmarginwidth</code> | The value for the MARGINWIDTH attribute.                                                 |
| <code>cscrolling</code>   | The value for the SCROLLING attribute.                                                   |
| <code>cnoresize</code>    | If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag. |
| <code>cattributes</code>  | The other attributes to be included as-is in the tag.                                    |

## Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth" MARGINHEIGHT="cmarginheight"
SCROLLING="cscrolling" NORESIZE cattributes>
```

## 225.5.56 FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section.

You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

### Syntax

```
HTP.FRAMESETCLOSE;
```

## Examples

This procedure generates

```
</FRAMESET>
```

## 225.5.57 FRAMESETOPEN Procedure

This procedure generates the `<FRAMESET>` tag which define a frameset section.

You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.FRAMESETOPEN (
    crows      IN      VARCHAR2    DEFAULT NULL,
    ccols      IN      VARCHAR2    DEFAULT NULL,
    cattributes IN      VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-45** FRAMESETOPEN Procedure Parameters

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>crows</code>       | The value for the ROWS attribute.                     |
| <code>ccols</code>       | The value for the COLS attribute.                     |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

## 225.5.58 HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section.

You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

## Syntax

```
HTP.HEADCLOSE;
```

## Examples

This procedure generates

```
</HEAD>
```

## 225.5.59 HEADER Procedure

This procedure generates opening heading tags (`<H1>` to `<H6>`) and their corresponding closing tags (`</H1>` to `</H6>`).

## Syntax

```
HTP.HEADER(  
    nsize          IN          INTEGER,  
    cheader        IN          VARCHAR2,  
    calign         IN          VARCHAR2    DEFAULT NULL,  
    cnowrap        IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-46** HEADER Procedure Parameters

| Parameter          | Description                                                |
|--------------------|------------------------------------------------------------|
| <code>nsize</code> | The the heading level. This is an integer between 1 and 6. |

**Table 225-46 (Cont.) HEADER Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| cheader     | The text to display in the heading.                   |
| calign      | The value for the <code>ALIGN</code> attribute.       |
| cnowrap     | The value for the <code>NOWRAP</code> attribute.      |
| cclear      | The value for the <code>CLEAR</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

**Examples**

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

## 225.5.60 HEADOPEN Procedure

This procedure generates the `<HEAD>` tag which marks the beginning of the HTML document head section.

You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

**Syntax**

```
HTP.HEADOPEN;
```

**Examples**

This procedure generates

```
<HEAD>
```

## 225.5.61 HR Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [LINE Procedure](#).

**Syntax**

```
HTP.HR (  
    cclear      IN          VARCHAR2    DEFAULT NULL,  
    csrc        IN          VARCHAR2    DEFAULT NULL,  
    cattributes IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-47 HR Procedure Parameters**

| Parameter                | Description                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------|
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.                                                        |
| <code>csrc</code>        | The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                  |

## Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 225.5.62 HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document.

You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

### Syntax

```
HTP.HTMLCLOSE;
```

### Examples

This procedure generates

```
</HTML>
```

## 225.5.63 HTMLOPEN Procedure

This procedure generates the `<HTML>` tag which marks the beginning of an HTML document.

You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

### Syntax

```
HTP.HTMLOPEN;
```

### Examples

This procedure generates

```
<HTML>
```

## 225.5.64 IMG Procedure

This procedure generates the `<IMG>` tag which directs the browser to load an image onto the HTML page.

The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

## Syntax

```
HTP.IMG (
    curl           IN          VARCHAR2  DEFAULT NULL,
    calign         IN          VARCHAR2  DEFAULT NULL,
    calt           IN          VARCHAR2  DEFAULT NULL,
    cismap         IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-48 IMG Procedure Parameters**

| Parameter   | Description                                                                                                                                  |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| curl        | The value for the SRC attribute.                                                                                                             |
| calign      | The value for the ALIGN attribute.                                                                                                           |
| calt        | The value for the ALT attribute which specifies alternative text to display if the browser does not support images.                          |
| cismap      | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| cattributes | The other attributes to be included as-is in the tag.                                                                                        |

## Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

## 225.5.65 IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page.

The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

## Syntax

```
HTP.IMG2 (
    curl           IN          VARCHAR2  DEFAULT NULL,
    calign         IN          VARCHAR2  DEFAULT NULL,
    calt           IN          VARCHAR2  DEFAULT NULL,
    cismap         IN          VARCHAR2  DEFAULT NULL,
    cusemap        IN          VARCHAR2  DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-49 IMG2 Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| curl      | The value for the SRC attribute.   |
| calign    | The value for the ALIGN attribute. |

**Table 225-49 (Cont.) IMG2 Procedure Parameters**

| Parameter                | Description                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>calt</code>        | The value for the ALT attribute which specifies alternative text to display if the browser does not support images.                          |
| <code>cismap</code>      | If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap. |
| <code>cusemap</code>     | The value for the USEMAP attribute which specifies a client-side image map.                                                                  |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                                                        |

### Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

## 225.5.66 ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

### Syntax

```
HTP.ISINDEX(  
    cprompt      IN      VARCHAR2      DEFAULT NULL,  
    curl         IN      VARCHAR2      DEFAULT NULL);
```

### Parameters

**Table 225-50 ISINDEX Procedure Parameters**

| Parameter            | Description                         |
|----------------------|-------------------------------------|
| <code>cprompt</code> | The value for the PROMPT attribute. |
| <code>curl</code>    | The value for the HREF attribute.   |

### Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

## 225.5.67 ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

### Syntax

```
HTP.ITALIC(  
    ctext      IN      VARCHAR2,  
    cattributes IN      VARCHAR2      DEFAULT NULL);
```

## Parameters

**Table 225-51** ITALIC Procedure Parameters

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text to be rendered in italics.                   |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<I cattributes>ctext</I>
```

## 225.5.68 KBD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KEYBOARD Procedure](#).

## Syntax

```
HTP.KBD(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-52** KBD Procedure Parameters

| Parameter                 | Description                                           |
|---------------------------|-------------------------------------------------------|
| c <code>text</code>       | The text to be rendered in monospace.                 |
| c <code>attributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 225.5.69 KEYBOARD Procedure

This procedure generates the `<KBD>` and `</KBD>` tags, which direct the browser to render the text in monospace font.

This subprogram performs the same operation as the [KBD Procedure](#).

## Syntax

```
HTP.KEYBOARD(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-53 KEYBOARD Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sub>text</sub></code>       | The text to be rendered in monospace.                 |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

## 225.5.70 LINE Procedure

This procedure generates the `<HR>` tag, which generates a line in the HTML document.

This subprogram performs the same operation as the [HR Procedure](#).

## Syntax

```
HTP.LINE(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    csrc            IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-54 LINE Procedure Parameters**

| Parameter                           | Description                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>c<sub>clear</sub></code>      | The value for the <code>CLEAR</code> attribute.                                                        |
| <code>c<sub>src</sub></code>        | The value for the <code>SRC</code> attribute which specifies a custom image as the source of the line. |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag.                                                  |

## Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

## 225.5.71 LINKREL Procedure

This procedure generates the `<LINK>` tag with the `REL` attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the `HREF` attribute is present.

This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

## Syntax

```
HTP.LINKREL(  
    crel          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle        IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-55 LINKREL Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| crel      | The value for the REL attribute.   |
| curl      | The value for the URL attribute.   |
| ctitle    | The value for the TITLE attribute. |

## Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

## 225.5.72 LINKREV Procedure

This procedure generates the `<LINK>` tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor.

This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

## Syntax

```
HTP.LINKREV(  
    crev          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle        IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-56 LINKREV Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| crev      | The value for the REV attribute.   |
| curl      | The value for the URL attribute.   |
| ctitle    | The value for the TITLE attribute. |

## Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

## 225.5.73 LISTHEADER Procedure

This procedure generates the `<LH>` and `</LH>` tags which print an HTML tag at the beginning of the list.

### Syntax

```
HTP.LISTHEADER(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-57 LISTHEADER Procedure Parameters**

| Parameter                | Description                                                                      |
|--------------------------|----------------------------------------------------------------------------------|
| <code>ctext</code>       | The text to place between <code>&lt;LH&gt;</code> and <code>&lt;/LH&gt;</code> . |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                            |

### Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

## 225.5.74 LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page.

To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

### Syntax

```
HTP.LISTINGCLOSE;
```

### Examples

This procedure generates

```
</LISTING>
```

## 225.5.75 LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page.

To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

### Syntax

```
HTP.LISTINGOPEN;
```

## Examples

This procedure generates

```
<LISTING>
```

## 225.5.76 LISTITEM Procedure

This procedure generates the `<LI>` tag, which indicates a list item.

### Syntax

```
HTP.LISTITEM(  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cdingbat       IN          VARCHAR2    DEFAULT NULL,  
    csrc           IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-58 LISTITEM Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text for the list item.                           |
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.       |
| <code>cdingbat</code>    | The value for the <code>DINGBAT</code> attribute.     |
| <code>csrc</code>        | The value for the <code>SRC</code> attribute.         |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

## 225.5.77 MAILTO Procedure

This procedure generates the `<A>` tag with the `HREF` set to 'mailto' prepended to the mail address argument.

### Syntax

```
HTP.MAILTO(  
    caddress       IN          VARCHAR2,  
    ctext          IN          VARCHAR2,  
    cname          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-59 MAILTO Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| caddress    | The email address of the recipient.                   |
| ctext       | The clickable portion of the link.                    |
| cname       | The value for the NAME attribute.                     |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

## 225.5.78 MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map.

To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Procedure](#).

## Syntax

```
HTP.MAPCLOSE;
```

## Examples

This procedure generates

```
</MAP>
```

## 225.5.79 MAPOPEN Procedure

This procedure generates the `<MAP>` tag which mark the beginning of a set of regions in a client-side image map.

To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

## Syntax

```
HTP.MAPOPEN(  
    cname          IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-60** MAOPEN Procedure Parameters

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cname</code>       | The value for the NAME attribute.                     |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

## 225.5.80 MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item.

To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

## Syntax

```
HTP.MENULISTCLOSE;
```

## Examples

This procedure generates

```
</MENU>
```

## 225.5.81 MENULISTOPEN Procedure

This procedure generates the `<MENU>` tag which begins a list that presents one line for each item.

To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

## Syntax

```
HTP.MENULISTOPEN;
```

## Examples

This procedure generates

```
<MENU>
```

## 225.5.82 META Procedure

This procedure generates the `<META>` tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

### Syntax

```
HTP.META(  
    chttp_equiv    IN      VARCHAR2,  
    cname          IN      VARCHAR2,  
    ccontent       IN      VARCHAR2);
```

### Parameters

**Table 225-61 META Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| chttp_equiv | The value for the <code>CHTTP_EQUIV</code> attribute. |
| cname       | The value for the <code>NAME</code> attribute.        |
| ccontent    | The value for the <code>CONTENT</code> attribute.     |

### Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

## 225.5.83 NL Procedure

This procedure generates the `<BR>` tag which begins a new line of text.

It performs the same operation as the [BR Procedure](#).

### Syntax

```
HTP.NL(  
    cclear          IN      VARCHAR2    DEFAULT NULL,  
    cattributes     IN      VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-62 NL Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.       |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

## 225.5.84 NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

## Syntax

```
HTP.NOBR(  
  ctext          IN          VARCHAR2);
```

## Parameters

**Table 225-63 NOBR Procedure Parameters**

| Parameter          | Description                                  |
|--------------------|----------------------------------------------|
| <code>ctext</code> | The text that is to be rendered on one line. |

## Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

## 225.5.85 NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section.

To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

## Syntax

```
HTP.NOFRAMESCLOSE;
```

## Examples

This procedure generates

```
</NOFRAMES>
```

## 225.5.86 NOFRAMESOPEN Procedure

This procedure generates the `<NOFRAMES>` tag which mark the beginning of a no-frames section.

To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

### Syntax

```
HTP.NOFRAMESOPEN;
```

### Examples

This procedure generates

```
<NOFRAMES>
```

## 225.5.87 OLISTCLOSE Procedure

This procedure generates the `</OL>` tag which defines the end of an ordered list. An ordered list presents a list of numbered items.

To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

### Syntax

```
HTP.OLISTCLOSE;
```

### Examples

This procedure generates

```
</OL>
```

## 225.5.88 OLISTOPEN Procedure

This procedure generates the `<OL>` tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items.

To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

### Syntax

```
HTP.OLISTOPEN(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cwrap           IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-64 OLISTOPEN Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.       |
| <code>cwrap</code>       | The value for the <code>WRAP</code> attribute.        |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

## 225.5.89 PARA Procedure

This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

## Syntax

```
HTP.PARA;
```

## Examples

This procedure generates

```
<P>
```

## 225.5.90 PARAGRAPH Procedure

You can use this procedure to add attributes to the `<P>` tag created by the `PARA` Procedure.

## Syntax

```
HTP.PARAGRAPH(  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cnowrap         IN          VARCHAR2    DEFAULT NULL,  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-65 PARAGRAPH Procedure Parameters**

| Parameter            | Description                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>calign</code>  | The value for the <code>ALIGN</code> attribute.                                                                   |
| <code>cnowrap</code> | If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cclear</code>  | The value for the <code>CLEAR</code> attribute.                                                                   |

**Table 225-65 (Cont.) PARAGRAPH Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

### Related Topics

- [PARA Procedure](#)  
This procedure generates the `<P>` tag which indicates that the text that comes after the tag is to be formatted as a paragraph.

## 225.5.91 PARAM Procedure

This procedure generates the `<PARAM>` tag which specifies parameter values for Java applets.

The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

### Syntax

```
HTP.PARAM(  
    cname          IN          VARCHAR2  
    cvalue         IN          VARCHAR2);
```

### Parameters

**Table 225-66 PARAM Procedure Parameters**

| Parameter           | Description                        |
|---------------------|------------------------------------|
| <code>cname</code>  | The value for the NAME attribute.  |
| <code>cvalue</code> | The value for the VALUE attribute. |

### Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

## 225.5.92 PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

### Syntax

```
HTP.PLAINTEXT(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 225-67 PLAINTEXT Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sub>text</sub></code>       | The text to be rendered in fixed-width font.          |
| <code>c<sub>attributes</sub></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

## 225.5.93 PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page.

To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

## Syntax

```
HTP.PRECLOSE;
```

## Examples

This procedure generates

```
</PRE>
```

## 225.5.94 PREOPEN Procedure

This procedure generates the `<PRE>` tag which marks the beginning of a section of preformatted text in the body of the HTML page.

To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

## Syntax

```
HTP.PREOPEN(  
    cclear          IN          VARCHAR2    DEFAULT NULL,  
    cwidth          IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-68 PREOPEN Procedure Parameters**

| Parameter                      | Description                                     |
|--------------------------------|-------------------------------------------------|
| <code>c<sub>clear</sub></code> | The value for the <code>CLEAR</code> attribute. |
| <code>c<sub>width</sub></code> | The value for the <code>WIDTH</code> attribute. |

**Table 225-68 (Cont.) PREOPEN Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

**Examples**

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

## 225.5.95 PRINT Procedures

These procedures generate the specified parameter as a string terminated with the `\n` newline character.

The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

**Syntax**

```
HTP.PRINT (  
    cbuf      IN      VARCHAR2);
```

```
HTP.PRINT (  
    dbuf      IN      DATE);
```

```
HTP.PRINT (  
    nbuf      IN      NUMBER);
```

**Parameters****Table 225-69 PRINT Procedure Parameters**

| Parameter         | Description                                     |
|-------------------|-------------------------------------------------|
| <code>cbuf</code> | The string to generate terminated by a newline. |
| <code>dbuf</code> | The string to generate terminated by a newline. |
| <code>nbuf</code> | The string to generate terminated by a newline. |

**Usage Notes**

- The `\n` character is not the same as `<BR>`. The `\n` character formats the HTML source but it does not affect how the browser renders the HTML source. Use `<BR>` to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

## 225.5.96 PRINTS Procedure

This procedure generates a string and replaces certain characters with a corresponding escape sequence.

The following characters are replaced with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

### Syntax

```
HTP.PRINTS (
    ctext      IN      VARCHAR2);
```

### Parameters

**Table 225-70 PRINTS Procedure Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| ctest     | The string where to perform character substitution. |

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

## 225.5.97 PRN Procedures

These procedures generate the specified parameter as a string.

Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

### Syntax

```
HTP.PRN (
    cbuf      IN      VARCHAR2);
```

```
HTP.PRN (
    dbuf      IN      DATE);
```

```
HTP.PRN (
    nbuf      IN      NUMBER);
```

### Parameters

**Table 225-71 PRN Procedure Parameters**

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| cbuf      | The string to generate (not terminated by a newline). |
| dbuf      | The string to generate (not terminated by a newline). |
| nbuf      | The string to generate (not terminated by a newline). |

### Usage Notes

These procedures do not have function equivalents.

## 225.5.98 PS Procedure

This procedure generates a string and replaces certain characters with the corresponding escape sequence.

This procedure replaces the following characters with the corresponding escape sequence.

- < to &lt;
- > to &gt;
- " to &quot;
- & to &amp;

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

### Syntax

```
HTP.PS (  
    ctext      IN      VARCHAR2);
```

### Parameters

**Table 225-72 PS Procedure Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| ctext     | The string where to perform character substitution. |

### Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) for the HTF implementation).

## 225.5.99 S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [STRIKE Procedure](#).

### Syntax

```
HTP.S (  
    ctext      IN      VARCHAR2,  
    cattributes IN      VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 225-73 S Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to be rendered in strikethrough type.        |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<S cattributes>ctext</S>
```

## 225.5.100 SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

## Syntax

```
HTP.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-74 SAMPLE Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to be rendered in monospace font.            |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

## 225.5.101 SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBScript.

## Syntax

```
HTP.SCRIPT (  
    cscript        IN          VARCHAR2,  
    clanguage      IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-75** SCRIPT Procedure Parameters

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| cscript   | The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.          |
| clanguage | The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language. |

## Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

## 225.5.102 SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

## Syntax

```
HTP.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-76** SMALL Procedure Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to be rendered in small font.                |
| cattributes | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

## 225.5.103 STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type.

This performs the same operation as [S Procedure](#).

### Syntax

```
HTP.STRIKE (
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-77 STRIKE Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to be rendered in strikethrough type.        |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

## 225.5.104 STRONG Procedure

This procedure generates the `<STRONG>` and `</STRONG>` tags which direct the browser to render the text they surround in bold, or however "strong" is defined.

### Syntax

```
HTP.STRONG(
    ctext          IN          VARCHAR2,
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-78 STRONG Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to be emphasized.                            |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

## 225.5.105 STYLE Procedure

This procedure generates the `<STYLE>` and `</STYLE>` tags which include a style sheet in a Web page.

You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

### Syntax

```
HTP.STYLE(  
    cstyle          IN          VARCHAR2);
```

### Parameters

**Table 225-79** STYLE Procedure Parameters

| Parameter | Description                           |
|-----------|---------------------------------------|
| cstyle    | The the style information to include. |

### Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

## 225.5.106 SUB Procedure

This procedure generates the `<SUB>` and `</SUB>` tags which direct the browser to render the text they surround as subscript.

### Syntax

```
HTP.SUB(  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-80** SUB Procedure Parameters

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render in subscript.                      |
| calign      | The value for the <code>ALIGN</code> attribute.       |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

## 225.5.107 SUP Procedure

This procedure generates the `<SUP>` and `</SUP>` tags which direct the browser to render the text they surround as superscript.

### Syntax

```
HTP.SUP (  
    ctext          IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-81 SUP Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ctext       | The text to render in superscript.                    |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

## 225.5.108 TABLECAPTION Procedure

This procedure generates the `<CAPTION>` and `</CAPTION>` tags which place a caption in an HTML table.

### Syntax

```
HTP.TABLECAPTION (  
    ccaption       IN          VARCHAR2,  
    calign         in          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-82 TABLECAPTION Procedure Parameters**

| Parameter   | Description                                           |
|-------------|-------------------------------------------------------|
| ccaption    | The text for the caption.                             |
| calign      | The value for the ALIGN attribute.                    |
| cattributes | The other attributes to be included as-is in the tag. |

### Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

## 225.5.109 TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table.

To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

### Syntax

```
HTP.TABLECLOSE;
```

### Examples

This procedure generates

```
</TABLE>
```

## 225.5.110 TABLEDATA Procedure

This procedure generates the `<TD>` and `</TD>` tags which insert data into a cell of an HTML table.

### Syntax

```
HTP.TABLEDATA (
    cvalue          IN          VARCHAR2    DEFAULT NULL,
    calign          IN          VARCHAR2    DEFAULT NULL,
    cdp            IN          VARCHAR2    DEFAULT NULL,
    cnowrap        IN          VARCHAR2    DEFAULT NULL,
    crowspan       IN          VARCHAR2    DEFAULT NULL,
    ccolspan       IN          VARCHAR2    DEFAULT NULL,
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 225-83 TABLEDATA Procedure Parameters**

| Parameter   | Description                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------|
| cvalue      | The data for the cell in the table.                                                                              |
| calign      | The value for the <code>ALIGN</code> attribute.                                                                  |
| cdp         | The value for the <code>DP</code> attribute.                                                                     |
| cnowrap     | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| ccolspan    | The value for the <code>COLSPAN</code> attribute.                                                                |
| cattributes | The other attributes to be included as-is in the tag.                                                            |

### Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

## 225.5.111 TABLEHEADER Procedure

This procedure generates the `<TH>` and `</TH>` tags which insert a header cell in an HTML table.

The `<TH>` tag is similar to the `<TD>` tag except that the text in this case the rows are usually rendered in bold type.

### Syntax

```
HTP.TABLEHEADER(  
    cvalue      IN      VARCHAR2  DEFAULT NULL,  
    calign      IN      VARCHAR2  DEFAULT NULL,  
    cdp         IN      VARCHAR2  DEFAULT NULL,  
    cnowrap     IN      VARCHAR2  DEFAULT NULL,  
    crowspan    IN      VARCHAR2  DEFAULT NULL,  
    ccolspan    IN      VARCHAR2  DEFAULT NULL,  
    cattributes IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 225-84** TABLEHEADER Procedure Parameters

| Parameter   | Description                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------|
| cvalue      | The data for the cell in the table.                                                                              |
| calign      | The value for the <code>ALIGN</code> attribute.                                                                  |
| cdp         | The value for the <code>DP</code> attribute.                                                                     |
| cnowrap     | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| crispen     | The value for the <code>ROWSPAN</code> attribute.                                                                |
| ccolspan    | The value for the <code>COLSPAN</code> attribute.                                                                |
| cattributes | The other attributes to be included as-is in the tag.                                                            |

### Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP  
cattributes>cvalue</TH>
```

## 225.5.112 TABLEOPEN Procedure

This procedure generates the `<TABLE>` tag which marks the beginning of an HTML table.

To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

### Syntax

```
HTP.TABLEOPEN(  
    cborder      IN      VARCHAR2  DEFAULT NULL,  
    calign      IN      VARCHAR2  DEFAULT NULL,  
    cnowrap     IN      VARCHAR2  DEFAULT NULL,  
    cclear      IN      VARCHAR2  DEFAULT NULL,  
    cattributes IN      VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-85** TABLEOPEN Procedure Parameters

| Parameter                | Description                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>border</code>      | The value for the <code>BORDER</code> attribute.                                                                 |
| <code>calign</code>      | The value for the <code>ALIGN</code> attribute.                                                                  |
| <code>cnowrap</code>     | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cclear</code>      | The value for the <code>CLEAR</code> attribute.                                                                  |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                            |

## Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

## 225.5.113 TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table.

To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

## Syntax

```
HTP.TABLEROWCLOSE;
```

## Examples

This procedure generates

```
</TABLE>
```

## 225.5.114 TABLEROWOPEN Procedure

This procedure generates the `<TR>` tag which marks the beginning of a new row in an HTML table.

To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

## Syntax

```
HTP.TABLEROWOPEN(  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cdp             IN          VARCHAR2    DEFAULT NULL,  
    cnowrap         IN          VARCHAR2    DEFAULT NULL,  
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 225-86** TABLEROWOPEN Procedure Parameters

| Parameter                | Description                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>calign</code>      | The value for the <code>ALIGN</code> attribute.                                                                  |
| <code>cvalign</code>     | The value for the <code>VALIGN</code> attribute.                                                                 |
| <code>cdp</code>         | The value for the <code>DP</code> attribute.                                                                     |
| <code>nowrap</code>      | If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag. |
| <code>cattributes</code> | The other attributes to be included as-is in the tag.                                                            |

## Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

## 225.5.115 TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

## Syntax

```
HTP.TELETYPE(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-87** TELETYPE Procedure Parameters

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to render in a fixed width typewriter font.  |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

## 225.5.116 TITLE Procedure

This procedure generates the `<TITLE>` and `</TITLE>` tags which specify the text to display in the titlebar of the browser window.

## Syntax

```
HTP.TITLE(  
    ctitle          IN          VARCHAR2);
```

## Parameters

**Table 225-88** TITLE Procedure Parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| ctitle    | The text to display in the titlebar of the browser window. |

## Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

## 225.5.117 ULISTCLOSE Procedure

This procedure generates the `</UL>` tag which marks the end of an unordered list. An unordered list presents items with bullets.

To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

## Syntax

```
HTP.ULISTCLOSE;
```

## Examples

This procedure generates

```
</TABLE>
```

## 225.5.118 ULISTOPEN Procedure

This procedure generates the `<UL>` tag which marks the beginning of an unordered list. An unordered list presents items with bullets.

To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

## Syntax

```
HTP.ULISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cdingbat    IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-89** ULISTOPEN Procedure Parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| cclear    | The value for the CLEAR attribute. |
| cwrap     | The value for the WRAP attribute.  |

**Table 225-89 (Cont.) ULISTOPEN Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>cdingbat</code>    | The value for the DINGBAT attribute.                  |
| <code>csrc</code>        | The value for the SRC attribute.                      |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

**Examples**

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

## 225.5.119 UNDERLINE Procedure

This procedure generates the `<U>` and `</U>` tags, which direct the browser to render the text they surround with an underline.

**Syntax**

```
HTP.UNDERLINE(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

**Parameters****Table 225-90 UNDERLINE Procedure Parameters**

| Parameter                | Description                                           |
|--------------------------|-------------------------------------------------------|
| <code>ctext</code>       | The text to render with an underline.                 |
| <code>cattributes</code> | The other attributes to be included as-is in the tag. |

**Examples**

This procedure generates

```
<U cattributes>ctext</U>
```

## 225.5.120 VARIABLE Procedure

This procedure generates the `<VAR>` and `</VAR>` tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

**Syntax**

```
HTP.VARIABLE(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 225-91 VARIABLE Procedure Parameters**

| Parameter                           | Description                                           |
|-------------------------------------|-------------------------------------------------------|
| <code>c<sup>text</sup></code>       | The text to render in italics.                        |
| <code>c<sup>attributes</sup></code> | The other attributes to be included as-is in the tag. |

## Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

## 225.5.121 WBR Procedure

This procedure generates the `<WBR>` tag, which inserts a soft line break within a section of NOBR text.

## Syntax

```
HTP.WBR;
```

## Examples

This procedure generates

```
<WBR>
```

# OWA\_CACHE

The `OWA_CACHE` package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA\\_CACHE Subprograms](#)

## 226.1 OWA\_CACHE Constants

`OWA_CACHE` defines several constants to use when specifying parameter values.

- `system_level` CONSTANT VARCHAR(6) := 'SYSTEM';
- `user_level` CONSTANT VARCHAR(4) := 'USER';

## 226.2 Summary of OWA\_CACHE Subprograms

This table lists the `OWA_CACHE` subprograms and briefly describes them.

**Table 226-1 OWA\_CACHE Package Subprograms**

| Subprogram                                      | Description                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <a href="#">DISABLE Procedure</a>               | Disables the cache for this particular request                                                   |
| <a href="#">GET_ETAG Function</a>               | Returns the tag associated with the cached content (used in the Validation technique model only) |
| <a href="#">GET_LEVEL Function</a>              | Returns the caching level (used in the Validation technique model only)                          |
| <a href="#">SET_CACHE Procedure</a>             | Sets up the cache headers for validation model cache type                                        |
| <a href="#">SET_EXPIRES Procedure</a>           | Sets up the cache headers for expires model cache type                                           |
| <a href="#">SET_NOT_MODIFIED Procedure</a>      | Sets up the headers for a not modified cache hit (used in the Validation technique model only)   |
| <a href="#">SET_SURROGATE_CONTROL Procedure</a> | Sets up the headers for a surrogate-control header for Web cache                                 |

## 226.2.1 DISABLE Procedure

This procedure disables the cache for this particular request.

### Syntax

```
OWA_CACHE.DISABLE;
```

## 226.2.2 GET\_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.GET_ETAG  
RETURN VARCHAR2;
```

### Return Values

The tag for cache hit, otherwise NULL.

## 226.2.3 GET\_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

### Syntax

```
OWA_CACHE.GET_LEVEL  
RETURN VARCHAR2;
```

### Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

## 226.2.4 SET\_CACHE Procedure

This procedure sets up the cache headers for validation model cache type.

### Syntax

```
OWA_CACHE.SET_CACHE(  
    p_etag      IN      VARCHAR2,  
    p_level     IN      VARCHAR2);
```

### Parameters

**Table 226-2** *SET\_CACHE Procedure Parameters*

| Parameter | Description                             |
|-----------|-----------------------------------------|
| p_etag    | The etag associated with this content   |
| p_level   | The caching level ('USER' or 'SYSTEM'). |

### Exceptions

VALUE\_ERROR is thrown if

- p\_etag is greater than 55
- p\_level is not 'USER' or 'SYSTEM'

## 226.2.5 SET\_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

### Syntax

```
OWA_CACHE.SET_EXPIRES (
    p_expires      IN      NUMBER,
    p_level        IN      VARCHAR2);
```

### Parameters

**Table 226-3 SET\_EXPIRES Procedure Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| p_expires | The number of minutes this content is valid. |
| p_level   | The caching level ('USER' or 'SYSTEM').      |

### Exceptions

VALUE\_ERROR is thrown if

- p\_expires is negative or zero
- p\_level is not 'USER' or 'SYSTEM'
- p\_expires is > 525600 (1 year)

## 226.2.6 SET\_NOT\_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

### Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

### Exceptions

VALUE\_ERROR is thrown if If the etag was not passed in

## 226.2.7 SET\_SURROGATE\_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

### Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(  
    p_value          IN          VARCHAR2);
```

### Parameters

**Table 226-4 SET\_SURROGATE\_CONTROL Procedure Parameters**

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| p_value   | The value to be passed as the Surrogate-Control header. |

### Exceptions

VALUE\_ERROR is thrown if p\_value is greater than 55 in length.

# OWA\_COOKIE

The OWA\_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)
- [Summary of OWA\\_COOKIE Subprograms](#)

## 227.1 OWA\_CUSTOM Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA\_CUSTOM package.

## 227.2 OWA\_COOKIE Types

This datatype contains cookie name-value pairs.

Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (  
    name          VARCHAR2(4000),  
    vals          vc_arr,  
    num_vals      INTEGER);
```

## 227.3 OWA\_COOKIE Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

## 227.4 Summary of OWA\_COOKIE Subprograms

This table lists the OWA\_COOKIE subprograms and briefly describes them.

**Table 227-1 OWA\_COOKIE Package Subprograms**

| Subprogram                        | Description                                      |
|-----------------------------------|--------------------------------------------------|
| <a href="#">GET Function</a>      | Gets the value of the specified cookie           |
| <a href="#">GET_ALL Procedure</a> | Gets all cookie name-value pairs                 |
| <a href="#">REMOVE Procedure</a>  | Removes the specified cookie                     |
| <a href="#">SEND procedure</a>    | Generates a "Set-Cookie" line in the HTTP header |

### 227.4.1 GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA\_COOKIE.COOKIE DATA TYPE .

#### Syntax

```
OWA_COOKIE.GET(  
    name          IN          VARCHAR2)  
    RETURN COOKIE;
```

#### Parameters

**Table 227-2 GET Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| name      | The name of the cookie. |

#### Return Values

OWA\_COOKIE.COOKIE DATA TYPE.

### 227.4.2 GET\_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

#### Syntax

```
OWA_COOKIE.GET_ALL(  
    names          OUT          vc_arr,  
    vals           OUT          vc_arr,  
    num_vals       OUT          INTEGER);
```

## Parameters

**Table 227-3 GET\_ALL Procedure Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| names     | The names of the cookies.         |
| vals      | The values of the cookies.        |
| num_vals  | The number of cookie-value pairs. |

## 227.4.3 REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990".

This procedure must be called within the context of an HTTP header.

### Syntax

```
OWA_COOKIE.REMOVE(  
    name          IN          VARCHAR2,  
    val           IN          VARCHAR2,  
    path          IN          VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 227-4 REMOVE Procedure Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| name      | The name of the cookie to expire. |
| val       | The value of the cookie.          |
| path      | [Currently unused]                |

## 227.4.4 SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client.

This procedure must occur in the context of an HTTP header.

### Syntax

```
OWA_COOKIE.SEND(  
    name          in          varchar2,  
    value         in          varchar2,  
    expires       in          date      DEFAULT NULL,  
    path          in          varchar2  DEFAULT NULL,  
    domain        in          varchar2  DEFAULT NULL,  
    secure        in          varchar2  DEFAULT NULL);
```

## Parameters

**Table 227-5 SEND Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| name      | The name of the cookie.                                                              |
| value     | The value of the cookie.                                                             |
| expires   | The date at which the cookie will expire                                             |
| path      | The value for the path field.                                                        |
| domain    | The value for the domain field.                                                      |
| secure    | If the value of this parameter is not NULL, the "secure" field is added to the line. |

# OWA\_CUSTOM

The `OWA_CUSTOM` package provides a Global PLSQL Agent Authorization callback function.

It is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of OWA\\_CUSTOM Subprograms](#)

## 228.1 OWA\_CUSTOM Constants

`OWA_CUSTOM` defines several constants to use when specifying parameter values.

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

## 228.2 Summary of OWA\_CUSTOM Subprograms

The `AUTHORIZE` function is the only subprogram in the `OWA_CUSTOM` package.

**Table 228-1 OWA\_CUSTOM Package Subprograms**

| Subprogram                         | Description                                                   |
|------------------------------------|---------------------------------------------------------------|
| <a href="#">AUTHORIZE Function</a> | Provides a Global PLSQL Agent Authorization callback function |

### 228.2.1 AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

#### Syntax

```
OWA_CUSTOM.AUTHORIZE
RETURN BOOLEAN;
```

# OWA\_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

The chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)
- [Summary of OWA\\_IMAGE Subprograms](#)

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 229.1 OWA\_IMAGE Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

## 229.2 OWA\_IMAGE Types

This datatype (`point`) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap.

It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

## 229.3 OWA\_IMAGE Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

## 229.4 OWA\_IMAGE Examples

This example shows use of OWA\_IMAGE.

```
CREATE OR REPLACE PROCEDURE process_image
  (my_img in OWA_IMAGE.POINT)
AS
  x integer := OWA_IMAGE.GET_X(my_img);
  y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
```

## 229.5 Summary of OWA\_IMAGE Subprograms

This table lists the OWA\_IMAGE subprograms and briefly describes them.

**Table 229-1** OWA\_IMAGE Package Subprograms

| Subprogram                     | Description                      |
|--------------------------------|----------------------------------|
| <a href="#">GET_X Function</a> | Gets the X value of a point type |
| <a href="#">GET_Y Function</a> | Gets the Y value of a point type |

### 229.5.1 GET\_X Function

This function returns the x coordinate of the point where the user clicked on an image map.

#### Syntax

```
OWA_IMAGE.GET_X(
  p          IN          point)
RETURN INTEGER;
```

#### Parameters

**Table 229-2** GET\_X Function Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| p         | The point where the user clicked. |

#### Return Values

The X coordinate as an integer.

## 229.5.2 GET\_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

### Syntax

```
OWA_IMAGE.GET_Y(  
    p          IN      point)  
RETURN INTEGER;
```

### Parameters

**Table 229-3** GET\_Y Function Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| p         | The point where the user clicked. |

### Return Values

The Y coordinate as an integer.

# OWA\_OPT\_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA\\_OPT\\_LOCK Subprograms](#)

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

## 230.1 OWA\_OPT\_LOCK Overview

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

## 230.2 OWA\_TEXT Types

This datatype is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR` DATA TYPE.

## 230.3 Summary of OWA\_OPT\_LOCK Subprograms

This table lists the OWA\_OPT\_LOCK subprograms and briefly describes them.

**Table 230-1 OWA\_OPT\_LOCK Package Subprograms**

| Subprogram                             | Description                                                      |
|----------------------------------------|------------------------------------------------------------------|
| <a href="#">CHECKSUM Functions</a>     | Returns the checksum value                                       |
| <a href="#">GET_ROWID Function</a>     | Returns the ROWID value                                          |
| <a href="#">STORE_VALUES Procedure</a> | Stores unmodified values in hidden fields for later verification |
| <a href="#">VERIFY_VALUES Function</a> | Verifies the stored values against modified values               |

### 230.3.1 CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

#### Syntax

```
OWA_OPT_LOCK.CHECKSUM(  
    p_buff      IN      VARCHAR2)  
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(  
    p_owner     IN      VARCHAR2,  
    p_tname     IN      VARCHAR2,  
    p_rowid     IN      ROWID)  
RETURN NUMBER;
```

#### Parameters

**Table 230-2 CHECKSUM Function Parameters**

| Parameter            | Description                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>p_buff</code>  | The nstring where you want to calculate the <code>checksum</code> .                                                                                                                 |
| <code>p_owner</code> | The owner of the table.                                                                                                                                                             |
| <code>p_tname</code> | The table name.                                                                                                                                                                     |
| <code>p_rowid</code> | The row in <code>p_tname</code> where you want to calculate the <code>checksum</code> value. Use the <a href="#">GET_ROWID Function</a> to convert VCARRAY values to proper rowids. |

## 230.3.2 GET\_ROWID Function

This function returns the ROWID datatype from the specified OWA\_OPT\_LOCK.VCARRAY DATA TYPE.

### Syntax

```
OWA_OPT_LOCK.GET_ROWID(  
    p_old_values      IN      varray)  
RETURN ROWID;
```

### Parameters

**Table 230-3 GET\_ROWID Function Parameters**

| Parameter    | Description                                            |
|--------------|--------------------------------------------------------|
| p_old_values | This parameter is usually passed in from an HTML form. |

## 230.3.3 STORE\_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

### Syntax

```
OWA_OPT_LOCK.STORE_VALUES(  
    p_owner      IN      VARCHAR2,  
    p_tname      IN      VARCHAR2,  
    p_rowid      IN      ROWID);
```

### Parameters

**Table 230-4 STORE\_VALUES Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| p_owner   | The owner of the table.                 |
| p_tname   | The name of the table.                  |
| p_rowid   | The row where you want to store values. |

### Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the table name.

- One element is created for each column in the row. The name of the element is "old\_p\_tname", where p\_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY\\_VALUES Function](#).

### 230.3.4 VERIFY\_VALUES Function

This function verifies whether values in the specified row have been updated since the last query.

Use this function with the [STORE\\_VALUES Procedure](#).

#### Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(  
    p_old_values IN varray)  
RETURN BOOLEAN;
```

#### Parameters

**Table 230-5**    *VERIFY\_VALUES Function Parameters*

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_old_values | <p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"><li>• p_old_values(1) specifies the owner of the table.</li><li>• p_old_values(2) specifies the table.</li><li>• p_old_values(3) specifies the rowid of the row to verify.</li></ul> <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the <a href="#">STORE_VALUES Procedure</a> to store the row values on hidden form elements.</p> |

#### Return Values

TRUE if no other update has been performed, otherwise FALSE.

# OWA\_PATTERN

The OWA\_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

## See Also:

For more information about implementation of this package, see the following:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Types](#)
- [Operational Notes](#)
- [Summary of OWA\\_PATTERN Subprograms](#)

## 231.1 OWA\_PATTERN Types

You can use a pattern as both an input and output parameter. Because of this, you can pass the same regular expression to OWA\_PATTERN function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

## 231.2 OWA\_PATTERN Operational Notes

The OWA\_PATTERN subprograms are overloaded. Specifically, there are six versions of `MATCH`, and four each of `AMATCH` and `CHANGE`.

The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` datatype.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)
- [Quantifiers](#)

- [Flags](#)

## 231.2.1 OWA\_PATTERN Wildcards

Wildcard tokens match something other than themselves.

**Table 231-1** *Wildcard tokens recognized by OWA\_PATTERN package*

| Token                      | Description                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>^</code>             | Matches newline or the beginning of the target                                                                                                                                                                                                                                                                                                   |
| <code>\$</code>            | Matches newline or the end of the target                                                                                                                                                                                                                                                                                                         |
| <code>\n</code>            | Matches newline                                                                                                                                                                                                                                                                                                                                  |
| <code>.</code>             | Matches any character except newline                                                                                                                                                                                                                                                                                                             |
| <code>\t</code>            | Matches tab                                                                                                                                                                                                                                                                                                                                      |
| <code>\d</code>            | Matches digits [0-9]                                                                                                                                                                                                                                                                                                                             |
| <code>\D</code>            | Matches non-digits [not 0-9]                                                                                                                                                                                                                                                                                                                     |
| <code>\w</code>            | Matches word characters (0-9, a-z, A-Z, or <code>_</code> )                                                                                                                                                                                                                                                                                      |
| <code>\W</code>            | Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code> )                                                                                                                                                                                                                                                                              |
| <code>\s</code>            | Matches whitespace characters (blank, tab, or newline).                                                                                                                                                                                                                                                                                          |
| <code>\S</code>            | Matches non-whitespace characters (not blank, tab, or newline)                                                                                                                                                                                                                                                                                   |
| <code>\b</code>            | Matches "word" boundaries (between <code>\w</code> and <code>\W</code> )                                                                                                                                                                                                                                                                         |
| <code>\x&lt;HEX&gt;</code> | Matches the value in the current character set of the two hexadecimal digits                                                                                                                                                                                                                                                                     |
| <code>\&lt;OCT&gt;</code>  | Matches the value in the current character set of the two or three octal digits                                                                                                                                                                                                                                                                  |
| <code>\</code>             | Followed by any character not covered by another case matches that character                                                                                                                                                                                                                                                                     |
| <code>&amp;</code>         | Applies only to <code>CHANGE</code> . This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under <a href="#">CHANGE Functions and Procedures</a> . |

## 231.2.2 OWA\_PATTERN Quantifiers

Any tokens except `&` can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals.

**Table 231-2** *Quantifiers*

| Quantifier         | Description                                                  |
|--------------------|--------------------------------------------------------------|
| <code>?</code>     | 0 or 1 occurrence(s)                                         |
| <code>*</code>     | 0 or more occurrences                                        |
| <code>+</code>     | 1 or more occurrence(s)                                      |
| <code>{n}</code>   | Exactly <i>n</i> occurrences                                 |
| <code>{n,}</code>  | At least <i>n</i> occurrences                                |
| <code>{n,m}</code> | At least <i>n</i> , but not more than <i>m</i> , occurrences |

## 231.2.3 OWA\_PATTERN Flags

In addition to targets and regular expressions, the OWA\_PATTERN functions and procedures use flags to affect how they are interpreted.

**Table 231-3** Flags

| Flag | Description                                                                                                                                     |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| i    | This indicates a case-insensitive search.                                                                                                       |
| g    | This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced. |

## 231.3 Summary of OWA\_PATTERN Subprograms

This table lists the OWA\_PATTERN subprograms and briefly describes them.

**Table 231-4** OWA\_PATTERN Package Subprograms

| Subprogram                                      | Description                                                                                                                                   |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">AMATCH Function</a>                 | Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur                         |
| <a href="#">CHANGE Functions and Procedures</a> | Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced |
| <a href="#">GETPAT Procedure</a>                | Generates a pattern datatype from a VARCHAR2 type                                                                                             |
| <a href="#">MATCH Function</a>                  | Determines if a string contains the specified pattern                                                                                         |

### 231.3.1 AMATCH Function

This function specifies if a pattern occurs in a particular location in a string.

There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern datatype.

#### Note:

If multiple overlapping strings match the regular expression, this function takes the longest match.

## Syntax

```
OWA_PATTERN.AMATCH (
    line          IN          VARCHAR2,
    from_loc      IN          INTEGER,
    pat           IN          VARCHAR2,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line          IN          VARCHAR2,
    from_loc      IN          INTEGER,
    pat           IN OUT      PATTERN,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line          IN          VARCHAR2
    from_loc      IN          INTEGER
    pat           in          varchar2
    backrefs      OUT         owa_text.vc_arr
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
    line          IN          VARCHAR2
    from_loc      IN          INTEGER
    pat           IN OUT      PATTERN
    backrefs      OUT         owa_text.vc_arr
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

## Parameters

**Table 231-5 AMATCH Function Parameters**

| Parameter | Description                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| line      | The text to search in.                                                                                                                                                              |
| from_loc  | The location (in number of characters) in line where the search is to begin.                                                                                                        |
| pat       | The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched. |
| backrefs  | The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.                                                             |
| flags     | Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.                         |

## Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.

## 231.3.2 CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` datatype. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

### Syntax

```
OWA_PATTERN.CHANGE (  
    line          IN OUT   VARCHAR2,  
    from_str      IN       VARCHAR2,  
    to_str        IN       VARCHAR2,  
    flags         IN       VARCHAR2  DEFAULT NULL)  
RETURN INTEGER;  
  
OWA_PATTERN.CHANGE (  
    line          IN OUT   VARCHAR2,  
    from_str      IN       VARCHAR2,  
    to_str        IN       VARCHAR2,  
    flags         IN       VARCHAR2  DEFAULT NULL);  
  
owa_pattern.change(  
    mline         IN OUT   owa_text.multi_line,  
    from_str      IN       VARCHAR2,  
    to_str        IN       VARCHAR2,  
    flags         IN       VARCHAR2  DEFAULT NULL)  
RETURN INTEGER;  
  
OWA_PATTERN.CHANGE (  
    mline         IN OUT   owa_text.multi_line,  
    from_str      IN       VARCHAR2,  
    to_str        IN       VARCHAR2,  
    flags         IN       VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 231-6** CHANGE Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| line      | The text to search in. The output value of this parameter is the altered string.                                                                                                                                                                                                |
| mline     | The text to search in. This is a <code>owa_text.multi_line</code> datatype. The output value of this parameter is the altered string.                                                                                                                                           |
| from_str  | The regular expression to replace.                                                                                                                                                                                                                                              |
| to_str    | The substitution pattern.                                                                                                                                                                                                                                                       |
| flags     | Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made. |

### Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

## Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red". If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

### Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found      INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

## 231.3.3 GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA\_PATTERN.PATTERN DATA TYPE.

### Syntax

```
OWA_PATTERN.GETPAT (
    arg      IN      VARCHAR2,
    pat      IN OUT  pattern);
```

### Parameters

**Table 231-7 GETPAT Procedure Parameters**

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| arg       | The string to convert.                                  |
| pat       | the OWA_PATTERN.PATTERN DATA TYPE initialized with arg. |

## 231.3.4 MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

### Syntax

```
owa_pattern.match(
    line      IN      VARCHAR2,
    pat       IN      VARCHAR2,
    flags     IN      VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
```

```

        line          IN          VARCHAR2,
        pat           IN OUT      PATTERN,
        flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    line          IN          VARCHAR2,
    pat           IN          VARCHAR2,
    backrefs      OUT         owa_text.vc_arr,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    line          IN          VARCHAR2,
    pat           IN OUT      PATTERN,
    backrefs      OUT         owa_text.vc_arr,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

owa_pattern.match(
    mline         IN          owa_text.multi_line,
    pat           IN          VARCHAR2,
    rlist         OUT         owa_text.row_list,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

OWA_PATTERN.MATCH(
    mline         IN          owa_text.multi_line,
    pat           IN OUT      pattern,
    rlist         OUT         owa_text.row_list,
    flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

```

## Parameters

**Table 231-8 MATCH Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| line      | The line to search in.                                                                                                                                                                                                                                        |
| mline     | The text to search in. This is a owa_text.multi_line datatype..                                                                                                                                                                                               |
| pat       | The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It is a pattern, the output value of this parameter is the pattern matched.                                                                                               |
| backrefs  | The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression. |
| rlist     | An output parameter containing a list of matches.                                                                                                                                                                                                             |
| flags     | Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.                                                                                                   |

## Return Values

TRUE if a match was found, FALSE otherwise.

## Examples

KAZOO is the target where it is searching for the `zoo.*` regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of `zoo`, followed by any set of characters neither ending in nor including a newline (which does not match the period). The `i` flag indicates to ignore case in the search. In this case, the function returns `TRUE`, which indicates that a match had been found.

```
boolean foundMatch;  
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in `sometext`. If found,

```
sometext  VARCHAR2(256);  
pat       VARCHAR2(256);  
  
sometext  := 'what is the goal?';  
pat       := 'goal.*';  
IF OWA_PATTERN.MATCH(sometext, pat)  
  THEN  
    HTP.PRINT('Match found');  
  ELSE  
    HTP.PRINT('Match not found');  
END IF;
```

## Operational Notes

- The regular expression in this function can be either a `VARCHAR2` or an `OWA_PATTERN.PATTERN` DATA TYPE. Create an `OWA_PATTERN.PATTERN` DATA TYPE from a string using the `OWA_PATTERN.GETPAT` procedure.
- Create a `MULTI_LINE` DATA TYPE from a long string using the `OWA_TEXT.STREAM2MULTI` procedure. If a `multi_line` is used, the `rlist` parameter specifies a list of chunks where matches were found.
- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

# OWA\_SEC

The OWA\_SEC package provides an interface for custom authentication.

The chapter contains the following topics:

- [Operational Notes](#)
- [Summary of OWA\\_SEC Subprograms](#)

## 232.1 OWA\_SEC Operational Notes

Parameters that have default values are optional.

## 232.2 Summary of OWA\_SEC Subprograms

This table lists the OWA\_SEC subprograms in alphabetical order and briefly describes them.

**Table 232-1 OWA\_SEC Package Subprograms**

| Subprogram                                     | Description                                                 |
|------------------------------------------------|-------------------------------------------------------------|
| <a href="#">GET_CLIENT_HOSTNAME Function</a>   | Returns the client's hostname                               |
| <a href="#">GET_CLIENT_IP Function</a>         | Returns the client's IP address                             |
| <a href="#">GET_PASSWORD Function</a>          | Returns the password that the user entered                  |
| <a href="#">GET_USER_ID Function</a>           | Returns the username that the user entered                  |
| <a href="#">SET_AUTHORIZATION Procedure</a>    | Enables the PL/SQL application to use custom authentication |
| <a href="#">SET_PROTECTION_REALM Procedure</a> | Defines the realm that the page is in                       |

### 232.2.1 GET\_CLIENT\_HOSTNAME Function

This function returns the hostname of the client.

#### Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
RETURN VARCHAR2;
```

### Return Values

The hostname.

## 232.2.2 GET\_CLIENT\_IP Function

This function returns the IP address of the client.

### Syntax

```
OWA_SEC.GET_CLIENT_IP  
    RETURN OWA_UTIL.IP_ADDRESS;
```

### Return Values

The IP address. The `owa_util.ip_address` datatype is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` datatype, the variable would contain the following values:

```
ipaddr(1) = 123  
ipaddr(2) = 45  
ipaddr(3) = 67  
ipaddr(4) = 89
```

## 232.2.3 GET\_PASSWORD Function

This function returns the password that the user used to log in.

### Syntax

```
OWA_SEC.GET_PASSWORD  
    RETURN VARCHAR2;
```

### Return Values

The password.

### Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

## 232.2.4 GET\_USER\_ID Function

This function returns the username that the user used to log in.

### Syntax

```
OWA_SEC.GET_USER_ID  
    RETURN VARCHAR2;
```

### Return Values

The username.

## 232.2.5 SET\_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA\_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway.

This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

### Syntax

```
OWA_SEC.SET_AUTHORIZATION(  
    scheme          IN      INTEGER);
```

### Parameters

**Table 232-2 SET\_AUTHORIZATION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scheme    | <p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"><li>OWA_SEC.NO_CHECK - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.</li><li>OWA_SEC.GLOBAL - Defines an authorize function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema.</li><li>OWA_SEC.PER_PACKAGE - Define an authorize function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.AUTHORIZE function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous authorize function in the user's schema is called.</li><li>OWA_SEC.CUSTOM - Implements different authorize functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an OWA_CUSTOM.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.</li></ul> <p>The custom authorize function has the following signature:</p> <pre>FUNCTION AUTHORIZE<br/>    RETURN BOOLEAN;</pre> <p>If the function returns TRUE, authentication succeeded. If it returns FALSE, authentication failed. If the authorize function is not defined, the Gateway returns an error and fails.</p> |

### Related Topics

- [OWA\\_CUSTOM](#)

The OWA\_CUSTOM package provides a Global PLSQL Agent Authorization callback function.

## 232.2.6 SET\_PROTECTION\_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

### Syntax

```
OWA_SEC.SET_PROTECTION_REALM(  
    realm      IN      VARCHAR2);
```

### Parameters

**Table 232-3 SET\_PROTECTION\_REALM Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| realm     | The realm where the page belongs. This string is displayed to the user. |

# OWA\_TEXT

The `OWA_TEXT` package contains subprograms used by `OWA_PATTERN` for manipulating strings. They are externalized so you can use them directly.

The chapter contains the following topics:

- [Types](#)
- [Summary of OWA\\_TEXT Subprograms](#)

## 233.1 OWA\_OPT\_LOCK Types

There are three `OWA_OPT_LOCK` lock types.

- [MULTI\\_LINE DATA TYPE](#)
- [ROW\\_LIST DATA TYPE](#)
- [VC\\_ARR DATA TYPE](#)

### 233.1.1 MULTI\_LINE DATA TYPE

This datatype is a PL/SQL record that holds large amounts of text. The `rows` field, of type `OWA_TEXT.VC_ARR DATA TYPE`, contains the text data in the record.

```
TYPE multi_line IS RECORD (
    rows          vc_arr,
    num_rows      INTEGER,
    partial_row    BOOLEAN);
```

### 233.1.2 ROW\_LIST DATA TYPE

This is the datatype for holding data to be processed.

```
TYPE row_list IS RECORD (
    rows          int_arr,
    num_rows      INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

## 233.1.3 VC\_ARR DATA TYPE

This is a component of the MULTI\_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

### Related Topics

- [MULTI\\_LINE DATA TYPE](#)

This datatype is a PL/SQL record that holds large amounts of text. The rows field, of type OWA\_TEXT.VC\_ARR DATA TYPE, contains the text data in the record.

## 233.2 Summary of OWA\_TEXT Subprograms

This table lists the OWA\_TEXT subprograms and briefly describes them.

**Table 233-1 OWA\_TEXT Package Subprograms**

| Subprogram                                          | Description                              |
|-----------------------------------------------------|------------------------------------------|
| <a href="#">ADD2MULTI Procedure</a>                 | Adds text to an existing multi_line type |
| <a href="#">NEW_ROW_LIST Function and Procedure</a> | Creates a new row_list                   |
| <a href="#">PRINT_MULTI Procedure</a>               | Prints out the contents of a multi_list  |
| <a href="#">PRINT_ROW_LIST Procedure</a>            | Prints out the contents of a row_list    |
| <a href="#">STREAM2MULTI Procedure</a>              | Converts a varchar2 to a multi_line type |

### 233.2.1 ADD2MULTI Procedure

This procedure adds content to an existing Multi\_Line Data Type

#### Syntax

```
OWA_TEXT.ADD2MULTI(  
    stream      IN      VARCHAR2,  
    mline       IN OUT  multi_line,  
  
    continue    IN      BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 233-2 ADD2MULTI Procedure Parameters**

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stream    | The text to add.                                                                                                                                                      |
| mline     | The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .                                                                              |
| continue  | If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row. |

## 233.2.2 NEW\_ROW\_LIST Function and Procedure

This function or procedure creates a new `OWA_TEXT.ROW_LIST` DATA TYPE.

The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` datatype as an output parameter.

### Syntax

```
OWA_TEXT.NEW_ROW_LIST
RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
    rlist    OUT    row_list);
```

### Parameters

**Table 233-3** *NEW\_ROW\_LIST Procedure Parameters*

| Parameter          | Description                                                                   |
|--------------------|-------------------------------------------------------------------------------|
| <code>rlist</code> | This is an output parameter containing the new <code>row_list</code> datatype |

### Return Values

The function version returns the new `row_list` datatype.

## 233.2.3 PRINT\_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.MULTI_LINE` DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_MULTI(
    mline    IN    multi_line);
```

### Parameters

**Table 233-4** *PRINT\_MULTI Procedure Parameters*

| Parameter          | Description                                    |
|--------------------|------------------------------------------------|
| <code>mline</code> | The <code>multi_line</code> datatype to print. |

### Return Values

The contents of the `multi_line`.

### Related Topics

- [PRINT Procedures](#)  
These procedures generate the specified parameter as a string terminated with the `\n` newline character.
- [PRN Procedures](#)  
These procedures generate the specified parameter as a string.

## 233.2.4 PRINT\_ROW\_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA\_TEXT.ROW\_LIST DATA TYPE.

### Syntax

```
OWA_TEXT.PRINT_ROW_LIST(  
    rlist          IN          multi_line);
```

### Parameters

**Table 233-5 PRINT\_ROW\_LIST Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| rlist     | The row_list datatype to print. |

### Return Values

The contents of the row\_list.

### Related Topics

- [PRINT Procedures](#)  
These procedures generate the specified parameter as a string terminated with the \n newline character.
- [PRN Procedures](#)  
These procedures generate the specified parameter as a string.

## 233.2.5 STREAM2MULTI Procedure

This procedure converts a string to a multi\_line datatype.

### Syntax

```
OWA_TEXT.STREAM2MULTI(  
    stream          IN          VARCHAR2  
    mline          OUT          multi_line);
```

### Parameters

**Table 233-6 STREAM2MULTI Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| stream    | The string to convert.                             |
| mline     | The stream in OWA_TEXT.MULTI_LINE DATA TYPE format |

# OWA\_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

This chapter contains the following topics:

- [Overview](#)
- [Types](#)
- [Summary of OWA\\_UTIL Subprograms](#)

## 234.1 OWA\_UTIL Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a datatype by the Oracle database.

## 234.2 OWA\_UTIL Types

`OWA_UTIL` uses Types to specify creating information.

- [DATETYPE Datatype](#)
- [IDENT\\_ARR Datatype](#)
- [IP\\_ADDRESS Datatype](#)

### 234.2.1 DATETYPE Datatype

The `TODATE` Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure `CHOOSE_DATE` Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

**Related Topics**

- [TODATE Function](#)  
This function converts the DATETYPE Datatype to the standard Oracle DATE type.
- [CHOOSE\\_DATE Procedure](#)  
This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

## 234.2.2 IDENT\_ARR Datatype

This datatype is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## 234.2.3 IP\_ADDRESS Datatype

This datatype is used by the GET\_CLIENT\_IP Function in the OWA\_SEC package.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

**Related Topics**

- [GET\\_CLIENT\\_IP Function](#)  
This function returns the IP address of the client.
- [OWA\\_SEC](#)  
The OWA\_SEC package provides an interface for custom authentication.

## 234.3 Summary of OWA\_UTIL Subprograms

This table lists the OWA\_UTIL subprograms and briefly describes them.

**Table 234-1 OWA\_UTIL Package Subprograms**

| Subprogram                                    | Description                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------|
| <a href="#">BIND_VARIABLES Function</a>       | Prepares a SQL query and binds variables to it                          |
| <a href="#">CALENDARPRINT Procedures</a>      | Prints a calendar                                                       |
| <a href="#">CELLSPRINT Procedures</a>         | Prints the contents of a query in an HTML table                         |
| <a href="#">CHOOSE_DATE Procedure</a>         | Generates HTML form elements that allow the user to select a date       |
| <a href="#">GET_CGI_ENV Function</a>          | Returns the value of the specified CGI environment variable             |
| <a href="#">GET_OWA_SERVICE_PATH Function</a> | Returns the full virtual path for the PL/SQL Gateway                    |
| <a href="#">GET_PROCEDURE Function</a>        | Returns the name of the procedure that is invoked by the PL/SQL Gateway |
| <a href="#">HTTP_HEADER_CLOSE Procedure</a>   | Closes the HTTP header                                                  |
| <a href="#">LISTPRINT Procedure</a>           | Generates a HTML form element that contains data from a query           |
| <a href="#">MIME_HEADER Procedure</a>         | Generates the Content-type line in the HTTP header                      |
| <a href="#">PRINT_CGI_ENV Procedure</a>       | Generates a list of all CGI environment variables and their values      |
| <a href="#">REDIRECT_URL Procedure</a>        | Generates the Location line in the HTTP header                          |
| <a href="#">SHOWPAGE Procedure</a>            | Prints a page generated by the HTP and HTF packages in SQL*Plus         |

**Table 234-1 (Cont.) OWA\_UTIL Package Subprograms**

| Subprogram                              | Description                                                            |
|-----------------------------------------|------------------------------------------------------------------------|
| <a href="#">SHOWSOURCE Procedure</a>    | Prints the source for the specified subprogram                         |
| <a href="#">SIGNATURE procedure</a>     | Prints a line that says that the page is generated by the PL/SQL Agent |
| <a href="#">STATUS_LINE Procedure</a>   | Generates the Status line in the HTTP header                           |
| <a href="#">TABLEPRINT Function</a>     | Prints the data from a table in the database as an HTML table          |
| <a href="#">TODATE Function</a>         | Converts dateType data to the standard PL/SQL date type                |
| <a href="#">WHO_CALLED_ME Procedure</a> | Returns information on the caller of the procedure.                    |

## 234.3.1 BIND\_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

### Syntax

```
OWA_UTIL.BIND_VARIABLES(  
    theQuery      IN      VARCHAR2  DEFAULT NULL,  
    bv1Name       IN      VARCHAR2  DEFAULT NULL,  
    bv1Value      IN      VARCHAR2  DEFAULT NULL,  
    bv2Name       IN      VARCHAR2  DEFAULT NULL,  
    bv2Value      IN      VARCHAR2  DEFAULT NULL,  
    bv3Name       IN      VARCHAR2  DEFAULT NULL,  
    bv3Value      IN      VARCHAR2  DEFAULT NULL,  
    ...  
    bv25Name      IN      VARCHAR2  DEFAULT NULL,  
    bv25Value     IN      VARCHAR2  DEFAULT NULL)  
RETURN INTEGER;
```

### Parameters

**Table 234-2 BIND\_VARIABLES Function Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| theQuery  | The SQL query statement which must be a SELECT statement |
| bv1Name   | The name of the variable                                 |
| bv1Value  | The value of the variable                                |

### Return Values

An integer identifying the opened cursor.

## 234.3.2 CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

### Syntax

```
OWA_UTIL.CALENDARPRINT (  
    p_query          IN          VARCHAR2,  
    p_mf_only        IN          VARCHAR2  DEFAULT 'N');  
  
OWA_UTIL.CALENDARPRINT (  
    p_cursor          IN          INTEGER,  
    p_mf_only         IN          VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 234-3 CALENDARPRINT Procedure Parameters**

| Parameter | Description                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------|
| p_query   | A PL/SQL query.                                                                                                                   |
| p_cursor  | A PL/SQL cursor containing the same format as p_query.                                                                            |
| p_mf_only | If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only. |

### Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

## 234.3.3 CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table.

There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT\\_CELL Function](#) in the "HTF" package.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

## Syntax

```
OWA_UTIL.CELLSPRINT(
    p_colCnt      IN    INTEGER,
    p_resultTbl   IN    vc_arr,

    p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
    p_theQuery    IN    VARCHAR2,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
    p_theCursor   IN    INTEGER,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT(
    p_theQuery    IN    VARCHAR2,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_skip_rec    IN    NUMBER    DEFAULT 0,
    p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT(
    p_theCursor   IN    INTEGER,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_skip_rec    IN    NUMBER    DEFAULT 0,
    p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT(
    p_theQuery    IN    VARCHAR2,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_recnt      OUT   NUMBER);
```

```
OWA_UTIL.CELLSPRINT(
    p_theCursor   IN    INTEGER,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_recnt      OUT   NUMBER);
```

```
OWA_UTIL.CELLSPRINT(
    p_theQuery    IN    VARCHAR2,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_skip_rec    IN    NUMBER    DEFAULT 0,
    p_more_data   OUT   BOOLEAN,
    p_recnt      OUT   NUMBER);
```

```
OWA_UTIL.CELLSPRINT(
    p_theCursor   IN    INTEGER,
    p_max_rows    IN    NUMBER    DEFAULT 100,
    p_format_numbers IN  VARCHAR2  DEFAULT NULL,
    p_skip_rec    IN    NUMBER    DEFAULT 0,
    p_more_data   OUT   BOOLEAN,
    p_recnt      OUT   NUMBER);
```

## Parameters

**Table 234-4 CELLSPRINT Procedure Parameters**

| Parameter        | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| p_query          | A PL/SQL query.                                                                                                          |
| p_colCnt         | The number of columns in the table.                                                                                      |
| p_theQuery       | A SQL SELECT statement.                                                                                                  |
| p_theCursor      | A cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .                             |
| p_max_rows       | The maximum number of rows to print.                                                                                     |
| p_format_numbers | If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.         |
| p_skip_rec       | The number of rows to exclude from the HTML table.                                                                       |
| p_more_data      | TRUE if there are more rows in the query or cursor, FALSE otherwise.                                                     |
| p_reccnt         | The number of rows that have been returned by the query. This value does not include skipped rows (if any).              |
| p_resultTbl      | The index table which will contain the result of the query. Each entry in the query will correspond to one column value. |

## Examples

This procedure generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

## 234.3.4 CHOOSE\_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

## Syntax

```
OWA_UTIL.CHOOSE_DATE (  
    p_name      IN      VARCHAR2,  
    p_date      IN      DATE      DEFAULT SYSDATE);
```

## Parameters

**Table 234-5 CHOOSE\_DATE Procedure Parameters**

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| p_name    | The name of the form elements.                                     |
| p_date    | The initial date that is selected when the HTML page is displayed. |

## Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET\\_CGI\\_ENV Function](#).

- Use the [TODATE Function](#) to convert the [GET\\_CGI\\_ENV Function](#) value to the standard Oracle DATE datatype.

### Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
...
<OPTION value="2002">2002
</SELECT>
```

## 234.3.5 GET\_CGI\_ENV Function

This function returns the value of the specified CGI environment variable.

### Syntax

```
OWA_UTIL.GET_CGI_ENV(
    param_name    IN    VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 234-6** GET\_CGI\_ENV Function Parameters

| Parameter  | Description                                                       |
|------------|-------------------------------------------------------------------|
| param_name | The name of the CGI environment variable. It is case-insensitive. |

### Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

## 234.3.6 GET\_OWA\_SERVICE\_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

### Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
RETURN VARCHAR2;
```

### Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

## 234.3.7 GET\_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

### Syntax

```
OWA_UTIL.GET_PROCEDURE
RETURN VARCHAR2;
```

### Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

## 234.3.8 HTTP\_HEADER\_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

### Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

### Return Values

A newline character, which closes the HTTP header.

### Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME\\_HEADER Procedure](#), [REDIRECT\\_URL Procedure](#), or [STATUS\\_LINE Procedure](#)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

## 234.3.9 LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query.

There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND\\_VARIABLES Function](#).

### Syntax

```
OWA_UTIL.LISTPRINT(
  p_theQuery    IN      VARCHAR2,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
  p_theCursor   IN      INTEGER,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 234-7 LISTPRINT Procedure Parameters**

| Parameter   | Description                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------|
| p_theQuery  | The SQL query.                                                                                  |
| p_theCursor | The cursor ID. This can be the return value from the <a href="#">BIND_VARIABLES Function</a> .  |
| p_cname     | The name of the HTML form element.                                                              |
| p_nsize     | The size of the form element (this controls how many items the user can see without scrolling). |
| p_multiple  | Whether multiple selection is permitted.                                                        |

## Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the `VALUE` attribute of the `OPTION` tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as `SELECTED` in the `OPTION` tag. If the value is not `NULL`, the row is selected.

## Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

## 234.3.10 MIME\_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any `HTP.PRINT` or `HTP.PRN` calls to direct the script not to use the default MIME header.

## Syntax

```
OWA_UTIL.MIME_HEADER(
  ccontent_type  IN      VARCHAR2  DEFAULT 'text/html',
  bclose_header  IN      BOOLEAN    DEFAULT TRUE,
  ccharset       IN      VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 234-8 MIME\_HEADER Procedure Parameters**

| Parameter     | Description               |
|---------------|---------------------------|
| ccontent_type | The MIME type to generate |

**Table 234-8 (Cont.) MIME\_HEADER Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bclose_header | Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.                                                                                                                                       |
| ccharset      | The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on. |

**Examples**

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

## 234.3.11 PRINT\_CGI\_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

**Syntax**

```
OWA_UTIL.PRINT_CGI_ENV;
```

**Examples**

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

## 234.3.12 REDIRECT\_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

**Syntax**

```
OWA_UTIL.REDIRECT_URL(  
    curl           IN      VARCHAR2  
    bclose_header IN      BOOLEAN   DEFAULT TRUE);
```

## Parameters

**Table 234-9 REDIRECT\_URL Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>curl</code>          | The URL to visit.                                                                                                                                                                      |
| <code>bclose_header</code> | Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. |

## Usage Notes

This procedure must come before any HTP procedure or HTF function call.

## Examples

This procedure generates

```
Location: <curl>\n\n
```

## 234.3.13 SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL\*Plus.

The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

## Syntax

```
OWA_UTIL.SHOWPAGE;
```

## Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS\\_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

## Examples

The output of htp procedure is displayed in SQL\*Plus, SQL\*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

## 234.3.14 SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

### Syntax

```
OWA_UTIL.SHOWSOURCE (
    cname      IN      VARCHAR2);
```

### Parameters

**Table 234-10 SHOWSOURCE Procedure Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| cname     | The function or procedure whose source you want to show. |

## 234.3.15 SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document.

If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

### Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
    cname      IN      VARCHAR2);
```

### Parameters

**Table 234-11 SIGNATURE Procedure Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| cname     | The function or procedure whose source you want to show. |

### Examples

Without a parameter, the procedure generates a line that looks like the following:

This page was produced by the **PL/SQL Agent** on August 9, 2001 09:30.

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

This page was produced by the **PL/SQL Agent** on 8/09/01 09:30  
View PL/SQL Source

## 234.3.16 STATUS\_LINE Procedure

This procedure sends a standard HTTP status code to the client.

This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

### Syntax

```
OWA_UTIL.STATUS_LINE(  
    nstatus      IN      INTEGER,  
    creason      IN      VARCHAR2  DEFAULT NULL,  
    bclose_header IN      BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 234-12 STATUS\_LINE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nstatus       | The status code.                                                                                                                                                                       |
| creason       | The string for the status code.                                                                                                                                                        |
| bclose_header | Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open. |

### Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

## 234.3.17 TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

### Syntax

```
OWA_UTIL.TABLEPRINT(  
    ctable      IN      VARCHAR2,  
    cattributes IN      VARCHAR2  DEFAULT NULL,  
    ntable_type IN      INTEGER   DEFAULT HTML_TABLE,  
    ccolumns    IN      VARCHAR2  DEFAULT '*',  
    cclauses    IN      VARCHAR2  DEFAULT NULL,  
    ccol_aliases IN      VARCHAR2  DEFAULT NULL,  
    nrow_min    IN      NUMBER    DEFAULT 0,  
    nrow_max    IN      NUMBER    DEFAULT NULL)  
RETURN BOOLEAN;
```

## Parameters

**Table 234-13 TABLEPRINT Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ctable       | The database table.                                                                                                                                                                                                                                                                                                                                                                          |
| cattributes  | Other attributes to be included as-is in the tag.                                                                                                                                                                                                                                                                                                                                            |
| ntable_type  | How to generate the table. Specify <code>HTML_TABLE</code> to generate the table using <code>&lt;TABLE&gt;</code> tags or <code>PRE_TABLE</code> to generate the table using the <code>&lt;PRE&gt;</code> tags. These are constants: <ul style="list-style-type: none"> <li><code>HTML_TABLE CONSTANT INTEGER := 1;</code></li> <li><code>PRE_TABLE CONSTANT INTEGER := 2;</code></li> </ul> |
| ccolumns     | A comma-delimited list of columns from <code>ctable</code> to include in the generated table.                                                                                                                                                                                                                                                                                                |
| cclauses     | <code>WHERE</code> or <code>ORDER BY</code> clauses, which specify which rows to retrieve from the database table, and how to order them.                                                                                                                                                                                                                                                    |
| ccol_aliases | A comma-delimited list of headings for the generated table.                                                                                                                                                                                                                                                                                                                                  |
| nrow_min     | The first row, of those retrieved, to display.                                                                                                                                                                                                                                                                                                                                               |
| nrow_max     | The last row, of those retrieved, to display.                                                                                                                                                                                                                                                                                                                                                |

## Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

## Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

## Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

`http://myhost:7777/pls/hr/showemps`

returns to the following to the client:

```
<PRE>
-----
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
-----
| 7369 | SMITH | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20     |
| 7499 | ALLEN | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30     |
| 7521 | WARD  | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30     |
| 7566 | JONES | MANAGER | 7839 | 02-APR-81 | 2975 |      | 20     |
```

```
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |      | 30 |
| 7782| CLARK   | MANAGER | 7839 | 09-JUN-81 | 2450 |      | 10 |
| 7788| SCOTT   | ANALYST | 7566 | 09-DEC-82 | 3000 |      | 20 |
| 7839| KING    | PRESIDENT |      | 17-NOV-81 | 5000 |      | 10 |
| 7844| TURNER  | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0    | 30 |
| 7876| ADAMS   | CLERK   | 7788 | 12-JAN-83 | 1100 |      | 20 |
| 7900| JAMES   | CLERK   | 7698 | 03-DEC-81 | 950  |      | 30 |
| 7902| FORD    | ANALYST | 7566 | 03-DEC-81 | 3000 |      | 20 |
| 7934| MILLER  | CLERK   | 7782 | 23-JAN-82 | 1300 |      | 10 |
```

</PRE>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
  ignore_more BOOLEAN;
begin
  ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

[http://myhost:7777/pls/hr/showemps\\_10](http://myhost:7777/pls/hr/showemps_10)

would return the following to the client:

<PRE>

```
-----
| Employee Number |Name      | Salary |
-----
| 7782            | CLARK    | 2450   |
| 7839            | KING     | 5000   |
| 7934            | MILLER   | 1300   |
-----
```

</PRE>

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := owa_util.tableprint('dept', 'BORDER');
END;
```

A request for a URL like

<http://myhost:7777/pls/hr/showdept>

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
```

```
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

| DEPTNO | DNAME      | LOC      |
|--------|------------|----------|
| 10     | ACCOUNTING | NEW YORK |
| 20     | RESEARCH   | DALLAS   |
| 30     | SALES      | CHICAGO  |

## 234.3.18 TODATE Function

This function converts the DATETYPE Datatype to the standard Oracle DATE type.

### Syntax

```
OWA_UTIL.TODATE (
    p_dateArray    IN    dateType)
RETURN DATE;
```

### Parameters

**Table 234-14** TODATE Function Parameters

| Parameter   | Description           |
|-------------|-----------------------|
| p_dateArray | The value to convert. |

### Related Topics

- [DATETYPE Datatype](#)  
The TODATE Function converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure CHOOSE\_DATE Procedure enables the user to select the desired date.

## 234.3.19 WHO\_CALLED\_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

### Syntax

```
OWA_UTIL.WHO_CALLED_ME(  
    owner      OUT    VARCHAR2,  
    name       OUT    VARCHAR2,  
    lineno     OUT    NUMBER,  
    caller_t    OUT    VARCHAR2);
```

### Parameters

**Table 234-15** WHO\_CALLED\_ME Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner     | The owner of the program unit.                                                                                                                                                                                                                                                                                         |
| name      | The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is <code>NULL</code> . |
| lineno    | The line number within the program unit where the call was made.                                                                                                                                                                                                                                                       |
| caller_t  | The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.                                                                                                                   |

## SDO\_CS

The `SDO_CS` package contains functions and procedures for working with coordinate systems.

You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_CSW\_PROCESS

The `SDO_CSW_PROCESS` package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*..

## SDO\_GCDR

The `SDO_GCDR` package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GCDR` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_GEOM

The `SDO_GEOM` package contains the geometry functions.

These can be grouped into the following categories (with examples of each):

- **Relationship (True/False) between two objects:** `RELATE`, `WITHIN_DISTANCE`
- **Validation:** `VALIDATE_GEOMETRY_WITH_CONTEXT`, `VALIDATE_LAYER_WITH_CONTEXT`
- **Single-object operations:** `SDO_ARC_DENSIFY`, `SDO_AREA`, `SDO_BUFFER`, `SDO_CENTROID`, `SDO_CONVEXHULL`, `SDO_LENGTH`, `SDO_MBR`, `SDO_POINTONSURFACE`
- **Two-object operations:** `SDO_DISTANCE`, `SDO_DIFFERENCE`, `SDO_INTERSECTION`, `SDO_UNION`, `SDO_XOR`

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_GEOR

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_ADMIN

The `SDO_GEOR_ADMIN` package contains subprograms for administrative operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_AGGR

The `SDO_GEOR_AGGR` package provides an interface to the `SDO_GEOR_AGGR` package for performing aggregate operations on GeoRaster objects.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_AGGR` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_RA

The `SDO_GEOR_RA` package provides an interface to the `SDO_GEOR_RA` package for performing raster algebra and analytic operations related to GeoRaster.

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_RA` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_GEOR\_UTL

The `SDO_GEOR_UTL` package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial and Graph GeoRaster Developer's Guide*.

## SDO\_LRS

The `SDO_LRS` package contains functions that create, modify, query, and convert linear referencing elements.

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_MIGRATE

The `SDO_MIGRATE` package lets you upgrade geometry tables from previous releases of Oracle Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_NET

The `SDO_NET` package contains functions and procedures for working with data modeled as nodes and links in a network.

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

## SDO\_NFE

The `SDO_NFE` package contains functions and procedures for performing network feature editing.

For a complete description of this package within the context of Oracle Spatial and Graph, see [SDO\\_NFE](#) in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

## SDO\_OLS

The `SDO_OLS` package contains subprograms for Spatial OpenLS support.

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_PC\_PKG

The `SDO_PC_PKG` package contains subprograms to support the use of point clouds in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_SAM

The `SDO_SAM` package contains functions and procedures for spatial analysis and data mining.

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_TIN\_PKG

The `SDO_TIN_PKG` package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the

## SDO\_TOPO

The `SDO_TOPO` package contains subprograms for creating and managing Oracle Spatial topologies.

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

## SDO\_TOPO\_MAP

The `SDO_TOPO_MAP` package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*.

## SDO\_TUNE

The `SDO_TUNE` package contains Spatial tuning functions and procedures.

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_UTIL

The `SDO_UTIL` package contains the utility functions and procedures for Oracle Spatial.

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_WFS\_LOCK

The `SDO_WFS_LOCK` package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial and Graph Developer's Guide*.

## SDO\_WFS\_PROCESS

The `SDO_WFS_PROCESS` package contains subprograms for various processing operations related to support for Web Feature Services.

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial and Graph Developer's Guide*.

## SEM\_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_OLS

The `SEM_OLS` package provides an interface to the `SEM_OLS` package for providing triple-level security to RDF data, using Oracle Label Security (OLS).

For a complete description of this package, see `SEM_OLS` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_PERF

The `SEM_PERF` package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

## SEM\_RDFCTX

The SEM\_RDFCTX package contains subprograms for managing extractor policies and semantic indexes created for documents.

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM\_RDFCTX in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*

## SEM\_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Spatial and Graph RDF Semantic Graph Developer's Guide*.

# UTL\_CALL\_STACK

The `UTL_CALL_STACK` package provides an interface to provide information about currently executing subprograms.

Functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. Other functions return error stack information.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [UTL\\_CALL\\_STACK Operational Notes](#)
- [UTL\\_CALL\\_STACK Exceptions](#)
- [Data Structures](#)
- [Summary of UTL\\_CALL\\_STACK Subprograms](#)

## See Also:

- *Oracle Database PL/SQL Language Reference* regarding Conditional Compilation
- *Oracle Database Development Guide* regarding Using PL/Scope and Using the PL/SQL Hierarchical Profiler

## 263.1 UTL\_CALL\_STACK Overview

The `UTL_CALL_STACK` package provides an interface for PL/SQL programmers to obtain information about currently executing programs including the subprogram name from dynamic and lexical stacks and the depths of those stacks.

Individual functions return subprogram names, unit names, owner names, edition names, and line numbers for given dynamic depths. More functions return error stack information. Such information can be used to create more revealing error logs and application execution traces.

### Dynamic Depth

The dynamic depth of an executing instance of a PL/SQL subprogram is defined recursively.

- The dynamic depth of the currently executing subprogram instance is one.
- Otherwise, the dynamic depth of the subprogram instance is one more than the dynamic depth of the subprogram it invoked.
- If there is a SQL, Java, or other non-PL/SQL context that invoked or was invoked by an executing subprogram, it occupies a level on the call stack as if it were a subprogram.

In the case of a call stack in which A calls B, which calls C, which calls D, which calls E, which calls F, which calls E, this stack can be written as a line with the dynamic depths underneath:

```
A B C D E F E
7 6 5 4 3 2 1
```

### Lexical Depth

The lexical depth of a PL/SQL subprogram is defined recursively.

- The lexical depth of a unit, an anonymous block, trigger, or ADT is one (1).
- The lexical depth of a subprogram defined within another object is one plus the lexical depth of that object.

Blocks do not affect lexical depth.

### Error Depth

The error depth is the number of errors on the error stack.

For example, consider the following anonymous block.

```
BEGIN
  BEGIN
    ... (1)
    raise zero_divide;
  EXCEPTION
    when others then
      raise no_data_found;
  END;
EXCEPTION
  WHEN others THEN
    ... (2)
END;
```

The error depth at (1) is zero and at (2) is two.

### Backtrace

The backtrace is a trace from where the exception was thrown to where the backtrace was examined.

Consider a call stack in which A calls B which calls C and C raises an exception. If the backtrace was examined in C, the backtrace would have one unit, C, and the backtrace depth would be one. If it was examined in A, it would have three units, A, B and C, and backtrace depth would be three.

The depth of a backtrace is zero in the absence of an exception.

## 263.2 UTL\_CALL\_STACK Security Model

EXECUTE on UTL\_CALL\_STACK is granted to PUBLIC.

The UTL\_CALL\_STACK package does not show wrapped program units. For example, consider a call stack in which program unit A calls B, which calls C, and in turn calls UTL\_CALL\_STACK to determine the subprogram list. If program unit B is wrapped, then the subprogram list only shows program unit C.

## 263.3 UTL\_CALL\_STACK Operational Notes

Certain operational notes apply to UTL\_CALL\_STACK.

- Compiler optimizations can change lexical, dynamic and backtrace depth.
- UTL\_CALL\_STACK is not supported past RPC boundaries. For example, if A calls remote procedure B, B will not be able to obtain information about A using UTL\_CALL\_STACK.
- Lexical unit information is available through the PL/SQL conditional compilation feature and is therefore not exposed through UTL\_CALL\_STACK.

## 263.4 UTL\_CALL\_STACK Exceptions

This table lists the exceptions raised by UTL\_CALL\_STACK.

**Table 263-1 Exceptions Raised by UTL\_CALL\_STACK**

| Exception           | Error Code | Description                                                                                                                                                                                                                          |
|---------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BAD_DEPTH_INDICATOR | 64610      | This exception is raised when a provided depth is out of bounds. Dynamic and lexical depth are positive integer values. Error and backtrace depths are non-negative integer values and are zero only in the absence of an exception. |

## 263.5 UTL\_CALL\_STACK Data Structures

The UTL\_CALL\_STACK package defines a VARRAY type, UNIT\_QUALIFIED\_NAME.

### VARRAY Type

- [UNIT\\_QUALIFIED\\_NAME](#)

### 263.5.1 UNIT\_QUALIFIED\_NAME

This data structure is a varray whose individual elements are, in order, the unit name, any lexical parents of the subprogram, and the subprogram name.

```
TYPE UNIT_QUALIFIED_NAME IS VARRAY(256) OF VARCHAR2(32767);
```

### Example

Consider the following contrived PL/SQL procedure:

```
PROCEDURE topLevel IS
  FUNCTION localFunction(...) RETURNS VARCHAR2 IS
    FUNCTION innerFunction(...) RETURNS VARCHAR2 IS
      BEGIN
        DECLARE
          localVar PLS_INTEGER;
        BEGIN
          ... (1)
        END;
      END;
    BEGIN
      ...
    END;
  END;
```

```
...  
END;
```

The unit qualified name at (1) would be

```
["topLevel", "localFunction", "innerFunction"]
```

If the unit were an anonymous block, the unit name would be "\_\_anonymous\_block"

## 263.6 Summary of UTL\_CALL\_STACK Subprograms

This table lists the subprograms in the UTL\_CALL\_STACK package.

**Table 263-2 UTL\_CALL\_STACK Package Subprograms**

| Subprogram                                      | Description                                                                                   |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">BACKTRACE_DEPTH Function</a>        | Returns the number of backtrace items in the backtrace                                        |
| <a href="#">BACKTRACE_LINE Function</a>         | Returns the line number of the unit at the specified backtrace depth                          |
| <a href="#">BACKTRACE_UNIT Function</a>         | Returns the name of the unit at the specified backtrace depth                                 |
| <a href="#">CURRENT_EDITION Function</a>        | Returns the current edition name of the unit of the subprogram at the specified dynamic depth |
| <a href="#">CONCATENATE_SUBPROGRAM Function</a> | Returns a concatenated form of a unit-qualified name                                          |
| <a href="#">DYNAMIC_DEPTH Function</a>          | Returns the number of subprograms on the call stack                                           |
| <a href="#">ERROR_DEPTH Function</a>            | Returns the number of errors on the error stack                                               |
| <a href="#">ERROR_MSG Function</a>              | Returns the error message of the error at the specified error depth                           |
| <a href="#">ERROR_NUMBER Function</a>           | Returns the error number of the error at the specified error depth                            |
| <a href="#">LEXICAL_DEPTH Function</a>          | Returns the lexical nesting level of the subprogram at the specified dynamic depth            |
| <a href="#">OWNER Function</a>                  | Returns the owner name of the unit of the subprogram at the specified dynamic depth           |
| <a href="#">UNIT_LINE Function</a>              | Returns the line number of the unit of the subprogram at the specified dynamic depth          |
| <a href="#">SUBPROGRAM Function</a>             | Returns the unit-qualified name of the subprogram at the specified dynamic depth              |

### 263.6.1 BACKTRACE\_DEPTH Function

This function returns the number of backtrace items in the backtrace.

#### Syntax

```
UTL_CALL_STACK.BACKTRACE_DEPTH  
RETURN PLS_INTEGER;
```

#### Return Values

The number of backtrace items in the backtrace, zero in the absence of an exception.

## 263.6.2 BACKTRACE\_LINE Function

This function returns the line number of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_LINE (  
    backtrace_depth IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 263-3** *BACKTRACE\_LINE Function Parameters*

| Parameter       | Description        |
|-----------------|--------------------|
| backtrace_depth | Depth in backtrace |

### Return Values

The line number of the unit at the specified backtrace depth

## 263.6.3 BACKTRACE\_UNIT Function

This function returns the name of the unit at the specified backtrace depth.

### Syntax

```
UTL_CALL_STACK.BACKTRACE_UNIT (  
    backtrace_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 263-4** *BACKTRACE\_UNIT Function Parameters*

| Parameter       | Description        |
|-----------------|--------------------|
| backtrace_depth | Depth in backtrace |

### Return Values

The name of the unit at the specified backtrace depth

## 263.6.4 CURRENT\_EDITION Function

This function returns the current edition name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.CURRENT_EDITION (  
    dynamic_depth IN PLS_INTEGER)  
RETURN VARCHAR2;
```

## Parameters

**Table 263-5** *CURRENT\_EDITION Function Parameters*

| Parameter     | Description              |
|---------------|--------------------------|
| dynamic_depth | Depth in the error stack |

## Return Values

The current edition name of the unit of the subprogram at the specified dynamic depth

## 263.6.5 CONCATENATE\_SUBPROGRAM Function

This function returns a concatenated form of a unit-qualified name.

### Syntax

```
UTL_CALL_STACK.CONCATENATE_SUBPROGRAM (  
    qualified_name    IN    UNIT_QUALIFIED_NAME)  
    RETURN VARCHAR2;
```

## Parameters

**Table 263-6** *CONCATENATE\_SUBPROGRAM Function Parameters*

| Parameter      | Description           |
|----------------|-----------------------|
| qualified_name | A unit-qualified name |

## Return Values

A string of the form UNIT.SUBPROGRAM.LOCAL\_SUBPROGRAM

## 263.6.6 DYNAMIC\_DEPTH Function

This function returns the number of subprograms on the call stack.

### Syntax

```
UTL_CALL_STACK.DYNAMIC_DEPTH  
    RETURN PLS_INTEGER;
```

## Return Values

The number of subprograms on the call stack

## 263.6.7 ERROR\_DEPTH Function

This function returns the number of errors on the error stack.

### Syntax

```
UTL_CALL_STACK.ERROR_DEPTH  
    RETURN PLS_INTEGER;
```

**Return Values**

The number of errors on the error stack

## 263.6.8 ERROR\_MSG Function

This function returns the error message of the error at the specified error depth.

**Syntax**

```
UTL_CALL_STACK.ERROR_MSG (  
    error_depth    IN    PLS_INTEGER)  
RETURN VARCHAR2;
```

**Parameters**

**Table 263-7** *ERROR\_MSG Function Parameters*

| Parameter   | Description              |
|-------------|--------------------------|
| error_depth | Depth in the error stack |

**Return Values**

The error message of the error at the specified error depth.

## 263.6.9 ERROR\_NUMBER Function

This function returns the error number of the error at the specified error depth.

**Syntax**

```
UTL_CALL_STACK.ERROR_NUMBER (  
    error_depth    IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

**Parameters**

**Table 263-8** *ERROR\_NUMBER Function Parameters*

| Parameter   | Description             |
|-------------|-------------------------|
| error_depth | Depth in the call stack |

**Return Values**

The error number of the error at the specified error depth

## 263.6.10 LEXICAL\_DEPTH Function

This function returns the lexical nesting level of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.LEXICAL_DEPTH (  
    dynamic_depth    IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 263-9** *LEXICAL\_DEPTH Function Parameters*

| Parameter     | Description             |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

### Return Values

The lexical nesting level of the subprogram at the specified dynamic depth

## 263.6.11 OWNER Function

This function returns the owner name of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.OWNER (  
    dynamic_depth    IN    PLS_INTEGER)  
RETURN VARCHAR2;
```

### Parameters

**Table 263-10** *OWNER Function Parameters*

| Parameter     | Description             |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

### Return Values

The owner name of the unit of the subprogram at the specified dynamic depth

## 263.6.12 UNIT\_LINE Function

This function returns the line number of the unit of the subprogram at the specified dynamic depth.

### Syntax

```
UTL_CALL_STACK.UNIT_LINE (  
    dynamic_depth    IN    PLS_INTEGER)  
RETURN PLS_INTEGER;
```

## Parameters

**Table 263-11** *UNIT\_LINE Function Parameters*

| Parameter     | Description             |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

## Return Values

The line number of the unit of the subprogram at the specified dynamic depth

## 263.6.13 SUBPROGRAM Function

This function returns the unit-qualified name of the subprogram at the specified dynamic depth.

## Syntax

```
UTL_CALL_STACK.SUBPROGRAM (
    dynamic_depth IN PLS_INTEGER)
RETURN UNIT_QUALIFIED_NAME;
```

## Parameters

**Table 263-12** *SUBPROGRAM Function Parameters*

| Parameter     | Description             |
|---------------|-------------------------|
| dynamic_depth | Depth in the call stack |

## Return Values

Returns the unit-qualified name of the subprogram at the specified dynamic depth

The UTL\_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL\\_COLL Subprograms](#)

## 264.1 Summary of UTL\_COLL Subprograms

The UTL\_COLL package has one subprogram, the IS Locator function.

**Table 264-1 UTL\_COLL Package Subprograms**

| Subprogram                          | Description                                                       |
|-------------------------------------|-------------------------------------------------------------------|
| <a href="#">IS Locator Function</a> | Determines whether a collection item is actually a locator or not |

### 264.1.1 IS Locator Function

This function determines whether a collection item is actually a locator or not.

#### Syntax

```
UTL_COLL.IS Locator (
    coln IN STANDARD)
    RETURNS BOOLEAN;
```

#### Pragmas

Asserts WNDS, WNPS and RNPS pragmas

#### Parameters

**Table 264-2 IS Locator Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| coln      | Nested table or varray item. |

#### Return Values

**Table 264-3 IS Locator Function Return Values**

| Return Value | Description                          |
|--------------|--------------------------------------|
| 1            | Collection item is indeed a locator. |
| 0            | Collection item is not a locator.    |

## Examples

```
CREATE OR REPLACE TYPE list_t AS TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
    pno    number,
    ph     list_t );
/

CREATE TABLE phone_book OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
    NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
    plist list_t;
    plist1 list_t;
BEGIN
    SELECT ph INTO plist FROM phone_book WHERE pno=1;

    SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

    IF (UTL_COLL.IS_LOCATOR(plist)) THEN
        DBMS_OUTPUT.PUT_LINE('plist is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist is not a locator');
    END IF;

    IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
        DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
    ELSE
        DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
    END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

# UTL\_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of UTL\\_COMPRESS Subprograms](#)

## 265.1 UTL\_COMPRESS Constants

The maximum number of handles for piecewise operations can be defined by a constant.

```
UTLCOMP_MAX_HANDLE    CONSTANT    PLS_INTEGER := 5;
```

## 265.2 UTL\_COMPRESS Exceptions

This table describes exceptions raised by `UTL_COMPRESS` subprograms.

**Table 265-1 UTL\_COMPRESS Exceptions**

| Exception                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| <code>BUFFER_TOO_SMALL</code> | The compressed representation is too big.                                |
| <code>DATA_ERROR</code>       | The input or output data stream was found to be an invalid format.       |
| <code>INVALID_ARGUMENT</code> | One of the arguments was an invalid type or value.                       |
| <code>INVALID_HANDLE</code>   | Invalid handle for piecewise compress or uncompress.                     |
| <code>STREAM_ERROR</code>     | An error occurred during compression or uncompression of the data stream |

## 265.3 UTL\_COMPRESS Operational Notes

Certain operational notes apply to `UTL_COMPRESS`.

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.

- The output of the UTL\_COMPRESS compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.

## 265.4 Summary of UTL\_COMPRESS Subprograms

This table lists the UTL\_COMPRESS subprograms and briefly describes them.

**Table 265-2 UTL\_COMPRESS Package Subprograms**

| Subprogram                             | Description                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------|
| ISOPEN Function                        | Checks to see if the handle to a piecewise (un)compress context is open or closed |
| LZ_COMPRESS Functions and Procedures   | Compresses data using Lempel-Ziv compression algorithm                            |
| LZ_COMPRESS_ADD Procedure              | Adds a piece of compressed data                                                   |
| LZ_COMPRESS_CLOSE                      | Closes and finishes piecewise compress operation                                  |
| LZ_COMPRESS_OPEN                       | Initializes a piecewise context that maintains the compress state and data        |
| LZ_UNCOMPRESS Functions and Procedures | Accepts compressed input, verifies it to be a valid and uncompresses it           |
| LZ_UNCOMPRESS_EXTRACT Procedure        | Extracts a piece of uncompressed data                                             |
| LZ_UNCOMPRESS_OPEN Function            | Initializes a piecewise context that maintains the uncompress state and data      |
| LZ_UNCOMPRESS_CLOSE Procedure          | Closes and finishes the piecewise uncompress                                      |

### 265.4.1 ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

#### Syntax

```
UTL_COMPRESS.ISOPEN(  
    handle in binary_integer)  
RETURN BOOLEAN;
```

#### Parameters

**Table 265-3 ISOPEN Function Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| handle    | The handle to a piecewise uncompress context. |

#### Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

## Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

## Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

## 265.4.2 LZ\_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

### Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      RAW,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BLOB,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
    src      IN      BFILE,
    dst      IN OUT NOCOPY BLOB,
    quality  IN      BINARY_INTEGER DEFAULT 6);
```

## Parameters

**Table 265-4 LZ\_COMPRESS Function and Procedures Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| src       | Data (RAW, BLOB or BFILE) to be compressed.                                       |
| dst       | Destination for compressed data                                                   |
| quality   | An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6 |

## Usage Notes

- quality is an optional compression tuning value. It allows the UTL\_COMPRESS user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

## 265.4.3 LZ\_COMPRESS\_ADD Procedure

This procedure adds a piece of compressed data.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (  
    handle IN          BINARY_INTEGER,  
    dst     IN OUT NOCOPY BLOB,  
    src     IN          RAW);
```

## Parameters

**Table 265-5 LZ\_COMPRESS\_ADD Procedure Parameters**

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| handle    | The handle to a piecewise compress context.                    |
| dst       | The opened LOB from LZ_COMPRESS_OPEN to store compressed data. |
| src       | The input data to be compressed.                               |

## Exceptions

- invalid\_handle - out of range invalid or unopened handle.
- invalid\_argument - NULL handle, src, dst, or invalid dst.

## 265.4.4 LZ\_COMPRESS\_CLOSE

This procedure closes and finishes piecewise compress operation.

### Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (  
    handle IN          BINARY_INTEGER,  
    dst     IN OUT NOCOPY BLOB);
```

## Parameters

**Table 265-6 LZ\_COMPRESS\_CLOSE Procedure Parameters**

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| handle    | The handle to a piecewise compress context.                    |
| dst       | The opened LOB from LZ_COMPRESS_OPEN to store compressed data. |

## Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

## 265.4.5 LZ\_COMPRESS\_OPEN

This function initializes a piecewise context that maintains the compress state and data.

## Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (  
    dst      IN OUT NOCOPY BLOB,  
    quality  IN          BINARY_INTEGER DEFAULT 6)  
RETURN BINARY_INTEGER;
```

## Parameters

**Table 265-7 LZ\_COMPRESS\_OPEN Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dst       | User supplied LOB to store compressed data.                                                                                                                                                                                                                 |
| quality   | Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none"><li>• Valid values are the range 1..9, with a default value of 6.</li><li>• 1=fastest compression, 9=slowest compression and best compressed file size.</li></ul> |

## Return Values

A handle to an initialized piecewise compress context.

## Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL dst or invalid quality specified.

## Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
  - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

## 265.4.6 LZ\_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

### Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB,
    dst IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE,
    dst IN OUT NOCOPY BLOB);
```

### Parameters

**Table 265-8 LZ\_UNCOMPRESS Function and Procedures Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| src       | Compressed data.                   |
| dst       | Destination for uncompressed data. |

## 265.4.7 LZ\_UNCOMPRESS\_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT (
    handle IN          BINARY_INTEGER,
    dst     OUT NOCOPY RAW);
```

## Parameters

**Table 265-9 LZ\_UNCOMPRESS\_EXTRACT Function Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| handle    | The handle to a piecewise uncompress context. |
| dst       | The uncompressed data.                        |

## Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

## 265.4.8 LZ\_UNCOMPRESS\_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

## Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(  
    src IN BLOB)  
RETURN BINARY_INTEGER;
```

## Parameters

**Table 265-10 LZ\_UNCOMPRESS\_OPEN Function Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| src       | The input data to be uncompressed. |

## Return Values

A handle to an initialized piecewise compress context.

## Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

## Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
  - in the event of an exception in the middle of process
- because lack of doing so will cause these handles to leak.

## 265.4.9 LZ\_UNCOMPRESS\_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

### Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(  
    handle IN BINARY_INTEGER);
```

### Parameters

**Table 265-11 LZ\_UNCOMPRESS\_CLOSE Procedure Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| handle    | The handle to a piecewise uncompress context. |

### Exceptions

- invalid\_handle - out of range invalid or uninitialized handle.
- invalid\_argument - NULL handle.

# UTL\_ENCODE

The `UTL_ENCODE` package provides functions that encode `RAW` data into a standard encoded format so that the data can be transported between hosts.

You can use `UTL_ENCODE` functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL\\_ENCODE Subprograms](#)

## 266.1 Summary of UTL\_ENCODE Subprograms

This table lists the `UTL_ENCODE` subprograms and briefly describes them.

**Table 266-1** *UTL\_ENCODE Package Subprograms*

| Subprogram                                       | Description                                                                                                                                   |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BASE64_DECODE Function</a>           | Reads the base 64-encoded <code>RAW</code> input string and decodes it to its original <code>RAW</code> value                                 |
| <a href="#">BASE64_ENCODE Function</a>           | Encodes the binary representation of the <code>RAW</code> value into base 64 elements and returns it in the form of a <code>RAW</code> string |
| <a href="#">MIMEHEADER_DECODE Function</a>       | Decodes a string from mime header format                                                                                                      |
| <a href="#">MIMEHEADER_ENCODE Function</a>       | Encodes a string into mime header format                                                                                                      |
| <a href="#">QUOTED_PRINTABLE_DECODE Function</a> | Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding <code>RAW</code> string              |
| <a href="#">QUOTED_PRINTABLE_ENCODE Function</a> | Reads the <code>RAW</code> input string and encodes it to the corresponding quoted printable format string                                    |
| <a href="#">TEXT_DECODE Function</a>             | Decodes a character set sensitive text string                                                                                                 |
| <a href="#">TEXT_ENCODE Function</a>             | Encodes a character set sensitive text string                                                                                                 |
| <a href="#">UUDECODE Function</a>                | Reads the <code>RAW</code> uuencode format input string and decodes it to the corresponding <code>RAW</code> string                           |
| <a href="#">UUENCODE Function</a>                | Reads the <code>RAW</code> input string and encodes it to the corresponding uuencode format string                                            |

## 266.1.1 BASE64\_DECODE Function

This function reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value.

### Syntax

```
UTL_ENCODE.BASE64_DECODE (  
    r    IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (base64_decode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 266-2 BASE64\_DECODE Function Parameters**

| Parameter | Description                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------|
| r         | The RAW string containing base 64-encoded data. There are no defaults or optional parameters. |

### Return Values

**Table 266-3 BASE64\_DECODE Function Return Values**

| Return | Description                 |
|--------|-----------------------------|
| RAW    | Contains the decoded string |

## 266.1.2 BASE64\_ENCODE Function

This function encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string.

### Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r    IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (base64_encode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 266-4 BASE64\_ENCODE Function Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| r         | The RAW value to be encoded. There are no defaults or optional parameters. |

## Return Values

**Table 266-5 BASE64\_ENCODE Function Return Values**

| Return | Description                           |
|--------|---------------------------------------|
| RAW    | Contains the encoded base 64 elements |

## 266.1.3 MIMEHEADER\_DECODE Function

This function accepts as input an "encoded word."

It uses the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The `<encoded text>` is encapsulated in mime header tags which give the `MIMEHEADER_DECODE` function information about how to decode the string. The mime header metadata tags are stripped from the input string and the `<encoded text>` is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the `<encoding>` metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a `VARCHAR2` string.

### Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
    buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 266-6 MIMEHEADER\_DECODE Function Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| buf       | The encoded text data with mime header format tags. |

## Return Values

**Table 266-7 MIMEHEADER\_DECODE Function Return Values**

| Return | Description                                        |
|--------|----------------------------------------------------|
| data   | The encoded text data with mime header format tags |

### Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

## 266.1.4 MIMEHEADER\_ENCODE Function

This function returns as an output an "encoded word".

The output is in the following form:

```
=?<charset>?<encoding>?<encoded text>?=  
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values

`UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

### Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (  
    buf                IN  VARCHAR2 CHARACTER SET ANY_CS,  
    encode_charset IN  VARCHAR2 DEFAULT NULL,  
    encoding           IN  PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

### Parameters

**Table 266-8** MIMEHEADER\_ENCODE Function Parameters

| Parameter                   | Description                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>buf</code>            | The text data.                                                                                                                        |
| <code>encode_charset</code> | The target character set.                                                                                                             |
| <code>encoding</code>       | The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> |

Return Values

Table 266-9 MIMEHEADER\_ENCODE Function Return Values

| Return | Description                                             |
|--------|---------------------------------------------------------|
| string | A VARCHAR2 encoded string with mime header format tags. |

266.1.5 QUOTED\_PRINTABLE\_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 266-10 QUOTED\_PRINTABLE\_DECODE Function Parameters

| Parameters | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| r          | The RAW string containing a quoted printable data string. There are no defaults or optional parameters. |

Return Values

Table 266-11 QUOTED\_PRINTABLE\_DECODE Function Return Values

| Return | Description        |
|--------|--------------------|
| RAW    | The decoded string |

266.1.6 QUOTED\_PRINTABLE\_ENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 266-12 QUOTED\_PRINTABLE\_ENCODE Function Parameters**

| Parameter      | Description                                                   |
|----------------|---------------------------------------------------------------|
| <code>r</code> | The RAW string. There are no defaults or optional parameters. |

## Return Values

**Table 266-13 QUOTED\_PRINTABLE\_ENCODE Function Return Values**

| Return | Description                          |
|--------|--------------------------------------|
| RAW    | Contains the quoted printable string |

## 266.1.7 TEXT\_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each `encoding` parameter. If NULL, quoted-printable is selected as a default decoding format. If `encode_charset` is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

## Syntax

```
UTL_ENCODE.TEXT_DECODE(  
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,  
    encode_charset IN VARCHAR2 DEFAULT NULL,  
    encoding      IN PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 266-14 TEXT\_DECODE Function Parameters**

| Parameter                   | Description                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>buf</code>            | The encoded text data.                                                                                                    |
| <code>encode_charset</code> | The source character set.                                                                                                 |
| <code>encoding</code>       | The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and NULL. |

## Return Values

**Table 266-15** TEXT\_DECODE Function Return Values

| Return | Description                     |
|--------|---------------------------------|
| string | A VARCHAR2 decoded text string. |

## Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(  
    'Here is some text',  
    WE8ISO8859P1,  
    UTL_ENCODE.BASE64);
```

## 266.1.8 TEXT\_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL.

The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

## Syntax

```
UTL_ENCODE.TEXT_ENCODE (  
    buf          IN  VARCHAR2 CHARACTER SET ANY_CS,  
    encode_charset IN  VARCHAR2 DEFAULT NULL,  
    encoding      IN  PLS_INTEGER DEFAULT NULL)  
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

## Parameters

**Table 266-16** TEXT\_ENCODE Function Parameters

| Parameter      | Description                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------|
| buf            | The text data.                                                                                |
| encode_charset | The target character set.                                                                     |
| encoding       | The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL |

## Return Values

**Table 266-17** TEXT\_ENCODE Function Return Values

| Return | Description                                             |
|--------|---------------------------------------------------------|
| string | A VARCHAR2 encoded string with mime header format tags. |

## Examples

```
v2:=utl_encode.text_encode(  
    'Here is some text',  
    'WE8ISO8859P1',  
    UTL_ENCODE.BASE64);
```

## 266.1.9 UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string.

See "[UUENCODE Function](#)" for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

## Syntax

```
UTL_ENCODE.UUDECODE (  
    r IN RAW)  
RETURN RAW;
```

## Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 266-18** UUDECODE Function Parameters

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| r         | The RAW string containing the uuencoded data string. There are no defaults or optional parameters. |

## Return Values

**Table 266-19** UUDECODE Function Return Values

| Return | Description            |
|--------|------------------------|
| RAW    | The decoded RAW string |

## 266.1.10 UUENCODE Function

This function reads the `RAW` input string and encodes it to the corresponding uuencode format string.

The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized `RAW` values, encoded, and concatenated into a single encoded string.

### Syntax

```
UTL_ENCODE.UUENCODE (  
    r          IN RAW,  
    type       IN PLS_INTEGER DEFAULT 1,  
    filename   IN VARCHAR2 DEFAULT NULL,  
    permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (uuencode, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 266-20 UUENCODE Function Parameters**

| Parameter  | Description                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r          | RAW string                                                                                                                                                                                     |
| type       | Optional number parameter containing the type of uuencoded output.<br>Options:<br>complete—a defined PL/SQL constant with a value of 1. (default)<br>header_piece ...middle_piece ...end_piece |
| filename   | Optional <code>varchar2</code> parameter containing the uuencode filename; the default is <code>uuencode.txt</code>                                                                            |
| permission | Optional <code>varchar2</code> parameter containing the permission mode; the default is 0 (a text string zero).                                                                                |

### Return Values

**Table 266-21 UUENCODE Function Return Values**

| Return | Description                         |
|--------|-------------------------------------|
| RAW    | Contains the uuencode format string |

# UTL\_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of UTL\\_FILE Subprograms](#)

## 267.1 UTL\_FILE Security Model

The set of files and directories that are accessible to the user through `UTL_FILE` is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user.

The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both `READ` and `WRITE` access to the directory object `USER_DIR`, the user can open a file located in the operating system directory described by `USER_DIR`, but not in subdirectories or parent directories of this directory.

Lastly, the client (text I/O) and server implementations are subject to operating system file permission checking.

`UTL_FILE` provides file access both on the client side and on the server side. When run on the server, `UTL_FILE` provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, `UTL_FILE` provides access to operating system files that are accessible from the client.

Directory objects offer more flexibility and granular control to the `UTL_FILE` application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. `CREATE ANY DIRECTORY` privilege is granted only to `SYS` and `SYSTEM` by default.

**Note:**

Use the `CREATE DIRECTORY` feature for directory access verification.

Note that neither hard nor symbolic links are supported.

On UNIX systems, the owner of a file created by the `FOPEN` function is the owner of the shadow process running the instance. Normally, this owner is `ORACLE`. Files created using `FOPEN` are always writable and readable using the `UTL_FILE` subprograms. However, non-privileged operating system users who need to read these files outside of PL/SQL may need access from a system administrator.

**WARNING:**

The privileges needed to access files in a directory object are operating system specific. `UTL_FILE` directory object privileges give you read and write access to all files within the specified directory.

## 267.2 UTL\_FILE Operational Notes

Keep these notes in mind when using `UTL_FILE`.

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators.

`UTL_FILE` expects that files opened by `UTL_FILE.FOPEN` in text mode are encoded in the database character set. It expects that files opened by `UTL_FILE.FOPEN NCHAR` in text mode are encoded in the UTF8 character set. If an opened file is not encoded in the expected character set, the result of an attempt to read the file is indeterminate. When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should therefore be the same as the database character set.

## 267.3 UTL\_FILE Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL\_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET\_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

### Note:

The UTL\_FILE package is similar to the client-side TEXT\_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL\_FILE and TEXT\_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

## 267.4 UTL\_FILE Exceptions

This table describes exceptions raised by UTL\_FILE subprograms.

**Table 267-1 UTL\_FILE Package Exceptions**

| Exception Name       | Description                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INVALID_PATH         | File location is invalid.                                                                                                                                                                                                                           |
| INVALID_MODE         | The open_mode parameter in FOPEN is invalid.                                                                                                                                                                                                        |
| INVALID_FILEHANDLE   | File handle is invalid.                                                                                                                                                                                                                             |
| INVALID_OPERATION    | File could not be opened or operated on as requested.                                                                                                                                                                                               |
| READ_ERROR           | Destination buffer too small, or operating system error occurred during the read operation                                                                                                                                                          |
| WRITE_ERROR          | Operating system error occurred during the write operation.                                                                                                                                                                                         |
| INTERNAL_ERROR       | Unspecified PL/SQL error                                                                                                                                                                                                                            |
| CHARSETMISMATCH      | A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.                                                                                                                                        |
| FILE_OPEN            | The requested operation failed because the file is open.                                                                                                                                                                                            |
| INVALID_MAXLINE SIZE | The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.                                                                                                                                                            |
| INVALID_FILENAME     | The filename parameter is invalid.                                                                                                                                                                                                                  |
| ACCESS_DENIED        | Permission to access to the file location is denied.                                                                                                                                                                                                |
| INVALID_OFFSET       | Causes of the INVALID_OFFSET exception: <ul style="list-style-type: none"><li>• ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or</li><li>• ABSOLUTE_OFFSET &lt; 0, or</li><li>• Either offset caused a seek past the end of the file</li></ul> |

**Table 267-1 (Cont.) UTL\_FILE Package Exceptions**

| Exception Name | Description                                 |
|----------------|---------------------------------------------|
| DELETE_FAILED  | The requested file delete operation failed. |
| RENAME_FAILED  | The requested file rename operation failed. |

Procedures in UTL\_FILE can also raise predefined PL/SQL exceptions such as NO\_DATA\_FOUND or VALUE\_ERROR.

## 267.5 UTL\_FILE Examples

These two examples show use of the procedure.

### Example 1

**Note:**

The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

| File Location | Filename   | READ and WRITE           |
|---------------|------------|--------------------------|
| /appl/gl/log  | L12345.log | Users with DBA privilege |
| /appl/gl/user | u12345.tmp | All users                |

The following file locations and filenames are invalid:

| File Location       | Filename         | Invalid Because                                                               |
|---------------------|------------------|-------------------------------------------------------------------------------|
| /appl/gl/log/backup | L12345.log       | # subdirectories are not accessible                                           |
| /APPL/gl/log        | L12345.log       | # directory strings must follow case sensitivity rules as required by the O/S |
| /appl/gl/log        | backup/L1234.log | # filenames may not include portions of directory paths                       |
| /user/tmp           | L12345.log       | # no corresponding CREATE DIRECTORY command has been issued                   |

## Example 2

```

DECLARE
    V1 VARCHAR2(32767);
    F1 UTL_FILE.FILE_TYPE;
BEGIN
    -- In this example MAX_LINESIZE is less than GET_LINE's length request
    -- so the number of bytes returned will be 256 or less if a line terminator is seen.
    F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R', 256);
    UTL_FILE.GET_LINE(F1, V1, 32767);
    UTL_FILE.FCLOSE(F1);

    -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
    -- so the number of bytes returned will be 1024 or less if a line terminator is seen.
    F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
    UTL_FILE.GET_LINE(F1, V1, 32767);
    UTL_FILE.FCLOSE(F1);

    -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults to
    -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and defaults to
    1024.
    -- So the number of bytes returned will be 1024 or less if a line terminator is seen.
    F1 := UTL_FILE.FOPEN('USER_DIR', 'u12345.tmp', 'R');
    UTL_FILE.GET_LINE(F1, V1);
    UTL_FILE.FCLOSE(F1);
END;

```

## 267.6 UTL\_FILE Data Structures

The UTL\_FILE package defines a RECORD type.

### Record Types

- [FILETYPE Record Type](#)

### 267.6.1 FILETYPE Record Type

The contents of FILE\_TYPE are private to the UTL\_FILE package. You should not reference or change components of this record.

```

TYPE file_type IS RECORD (
    id          BINARY_INTEGER,
    datatype    BINARY_INTEGER,
    byte_mode   BOOLEAN);

```

### Fields

**Table 267-2 FILE\_TYPE Fields**

| Field     | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| id        | A numeric value indicating the internal file handle number              |
| datatype  | Indicates whether the file is a CHAR file, Nchar file or other (binary) |
| byte_mode | Indicates whether the file was open as a binary file, or as a text file |

**⚠ Caution:**

Oracle does not guarantee the persistence of `FILE_TYPE` values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have indeterminate outcomes.

## 267.7 Summary of UTL\_FILE Subprograms

This table lists the `UTL_FILE` subprograms and briefly describes them.

**Table 267-3 UTL\_FILE Subprograms**

| Subprogram                               | Description                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <a href="#">FCLOSE Procedure</a>         | Closes a file                                                                                                    |
| <a href="#">FCLOSE_ALL Procedure</a>     | Closes all open file handles                                                                                     |
| <a href="#">FCOPY Procedure</a>          | Copies a contiguous portion of a file to a newly created file                                                    |
| <a href="#">FFLUSH Procedure</a>         | Physically writes all pending output to a file                                                                   |
| <a href="#">FGETATTR Procedure</a>       | Reads and returns the attributes of a disk file                                                                  |
| <a href="#">FGETPOS Function</a>         | Returns the current relative offset position within a file, in bytes                                             |
| <a href="#">FOPEN Function</a>           | Opens a file for input or output                                                                                 |
| <a href="#">FOPEN_NCHAR Function</a>     | Opens a file in Unicode for input or output                                                                      |
| <a href="#">FREMOVE Procedure</a>        | Deletes a disk file, assuming that you have sufficient privileges                                                |
| <a href="#">FRENAME Procedure</a>        | Renames an existing file to a new name, similar to the UNIX <code>mv</code> function                             |
| <a href="#">FSEEK Procedure</a>          | Adjusts the file pointer forward or backward within the file by the number of bytes specified                    |
| <a href="#">GET_LINE Procedure</a>       | Reads text from an open file                                                                                     |
| <a href="#">GET_LINE_NCHAR Procedure</a> | Reads text in Unicode from an open file                                                                          |
| <a href="#">GET_RAW Procedure</a>        | Reads a <code>RAW</code> string value from a file and adjusts the file pointer ahead by the number of bytes read |
| <a href="#">IS_OPEN Function</a>         | Determines if a file handle refers to an open file                                                               |
| <a href="#">NEW_LINE Procedure</a>       | Writes one or more operating system-specific line terminators to a file                                          |
| <a href="#">PUT Procedure</a>            | Writes a string to a file                                                                                        |
| <a href="#">PUT_LINE Procedure</a>       | Writes a line to a file, and so appends an operating system-specific line terminator                             |
| <a href="#">PUT_LINE_NCHAR Procedure</a> | Writes a Unicode line to a file                                                                                  |
| <a href="#">PUT_NCHAR Procedure</a>      | Writes a Unicode string to a file                                                                                |
| <a href="#">PUTF Procedure</a>           | A <code>PUT</code> procedure with formatting                                                                     |
| <a href="#">PUTF_NCHAR Procedure</a>     | A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting       |
| <a href="#">PUT_RAW Procedure</a>        | Accepts as input a <code>RAW</code> data value and writes the value to the output buffer                         |

## 267.7.1 FCLOSE Procedure

This procedure closes an open file identified by a file handle.

### Syntax

```
UTL_FILE.FCLOSE (  
    file IN OUT FILE_TYPE);
```

### Parameters

**Table 267-4 FCLOSE Procedure Parameters**

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| file      | Active file handle returned by an FOPEN or FOPEN_NCHAR call |

### Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE\_ERROR exception when closing a file.

### Exceptions

WRITE\_ERROR  
INVALID\_FILEHANDLE

## 267.7.2 FCLOSE\_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

### Syntax

```
UTL_FILE.FCLOSE_ALL;
```

### Usage Notes

#### Note:

FCLOSE\_ALL does not alter the state of the open file handles held by the user. This means that an IS\_OPEN test on a file handle after an FCLOSE\_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE\_ALL.

### Exceptions

WRITE\_ERROR

## 267.7.3 FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file.

By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

### Syntax

```
UTL_FILE.FCOPY (  
    src_location      IN VARCHAR2,  
    src_filename      IN VARCHAR2,  
    dest_location     IN VARCHAR2,  
    dest_filename     IN VARCHAR2,  
    start_line        IN BINARY_INTEGER DEFAULT 1,  
    end_line          IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 267-5 FCOPY Procedure Parameters**

| Parameters                 | Description                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>src_location</code>  | Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive) |
| <code>src_filename</code>  | Source file to be copied                                                                                                         |
| <code>dest_location</code> | Destination directory where the destination file is created                                                                      |
| <code>dest_filename</code> | Destination file created from the source file                                                                                    |
| <code>start_line</code>    | Line number at which to begin copying. The default is 1 for the first line                                                       |
| <code>end_line</code>      | Line number at which to stop copying. The default is <code>NULL</code> , signifying end of file                                  |

### Exceptions

```
INVALID_FILENAME  
INVALID_PATH  
INVALID_OPERATION  
INVALID_OFFSET  
READ_ERROR  
WRITE_ERROR
```

## 267.7.4 FFLUSH Procedure

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

## Syntax

```
UTL_FILE.FFLUSH (  
    file IN FILE_TYPE);
```

## Parameters

**Table 267-6 FFLUSH Procedure Parameters**

| Parameters | Description                                                 |
|------------|-------------------------------------------------------------|
| file       | Active file handle returned by an FOPEN or FOPEN_NCHAR call |

## Exceptions

```
INVALID_FILENAME  
INVALID_MAXLINESIZE  
INVALID_OPERATION  
WRITE_ERROR
```

## 267.7.5 FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

## Syntax

```
UTL_FILE.FGETATTR(  
    location      IN VARCHAR2,  
    filename      IN VARCHAR2,  
    fexists       OUT BOOLEAN,  
    file_length   OUT NUMBER,  
    block_size    OUT BINARY_INTEGER);
```

## Parameters

**Table 267-7 FGETATTR Procedure Parameters**

| Parameters  | Description                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------|
| location    | Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive) |
| filename    | Name of the file to be examined                                                                        |
| fexists     | A BOOLEAN for whether or not the file exists                                                           |
| file_length | Length of the file in bytes. NULL if file does not exist.                                              |
| block_size  | File system block size in bytes. NULL if the file does not exist.                                      |

## 267.7.6 FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

### Syntax

```
UTL_FILE.FGETPOS (  
    file IN FILE_TYPE)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 267-8 FGETPOS Parameters**

| Parameters | Description                           |
|------------|---------------------------------------|
| file       | Directory location of the source file |

### Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

READ\_ERROR

### Usage Notes

If file is opened for byte mode operations, then the INVALID\_OPERATION exception is raised.

## 267.7.7 FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously.

See also [FOPEN\\_NCHAR Function](#).

### Syntax

```
UTL_FILE.FOPEN (  
    location      IN VARCHAR2,  
    filename      IN VARCHAR2,  
    open_mode     IN VARCHAR2,  
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)  
RETURN FILE_TYPE;
```

## Parameters

**Table 267-9 FOPEN Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| location     | Directory location of file. This string is a directory object name and must be specified in upper case. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.                                                                                                                                                                                                                |
| filename     | File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.                                                                                                                                                                                                                        |
| open_mode    | <p>Specifies how the file is opened. Modes include:</p> <ul style="list-style-type: none"><li>• r -- read text</li><li>• w -- write text</li><li>• a -- append text</li><li>• rb -- read byte mode</li><li>• wb -- write byte mode</li><li>• ab -- append byte mode</li></ul> <p>If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.</p> |
| max_linesize | Maximum number of bytes for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.                                                                                                                                                                                                                              |

## Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL\_FILE package, and individual components should not be referenced or changed by the UTL\_FILE user.

**Table 267-10 FOPEN Function Return Values**

| Return    | Description         |
|-----------|---------------------|
| FILE_TYPE | Handle to open file |

## Exceptions

INVALID\_MAXLINESIZE

INVALID\_MODE

INVALID\_OPERATION

INVALID\_PATH

INVALID\_FILENAME

## Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL\_DIRECTORIES view of accessible directory objects.

## 267.7.8 FOPEN\_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. With this function, you can read or write a text file in Unicode instead of in the database character set.

You can have a maximum of 50 files open simultaneously.

Even though the contents of an `NVARCHAR2` buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. `UTL_FILE` converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#).

### Syntax

```
UTL_FILE.FOPEN_NCHAR (  
    location      IN VARCHAR2,  
    filename      IN VARCHAR2,  
    open_mode     IN VARCHAR2,  
    max_linesize  IN BINARY_INTEGER DEFAULT 1024)  
RETURN FILE_TYPE;
```

### Parameters

**Table 267-11 FOPEN\_NCHAR Function Parameters**

| Parameter    | Description                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| location     | Directory location of file                                                                                                        |
| filename     | File name (including extension)                                                                                                   |
| open_mode    | Open mode (r,w,a,rb,wb,ab)                                                                                                        |
| max_linesize | Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767) |

### Return Values

`FOPEN_NCHAR` returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the `UTL_FILE` package, and individual components should not be referenced or changed by the `UTL_FILE` user.

**Table 267-12 FOPEN\_NCHAR Function Return Values**

| Return                 | Description         |
|------------------------|---------------------|
| <code>FILE_TYPE</code> | Handle to open file |

### Exceptions

`INVALID_MAXILINESIZE`

`INVALID_MODE`

`INVALID_OPERATION`

INVALID\_PATH

## 267.7.9 FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

### Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

### Parameters

**Table 267-13 FREMOVE Procedure Parameters**

| Parameters | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| location   | Directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive) |
| filename   | Name of the file to be deleted                                                         |

### Exceptions

ACCESS\_DENIED  
DELETE\_FAILED  
INVALID\_FILENAME  
INVALID\_OPERATION  
INVALID\_PATH

### Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

## 267.7.10 FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX mv function.

### Syntax

```
UTL_FILE.FRENAME (  
    src_location    IN    VARCHAR2,  
    src_filename    IN    VARCHAR2,  
    dest_location   IN    VARCHAR2,  
    dest_filename   IN    VARCHAR2,  
    overwrite       IN    BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 267-14 FRENAME Procedure Parameters**

| Parameters    | Description                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_location  | Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)                                                                                                                                                            |
| src_filename  | Source file to be renamed                                                                                                                                                                                                                                         |
| dest_location | Destination directory of the destination file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive)                                                                                                                                                    |
| dest_filename | New name of the file                                                                                                                                                                                                                                              |
| overwrite     | Default is FALSE. Permission on both the source and destination directories must be granted. You can use the overwrite parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is FALSE for no overwrite. |

## Exceptions

ACCESS\_DENIED  
INVALID\_FILENAME  
INVALID\_PATH  
RENAME\_FAILED

## 267.7.11 FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

## Syntax

```
UTL_FILE.FSEEK (  
    file           IN OUT  UTL_FILE.FILE_TYPE,  
    absolute_offset IN     PL_INTEGER DEFAULT NULL,  
    relative_offset IN     PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 267-15 FSEEK Procedure Parameters**

| Parameters      | Description                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| file            | File handle                                                                                                                           |
| absolute_offset | Absolute location to which to seek; default = NULL                                                                                    |
| relative_offset | Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL |

## Exceptions

INVALID\_FILEHANDLE  
INVALID\_OFFSET

INVALID\_OPERATION

READ\_ERROR

### Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## 267.7.12 GET\_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

### Syntax

```
UTL_FILE.GET_LINE (  
    file      IN  FILE_TYPE,  
    buffer    OUT VARCHAR2,  
    len       IN  PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 267-16 GET\_LINE Procedure Parameters**

| Parameters | Description                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file       | Active file handle returned by an <code>FOPEN</code> call.<br>The file must be open for reading (mode <code>r</code> ); otherwise an <code>INVALID_OPERATION</code> exception is raised. |
| buffer     | Data buffer to receive the line read from the file                                                                                                                                       |
| len        | The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .                                   |

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

NO\_DATA\_FOUND

READ\_ERROR

### Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. See also "[GET\\_LINE\\_NCHAR Procedure](#)".

## 267.7.13 GET\_LINE\_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype, such as `NCHAR`, `NCLOB`, or `VARCHAR2` is specified, PL/SQL will perform standard implicit conversion from `NVARCHAR2` after the text is read.

See also [GET\\_LINE Procedure](#)

### Syntax

```
UTL_FILE.GET_LINE_NCHAR (  
    file          IN  FILE_TYPE,  
    buffer        OUT NVARCHAR2,  
    len           IN  PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 267-17 GET\_LINE\_NCHAR Procedure Parameters**

| Parameters          | Description                                                                                                                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>file</code>   | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code> ). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised. |
| <code>buffer</code> | Data buffer to receive the line read from the file                                                                                                                                                                                                               |
| <code>len</code>    | The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .                                                                                                           |

### Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`NO_DATA_FOUND`

`READ_ERROR`

## 267.7.14 GET\_RAW Procedure

This procedure reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL\_FILE.GET\_RAW ignores line terminators.

### Syntax

```
UTL_FILE.GET_RAW (  
    file      IN          UTL_FILE.FILE_TYPE,  
    buffer    OUT NOCOPY  RAW,  
    len       IN          PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 267-18 GET\_RAW Procedure Parameters**

| Parameters | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| file       | File handle                                                                                                       |
| buffer     | RAW data                                                                                                          |
| len        | The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW. |

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

LENGTH\_MISMATCH

NO\_DATA\_FOUND

READ\_ERROR

### Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS  
    h      UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);  
    Buf    RAW(32767);  
    Amnt   CONSTANT PLS_INTEGER := 32767;  
BEGIN  
    LOOP  
        BEGIN  
            Utl_File.Get_Raw(h, Buf, Amnt);  
            -- Do something with this chunk  
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;  
    END LOOP;  
    UTL_FILE.FCLOSE (h);  
END;
```

## 267.7.15 IS\_OPEN Function

This function tests a file handle to see if it identifies an open file.

`IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

### Syntax

```
UTL_FILE.IS_OPEN (  
    file    IN FILE_TYPE)  
    RETURN BOOLEAN;
```

### Parameters

**Table 267-19 IS\_OPEN Function Parameters**

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| file      | Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call |

### Return Values

TRUE or FALSE

### Exceptions

INVALID\_FILEHANDLE

## 267.7.16 NEW\_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle.

This procedure is separate from `PUT` because the line terminator is a platform-specific character or sequence of characters.

### Syntax

```
UTL_FILE.NEW_LINE (  
    file      IN FILE_TYPE,  
    lines     IN BINARY_INTEGER := 1);
```

### Parameters

**Table 267-20 NEW\_LINE Procedure Parameters**

| Parameters | Description                                                                           |
|------------|---------------------------------------------------------------------------------------|
| file       | Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call |
| lines      | Number of line terminators to be written to the file                                  |

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## 267.7.17 PUT Procedure

**PUT** writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

The file must be open for write operations. No line terminator is appended by **PUT**; use **NEW\_LINE** to terminate the line or use **PUT\_LINE** to write a complete line with a line terminator. See also "[PUT\\_NCHAR Procedure](#)".

### Syntax

```
UTL_FILE.PUT (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2);
```

### Parameters

**Table 267-21 PUT Procedure Parameters**

| Parameters          | Description                                                                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>file</code>   | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.                                                                                                             |
| <code>buffer</code> | Buffer that contains the text to be written to the file.<br>User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised. |

### Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential **PUT** calls cannot exceed 32767 without intermediate buffer flushes.

### Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## 267.7.18 PUT\_LINE Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

The file must be open for write operations. **PUT\_LINE** terminates the line with the platform-specific line terminator character or characters.

See also "[PUT\\_LINE\\_NCHAR Procedure](#)".

## Syntax

```
UTL_FILE.PUT_LINE (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2,  
    autoflush IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 267-22 PUT\_LINE Procedure Parameters**

| Parameters | Description                                                   |
|------------|---------------------------------------------------------------|
| file       | Active file handle returned by an FOPEN call                  |
| buffer     | Text buffer that contains the lines to be written to the file |
| autoflush  | Flushes the buffer to disk after the WRITE                    |

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## 267.7.19 PUT\_LINE\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set.

This procedure is equivalent to the [PUT\\_NCHAR Procedure](#), except that the line separator is appended to the written text. See also [PUT\\_LINE Procedure](#).

## Syntax

```
UTL_FILE.PUT_LINE_NCHAR (  
    file      IN FILE_TYPE,  
    buffer    IN NVARCHAR2);
```

## Parameters

**Table 267-23 PUT\_LINE\_NCHAR Procedure Parameters**

| Parameters | Description                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------|
| file       | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing. |

**Table 267-23 (Cont.) PUT\_LINE\_NCHAR Procedure Parameters**

| Parameters | Description                                                   |
|------------|---------------------------------------------------------------|
| buffer     | Text buffer that contains the lines to be written to the file |

**Exceptions**

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

**Usage Notes**

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## 267.7.20 PUT\_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

**Syntax**

```
UTL_FILE.PUT_NCHAR (  
    file      IN FILE_TYPE,  
    buffer    IN NVARCHAR2);
```

**Parameters****Table 267-24 PUT\_NCHAR Procedure Parameters**

| Parameters | Description                                                                                                                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file       | Active file handle returned by an <code>FOPEN_NCHAR</code> call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.          |
| buffer     | Buffer that contains the text to be written to the file.<br>User must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised. |

**Exceptions**

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

Related Topics

- [PUT Procedure](#)  
`PUT` writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

267.7.21 PUTF Procedure

This procedure is a formatted `PUT` procedure.

It works like a limited `printf()`.

Syntax

```
UTL_FILE.PUTF (  
    file      IN FILE_TYPE,  
    format    IN VARCHAR2,  
    [arg1     IN VARCHAR2  DEFAULT NULL,  
    . . .  
    arg5      IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 267-25    PUTF Procedure Parameters

| Parameters | Description                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file       | Active file handle returned by an <code>FOPEN</code> call                                                                                                                                                                                                                                                                                    |
| format     | Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code>                                                                                                                                                                                                                                 |
| arg1..arg5 | From one to five operational argument strings.<br>Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string.<br>If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument. |

Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

| Character Sequence | Meaning                                                                                   |
|--------------------|-------------------------------------------------------------------------------------------|
| <code>%s</code>    | Substitute this sequence with the string value of the next argument in the argument list. |
| <code>\n</code>    | Substitute with the appropriate platform-specific line terminator.                        |

## Exceptions

INVALID\_FILEHANDLE

INVALID\_OPERATION

WRITE\_ERROR

## Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
      my_world,
      'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

This procedure is a formatted version of a PUT\_NCHAR Procedure.

## 267.7.22 PUTF\_NCHAR Procedure

This procedure is a formatted version of a PUT\_NCHAR Procedure.

Using PUTF\_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

## Syntax

```
UTL_FILE.PUTF_NCHAR (
    file      IN FILE_TYPE,
    format    IN NVARCHAR2,
    [arg1     IN NVARCHAR2 DEFAULT NULL,
    . . .
    arg5      IN NVARCHAR2 DEFAULT NULL]);
```

## Parameters

**Table 267-26 PUTF\_NCHAR Procedure Parameters**

| Parameters               | Description                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file                     | Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code> ). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.                                                                             |
| format                   | Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code> .                                                                                                                                                                                                                               |
| arg1.. <code>arg5</code> | From one to five operational argument strings.<br>Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string.<br>If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument. |

## Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

## Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID_OPERATION` exception is raised.

## Related Topics

- [PUT\\_NCHAR Procedure](#)  
This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

## 267.7.23 PUT\_RAW Procedure

This procedure accepts as input a `RAW` data value and writes the value to the output buffer.

## Syntax

```
UTL_FILE.PUT_RAW (  
    file           IN      UTL_FILE.FILE_TYPE,  
    buffer         IN      RAW,  
    autoflush      IN      BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 267-27 PUT\_RAW Procedure Parameters**

| Parameters             | Description                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>file</code>      | File handle                                                                                                                |
| <code>buffer</code>    | The RAW data written to the buffer                                                                                         |
| <code>autoflush</code> | If <code>TRUE</code> , then performs a flush after writing the value to the output buffer; default is <code>FALSE</code> . |

## Exceptions

`INVALID_FILEHANDLE`

`INVALID_OPERATION`

`WRITE_ERROR`

## Usage Notes

You can request an automatic flush of the buffer by setting the third argument to `TRUE`.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

# UTL\_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the `orapki` utility. Non-HTTPS fetches do not require an Oracle wallet.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Examples](#)
- [Data Structures](#)
- [Operations](#)
- [Subprogram Groups](#)
- [Summary of UTL\\_HTTP Subprograms](#)

## See Also:

## 268.1 UTL\_HTTP Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. `UTL_HTTP` also contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

## 268.2 UTL\_HTTP Security Model

This package is an invoker's rights package. The invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

## 268.3 UTL\_HTTP Constants

The `UTL_HTTP` package defines several constants to use when specifying parameter values.

These are shown in following tables.

- [Table 268-1](#)
- [Table 268-2](#)
- [Table 268-3](#)

**Table 268-1 UTL\_HTTP Constants - HTTP Versions**

| Name             | Type         | Value      | Description                                                                            |
|------------------|--------------|------------|----------------------------------------------------------------------------------------|
| HTTP_VERSION_1_0 | VARCHAR2(10) | 'HTTP/1.0' | Denotes HTTP version 1.0 that can be used in the function <code>BEGIN_REQUEST</code> . |
| HTTP_VERSION_1_1 | VARCHAR2(10) | 'HTTP/1.1' | Denotes HTTP version 1.1 that can be used in the function <code>BEGIN_REQUEST</code> . |

**Table 268-2 UTL\_HTTP Constants - Default Ports**

| Name               | Type        | Value | Description                                                                |
|--------------------|-------------|-------|----------------------------------------------------------------------------|
| DEFAULT_HTTP_PORT  | PLS_INTEGER | 80    | The default TCP/IP port (80) at which a Web server or proxy server listens |
| DEFAULT_HTTPS_PORT | PLS_INTEGER | 443   | The default TCP/IP port (443) at which an HTTPS Web server listens         |

**Table 268-3 UTL\_HTTP Constants - HTTP 1.1 Status Codes**

| Name                        | Type        | Value | Description                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP_CONTINUE               | PLS_INTEGER | 100   | The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.                                                                                                                                                       |
| HTTP_SWITCHING_PROTOCOLS    | PLS_INTEGER | 101   | The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response. |
| HTTP_OK                     | PLS_INTEGER | 200   | The request has succeeded. The information returned with the response is dependent on the method used in the request                                                                                                                                                                                                                                      |
| HTTP_CREATED                | PLS_INTEGER | 201   | The request has been fulfilled and resulted in a new resource being created.                                                                                                                                                                                                                                                                              |
| HTTP_ACCEPTED               | PLS_INTEGER | 202   | The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.                                                                                                                                         |
| HTTP_NON_AUTHORITATIVE_INFO | PLS_INTEGER | 203   | The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.                                                                                                                                                                                      |
| HTTP_NO_CONTENT             | PLS_INTEGER | 204   | The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.                                                                                                                                                                                                                        |
| HTTP_RESET_CONTENT          | PLS_INTEGER | 205   | The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.                                                                                                                                                                                      |
| HTTP_PARTIAL_CONTENT        | PLS_INTEGER | 206   | The server has fulfilled the partial GET request for the resource.                                                                                                                                                                                                                                                                                        |
| HTTP_MULTIPLE_CHOICES       | PLS_INTEGER | 300   | The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.                                                              |
| HTTP_MOVED_PERMANENTLY      | PLS_INTEGER | 301   | The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.                                                                                                                                                                                                              |
| HTTP_FOUND                  | PLS_INTEGER | 302   | The requested resource resides temporarily under a different URI.                                                                                                                                                                                                                                                                                         |

**Table 268-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

| Name                     | Type        | Value | Description                                                                                                                                                                                                                                                                   |
|--------------------------|-------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP_SEE_OTHER           | PLS_INTEGER | 303   | The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.                                                                                                                                                   |
| HTTP_NOT_MODIFIED        | PLS_INTEGER | 304   | If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.                                                                                                               |
| HTTP_USE_PROXY           | PLS_INTEGER | 305   | The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.                                                                                                                                         |
| HTTP_TEMPORARY_REDIRECT  | PLS_INTEGER | 307   | The requested resource resides temporarily under a different URI.                                                                                                                                                                                                             |
| HTTP_BAD_REQUEST         | PLS_INTEGER | 400   | The request could not be understood by the server due to malformed syntax.                                                                                                                                                                                                    |
| HTTP_UNAUTHORIZED        | PLS_INTEGER | 401   | The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials. |
| HTTP_PAYMENT_REQUIRED    | PLS_INTEGER | 402   | This code is reserved for future use.                                                                                                                                                                                                                                         |
| HTTP_FORBIDDEN           | PLS_INTEGER | 403   | The server understood the request, but is refusing to fulfill it.                                                                                                                                                                                                             |
| HTTP_NOT_FOUND           | PLS_INTEGER | 404   | The server has not found anything matching the Request-URI.                                                                                                                                                                                                                   |
| HTTP_NOT_ACCEPTABLE      | PLS_INTEGER | 406   | The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.                                                                                 |
| HTTP_PROXY_AUTH_REQUIRED | PLS_INTEGER | 407   | This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.                                                                                                                                                      |
| HTTP_REQUEST_TIMEOUT     | PLS_INTEGER | 408   | The client did not produce a request within the time that the server was prepared to wait.                                                                                                                                                                                    |
| HTTP_CONFLICT            | PLS_INTEGER | 409   | The request could not be completed due to a conflict with the current state of the resource.                                                                                                                                                                                  |
| HTTP_GONE                | PLS_INTEGER | 410   | The requested resource is no longer available at the server and no forwarding address is known.                                                                                                                                                                               |
| HTTP_LENGTH_REQUIRED     | PLS_INTEGER | 411   | The server refuses to accept the request without a defined Content-Length.                                                                                                                                                                                                    |
| HTTP_PRECONDITION_FAILED | PLS_INTEGER | 412   | The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.                                                                                                                                                       |

**Table 268-3 (Cont.) UTL\_HTTP Constants - HTTP 1.1 Status Codes**

| Name                                   | Type        | Value | Description                                                                                                                                                                                                                                                                       |
|----------------------------------------|-------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP_REQUEST_ENTITY_TOO_LARGE_CONSTANT | PLS_INTEGER | 413   | The server is refusing to process a request because the request entity is larger than the server is willing or able to process.                                                                                                                                                   |
| HTTP_REQUEST_URI_TOO_LARGE             | PLS_INTEGER | 414   | The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.                                                                                                                                                          |
| HTTP_UNSUPPORTED_MEDIA_TYPE            | PLS_INTEGER | 415   | The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.                                                                                                                  |
| HTTP_REQ_RANGE_NOT_SATISFIABLE         | PLS_INTEGER | 416   | A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field. |
| HTTP_EXPECTATION_FAILED                | PLS_INTEGER | 417   | The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.                                                              |
| HTTP_NOT_IMPLEMENTED                   | PLS_INTEGER | 501   | The server does not support the functionality required to fulfill the request.                                                                                                                                                                                                    |
| HTTP_BAD_GATEWAY                       | PLS_INTEGER | 502   | The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request.                                                                                                                           |
| HTTP_SERVICE_UNAVAILABLE               | PLS_INTEGER | 503   | The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.                                                                                                                                                                 |
| HTTP_GATEWAY_TIMEOUT                   | PLS_INTEGER | 504   | The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.       |
| HTTP_VERSION_NOT_SUPPORTED             | PLS_INTEGER | 505   | The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.                                                                                                                                                               |

## 268.4 UTL\_HTTP Exceptions

Exceptions indicate that the UTL\_HTTP package encountered issues.

The following table lists these exceptions. By default, UTL\_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

**Table 268-4 UTL\_HTTP Exceptions**

| Exception                   | Error Code | Reason                                                                                                                                                                                                                                          | Where Raised                                                                                                     |
|-----------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| BAD_ARGUMENT                | 29261      | The argument passed to the interface is bad                                                                                                                                                                                                     | Any HTTP request or response interface when <code>detailed_exception</code> is enabled                           |
| BAD_URL                     | 29262      | The requested URL is badly formed                                                                                                                                                                                                               | BEGIN_REQUEST, when <code>detailed_exception</code> is enabled                                                   |
| END_OF_BODY                 | 29266      | The end of HTTP response body is reached                                                                                                                                                                                                        | READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled                              |
| HEADER_NOT_FOUND            | 29265      | The header is not found                                                                                                                                                                                                                         | GET_HEADER, GET_HEADER_BY_NAME, when <code>detailed_exception</code> is enabled                                  |
| HTTP_CLIENT_ERROR           | 29268      | From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy. | GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled                                      |
| HTTP_SERVER_ERROR           | 29269      | From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy. | GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled                                      |
| NETWORK_ACCESS_DENIED       | 24247      | Access to the remote network host or credentials in an Oracle wallet is denied                                                                                                                                                                  | BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when <code>detailed_exception</code> is enabled                 |
| ILLEGAL_CALL                | 29267      | The call to UTL_HTTP is illegal at the current state of the HTTP request                                                                                                                                                                        | SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when <code>detailed_exception</code> is enabled |
| PARTIAL_MULTIBYTE_EXCEPTION | 29275      | No complete character is read and a partial multibyte character is found at the end of the response body                                                                                                                                        | READ_TEXT and READ_LINE, when <code>detailed_exception</code> is enabled                                         |
| PROTOCOL_ERROR              | 29263      | An HTTP protocol error occurs when communicating with the Web server                                                                                                                                                                            | SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled    |
| REQUEST_FAILED              | 29273      | The request fails to execute                                                                                                                                                                                                                    | Any HTTP request or response interface when <code>detailed_exception</code> is disabled                          |
| TOO_MANY_REQUESTS           | 29270      | Too many requests or responses are open                                                                                                                                                                                                         | BEGIN_REQUEST, when <code>detailed_exception</code> is enabled                                                   |
| TRANSFER_TIMEOUT            | 29276      | No data is read and a read timeout occurred                                                                                                                                                                                                     | READ_TEXT and READ_LINE, when <code>detailed_exception</code> is enabled                                         |
| UNKNOWN_SCHEME              | 29264      | The scheme of the requested URL is unknown                                                                                                                                                                                                      | BEGIN_REQUEST and GET_RESPONSE, when <code>detailed_exception</code> is enabled                                  |

**Note:**

The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

## 268.5 UTL\_HTTP Examples

These five examples demonstrate how to use `UTL_HTTP`.

- [General Usage](#)
- [Retrieving HTTP Response Headers](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)
- [Making HTTP Request with Private Wallet and Cookie Table](#)

### 268.5.1 UTL\_HTTP General Usage

This is an general example of `UTL_HTTP` usage.

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req  UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

### 268.5.2 UTL\_HTTP Retrieving HTTP Response Headers

This example shows how `UTL_HTTP` retrieves HTTP response headers.

```
SET SERVEROUTPUT ON SIZE 40000
```

```

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    name   VARCHAR2(256);
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;

```

## 268.5.3 UTL\_HTTP Handling HTTP Authentication

This code sample indicates how UTL\_HTTP handles HTTP authentication.

```
SET serveroutput ON SIZE 40000
```

```

CREATE OR REPLACE PROCEDURE get_page (url          IN VARCHAR2,
                                     username IN VARCHAR2 DEFAULT NULL,
                                     password IN VARCHAR2 DEFAULT NULL,
                                     realm      IN VARCHAR2 DEFAULT NULL) AS

    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    my_scheme VARCHAR2(256);
    my_realm  VARCHAR2(256);
    name     VARCHAR2(256);
    value    VARCHAR2(256);
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.SET_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic Authen.
        Scheme
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, FALSE);
        DBMS_OUTPUT.PUT_LINE('Web proxy server is protected. ');
        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
for the proxy server. ');
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    ELSIF (resp.status_code = UTL_HTTP.HTTP_PROXY_AUTH_REQUIRED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, TRUE);
        DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected. ');
        DBMS_OUTPUT.PUT('Please provide the required ' || my_scheme || ' authentication
username/password for realm ' || my_realm || '
for the Web page. ');
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    END IF;
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP

```

```

        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

## 268.5.4 UTL\_HTTP Retrieving and Restoring Cookies

This example show how UTL\_HTTP can be used to retrieve and restore cookies.

```

CREATE TABLE my_cookies (
    session_id INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
    cookies        UTL_HTTP.COOKIE_TABLE;
    my_session_id  PLS_INTEGER;
    secure         VARCHAR2(1);
BEGIN
    /* assume that some cookies have been set in previous HTTP requests. */
    UTL_HTTP.GET_COOKIES(cookies);
    SELECT session_id.nextval INTO my_session_id FROM DUAL;
    FOR i IN 1..cookies.count LOOP
        IF (cookies(i).secure) THEN
            secure := 'Y';
        ELSE
            secure := 'N';
        END IF;
        INSERT INTO my_cookies
        VALUES (my_session_id, cookies(i).name, cookies(i).value,
                cookies(i).domain,
                cookies(i).expire, cookies(i).path, secure, cookies(i).version);
    END LOOP;
    RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
    cookies        UTL_HTTP.COOKIE_TABLE;
    cookie         UTL_HTTP.COOKIE;
    i              PLS_INTEGER := 0;
    CURSOR c (c_session_id PLS_INTEGER) IS
        SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
    FOR r IN c(this_session_id) LOOP
        i := i + 1;
        cookie.name      := r.name;
        cookie.value     := r.value;
        cookie.domain    := r.domain;
        cookie.expire    := r.expire;
```

```

        cookie.path      := r.path;
        IF (r.secure = 'Y') THEN
            cookie.secure := TRUE;
        ELSE
            cookie.secure := FALSE;
        END IF;
        cookie.version := r.version;
        cookies(i) := cookie;
    END LOOP;
    UTL_HTTP.CLEAR_COOKIES;
    UTL_HTTP.ADD_COOKIES(cookies);
END;
/

```

## 268.5.5 UTL\_HTTP Making HTTP Request with Private Wallet and Cookie Table

This example shows how UTL\_HTTP creates a request context with a wallet and cookie table, then makes an HTTP Request using that wallet and cookie table.

```

SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
    req             UTL_HTTP.REQ;
    resp            UTL_HTTP.RESP;
    data            VARCHAR2(1024);

BEGIN
    -- Create a request context with its wallet and cookie table
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
        wallet_path      => 'file:/oracle/wallets/test/wallet',
        wallet_password   => '*****',
        enable_cookies    => TRUE,
        max_cookies       => 300,
        max_cookies_per_site => 20);

    -- Make a HTTP request using the private wallet and cookie
    -- table in the request context
    req := UTL_HTTP.BEGIN_REQUEST(
        url              => url,
        request_context => request_context);
    resp := UTL_HTTP.GET_RESPONSE(req);

    BEGIN
        LOOP
            UTL_HTTP.READ_TEXT(resp, data);
            DBMS_OUTPUT.PUT(data);
        END LOOP;
    EXCEPTION
        WHEN UTL_HTTP.END_OF_BODY THEN
            UTL_HTTP.END_RESPONSE(resp);
    END;

    -- Destroy the request context
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

```

```
BEGIN
  DISPLAY_PAGE('https://www.example.com/');
END;
/
```

## 268.5.6 UTL\_HTTP Using a Proxy Server

This example shows using a proxy server for an Oracle Database connection.

The `UTL_HTTP.REQUEST` procedure uses the proxy server host name and the port number to access the HTTPS URL from within the Oracle Database.

```
SELECT UTL_HTTP.REQUEST('<URL>', '<proxy_hostname>:<proxy_port_number>',
  '<wallet_directory>', '<wallet_password>') FROM DUAL;
```

### Note:

By default, the `UTL_HTTP.REQUEST` procedure enables you to omit or set the "proxy" argument as `NULL`.

## 268.6 UTL\_HTTP Data Structures

Data structures are used to represent requests, responses, cookies, connections, and request context.

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE\\_TABLE Types](#)
- [CONNECTION Type](#)
- [REQUEST\\_CONTEXT\\_KEY Type](#)

### 268.6.1 REQ Type

Use this PL/SQL record type to represent an HTTP request.

#### Syntax

```
TYPE req IS RECORD (
  url          VARCHAR2(32767),
  method       VARCHAR2(64),
  http_version VARCHAR2(64));
```

#### Parameters

**Table 268-5** REQ Type Parameters

| Parameter | Description                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------|
| url       | The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> . |

**Table 268-5 (Cont.) REQ Type Parameters**

| Parameter    | Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| method       | The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> . |
| http_version | The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .               |

**Usage Notes**

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

## 268.6.2 REQUEST\_CONTEXT\_KEY Type

This type is used to represent the key to a request context.

A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

**Syntax**

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

**Usage Notes**

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

## 268.6.3 RESP Type

This PL/SQL record type is used to represent an HTTP response.

**Syntax**

```
TYPE resp IS RECORD (  
    status_code    PLS_INTEGER,  
    reason_phrase  VARCHAR2(256),  
    http_version   VARCHAR2(64));
```

## Parameters

**Table 268-6** RESP Type Parameters

| Parameter     | Description                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status_code   | The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by <code>GET_RESPONSE</code> .                                  |
| reason_phrase | The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by <code>GET_RESPONSE</code> . |
| http_version  | The HTTP protocol version used in the HTTP response. It is set after the response is processed by <code>GET_RESPONSE</code> .                                                                                                                              |

## Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

## 268.6.4 COOKIE and COOKIE\_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

## Syntax

```
TYPE cookie IS RECORD (  
    name  VARCHAR2(256),  
    value  VARCHAR2(1024),  
    domain VARCHAR2(256),  
    expire TIMESTAMP WITH TIME ZONE,  
    path   VARCHAR2(1024),  
    secure BOOLEAN,  
    version PLS_INTEGER,  
    comment VARCHAR2(1024));  
  
TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

## Fields of COOKIE Record Type

[Table 268-7](#) shows the fields for the `COOKIE` and `COOKIE_TABLE` record types.

**Table 268-7** Fields of `COOKIE` and `COOKIE_TABLE` Type

| Field  | Description                              |
|--------|------------------------------------------|
| name   | The name of the HTTP cookie              |
| value  | The value of the cookie                  |
| domain | The domain for which the cookie is valid |

**Table 268-7 (Cont.) Fields of COOKIE and COOKIE\_TABLE Type**

| Field   | Description                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------|
| expire  | The time by which the cookie will expire                                                                   |
| path    | The subset of URLs to which the cookie applies                                                             |
| secure  | Should the cookie be returned to the Web server using secured means only.                                  |
| version | The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies. |
| comment | The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.        |

### Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the `UTL_HTTP` package. The cookies are maintained by the package transparently. They are maintained inside the `UTL_HTTP` package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using `GET_COOKIES`, store them persistently in a database table, and re-store the cookies back in the package using `ADD_COOKIES` in the next database session. All the fields in the `cookie` record, except for the `comment` field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See ["Retrieving and Restoring Cookies"](#).

## 268.6.5 CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. `connection_table` is a PL/SQL table of `connection`.

For a direct HTTP persistent connection to a Web server, the `host` and `port` fields contain the host name and TCP/IP port number of the Web server. The `proxy_host` and `proxy_port` fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the `proxy_host` and `proxy_port` fields contain the host name and TCP/IP port number of the proxy server. The `host` and `port` fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The `ssl` field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the `host` and `port` fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

### Syntax

```
TYPE connection IS RECORD (  
    host VARCHAR2(256),  
    port PLS_INTEGER,  
    proxy_host VARCHAR2(256),  
    proxy_port PLS_INTEGER,  
    ssl BOOLEAN);  
  
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

## 268.7 UTL\_HTTP Operations

These topics provide information about how UTL\_HTTP makes HTTP requests from SQL and PL/SQL.

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [HTTP Persistent Connections](#)
- [Error Conditions](#)
- [Session Settings](#)
- [Request Context](#)
- [External Password Store](#)

### 268.7.1 UTL\_HTTP Operational Flow

The UTL\_HTTP package provides access to the HTTP protocol.

The interfaces must be called in the order shown in the following illustration, or an exception will be raised.

**Figure 268-1 Flow of the Core UTL\_HTTP Package**

**illustration:** arpls006  
**release:** 9  
**caption:** The flow of the core UTL\_HTTP Package API  
**date:** 9/5/01  
**platform:** pc

The following can be called at any time:

- **Non-protocol interfaces that manipulate cookies**
  - GET\_COOKIE\_COUNT
  - GET\_COOKIES
  - ADD\_COOKIES
  - CLEAR\_COOKIES
- **Persistent connections**
  - GET\_PERSISTENT\_CONN\_COUNT
  - GET\_PERSISTENT\_CONNS
  - CLOSE\_PERSISTENT\_CONN
  - CLOSE\_PERSISTENT\_CONNS
- **Interfaces that manipulate attributes and configurations of the UTL\_HTTP package in the current session**
  - SET\_PROXY
  - GET\_PROXY
  - SET\_COOKIE\_SUPPORT
  - GET\_COOKIE\_SUPPORT
  - SET\_FOLLOW\_REDIRECT
  - GET\_FOLLOW\_REDIRECT
  - SET\_BODY\_CHARSET
  - GET\_BODY\_CHARSET
  - SET\_PERSISTENT\_CONN\_SUPPORT
  - GET\_PERSISTENT\_CONN\_SUPPORT
  - SET\_DETAILED\_EXCP\_SUPPORT
  - GET\_DETAILED\_EXCP\_SUPPORT
  - SET\_WALLET
  - SET\_TRANSFER\_TIMEOUT
  - GET\_TRANSFER\_TIMEOUT
- **Interfaces that retrieve the last detailed exception code and message UTL\_HTTP package in the current session**
  - GET\_DETAILED\_SQLCODE
  - GET\_DETAILED\_SQLERRM

 **Note:**

Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

## 268.7.2 UTL\_HTTP Simple HTTP Fetches

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect `REQUEST` or `REQUEST_PIECES` to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If `REQUEST` or `REQUEST_PIECES` fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each `REQUEST` or `REQUEST_PIECES` call using the optional `proxy` parameter.

 **Note:**

UTL\_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL\_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

## 268.7.3 UTL\_HTTP HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-

connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

**See Also:**

[HTTP Requests Subprograms](#)

## 268.7.4 UTL\_HTTP HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET\_RESPONSE and receive response information from the Web server.

When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

**See Also:**

[HTTP Responses Subprograms](#)

## 268.7.5 UTL\_HTTP HTTP Cookies

The UTL\_HTTP package provides subprograms to manipulate HTTP cookies.

**See Also:**

[HTTP Cookies Subprograms](#)

## 268.7.6 UTL\_HTTP HTTP Persistent Connections

The UTL\_HTTP package provides subprograms to manipulate persistent connections.

**See Also:**

[HTTP Persistent Connections Subprograms](#)

## 268.7.7 UTL\_HTTP Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

### See Also:

[Error Conditions Subprograms](#)

## 268.7.8 UTL\_HTTP Session Settings

Session settings manipulate the configuration and default behavior of `UTL_HTTP` when HTTP requests are executed within a database user session.

When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

### See Also:

[Session Settings Subprograms](#)

## 268.7.9 UTL\_HTTP Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

### See Also:

[HTTP Requests Subprograms](#)

## 268.7.10 UTL\_HTTP External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

## 268.8 UTL\_HTTP Subprogram Groups

This section describes the `UTL_HTTP` subprograms. They are grouped by function.

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Request Contexts Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

### 268.8.1 UTL\_HTTP Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

**Table 268-8 UTL\_HTTP Subprograms—Simple HTTP Fetches in a Single Call**

| Subprogram                              | Description                                                                                                                     |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REQUEST Function</a>        | Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries. |
| <a href="#">REQUEST_PIECES Function</a> | Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL                                             |

### 268.8.2 UTL\_HTTP Session Settings Subprograms

This table lists and briefly describes the `UTL_HTTP` Session Settings Subprograms.

**Table 268-9 UTL\_HTTP Subprograms—Session Settings**

| Subprogram                                 | Description                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">GET_BODY_CHARSET Procedure</a> | Retrieves the default character set of the body of all future HTTP requests |

**Table 268-9 (Cont.) UTL\_HTTP Subprograms—Session Settings**

| Subprogram                                            | Description                                                                                                                                                                                 |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_COOKIE_SUPPORT Procedure</a>          | Retrieves the current cookie support settings                                                                                                                                               |
| <a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a>   | Checks if the UTL_HTTP package will raise a detailed exception or not                                                                                                                       |
| <a href="#">GET_FOLLOW_REDIRECT Procedure</a>         | Retrieves the follow-redirect setting in the current session                                                                                                                                |
| <a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a> | Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session                                                         |
| <a href="#">GET_PROXY Procedure</a>                   | Retrieves the current proxy settings                                                                                                                                                        |
| <a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a>    | Checks if the response error check is set or not                                                                                                                                            |
| <a href="#">GET_TRANSFER_TIMEOUT Procedure</a>        | Retrieves the current network transfer timeout value                                                                                                                                        |
| <a href="#">SET_COOKIE_SUPPORT Procedures</a>         | Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session                                      |
| <a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a>   | Sets the UTL_HTTP package to raise a detailed exception                                                                                                                                     |
| <a href="#">SET_FOLLOW_REDIRECT Procedures</a>        | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function                                       |
| <a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> | Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session |
| <a href="#">SET_PROXY Procedure</a>                   | Sets the proxy to be used for requests of HTTP or other protocols                                                                                                                           |
| <a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a>    | Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges                               |
| <a href="#">SET_TRANSFER_TIMEOUT Procedure</a>        | Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server                                                                                           |
| <a href="#">SET_WALLET Procedure</a>                  | Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS                                                                                           |

## 268.8.3 UTL\_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL\_HTTP HTTP Requests.

**Table 268-10 UTL\_HTTP Subprograms—HTTP Requests**

| Subprogram                                   | Description                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BEGIN_REQUEST Function</a>       | Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. |
| <a href="#">SET_HEADER Procedure</a>         | Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.                                                      |
| <a href="#">SET_AUTHENTICATION Procedure</a> | Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.                     |

**Table 268-10 (Cont.) UTL\_HTTP Subprograms—HTTP Requests**

| Subprogram                                               | Description                                                                                                                                                                                           |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> | Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet. |
| <a href="#">SET_BODY_CHARSET Procedures</a>              | Sets the character set of the request body when the media type is text but the character set is not specified in the Content-Type header                                                              |
| <a href="#">SET_COOKIE_SUPPORT Procedures</a>            | Enables or disables support for the HTTP cookies in the request                                                                                                                                       |
| <a href="#">SET_FOLLOW_REDIRECT Procedures</a>           | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <a href="#">GET_RESPONSE Function</a>                                     |
| <a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a>    | Enables or disables support for the HTTP 1.1 persistent-connection in the request                                                                                                                     |
| <a href="#">SET_PROXY Procedure</a>                      | Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP)                                                                                   |
| <a href="#">WRITE_RAW Procedure</a>                      | Writes some binary data in the HTTP request body                                                                                                                                                      |
| <a href="#">WRITE_TEXT Procedure</a>                     | Writes some text data in the HTTP request body                                                                                                                                                        |

## 268.8.4 UTL\_HTTP HTTP Request Contexts Subprograms

UTL\_HTTP HTTP Request Contexts subprograms create or destroy a request context.

The following table lists and briefly describes the UTL\_HTTP HTTP Request Contexts.

**Table 268-11 UTL\_HTTP Subprograms—HTTP Request Contexts**

| Subprogram                                        | Description                                                           |
|---------------------------------------------------|-----------------------------------------------------------------------|
| <a href="#">CREATE_REQUEST_CONTEXT Function</a>   | Creates a request context in UTL_HTTP for a wallet and a cookie table |
| <a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> | Destroys a request context in UTL_HTTP                                |

## 268.8.5 UTL\_HTTP HTTP Responses Subprograms

This table lists and briefly describes the HTTP Responses Subprograms of UTL\_HTTP.

**Table 268-12 UTL\_HTTP Subprograms—HTTP Responses**

| Subprogram                                   | Description                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">END_RESPONSE Procedure</a>       | Ends the HTTP response. It completes the HTTP request and response.                                                                            |
| <a href="#">GET_AUTHENTICATION Procedure</a> | Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header |
| <a href="#">GET_HEADER Procedure</a>         | Returns the n <sup>th</sup> HTTP response header name and value returned in the response                                                       |
| <a href="#">GET_HEADER_BY_NAME Procedure</a> | Returns the HTTP response header value returned in the response given the name of the header                                                   |
| <a href="#">GET_HEADER_COUNT Function</a>    | Returns the number of HTTP response headers returned in the response                                                                           |

**Table 268-12 (Cont.) UTL\_HTTP Subprograms—HTTP Responses**

| Subprogram                                  | Description                                                                                                                                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_RESPONSE Function</a>       | Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.                          |
| <a href="#">READ_LINE Procedure</a>         | Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer                          |
| <a href="#">READ_RAW Procedure</a>          | Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer                                                         |
| <a href="#">READ_TEXT Procedure</a>         | Reads the HTTP response body in text form and returns the output in the caller-supplied buffer                                                           |
| <a href="#">SET_BODY_CHARSET Procedures</a> | Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header |

## 268.8.6 UTL\_HTTP HTTP Cookies Subprograms

The HTTP cookies subprograms manages cookies in the `UTL_HTTP` package.

The following table lists and briefly describes the HTTP cookies subprograms of `UTL_HTTP`.

**Table 268-13 UTL\_HTTP Subprograms—HTTP Cookies**

| Subprogram                                | Description                                                                                                                   |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COOKIES Procedure</a>     | Add the cookies either to a request context or to the <code>UTL_HTTP</code> package's session state                           |
| <a href="#">CLEAR_COOKIES Procedure</a>   | Clears all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state         |
| <a href="#">GET_COOKIE_COUNT Function</a> | Returns the number of cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session states |
| <a href="#">GET_COOKIES Function</a>      | Returns all the cookies maintained either in a request context or in the <code>UTL_HTTP</code> package's session state.       |

## 268.8.7 UTL\_HTTP HTTP Persistent Connections Subprograms

This table lists and briefly describes the `UTL_HTTP` HTTP Persistent Connections subprograms.

**Table 268-14 UTL\_HTTP Subprograms—HTTP Persistent Connections**

| Subprogram                                         | Description                                                                                                                   |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLOSE_PERSISTENT_CONN Procedure</a>    | Closes an HTTP persistent connection maintained by the <code>UTL_HTTP</code> package in the current database session          |
| <a href="#">CLOSE_PERSISTENT_CONNS Procedure</a>   | Closes a group of HTTP persistent connections maintained by the <code>UTL_HTTP</code> package in the current database session |
| <a href="#">GET_PERSISTENT_CONN_COUNT Function</a> | Returns the number of network connections currently kept persistent by the <code>UTL_HTTP</code> package to the Web servers   |
| <a href="#">GET_PERSISTENT_CONNS Procedure</a>     | Returns all the network connections currently kept persistent by the <code>UTL_HTTP</code> package to the Web servers         |

## 268.8.8 UTL\_HTTP Error Conditions Subprograms

This table lists and briefly describes error conditions subprograms of UTL\_HTTP .

**Table 268-15 UTL\_HTTP Subprograms—Error Conditions**

| Subprogram                                    | Description                                                 |
|-----------------------------------------------|-------------------------------------------------------------|
| <a href="#">GET_DETAILED_SQLCODE Function</a> | Retrieves the detailed SQLCODE of the last exception raised |
| <a href="#">GET_DETAILED_SQLERRM Function</a> | Retrieves the detailed SQLERRM of the last exception raised |

## 268.9 Summary of UTL\_HTTP Subprograms

This table lists the UTL\_HTTP subprograms and briefly describes them.

**Table 268-16 UTL\_HTTP Package Subprograms**

| Subprogram                                        | Description                                                                                                                                         | Group                                                   |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <a href="#">ADD_COOKIES Procedure</a>             | Add the cookies either to a request context or to the UTL_HTTP package's session state                                                              | <a href="#">HTTP Cookies Subprograms</a>                |
| <a href="#">BEGIN_REQUEST Function</a>            | Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line | <a href="#">HTTP Requests Subprograms</a>               |
| <a href="#">CLEAR_COOKIES Procedure</a>           | Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state                                            | <a href="#">HTTP Cookies Subprograms</a>                |
| <a href="#">CLOSE_PERSISTENT_CONN Procedure</a>   | Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session                                             | <a href="#">HTTP Persistent Connections Subprograms</a> |
| <a href="#">CLOSE_PERSISTENT_CONNS Procedure</a>  | Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session                                    | <a href="#">HTTP Persistent Connections Subprograms</a> |
| <a href="#">CREATE_REQUEST_CONTEXT Function</a>   | Creates a request context in UTL_HTTP for a wallet and a cookie table                                                                               | <a href="#">HTTP Requests Subprograms</a>               |
| <a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> | Destroys a request context in UTL_HTTP for a wallet and a cookie table                                                                              | <a href="#">HTTP Requests Subprograms</a>               |
| <a href="#">END_REQUEST Procedure</a>             | Ends the HTTP request                                                                                                                               | <a href="#">HTTP Requests Subprograms</a>               |
| <a href="#">END_RESPONSE Procedure</a>            | Ends the HTTP response. It completes the HTTP request and response                                                                                  | <a href="#">HTTP Responses Subprograms</a>              |

**Table 268-16 (Cont.) UTL\_HTTP Package Subprograms**

| Subprogram                                          | Description                                                                                                                                                                                 | Group                                                         |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| <a href="#">GET_AUTHENTICATION Procedure</a>        | Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header                                              | <a href="#">HTTP Responses Subprograms</a>                    |
| <a href="#">GET_BODY_CHARSET Procedure</a>          | Retrieves the default character set of the body of all future HTTP requests                                                                                                                 | <a href="#">Session Settings Subprograms</a>                  |
| <a href="#">GET_COOKIE_COUNT Function</a>           | Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers                                                                                           | <a href="#">HTTP Cookies Subprograms</a>                      |
| <a href="#">GET_COOKIE_SUPPORT Procedure</a>        | Retrieves the current cookie support settings                                                                                                                                               | <a href="#">Session Settings Subprograms</a>                  |
| <a href="#">GET_COOKIES Function</a>                | Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers                                                                                                 | <a href="#">HTTP Cookies Subprograms</a>                      |
| <a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a> | Checks if the UTL_HTTP package will raise a detailed exception or not                                                                                                                       | <a href="#">Session Settings Subprograms</a>                  |
| <a href="#">GET_DETAILED_SQLCODE Function</a>       | Retrieves the detailed <code>SQLCODE</code> of the last exception raised                                                                                                                    | <a href="#">Error Conditions Subprograms</a>                  |
| <a href="#">GET_DETAILED_SQLERRM Function</a>       | Retrieves the detailed <code>SQLERRM</code> of the last exception raised                                                                                                                    | <a href="#">Error Conditions Subprograms</a>                  |
| <a href="#">GET_FOLLOW_REDIRECT Procedure</a>       | Retrieves the follow-redirect setting in the current session                                                                                                                                | <a href="#">Session Settings Subprograms</a>                  |
| <a href="#">GET_HEADER Procedure</a>                | Returns the $n^{\text{th}}$ HTTP response header name and value returned in the response                                                                                                    | <a href="#">HTTP Responses Subprograms</a>                    |
| <a href="#">GET_HEADER_BY_NAME Procedure</a>        | Returns the HTTP response header value returned in the response given the name of the header                                                                                                | <a href="#">HTTP Responses Subprograms</a>                    |
| <a href="#">GET_HEADER_COUNT Function</a>           | Returns the number of HTTP response headers returned in the response                                                                                                                        | <a href="#">HTTP Responses and HTTP Responses Subprograms</a> |
| <a href="#">GET_PERSISTENT_CONN_COUNT Function</a>  | Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers                                                                              | <a href="#">HTTP Persistent Connections Subprograms</a>       |
| <a href="#">GET_HEADER_COUNT Function</a>           | Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session | <a href="#">Session Settings Subprograms</a>                  |

Table 268-16 (Cont.) UTL\_HTTP Package Subprograms

| Subprogram                                               | Description                                                                                                                                                                                           | Group                                                            |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a>    | Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see <a href="#">Session Settings Subprograms</a> )               | <a href="#">HTTP Persistent Connections Subprograms</a>          |
| <a href="#">GET_PERSISTENT_CONNS Procedure</a>           | Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers                                                                                              | <a href="#">HTTP Persistent Connections Subprograms</a>          |
| <a href="#">GET_PROXY Procedure</a>                      | Retrieves the current proxy settings                                                                                                                                                                  | <a href="#">Session Settings Subprograms</a>                     |
| <a href="#">GET_RESPONSE Function</a>                    | Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed                                                                        | <a href="#">HTTP Responses Subprograms</a>                       |
| <a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a>       | Checks if the response error check is set or no                                                                                                                                                       | <a href="#">Session Settings Subprograms</a>                     |
| <a href="#">GET_TRANSFER_TIMEOUT Procedure</a>           | Retrieves the current network transfer timeout value                                                                                                                                                  | <a href="#">Session Settings Subprograms</a>                     |
| <a href="#">READ_LINE Procedure</a>                      | Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer                                                                       | <a href="#">HTTP Responses Subprograms</a>                       |
| <a href="#">READ_RAW Procedure</a>                       | Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer                                                                                                      | <a href="#">HTTP Responses Subprograms</a>                       |
| <a href="#">READ_TEXT Procedure</a>                      | Reads the HTTP response body in text form and returns the output in the caller-supplied buffer                                                                                                        | <a href="#">HTTP Responses Subprograms</a>                       |
| <a href="#">REQUEST Function</a>                         | Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.                                                                       | <a href="#">Simple HTTP Fetches in a Single Call Subprograms</a> |
| <a href="#">REQUEST_PIECES Function</a>                  | Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL                                                                                                                   | <a href="#">Simple HTTP Fetches in a Single Call Subprograms</a> |
| <a href="#">SET_AUTHENTICATION Procedure</a>             | Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.                                                                      | <a href="#">HTTP Requests Subprograms</a>                        |
| <a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> | Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet. | <a href="#">HTTP Requests Subprograms</a>                        |

**Table 268-16 (Cont.) UTL\_HTTP Package Subprograms**

| Subprogram                                                  | Description                                                                                                                                                                                    | Group                                                                       |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">SET_BODY_CHARSET Procedures</a>                 | Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header | <a href="#">Session Settings Subprograms</a>                                |
| <a href="#">SET_BODY_CHARSET Procedures</a>                 | Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header                             | <a href="#">HTTP Requests Subprograms</a>                                   |
| <a href="#">SET_BODY_CHARSET Procedures</a>                 | Sets the character set of the response body when the media type is <code>"text"</code> but the character set is not specified in the <code>Content-Type</code> header                          | <a href="#">HTTP Responses Subprograms and Session Settings Subprograms</a> |
| <a href="#">SET_COOKIE_SUPPORT Procedures</a>               | Enables or disables support for the HTTP cookies in the request                                                                                                                                | <a href="#">HTTP Requests Subprograms</a>                                   |
| <a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a>         | Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session                                         | <a href="#">Session Settings Subprograms</a>                                |
| <a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a>         | Sets the UTL_HTTP package to raise a detailed exception                                                                                                                                        | <a href="#">Session Settings Subprograms</a>                                |
| <a href="#">SET_FOLLOW_REDIRECT Procedures</a>              | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <code>GET_RESPONSE</code> function                                 | <a href="#">HTTP Requests Subprograms</a>                                   |
| <a href="#">SET_HEADER Procedure</a>                        | Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function                             | <a href="#">Session Settings Subprograms</a>                                |
| <a href="#">SET_HEADER Procedure</a>                        | Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.                                                                                                | <a href="#">HTTP Requests Subprograms</a>                                   |
| <a href="#">SET_PERSISTENT_CONNECTION_SUPPORT Procedure</a> | Enables or disables support for the HTTP 1.1 persistent-connection in the request                                                                                                              | <a href="#">HTTP Requests Subprograms</a>                                   |
| <a href="#">SET_PROXY Procedure</a>                         | Sets the proxy to be used for requests of HTTP or other protocols                                                                                                                              | <a href="#">Session Settings and Session Settings Subprograms</a>           |
| <a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a>          | Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges                     | <a href="#">Session Settings Subprograms</a>                                |

**Table 268-16 (Cont.) UTL\_HTTP Package Subprograms**

| Subprogram                                     | Description                                                                                                        | Group                                                             |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">SET_TRANSFER_TIMEOUT Procedure</a> | Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server                  | <a href="#">Session Settings and Session Settings Subprograms</a> |
| <a href="#">SET_WALLET Procedure</a>           | Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS                  | <a href="#">Session Settings Subprograms</a>                      |
| <a href="#">WRITE_LINE Procedure</a>           | Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP | <a href="#">HTTP Requests Subprograms</a>                         |
| <a href="#">WRITE_RAW Procedure</a>            | Writes some binary data in the HTTP request body                                                                   | <a href="#">HTTP Requests Subprograms</a>                         |
| <a href="#">WRITE_TEXT Procedure</a>           | Writes some text data in the HTTP request body                                                                     | <a href="#">HTTP Requests Subprograms</a>                         |

## 268.9.1 ADD\_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.ADD_COOKIES (  
    cookies          IN  cookie_table,  
    request_context  IN  request_context_key DEFAULT NULL);
```

### Parameters

**Table 268-17 ADD\_COOKIES Procedure Parameters**

| Parameter       | Description                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------|
| cookies         | The cookies to be added                                                                                                 |
| request_context | Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead. |

### Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

## 268.9.2 BEGIN\_REQUEST Function

This function begins a new HTTP request. `UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@]host[:port]/[...]
```

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.BEGIN_REQUEST (
    url            IN  VARCHAR2,
    method         IN  VARCHAR2 DEFAULT 'GET',
    http_version   IN  VARCHAR2 DEFAULT NULL,
    request_context IN  request_context_key DEFAULT NULL,
    https_host     IN  VARCHAR2 DEFAULT NULL)
RETURN req;
```

### Parameters

**Table 268-18 BEGIN\_REQUEST Function Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>url</code>             | The URL of the HTTP request                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>method</code>          | The method performed on the resource identified by the URL                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>http_version</code>    | The HTTP protocol version that sends the request. The format of the protocol version is <code>HTTP/major-version.minor-version</code> , where <code>major-version</code> and <code>minor-version</code> are positive numbers. If this parameter is set to <code>NULL</code> , <code>UTL_HTTP</code> uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is <code>NULL</code> . |
| <code>request_context</code> | Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is <code>NULL</code> , the wallet and cookie table shared in the current database session will be used instead.                                                                                                                                                                                                                                                                                 |
| <code>https_host</code>      | A string representing the host name.<br>If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI).<br>If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request.<br>If <code>NULL</code> , the host name in the given URL will be used for SNI.                                                                                                   |

### Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the `UTL_URL` package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [UTL\\_URL](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- `BEGIN_REQUEST` can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the [GET\\_RESPONSE Function](#) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      => req,
                    name    => 'Content-Type',
                    value   => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      => req,
                    name    => 'Content-Length',
                    value   => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      => req,
                    data    => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
        (r      => req);
...
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET\\_WALLET Procedure](#) on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

## 268.9.3 CLEAR\_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.CLEAR_COOKIES (  
    request_context IN request_context_key DEFAULT NULL);
```

### Parameters

**Table 268-19 CLEAR\_COOKIES Procedure Parameters**

| Parameter       | Description                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_context | Request context to clear the cookies. If <code>NULL</code> , the cookies maintained in the <code>UTL_HTTP</code> package's session state will be cleared instead. |

## 268.9.4 CLOSE\_PERSISTENT\_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (  
    conn IN connection);
```

### Parameters

**Table 268-20 CLOSE\_PERSISTENT\_CONN Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| conn      | The HTTP persistent connection to close |

## 268.9.5 CLOSE\_PERSISTENT\_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters `NULL`. If a particular parameter is set to `NULL` when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to `foobar`:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the `foobar` at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',  
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

#### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (  
    host          IN VARCHAR2 DEFAULT NULL,  
    port          IN PLS_INTEGER DEFAULT NULL,  
    proxy_host    IN VARCHAR2 DEFAULT NULL,  
    proxy_port    IN PLS_INTEGER DEFAULT NULL,  
    ssl           IN BOOLEAN DEFAULT NULL);
```

### Parameters

**Table 268-21** CLOSE\_PERSISTENT\_CONNS Procedure Parameters

| Parameter  | Description                                                       |
|------------|-------------------------------------------------------------------|
| host       | The host for which persistent connections are to be closed        |
| port       | The port number for which persistent connections are to be closed |
| proxy_host | The proxy host for which persistent connections are to be closed  |
| proxy_port | The proxy port for which persistent connections are to be closed  |
| ssl        | Close persistent SSL connection                                   |

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

## 268.9.6 CREATE\_REQUEST\_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet

and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

### See Also:

[Request Context](#) and [HTTP Request Contexts Subprograms](#)

## Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (  
    wallet_path          IN VARCHAR2 DEFAULT NULL,  
    wallet_password      IN VARCHAR2 DEFAULT NULL,  
    enable_cookies       IN BOOLEAN  DEFAULT TRUE,  
    max_cookies          IN PLS_INTEGER DEFAULT 300,  
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20)  
RETURN request_context_key;
```

## Parameters

**Table 268-22** CREATE\_REQUEST\_CONTEXT Function Parameters

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wallet_path          | Directory path that contains the Oracle wallet. The format is <i>file:directory-path</i> .<br><br>If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the <i>path</i> parameter to <i>system:</i> (include the colon). This simplifies configuration and improves productivity.                                      |
| wallet_password      | The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <i>NULL</i> . See the <i>Oracle Database Enterprise User Security Administrator's Guide</i> for detailed information about wallets.<br><br>If you set <i>path</i> to <i>system:</i> , then omit the password by setting it to <i>NULL</i> . |
| enable_cookies       | Sets whether HTTP requests using this request context should support HTTP cookies or not: <i>TRUE</i> to enable the support, <i>FALSE</i> to disable it.                                                                                                                                                                                                                  |
| max_cookies          | Sets the maximum total number of cookies that will be maintained in this request context                                                                                                                                                                                                                                                                                  |
| max_cookies_per_site | Sets the maximum number of cookies per each Web site that will be maintained in this request context                                                                                                                                                                                                                                                                      |

## Return Values

The request context created.

## Examples

```
DECLARE  
    request_context UTL_HTTP.REQUEST_CONTEXT_KEY;  
    req            utl_http.req;  
BEGIN  
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(  
        wallet_path          => 'file:/oracle/wallets/test_wallets',  
        wallet_password      => NULL,  
        enable_cookies       => TRUE,
```

```
        max_cookies           => 300,  
        max_cookies_per_site => 20);  
req := UTL_HTTP.BEGIN_REQUEST(  
    url           => 'http://www.example.com/',  
    request_context => request_context);  
END;
```

## 268.9.7 DESTROY\_REQUEST\_CONTEXT Procedure

This procedure destroys a request context in UTL\_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

### See Also:

[Request Context](#) and [HTTP Request Contexts Subprograms](#)

### Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (  
    request_context    request_context_key);
```

### Parameters

**Table 268-23 DESTROY\_REQUEST\_CONTEXT Procedure Parameters**

| Parameter       | Description                |
|-----------------|----------------------------|
| request_context | Request context to destroy |

### Examples

```
DECLARE  
    request_context    UTL_HTTP.REQUEST_CONTEXT_KEY;  
BEGIN  
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT (...);  
    ...  
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);  
END;
```

## 268.9.8 END\_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.END_REQUEST (  
    r    IN OUT NOCOPY req);
```

### Parameters

**Table 268-24** END\_REQUEST Procedure Parameters

| Parameter | Description      |
|-----------|------------------|
| r         | The HTTP request |

## 268.9.9 END\_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.END_RESPONSE (  
    r    IN OUT NOCOPY resp);
```

### Parameters

**Table 268-25** END\_RESPONSE Procedure Parameters

| Parameter | Description       |
|-----------|-------------------|
| r         | The HTTP response |

## 268.9.10 GET\_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_AUTHENTICATION(  
    r            IN OUT NOCOPY resp,  
    scheme      OUT VARCHAR2,
```

```
realm      OUT VARCHAR2,  
for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 268-26 GET\_AUTHENTICATION Procedure Parameters**

| Parameter | Description                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The HTTP response                                                                                                                        |
| scheme    | The scheme for the required HTTP authentication                                                                                          |
| realm     | The realm for the required HTTP authentication                                                                                           |
| for_proxy | Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE |

### Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

## 268.9.11 GET\_BODY\_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_BODY_CHARSET (  
    charset  OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 268-27 GET\_BODY\_CHARSET Procedure Parameters**

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| charset   | The default character set of the body of all future HTTP requests |

## 268.9.12 GET\_COOKIE\_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (  
    request_context IN request_context_key DEFAULT NULL)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 268-28** GET\_COOKIE\_COUNT Function Parameters

| Parameter       | Description                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| request_context | Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead. |

## 268.9.13 GET\_COOKIE\_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (  
    enable           OUT BOOLEAN,  
    max_cookies      OUT PLS_INTEGER,  
    max_cookies_per_site OUT PLS_INTEGER);
```

### Parameters

**Table 268-29** GET\_COOKIE\_SUPPORT Procedure Parameters

| Parameter   | Description                                                                              |
|-------------|------------------------------------------------------------------------------------------|
| enable      | Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE) |
| max_cookies | Indicates the maximum total number of cookies maintained in the current session          |

**Table 268-29 (Cont.) GET\_COOKIE\_SUPPORT Procedure Parameters**

| Parameter            | Description                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------|
| max_cookies_per_site | Indicates the maximum number of cookies maintained in the current session for each Web site |

## 268.9.14 GET\_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL\_HTTP package's session state.

### See Also:

[HTTP Cookies](#) and [HTTP Cookies Subprograms](#)

### Syntax

```
UTL_HTTP.GET_COOKIES (  
    cookies          IN OUT NOCOPY cookie_table,  
    request_context  IN          request_context_key DEFAULT NULL);
```

### Parameters

**Table 268-30 GET\_COOKIES Function Parameters**

| Parameter       | Description                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| cookies         | The cookies returned                                                                                                                         |
| request_context | Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead. |

## 268.9.15 GET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure checks if the UTL\_HTTP package will raise a detailed exception or not.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (  
    enable  OUT BOOLEAN);
```

## Parameters

**Table 268-31 GET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| enable    | TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE |

## 268.9.16 GET\_DETAILED\_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

### See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

## Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE  
RETURN PLS_INTEGER;
```

## 268.9.17 GET\_DETAILED\_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

### See Also:

[Error Conditions](#) and [Error Conditions Subprograms](#)

## Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM  
RETURN VARCHAR2;
```

## 268.9.18 GET\_FOLLOW\_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (  
    max_redirects OUT PLS_INTEGER);
```

## Parameters

**Table 268-32 GET\_FOLLOW\_REDIRECT Procedure Parameters**

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| max_redirects | The maximum number of redirections for all future HTTP requests |

## 268.9.19 GET\_HEADER Procedure

This procedure returns the  $n^{\text{th}}$  HTTP response header name and value returned in the response.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.GET_HEADER (  
    r      IN OUT NOCOPY resp,  
    n      IN PLS_INTEGER,  
    name   OUT NOCOPY VARCHAR2,  
    value  OUT NOCOPY VARCHAR2);
```

## Parameters

**Table 268-33 GET\_HEADER Procedure Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| r         | The HTTP response                     |
| n         | The $n^{\text{th}}$ header to return  |
| name      | The name of the HTTP response header  |
| value     | The value of the HTTP response header |

## Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 268.9.20 GET\_HEADER\_BY\_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(  
    r          IN OUT NOCOPY resp,  
    name       IN VARCHAR2,  
    value      OUT NOCOPY VARCHAR2,  
    n          IN PLS_INTEGER DEFAULT 1);
```

### Parameters

**Table 268-34 GET\_HEADER\_BY\_NAME Procedure Parameters**

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| r         | The HTTP response                                                                                            |
| name      | The name of the HTTP response header for which the value is to return                                        |
| value     | The value of the HTTP response header                                                                        |
| n         | The $n^{\text{th}}$ occurrence of an HTTP response header by the specified name to return. The default is 1. |

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 268.9.21 GET\_HEADER\_COUNT Function

This function returns the number of HTTP response headers returned in the response.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 268-35 GET\_HEADER\_COUNT Function Parameters**

| Parameter | Description       |
|-----------|-------------------|
| r         | The HTTP response |

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## 268.9.22 GET\_PERSISTENT\_CONN\_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

#### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;
```

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 268.9.23 GET\_PERSISTENT\_CONN\_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

#### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable      OUT BOOLEAN,  
    max_conns   OUT PLS_INTEGER);
```

## Parameters

**Table 268-36** GET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| enable    | TRUE if persistent connection support is enabled; otherwise FALSE              |
| max_conns | the maximum number of persistent connections maintained in the current session |

## 268.9.24 GET\_PERSISTENT\_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

### See Also:

[HTTP Persistent Connections](#) and [HTTP Persistent Connections Subprograms](#)

## Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

## Parameters

**Table 268-37** GET\_PERSISTENT\_CONNS Procedure Parameters

| Parameter   | Description                             |
|-------------|-----------------------------------------|
| connections | The network connections kept persistent |

## Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## 268.9.25 GET\_PROXY Procedure

This procedure retrieves the current proxy settings.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_PROXY (  
    proxy          OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 268-38 GET\_PROXY Procedure Parameters**

| Parameter        | Description                                                                         |
|------------------|-------------------------------------------------------------------------------------|
| proxy            | The proxy (host and an optional port number) currently used by the UTL_HTTP package |

## 268.9.26 GET\_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.GET_RESPONSE (  
    r                      IN OUT NOCOPY req,  
    return_info_response   IN BOOLEAN DEFAULT FALSE)  
RETURN resp;
```

### Parameters

**Table 268-39 GET\_RESPONSE Function Parameters**

| Parameter | Description       |
|-----------|-------------------|
| r         | The HTTP response |

**Table 268-39 (Cont.) GET\_RESPONSE Function Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| return_info_response | <p>Return 100 informational response or not.</p> <ul style="list-style-type: none"><li>• TRUE means <code>get_response</code> should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned.</li><li>• FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.</li></ul> |

### Exceptions

- When detailed-exception is disabled:  
ORA-29273 REQUEST\_FAILED - the request fails to execute. Use the [GET\\_DETAILED\\_EXCP\\_SUPPORT Procedure](#) and the [GET\\_DETAILED\\_SQLERRM Function](#) to get the detailed error message.
- When detailed-exception is enabled:  
ORA-29261 BAD\_ARGUMENT - some arguments passed are not valid
- When response error check is enabled:  
ORA-29268 HTTP\_CLIENT\_ERROR - the response code is in 400 range  
ORA-29269 HTTP\_SERVER\_ERROR - the response code is in 500 range

### Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the [END\\_REQUEST Procedure](#).
- If URL redirection occurs, the URL and method fields in the `req` record will be updated to the last redirected URL and the method used to access the URL.

### Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to `GET_RESPONSE` to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to `GET_RESPONSE` to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional `EXPECT: 100-CONTINUE` request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.

The following code example illustrates this:

```
DECLARE
  data  VARCHAR2(1024) := '...';
  req   utl_http.req;
  resp  utl_http.resp;
BEGIN
```

```
req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
utl_http.set_header(req, 'Content-Length', length(data));
-- Ask HTTP server to return "100 Continue" response
utl_http.set_header(req, 'Expect', '100-continue');
resp := utl_http.get_response(req, TRUE);

-- Check for and dispose "100 Continue" response
IF (resp.status_code <> 100) THEN
    utl_http.end_response(resp);
    raise_application_error(20000, 'Request rejected');
END IF;
utl_http.end_response(resp);

-- Now, send the request body
utl_http.write_text(req, data);

-- Get the regular response
resp := utl_http.get_response(req);
utl_http.read_text(resp, data);

utl_http.end_response(resp);

END;
```

## 268.9.27 GET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure checks if the response error check is set or not.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
    enable OUT BOOLEAN);
```

### Parameters

**Table 268-40** GET\_RESPONSE\_ERROR\_CHECK Procedure Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| enable    | TRUE if the response error check is set; otherwise FALSE |

## 268.9.28 GET\_TRANSFER\_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
    timeout OUT PLS_INTEGER);
```

## Parameters

**Table 268-41 GET\_TRANSFER\_TIMEOUT Procedure Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| timeout   | The network transfer timeout value in seconds |

## 268.9.29 READ\_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of UTL\_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.READ_LINE(
    r          IN OUT NOCOPY resp,
    data       OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
    remove_crlf IN  BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 268-42 READ\_LINE Procedure Parameters**

| Parameter   | Description                                   |
|-------------|-----------------------------------------------|
| r           | The HTTP response                             |
| data        | The HTTP response body in text form           |
| remove_crlf | Removes the newline characters if set to TRUE |

## Usage Notes

The UTL\_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns

all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 268.9.30 READ\_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

### Syntax

```
UTL_HTTP.READ_RAW(  
    r      IN OUT NOCOPY resp,  
    data   OUT NOCOPY RAW,  
    len    IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 268-43 READ\_RAW Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>r</code>    | The HTTP response                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>data</code> | The HTTP response body in binary form                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>len</code>  | The number of bytes of data to read. If <code>len</code> is <code>NULL</code> , this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is <code>NULL</code> . |

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## 268.9.31 READ\_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The `end_of_body` exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

### See Also:

[HTTP Responses](#) and [HTTP Responses Subprograms](#)

## Syntax

```
UTL_HTTP.READ_TEXT(
    r      IN OUT NOCOPY resp,
    data   OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len    IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 268-44 READ\_TEXT Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>r</code>    | The HTTP response                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>data</code> | The HTTP response body in text form                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>len</code>  | The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL. |

## Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## 268.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

### See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

### Syntax

```
UTL_HTTP.REQUEST (
    url            IN VARCHAR2,
    proxy          IN VARCHAR2 DEFAULT NULL,
    wallet_path    IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL,
    https_host     IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

## Parameters

**Table 268-45 REQUEST Function Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>url</code>             | Uniform resource locator                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>proxy</code>           | (Optional) Specifies a proxy server to use when making the HTTP request. See <code>SET_PROXY</code> for the full format of the proxy setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>wallet_path</code>     | <p>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code>, and in Unix is, for example, <code>file:/home/username/wallets</code></p> <p>When the <code>UTL_HTTP</code> package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See <code>SET_WALLET</code> for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</p> <p>If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the <code>path</code> parameter to <code>system:</code> (include the colon). This simplifies configuration and improves productivity.</p> |
| <code>wallet_password</code> | <p>(Optional) Specifies the password required to open the wallet</p> <p>If you set <code>path</code> to <code>system:</code>, then omit the password by setting it to <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>https_host</code>      | <p>A string representing the host name.</p> <p>If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI).</p> <p>If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request.</p> <p>If <code>NULL</code>, the host name in the given URL will be used for SNI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

## Exceptions

`INIT_FAILED`  
`REQUEST_FAILED`

## Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the `UTL_URL` package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document: http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host: home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

### Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM DUAL;
```

## 268.9.33 REQUEST\_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

### See Also:

[Simple HTTP Fetches](#) and [Simple HTTP Fetches in a Single Call Subprograms](#)

### Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
    url            IN VARCHAR2,
    max_pieces     IN NATURAL DEFAULT 32767,
    proxy          IN VARCHAR2 DEFAULT NULL,
    wallet_path    IN VARCHAR2 DEFAULT NULL,
```

```
wallet_password IN VARCHAR2 DEFAULT NULL,  
https_host      IN VARCHAR2 DEFAULT NULL)  
RETURN html_pieces;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 268-46 REQUEST\_PIECES Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url             | Uniform resource locator                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| max_pieces      | (Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| proxy           | (Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| wallet_path     | (Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.<br><br>The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.<br><br>See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.<br><br>If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the path parameter to system: (include the colon). This simplifies configuration and improves productivity. |
| wallet_password | (Optional) Specifies the password required to open the wallet<br><br>If you set path to system:, then omit the password by setting it to NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| https_host      | A string representing the host name.<br><br>If the string does not begin with a wildcard, the string will be used as the host name for server name indication (SNI).<br><br>If the string begins with a wildcard, the string will be used to match against the common name (CN) of the remote server's certificate for an HTTPS request.<br><br>If NULL, the host name in the given URL will be used for SNI.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Return Values

REQUEST\_PIECES returns a PL/SQL table of type UTL\_HTTP.HTML\_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST\_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

### Exceptions

```
INIT_FAILED  
REQUEST_FAILED
```

## Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the `UTL_URL` package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

## Examples

```
SET SERVEROUTPUT ON

DECLARE
    x    UTL_HTTP.HTML_PIECES;
    len  PLS_INTEGER;
BEGIN
    x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
    DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
    DBMS_OUTPUT.PUT_LINE('with total length ');
    IF x.count < 1 THEN
        DBMS_OUTPUT.PUT_LINE('0');
    ELSE
        len := 0;
        FOR i in 1..x.count LOOP
            len := len + length(x(i));
        END LOOP;
        DBMS_OUTPUT.PUT_LINE(len);
    END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
```

with total length  
7687

## 268.9.34 SET\_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.SET_AUTHENTICATION(  
    r           IN OUT NOCOPY req,  
    username    IN VARCHAR2,  
    password    IN VARCHAR2,  
    scheme      IN VARCHAR2 DEFAULT 'Basic',  
    for_proxy   IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 268-47 SET\_AUTHENTICATION Procedure Parameters**

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | HTTP request                                                                                                                                         |
| username  | Username for the HTTP authentication                                                                                                                 |
| password  | Password for the HTTP authentication                                                                                                                 |
| scheme    | HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is <code>basic</code> . |
| for_proxy | Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .  |

### Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

## 268.9.35 SET\_AUTHENTICATION\_FROM\_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

### See Also:

[External Password Store](#) on [Oracle Database](#), and [HTTP Requests Subprograms](#)

## Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(  
    r           IN OUT NOCOPY req,  
    alias       IN VARCHAR2,  
    scheme      IN VARCHAR2 DEFAULT 'Basic',  
    for_proxy   IN BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 268-48 SET\_AUTHENTICATION\_FROM\_WALLET Procedure Parameters**

| Parameter | Description                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The HTTP request                                                                                                                                     |
| alias     | Alias to identify and retrieve the username and password credential stored in the Oracle wallet                                                      |
| scheme    | HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is <code>basic</code> . |
| for_proxy | Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .  |

## Usage Notes

- To use the password credentials in a wallet, the `UTL_HTTP` user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

## Examples

### Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create  
Enter password: *****  
Enter password again: *****  
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith  
Your secret/Password is missing in the command line  
Enter your secret/Password: ****  
Re-enter your secret/Password: ****  
Enter wallet password: *****
```

### Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN  
    DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(  
        acl           => 'wallet-acl.xml',  
        description   => 'Wallet ACL',  
        principal     => 'SCOTT',  
        is_grant      => TRUE,  
        privilege      => 'use-passwords');  
    DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(  
        acl           => 'wallet-acl.xml',  
        wallet_path    => 'file: /oracle/wallets/test_wallet');  
END;
```

### Using username and password from the wallet

```

DECLARE
    req  UTL_HTTP.req;
BEGIN
    UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
    req := UTL_HTTP.BEGIN_REQUEST(...);
    UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
    ...
END;

```

## 268.9.36 SET\_BODY\_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Responses](#) and [HTTP Responses Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```

UTL_HTTP.SET_BODY_CHARSET (
    charset  IN VARCHAR2 DEFAULT NULL);

```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is `"text"` but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `"ISO-8859-1"`. Use this procedure to change the default body character set a request inherits from the session default setting:

```

UTL_HTTP.SET_BODY_CHARSET (
    r          IN OUT NOCOPY req,
    charset    IN VARCHAR2 DEFAULT NULL);

```

Sets the character set of the response body when the media type is `"text"` but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is `"text"` but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `"ISO-8859-1"`. Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(  
    r          IN OUT NOCOPY resp,  
    charset    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 268-49 SET\_BODY\_CHARSET Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| r         | The HTTP response.                                                                                                                                                                                                                        |
| charset   | The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code> , the database character set is assumed. |

## 268.9.37 SET\_COOKIE\_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

### See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(  
    r          IN OUT NOCOPY REQ,  
    enable     IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (  
    enable      IN BOOLEAN,  
    max_cookies IN PLS_INTEGER DEFAULT 300,  
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

### Parameters

**Table 268-50 SET\_COOKIE\_SUPPORT Procedure Parameters**

| Parameter   | Description                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------|
| r           | The HTTP request                                                                                          |
| enable      | Set <code>enable</code> to <code>TRUE</code> to enable HTTP cookie support; <code>FALSE</code> to disable |
| max_cookies | Sets the maximum total number of cookies maintained in the current session                                |

**Table 268-50 (Cont.) SET\_COOKIE\_SUPPORT Procedure Parameters**

| Parameter            | Description                                                                            |
|----------------------|----------------------------------------------------------------------------------------|
| max_cookies_per_site | Sets the maximum number of cookies maintained in the current session for each Web site |

### Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#)" for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

## 268.9.38 SET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLEERM` for more detailed information about the error.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
    enable IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 268-51 SET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| enable    | Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE |

## 268.9.39 SET\_FOLLOW\_REDIRECT Procedures

This procedure sets the maximum number of times UTL\_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET\_RESPONSE function.

### See Also:

- [HTTP Requests](#) and [HTTP Requests Subprograms](#)
- [Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (  
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(  
    r IN OUT NOCOPY req,  
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

## Parameters

**Table 268-52 SET\_FOLLOW\_REDIRECT Procedure Parameters**

| Parameter     | Description                                                        |
|---------------|--------------------------------------------------------------------|
| r             | The HTTP request                                                   |
| max_redirects | The maximum number of redirects. Set to zero to disable redirects. |

## Usage Notes

If max\_redirects is set to a positive number, the [GET\\_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used

to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

## 268.9.40 SET\_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

```
UTL_HTTP.SET_HEADER (
    r          IN OUT NOCOPY req,
    name       IN VARCHAR2,
    value      IN VARCHAR2);
```

### Parameters

**Table 268-53 SET\_HEADER Procedure Parameters**

| Parameter          | Description                          |
|--------------------|--------------------------------------|
| <code>r</code>     | The HTTP request                     |
| <code>name</code>  | The name of the HTTP request header  |
| <code>value</code> | The value of the HTTP request header |

### Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, `UTL_HTTP` sets the Host header automatically for you.

When you set the `Content-Type` header with this procedure, `UTL_HTTP` looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the `SET_BODY_CHARSET` procedure.

When you set the `Transfer-Encoding` header with the value `chunked`, `UTL_HTTP` automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW`

procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

## 268.9.41 SET\_PERSISTENT\_CONN\_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

### Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(  
    enable      IN BOOLEAN DEFAULT FALSE,  
    max_conns   IN PLS_INTEGER DEFAULT 0);
```

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(  
    r           IN OUT NOCOPY req,  
    enable      IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 268-54 SET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

| Parameter     | Description                                                      |
|---------------|------------------------------------------------------------------|
| enable        | TRUE to keep the network connection persistent. FALSE otherwise. |
| maximum_conns | Maximum number of connections                                    |
| r             | The HTTP request                                                 |

### Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a

request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL\_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the `maximum_conns` parameter prior to calling the [BEGIN\\_REQUEST Function](#), otherwise persistent connections will not be enabled for the current request even if the other form of `SET_PERSISTENT_CONN_SUPPORT` is called.

## Examples

Using `SET_PERSISTENT_CONN_SUPPORT` in http requests at the session level, showing the active persistent connection after each request

```
DECLARE
    pieces utl_http.html_pieces;
    conns utl_http.connection_table;
BEGIN

    -- Turns on persistent connection support for the request_pieces call.
    utl_http.set_persistent_conn_support(true, 1);

    FOR i IN 1..10 LOOP

        pieces := utl_http.request_pieces('http://www.example.com/');

        -- Shows the active persistent connection
        utl_http.get_persistent_conns(conns);
        FOR j IN 1..conns.count LOOP
            dbms_output.put_line('Persistent connection ' || j || ': ' || conns(j).host || ':' ||
conns(j).port);
        END LOOP;

    END LOOP;

    -- Turns off persistent connection support. Set active max persistent connection to 0
    to close all active connections.
    utl_http.set_persistent_conn_support(false, 0);

END;
/
```

Using `SET_PERSISTENT_CONN_SUPPORT` in HTTP requests showing how to use persistent connection individually in each request to fetch multiple URLs at the same host

```

DECLARE
-- Table to store the URLs
TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
paths VC2_TABLE;

PROCEDURE fetch_pages(paths IN vc2_table) AS
    req UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    data VARCHAR2(1024);

BEGIN

    -- Set the proxy server
    UTL_HTTP.SET_PROXY('www-proxy.example.com:80', '');

    FOR i IN 1..paths.count LOOP

        req := UTL_HTTP.BEGIN_REQUEST(paths(i));

        -- Use persistent connections except for the last request
        IF (i < paths.count) THEN
            -- Use a persistent connection for the current request
            UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
        END IF;

        resp := UTL_HTTP.GET_RESPONSE(req);

        -- Display the results of the response
        DBMS_OUTPUT.PUT_LINE('-');
        DBMS_OUTPUT.PUT_LINE('URL: ' || paths(i));
        DBMS_OUTPUT.PUT_LINE('HTTP Response Status Code: ' || resp.status_code);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Reason Phrase: ' || resp.reason_phrase);
        DBMS_OUTPUT.PUT_LINE('HTTP Response Version: ' || resp.http_version);

        BEGIN
            LOOP
                UTL_HTTP.READ_TEXT(resp, data);
                -- do something with the data
            END LOOP;
        EXCEPTION
            WHEN UTL_HTTP.END_OF_BODY THEN
                NULL;
        END;
        UTL_HTTP.END_RESPONSE(resp);
    END LOOP;
END;

BEGIN
-- Set a maximum of 1 persistent connection, but start with persistent connections
-- off
    UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);

    -- Create a list of URLs
    paths(1) := 'http://www.example.com/technetwork/index.html';
    paths(2) := 'http://www.example.com/us/products/index.html';

    fetch_pages(paths);
END;
/

```

## 268.9.42 SET\_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`.

`no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.SET_PROXY (
    proxy          IN VARCHAR2,
    no_proxy_domains IN VARCHAR2);
```

### Parameters

**Table 268-55 SET\_PROXY Procedure Parameters**

| Parameter                     | Description                                                                      |
|-------------------------------|----------------------------------------------------------------------------------|
| <code>proxy</code>            | The proxy (host and an optional port number) to be used by the UTL_HTTP package  |
| <code>no_proxy_domains</code> | The list of hosts and domains for which no proxy should be used for all requests |

### Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL\_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

## 268.9.43 SET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

### Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (  
    enable IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 268-56 SET\_RESPONSE\_ERROR\_CHECK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| enable    | TRUE to check for response errors; otherwise FALSE |

### Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to FALSE, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to FALSE.

## 268.9.44 SET\_TRANSFER\_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the `UTL_HTTP` package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

### See Also:

[Session Settings](#) and [Session Settings Subprograms](#)

## Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);
```

## Parameters

**Table 268-57 SET\_TRANSFER\_TIMEOUT Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| timeout   | The network transfer timeout value in seconds. |

## Usage Notes

The default value of the time out is 60 seconds.

## 268.9.45 SET\_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the `UTL_HTTP` package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the `UTL_HTTP` package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the `UTL_HTTP` package. An Oracle wallet is required to make an HTTPS request.

### See Also:

- [Session Settings](#) and [Session Settings Subprograms](#)
- *Oracle Database Security Guide* managing fine-grained access

## Syntax

```
UTL_HTTP.SET_WALLET (  
    path      IN VARCHAR2,  
    password  IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 268-58 SET\_WALLET Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path      | <p>The directory path that contains the Oracle wallet. The format is <i>file:directory-path</i>.</p> <p>The format of <i>wallet_path</i> on a PC is, for example, <i>file:c:\WINNT\Profiles\username\WALLETS</i>, and in Unix is, for example, <i>file:/home/username/wallets</i>. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</p> <p>If you want to use the operating system certificate store to act in place of the Oracle wallet, then set the <i>path</i> parameter to <i>system:</i> (include the colon). This simplifies configuration and improves productivity.</p> |
| password  | <p>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See <i>Oracle Database Advanced Security Guide</i> for information about using Oracle Wallet Manager and the <i>ORAPKI</i> utility to create an auto-login wallet.</p> <p>If you set <i>path</i> to <i>system:</i>, then omit the password by setting it to NULL.</p>                                                                                                                                                                                                                                                                                                                   |

## Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

### See Also:

*Oracle Database Advanced Security Guide* for more information on Wallet Manager

## 268.9.46 WRITE\_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in *UTL\_TCP*).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

**See Also:**[HTTP Requests](#) and [HTTP Requests Subprograms](#)**Syntax**

```
UTL_HTTP.WRITE_LINE(  
    r          IN OUT NOCOPY req,  
    data      IN VARCHAR2 CHARACTER SET ANY_CS);
```

**Parameters****Table 268-59** WRITE\_LINE Procedure Parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| r         | The HTTP request                               |
| data      | The text line to send in the HTTP request body |

**Usage Notes**

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

## 268.9.47 WRITE\_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

**See Also:**[HTTP Requests](#) and [HTTP Requests Subprograms](#)

## Syntax

```
UTL_HTTP.WRITE_RAW(  
    r      IN OUT NOCOPY REQ,  
    data   IN              RAW);
```

## Parameters

**Table 268-60** WRITE\_RAW Procedure Parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| r         | The HTTP request                                 |
| data      | The binary data to send in the HTTP request body |

## Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

## 268.9.48 WRITE\_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

### See Also:

[HTTP Requests](#) and [HTTP Requests Subprograms](#)

## Syntax

```
UTL_HTTP.WRITE_TEXT(  
    r      IN OUT NOCOPY REQ,  
    data   IN              VARCHAR2 CHARACTER SET ANY_CS);
```

## Parameters

**Table 268-61** WRITE\_TEXT Procedure Parameters

| Parameter | Description      |
|-----------|------------------|
| r         | The HTTP request |

**Table 268-61 (Cont.) WRITE\_TEXT Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| data      | The text data to send in the HTTP request body |

**Usage Notes**

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

# UTL\_I18N

UTL\_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

## See Also:

*Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of UTL\\_I18N Subprograms](#)

## 269.1 UTL\_I18N Overview

UTL\_I18N services provide additional globalization functionality for applications written in PL/SQL.

The UTL\_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

## 269.2 UTL\_I18N Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default.

## 269.3 UTL\_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 269-1 UTL\_I18N Constants**

| Constant                           | Type                      | Value                                | Description                                                                                            |
|------------------------------------|---------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>GENERIC_CONTEXT</code>       | <code>PLS_INTEGER</code>  | 0                                    | Returns the default character set for general cases.                                                   |
| <code>MAIL_GENERIC</code>          | <code>PLS_INTEGER</code>  | 0                                    | Map from an Oracle character set name to an email safe character set name on a non-Windows platform.   |
| <code>ORACLE_TO_IANA</code>        | <code>PLS_INTEGER</code>  | 0                                    | Map from an Oracle character set name to an IANA character set name.                                   |
| <code>SHIFT_IN</code>              | <code>PLS_INTEGER</code>  | 0                                    | Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion. |
| <code>IANA_TO_ORACLE</code>        | <code>PLS_INTEGER</code>  | 1                                    | Map from an IANA character set name to an Oracle character set name.                                   |
| <code>MAIL_CONTEXT</code>          | <code>PLS_INTEGER</code>  | 1                                    | The mapping is between an Oracle character set name and an email safe character set name.              |
| <code>MAIL_WINDOWS</code>          | <code>PLS_INTEGER</code>  | 1                                    | Map from an Oracle character set name to an email safe character set name on a Windows platform.       |
| <code>SHIFT_OUT</code>             | <code>PLS_INTEGER</code>  | 1                                    |                                                                                                        |
| <code>FWKATAKANA_HIRAGANA</code>   | <code>VARCHAR2(30)</code> | <code>'fwkatakana_hiragana'</code>   | Converts only fullwidth Katakana characters to fullwidth Hiragana characters.                          |
| <code>FWKATAKANA_HWKATAKANA</code> | <code>VARCHAR2(30)</code> | <code>'fwkatakana_hwkatakana'</code> | Converts only fullwidth Katakana characters to halfwidth Katakana characters.                          |
| <code>HIRAGANA_FWKATAKANA</code>   | <code>VARCHAR2(30)</code> | <code>'hiragana_fwkatkana'</code>    | Converts only fullwidth Hiragana characters to fullwidth Katakana characters.                          |
| <code>HIRAGANA_HWKATAKANA</code>   | <code>VARCHAR2(30)</code> | <code>'hiragana_hwkatakana'</code>   | Converts only fullwidth Hiragana characters to halfwidth Katakana characters.                          |

**Table 269-1 (Cont.) UTL\_I18N Constants**

| Constant                  | Type         | Value                       | Description                                                                   |
|---------------------------|--------------|-----------------------------|-------------------------------------------------------------------------------|
| HWKATAKANA_FWKAT<br>AKANA | VARCHAR2(30) | 'hwkatakana_fwka<br>takana' | Converts only halfwidth Katakana characters to fullwidth Katakana characters. |
| HWKATAKANA_HIRAG<br>ANA   | VARCHAR2(30) | 'hwkatakana_hira<br>gana'   | Converts only halfwidth Katakana characters to fullwidth Hiragana characters. |
| KANA_FWKATAKANA           | VARCHAR2(30) | 'kana_fwkatakana<br>'       | Converts any type of Kana character to a fullwidth Katakana character.        |
| KANA_HIRAGANA             | VARCHAR2(30) | 'kana_hiragana'             | Converts any type of Kana character to a fullwidth Hiragana character.        |
| KANA_HWKATAKANA           | VARCHAR2(30) | 'kana_hwkatakana<br>'       | Converts any type of Kana character to a halfwidth Katakana character.        |

## 269.4 Summary of UTL\_I18N Subprograms

This table lists the UTL\_I18N subprograms and briefly describes them.

**Table 269-2 UTL\_I18N Package Subprograms**

| Procedure                                            | Description                                                                                                                        |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ESCAPE_REFERENCE Function</a>            | Converts a given text string to its character reference counterparts, for characters that fall outside the document character set. |
| <a href="#">GET_COMMON_TIME_ZONES Function</a>       | Returns the list of common time zone IDs that are independent of the locales.                                                      |
| <a href="#">GET_DEFAULT_CHARSET Function</a>         | Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.          |
| <a href="#">GET_DEFAULT_ISO_CURRENCY Function</a>    | Returns the default ISO 4217 currency code for the specified territory.                                                            |
| <a href="#">GET_DEFAULT_LINGUISTIC_SORT Function</a> | Returns the default linguistic sort name for the specified language.                                                               |
| <a href="#">GET_LOCAL_LANGUAGES Function</a>         | Returns the local language names for the specified territory.                                                                      |
| <a href="#">GET_LOCAL_LINGUISTIC_SORTS Function</a>  | Returns the local linguistic sort names for the specified language.                                                                |
| <a href="#">GET_LOCAL_TERRITORIES Function</a>       | Returns the local territory names for the specified language.                                                                      |
| <a href="#">GET_LOCAL_TIME_ZONES Function</a>        | Returns the local time zone IDs for the specified territory.                                                                       |
| <a href="#">GET_MAX_CHARACTER_SIZE Function</a>      | Returns the maximum character size of a given character set.                                                                       |
| <a href="#">GET_TRANSLATION Function</a>             | Returns the translation of the language and territory name in the specified translation language.                                  |

**Table 269-2 (Cont.) UTL\_I18N Package Subprograms**

| Procedure                                            | Description                                                                                                                                                                                                                                                                   |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">MAP_CHARSET Function</a>                 | <ul style="list-style-type: none"> <li>Maps an Oracle character set name to an IANA character set name.</li> <li>Maps an IANA character set name to an Oracle character set name.</li> <li>Maps an Oracle character set name to an e-mail safe character set name.</li> </ul> |
| <a href="#">MAP_FROM_SHORT_LANGUAGE Function</a>     | Maps an Oracle short language name to an Oracle language name.                                                                                                                                                                                                                |
| <a href="#">MAP_LANGUAGE_FROM_ISO Function</a>       | Returns an Oracle language name from an ISO locale name.                                                                                                                                                                                                                      |
| <a href="#">MAP_LOCALE_TO_ISO Function</a>           | Returns an ISO locale name from the Oracle language and territory name.                                                                                                                                                                                                       |
| <a href="#">MAP_TERRITORY_FROM_ISO Function</a>      | Returns an Oracle territory name from an ISO locale name.                                                                                                                                                                                                                     |
| <a href="#">MAP_TO_SHORT_LANGUAGE Function</a>       | Maps an Oracle language name to an Oracle short language name.                                                                                                                                                                                                                |
| <a href="#">RAW_TO_CHAR Functions</a>                | Converts RAW data that is not encoded in the database character set into a VARCHAR2 string                                                                                                                                                                                    |
| <a href="#">RAW_TO_NCHAR Functions</a>               | Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string                                                                                                                                                                                  |
| <a href="#">STRING_TO_RAW Function</a>               | Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.                                                                                                                                                                   |
| <a href="#">TRANSLITERATE Function</a>               | Transliterates between Japanese hiragana and katakana.                                                                                                                                                                                                                        |
| <a href="#">UNESCAPE_REFERENCE Function</a>          | Converts an input string that contains character references to a text string.                                                                                                                                                                                                 |
| <a href="#">VALIDATE_CHARACTER_ENCODING Function</a> | Validates the character encoding of VARCHAR2, NVARCHAR2, CLOB, and NCLOB data.                                                                                                                                                                                                |

## 269.4.1 ESCAPE\_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#xe5;` is the numeric character reference for the small letter "a" with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `&lt;` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

### Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str          IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

## Parameters

**Table 269-3** ESCAPE\_REFERENCE Function Parameters

| Parameter    | Description                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| str          | Specifies the input string                                                                                                                                                         |
| page_cs_name | Specifies the character set of the document. If page_cs_name is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data. |

## Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

## Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello &lt; &#xe5;'.

## 269.4.2 GET\_COMMON\_TIME\_ZONES Function

This function returns a listing of the most cocommonly used time zones. This list contains a subset of the time zones that are supported in the database.

## Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES  
RETURN STRING_ARRAY;
```

## Examples

Returns the list of the most commonly used time zones.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
BEGIN  
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;  
END;  
/
```

## 269.4.3 GET\_DEFAULT\_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

### See Also:

["MAP\\_CHARSET Function"](#) for an explanation of an e-mail safe character set

## Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(  
    language IN VARCHAR2,  
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,  
    iswindows IN BOOLEAN DEFAULT FALSE)  
RETURN VARCHAR2;
```

## Parameters

**Table 269-4 GET\_DEFAULT\_CHARSET Function Parameters**

| Parameter | Description                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| language  | Specifies a valid Oracle language                                                                                                                                                                                                   |
| context   | GENERIC_CONTEXT   MAIL_CONTEXT<br>GENERIC_CONTEXT: Returns the default character set for general cases<br>MAIL_CONTEXT: Returns the default e-mail safe character set name                                                          |
| iswindows | If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.<br>iswindows has no effect if context is set as GENERIC_CONTEXT. |

## Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

## Examples

GENERIC\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL\_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

## 269.4.4 GET\_DEFAULT\_ISO\_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

## Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

## Parameters

**Table 269-5 GET\_DEFAULT\_ISO\_CURRENCY Function Parameters**

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

## Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

## Examples

Displays the default ISO currency code for China.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

## 269.4.5 GET\_DEFAULT\_LINGUISTIC\_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

## Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

## Parameters

**Table 269-6 GET\_DEFAULT\_LINGUISTIC\_SORT Function Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| language  | Specifies a valid Oracle language. It is case-insensitive. |

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    SELECT value INTO retval FROM nls_database_parameters
    WHERE parameter = 'NLS_LANGUAGE';
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
    DBMS_OUTPUT.PUT_LINE(retval);
END;
```

```
END;  
/
```

## 269.4.6 GET\_LOCAL\_LANGUAGES Function

This function returns the local language names for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (  
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;
```

### Parameters

**Table 269-7** GET\_LOCAL\_LANGUAGES Function Parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

### Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

### Examples

Returns the list of local languages used in Belgium.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
    cnt    INTEGER;  
BEGIN  
    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');  
    DBMS_OUTPUT.PUT('Count = ');  
    DBMS_OUTPUT.PUT_LINE(retval.LAST);  
    cnt := retval.FIRST;  
    WHILE cnt IS NOT NULL LOOP  
        DBMS_OUTPUT.PUT_LINE(retval(cnt));  
        cnt := retval.NEXT(cnt);  
    END LOOP;  
END;  
/  
...  
Count = 2  
DUTCH  
FRENCH
```

## 269.4.7 GET\_LOCAL\_LINGUISTIC\_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

### Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN STRING_ARRAY;
```

## Parameters

**Table 269-8 GET\_LOCAL\_LINGUISTIC\_SORTS Function Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| language  | Specifies a valid Oracle language. It is case-insensitive. |

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Displays the local linguistic sort names for `JAPANESE`.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

## 269.4.8 GET\_LOCAL\_TERRITORIES Function

This function returns the local territory names for the specified language.

## Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

## Parameters

**Table 269-9 GET\_LOCAL\_TERRITORIES Function Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| language  | Specifies a valid Oracle language. It is case-insensitive. |

## Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

## Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval    UTL_I18N.STRING_ARRAY;
    cnt       INTEGER;
BEGIN
    retval := UTL_I18N.GET_LCOAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

## 269.4.9 GET\_LOCAL\_TIME\_ZONES Function

This function returns the local time zone IDs for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

### Parameters

**Table 269-10** GET\_LOCAL\_TIME\_ZONES Function Parameters

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| territory | Specifies a valid Oracle territory. It is case-insensitive. |

### Usage Notes

If the user specifies an invalid territory name, then the function returns a `NULL` string.

### Examples

Creates a function that returns the list of time zones locally used in the territory `AZERBAIJAN` followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval utl_i18n.string_array;
```

```

    retval2 utl_i18n.string_array;
    stpos   INTEGER;
BEGIN
    retval  := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
/

```

Returns the list of local time zones for **AZERBAIJAN** followed by the common time zones with a separator string of five dashes (-----).

```

DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

```

```

```

## 269.4.10 GET\_MAX\_CHARACTER\_SIZE Function

This function returns the maximum character size of a given character set.

### Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(  
    charset_name      IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 269-11** GET\_MAX\_CHARACTER\_SIZE Function Parameters

| Parameter    | Description                                                   |
|--------------|---------------------------------------------------------------|
| charset_name | Specifies a valid character set name. It is case-insensitive. |

### Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

### Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.

## 269.4.11 GET\_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

### Syntax

```
UTL_I18N.GET_TRANSLATION (  
    parameter          IN VARCHAR2 CHARACTER SET ANY_CS,  
    trans_language     IN VARCHAR2 'AMERICAN',  
    flag               IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)  
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

### Parameters

**Table 269-12** GET\_TRANSLATION Function Parameters

| Parameter      | Description                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter      | Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.                           |
| trans_language | Specifies a translation language name. For example, <i>ITALIAN</i> is for the Italian language. The default is <i>AMERICAN</i> , which indicates American English. |

**Table 269-12 (Cont.) GET\_TRANSLATION Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flag      | <p>Specifies the translation type:</p> <ul style="list-style-type: none"><li>LANGUAGE_TRANS: The function returns the language translation.</li><li>TERRITORY_TRANS: The function returns the territory translation.</li><li>LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.</li></ul> <p>The default translation type is LANGUAGE_TRANS.</p> |

### Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

### Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
  CURSOR c1 IS
    SELECT value FROM V$NLS_VALID_VALUES
    WHERE parameter = 'LANGUAGE'
    ORDER BY value;
  retval NVARCHAR2(100);
BEGIN
  FOR item IN c1 LOOP
    retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
  END LOOP;
END;
```

## 269.4.12 MAP\_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

### Syntax

```
UTL_I18N.MAP_CHARSET(
  charset    IN VARCHAR2,
  context    IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
  flag       IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

## Parameters

**Table 269-13 MAP\_CHARSET Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charset   | Specifies the character set name to be mapped. The mapping is case-insensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| context   | GENERIC_CONTEXT   MAIL_CONTEXT<br>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.<br>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.                                                                                                                                                                                                                                                                                                                                          |
| flag      | <ul style="list-style-type: none"><li>ORACLE_TO_IANA   IANA_TO_ORACLE if GENERIC_CONTEXT is set<br/>ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.<br/>IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</li><li>MAIL_GENERIC   MAIL_WINDOWS if MAIL_CONTEXT is set<br/>MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.<br/>MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</li></ul> |

## Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the `MAP_CHARSET` function with the `ORACLE_TO_IANA` option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the `WE8DEC` character set, whose corresponding IANA name is `DEC-MCS`. If `WE8DEC` is passed to the `MAP_CHARSET` function with the `MAIL_CONTEXT` option, then the function returns `WE8ISO8859P1`. Its corresponding IANA name, `ISO-8859-1`, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the `MAP_CHARSET` function with the `MAIL_CONTEXT | MAIL_GENERIC` option with the database character set name, `WE8DEC`. The result is `WE8ISO8859P1`.
2. Convert the contents stored in the database to `WE8ISO8859P1`.
3. Call the `MAP_CHARSET` function with the `ORACLE_TO_IANA | GENERIC_CONTEXT` option with the e-mail safe character set, `WE8ISO8859P1`. The result is `ISO-8859-1`.
4. Specify `ISO-8859-1` in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns `NULL`.

**Note:**

Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

**Examples****Generic Context**

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
```

This returns 'WE8ISO8859P1'.

**Context**

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

**See Also:**

*Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

## 269.4.13 MAP\_FROM\_SHORT\_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

**Syntax**

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (  
    language          IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

**Parameters**

**Table 269-14** MAP\_FROM\_SHORT\_LANGUAGE Function Parameters

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| language  | Specifies a valid short language name. It is case-insensitive. |

**Usage Notes**

If the user specifies an invalid language name, then the function returns a `NULL` string.

**Examples**

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
  short_n VARCHAR2(10);
  ling_n VARCHAR2(50);
BEGIN
  SELECT nls_language INTO short
  FROM customers WHERE customer_id = 9000;
  ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
    UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
  DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

## 269.4.14 MAP\_LANGUAGE\_FROM\_ISO Function

This function returns an Oracle language name from an ISO locale name.

### Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 269-15** MAP\_LANGUAGE\_FROM\_ISO Function Parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| isolocale | Specifies the ISO locale. The mapping is case-insensitive. |

### Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

### Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

#### See Also:

## 269.4.15 MAP\_LOCALE\_TO\_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

## Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (  
    ora_language    IN VARCHAR2,  
    ora_territory   IN VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 269-16** MAP\_LOCALE\_TO\_ISO Function Parameters

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| ora_language  | Specifies an Oracle language name. It is case-insensitive.  |
| ora_territory | Specifies an Oracle territory name. It is case-insensitive. |

## Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

## Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en\_US'.

### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

## 269.4.16 MAP\_TERRITORY\_FROM\_ISO Function

This function returns an Oracle territory name from an ISO locale.

## Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
    isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 269-17** MAP\_TERRITORY\_FROM\_ISO Function Parameters

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| isolocale | Specifies the ISO locale. The mapping is case-insensitive. |

## Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

### Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

#### See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle territories

## 269.4.17 MAP\_TO\_SHORT\_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

### Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language    IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

### Parameters

**Table 269-18** MAP\_TO\_SHORT\_LANGUAGE Function Parameters

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| language  | Specifies a valid full language name. It is case-insensitive. |

### Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

### Examples

Returns the short language name for the language.

```
DECLARE retval VARCHAR2(100);BEGIN retval :=  
UTL_I18N.MAP_TO_SHORT_LANGUAGE('american'); DBMS_OUTPUT.PUT_LINE(retval);END;/US
```

## 269.4.18 RAW\_TO\_CHAR Functions

This function converts `RAW` data from a valid Oracle character set to a `VARCHAR2` string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(  
    data          IN RAW,  
    src_charset   IN VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (  
    data          IN RAW,  
    src_charset   IN VARCHAR2 DEFAULT NULL,  
    scanned_length OUT PLS_INTEGER,  
    shift_status  IN OUT PLS_INTEGER)  
RETURN VARCHAR2;
```

Parameters

Table 269-19 RAW\_TO\_CHAR Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data           | Specifies the RAW data to be converted to a VARCHAR2 string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| src_charset    | Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| scanned_length | Specifies the number of bytes of source data scanned                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| shift_status   | Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.<br><br><b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state. |

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets shf to SHIFT\_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```

rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g http.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

## 269.4.19 RAW\_TO\_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```

UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

## Parameters

**Table 269-20 RAW\_TO\_NCHAR Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>data</code>           | Specifies the RAW data to be converted to an NVARCHAR2 string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>src_charset</code>    | Specifies the character set that the RAW data was derived from. If <code>src_charset</code> is NULL, then the database character set is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>scanned_length</code> | Specifies the number of bytes of source data scanned                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>shift_status</code>   | Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion.<br><br><b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state. |

## Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

## Examples

### Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

### Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
```

```

remote_port => 2000);

LOOP
  tlen := utl_tcp.read_raw(conn, rvalue, 1024);
  rvalue := utl_raw.concat(rtemp, rvalue);
  nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
  if (converted_len < utl_raw.length(rvalue) )
  then
    rtemp := utl_raw.substr(rvalue, converted_len+1);
  else
    rtemp := '';
  end if;
  /* do anything you want with nvalue */
  /* e.g http.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
  WHEN utl_tcp.end_of_input THEN
    utl_tcp.close_connection(conn);
END;
```

## 269.4.20 STRING\_TO\_RAW Function

This function converts a `VARCHAR2` or `NVARCHAR2` string to another valid Oracle character set and returns the result as `RAW` data.

### Syntax

```

UTL_I18N.STRING_TO_RAW(
  data          IN VARCHAR2 CHARACTER SET ANY_CS,
  dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

### Parameters

**Table 269-21** STRING\_TO\_RAW Function Parameters

| Parameter                | Description                                                                                                                                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>data</code>        | Specifies the <code>VARCHAR2</code> or <code>NVARCHAR2</code> string to convert.                                                                                                                                                   |
| <code>dst_charset</code> | Specifies the destination character set. If <code>dst_charset</code> is <code>NULL</code> , then the database character set is used for <code>CHAR</code> data and the national character set is used for <code>NCHAR</code> data. |

### Usage Notes

If the user specifies an invalid character set, a `NULL` string, or a string whose length is 0, then the function returns a `NULL` string.

### Examples

```

DECLARE
  r raw(50);
  s varchar2(20);
BEGIN
  s:='abcdef' || chr(170);
  r:=utl_i18n.string_to_raw(s,'utf8');
  dbms_output.put_line(rawtohex(r));
```

```
end;  
/
```

This returns a hex value of '616263646566C2AA'.

## 269.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the `TRANSLITERATE` function only supports Japanese Kana conversion.

### Syntax

```
UTL_I18N.TRANSLITERATE (  
    data IN VARCHAR2 CHARACTER SET ANY_CS,  
    name IN VARCHAR2)  
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

### Parameters

**Table 269-22 TRANSLITERATE Function Parameters**

| Parameter | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| data      | Specifies the data to be converted. Either <code>CHAR</code> or <code>NCHAR</code> datatype can be specified. |
| name      | Specifies the transliteration name string. For a list of valid names, see <a href="#">Table 269-23</a> .      |

### Constants

These options specify Japanese Kana conversions.

**Table 269-23 TRANSLITERATE Function Constants**

| Constant Name         | Value                  | Description                                                                   |
|-----------------------|------------------------|-------------------------------------------------------------------------------|
| KANA_FWKATAKANA       | 'kana_fwkatkana'       | Converts any type of Kana character to a fullwidth Katakana character.        |
| KANA_HWKATAKANA       | 'kana_hwkatakana'      | Converts any type of Kana character to a halfwidth Katakana character.        |
| KANA_HIRAGANA         | 'kana_hiragana'        | Converts any type of Kana character to a fullwidth Hiragana character.        |
| FWKATAKANA_HWKATAKANA | 'fwkatkana_hwkatakana' | Converts only fullwidth Katakana characters to halfwidth Katakana characters. |
| FWKATAKANA_HIRAGANA   | 'fwkatkana_hiragana'   | Converts only fullwidth Katakana characters to fullwidth Hiragana characters. |
| HWKATAKANA_FWKATAKANA | 'hwkatkana_fwkatkana'  | Converts only halfwidth Katakana characters to fullwidth Katakana characters. |
| HWKATAKANA_HIRAGANA   | 'hwkatkana_hiragana'   | Converts only halfwidth Katakana characters to fullwidth Hiragana characters. |
| HIRAGANA_FWKATAKANA   | 'hiragana_fwkatkana'   | Converts only fullwidth Hiragana characters to fullwidth Katakana characters. |
| HIRAGANA_HWKATAKANA   | 'hiragana_hwkatakana'  | Converts only fullwidth Hiragana characters to halfwidth Katakana characters. |

### Usage Notes

The function returns the converted string.

### Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

**Figure 269-1 Loading Locale-Specific Data to the Database**

タナカ  
たなか  
タナカ

↓

たなか  
たなか  
たなか

The following statement normalizes one kana name to hiragana:

```
DECLARE
  Name  japanese_emp.ename%TYPE;
  Eno   CONSTANT NUMBER(4) := 1;
BEGIN
  SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
  name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
  UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
  WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
    DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

## 269.4.22 UNESCAPE\_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

### See Also:

"[ESCAPE\\_REFERENCE Function](#)" for more information about escape sequences

## Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (  
    str IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

## Parameters

**Table 269-24 UNESCAPE\_REFERENCE Function Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| str       | Specifies the input string |

## Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

## Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns 'hello <' || chr(229).

## 269.4.23 VALIDATE\_CHARACTER\_ENCODING Functions

This function validates the character encoding of `VARCHAR2`, `NVARCHAR2`, `CLOB`, and `NCLOB` data. The validation is based on the database character set for `VARCHAR2` and `CLOB` data and national character set for `NVARCHAR2` and `NCLOB` data.

For Unicode character sets, such as `AL32UTF8`, `AL16UTF16`, `AL16UTF16LE`, `UTF8`, and `UTFE`, any byte sequences mapped to the following Unicode code points are considered invalid:

- Unpaired surrogate code point
- Non-character code point

In addition, any irregular or illegal UTF-8 byte sequence is considered invalid for `AL32UTF8` and `UTF8` character sets.

The `VALIDATE_CHARACTER_ENCODING` function is overloaded. One function is for validating `VARCHAR2` and `NVARCHAR2` data, while the other function is for validating `CLOB` and `NCLOB` data.

- **Validating VARCHAR2 and NVARCHAR2 data**

A `VARCHAR2` or `NVARCHAR2` byte or its byte sequence is considered invalid for a character set, if it does not map to any of the characters defined in the character set.

- **Validating CLOB and NCLOB data**

A LOB character is considered invalid for a character set if a byte (in case of a single-byte database character set) or a byte pair (in case of UTF-16 encoding used with a multibyte database character set) corresponding to the encoding of the LOB character does not map to any of the characters defined in the character set.

## Syntax

This function validates VARCHAR2 and NVARCHAR2 data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (  
    data IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

This function validates CLOB and NCLOB data:

```
UTL_I18N.VALIDATE_CHARACTER_ENCODING (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

## Parameters

**Table 269-25 VALIDATE\_CHARACTER\_ENCODING Function Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| data      | VARCHAR2 or NVARCHAR2 data to validate. |
| lob_loc   | CLOB or NCLOB data to validate.         |

## Usage Notes

This function returns the offset of the first invalid byte for the VARCHAR2 or NVARCHAR2 data. It returns the offset of the first invalid character for the CLOB or NCLOB data. It returns 0, if all the bytes in the character data are valid. It returns NULL, if the value of the parameter data or lob\_loc is NULL.

## Examples

This example validates the character encoding of NVARCHAR2 and CLOB data where the database character set is AL32UTF8 while the national character set is AL16UTF16.

```
CREATE TABLE temp(col1 NVARCHAR2(20), col2 CLOB);  
INSERT INTO temp VALUES(UNISTR('foo\D800bar'), UNISTR('foo\D800bar'));  
COMMIT;  
SELECT UTL_I18N.VALIDATE_CHARACTER_ENCODING(col1) invalid_offset_column1,  
       UTL_I18N.VALIDATE_CHARACTER_ENCODING(col2) invalid_offset_column2  
FROM temp;
```

The query returns:

```
INVALID_OFFSET_COLUMN1  INVALID_OFFSET_COLUMN2  
-----  
                        7                      4
```

Here, the surrogate code point U+D800 is invalid. The number 7 is returned as INVALID\_OFFSET\_COLUMN1, because for col1, 'foo' is encoded in 6 bytes in NVARCHAR2 and the invalid code point U+D800 starts at offset 7. The number 4 is returned as INVALID\_OFFSET\_COLUMN2, because for col2, 'foo' is encoded in 3 UTF-16 code points in CLOB and the invalid code point U+D800 starts at offset 4.

# 270

## UTL\_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)

### 270.1 UTL\_IDENT Overview

The `UTL_IDENT` package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

### 270.2 UTL\_IDENT Security Model

The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`.

### 270.3 UTL\_IDENT Constants

The `UTL_IDENT` package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 270-1 UTL\_IDENT Constants**

| Constant                      | Type    | Value      | Description                        |
|-------------------------------|---------|------------|------------------------------------|
| <code>IS_ORACLE_SERVER</code> | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Server or not |
| <code>IS_ORACLE_CLIENT</code> | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Client or not |
| <code>IS_TIMESTEN</code>      | BOOLEAN | TRUE/FALSE | Stipulates if TimesTen or not      |
| <code>IS_ORACLE_FORMS</code>  | BOOLEAN | TRUE/FALSE | Stipulates if Oracle Forms or not  |

# UTL\_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL\\_INADDR Subprograms](#)

## 271.1 UTL\_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

## 271.2 UTL\_INADDR Exceptions

This table describes exceptions raised by `UTL_INADDR` subprograms.

**Table 271-1** *Exception - Internet Address Package*

| Number    | Exception             | Description                  |
|-----------|-----------------------|------------------------------|
| ORA-24247 | NETWORK_ACCESS_DENIED | Access to network is denied. |
| ORA-29257 | UNKNOWN_HOST          | The host is unknown.         |

## 271.3 UTL\_INADDR Examples

This `UTL_INADDR` example retrieves the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
END;
/
```

## 271.4 Summary of UTL\_INADDR Subprograms

This table lists the UTL\_INADDR subprograms and briefly describes them.

**Table 271-2 UTL\_INADDR Package Subprograms**

| Subprogram                                | Description                                                         |
|-------------------------------------------|---------------------------------------------------------------------|
| <a href="#">GET_HOST_ADDRESS Function</a> | Retrieves the IP address of the local or remote host given its name |
| <a href="#">GET_HOST_NAME Function</a>    | Retrieves the name of the local or remote host given its IP address |

### 271.4.1 GET\_HOST\_ADDRESS Function

This function retrieves the IP address of the specified host.

#### Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (  
    host IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;
```

#### Parameters

**Table 271-3 GET\_HOST\_ADDRESS Function Parameters**

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| host      | The name of the host to retrieve the IP address. |

#### Return Values

**Table 271-4 GET\_HOST\_ADDRESS Function Return Values**

| Parameter    | Description                                                                      |
|--------------|----------------------------------------------------------------------------------|
| host_address | The IP address of the specified host, or that of the local host if host is NULL. |

#### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

#### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

## 271.4.2 GET\_HOST\_NAME Function

This function retrieves the name of the local or remote host given its IP address.

### Syntax

```
UTL_INADDR.GET_HOST_NAME (  
    ip IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

### Parameters

**Table 271-5 GET\_HOST\_NAME Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip        | The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs. |

### Return Values

**Table 271-6 GET\_HOST\_NAME Function Return Values**

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| host_name | The name of the local or remote host of the specified IP address. |

### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

# UTL\_LMS

UTL\_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL\\_LMS Subprograms](#)

## See Also:

*Oracle Database Globalization Support Guide*

## 272.1 UTL\_LMS Security Model

This package must be created as the user SYS.

## 272.2 Summary of UTL\_LMS Subprograms

This table lists the UTL\_LMS subprograms and briefly describes them.

**Table 272-1 UTL\_LMS Package Subprograms**

| Function                                | Description                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">FORMAT_MESSAGE Function</a> | Formats a retrieved error message                                                                    |
| <a href="#">GET_MESSAGE Function</a>    | Retrieves an error message based on error number, product, facility, language, and message specified |

### 272.2.1 FORMAT\_MESSAGE Function

This function formats a message retrieved by the GET\_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

| Special Character | Description                          |
|-------------------|--------------------------------------|
| '%s'              | Substitute the next string argument  |
| '%d'              | Substitute the next integer argument |
| '%%'              | Represents the special character %   |

## Syntax

```
UTL_LMS.FORMAT_MESSAGE (  
    format IN VARCHAR2 CHARACTER SET ANY_CS,  
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)  
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

## Parameters

**Table 272-2** FORMAT\_MESSAGE Procedure Parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| format    | Specifies the string to format  |
| args      | Specifies the list of arguments |

## Examples

```
DECLARE  
    s varchar2(200);  
    i pls_integer;  
BEGIN  
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);  
    dbms_output.put_line('before format, message is: '||s);  
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,  
'my_column_name');  
END;  
/
```

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my\_column\_name.

## 272.2.2 GET\_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

### See Also:

*Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

## Syntax

```
UTL_LMS.GET_MESSAGE (  
    errnum   IN PLS_INTEGER,  
    product  IN VARCHAR2,  
    facility  IN VARCHAR2,
```

```
    language IN VARCHAR2,  
    message OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

## Parameters

**Table 272-3 GET\_MESSAGE Function Parameters**

| Parameter | Description                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| errnum    | Specifies the error number.<br>Example: '972' (for ORA-00972)                                                                                                                   |
| product   | Specifies the product to which the error message applies<br>Example: 'rdbms'                                                                                                    |
| facility  | Specifies the error message prefix<br>Example: 'ora'                                                                                                                            |
| language  | Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter. |
| message   | Specifies the output buffer for the retrieved message                                                                                                                           |

## Usage Notes

If the `language` parameter is set to NULL, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

## Examples

```
DECLARE  
    s varchar2(200);  
    i pls_integer;  
BEGIN  
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);  
    dbms_output.put_line('OCI--00601 is: '||s);  
END  
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

# UTL\_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Summary of UTL\\_MAIL Subprograms](#)

## 273.1 UTL\_MAIL Security Model

`UTL_MAIL` is not installed by default because of the `SMTP_OUT_SERVER` configuration requirement and the security exposure this involves. In installing `UTL_MAIL`, you should take steps to prevent the port defined by `SMTP_OUT_SERVER` being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*.

## 273.2 UTL\_MAIL Operational Notes

You must both install `UTL_MAIL` and define the `SMTP_OUT_SERVER`.

- To install `UTL_MAIL`:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```
- You define the `SMTP_OUT_SERVER` parameter in the `init.ora` `rdbms` initialization file. However, if `SMTP_OUT_SERVER` is not defined, this invokes a default of `DB_DOMAIN` which is guaranteed to be defined to perform appropriately.

## 273.3 UTL\_MAIL Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

## 273.4 Summary of UTL\_MAIL Subprograms

This table lists the UTL\_MAIL subprograms and briefly describes them.

**Table 273-1 UTL\_MAIL Package Subprograms**

| Subprogram                                     | Description                                                                                                                                                   |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SEND Procedure</a>                 | Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients |
| <a href="#">SEND_ATTACH_RAW Procedure</a>      | Represents the SEND Procedure overloaded for RAW attachments                                                                                                  |
| <a href="#">SEND_ATTACH_VARCHAR2 Procedure</a> | Represents the SEND Procedure overloaded for VARCHAR2 attachments                                                                                             |

### 273.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

#### Syntax

```
UTL_MAIL.SEND (  
    sender      IN    VARCHAR2 CHARACTER SET ANY_CS,  
    recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,  
    cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,  
    message     IN    VARCHAR2 CHARACTER SET ANY_CS,  
    mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',  
    priority    IN    PLS_INTEGER DEFAULT 3,  
    replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

#### Parameters

**Table 273-2 SEND Procedure Parameters**

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| sender     | Email address of the sender                                                   |
| recipients | Email addresses of the recipient(s), separated by commas                      |
| cc         | Email addresses of the CC recipient(s), separated by commas, default is NULL  |
| bcc        | Email addresses of the BCC recipient(s), separated by commas, default is NULL |
| subject    | String to be included as email subject string, default is NULL                |
| message    | Text message body                                                             |
| mime_type  | Mime type of the message, default is 'text/plain; charset=us-ascii'           |

**Table 273-2 (Cont.) SEND Procedure Parameters**

| Parameter | Description                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------|
| priority  | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| replyto   | Defines to whom the reply email is to be sent                                                                       |

## 273.4.2 SEND\_ATTACH\_RAW Procedure

This procedure is the `SEND` Procedure overloaded for `RAW` attachments.

### Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
    sender          IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients      IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc             IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type       IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
    priority        IN    PLS_INTEGER DEFAULT 3,
    attachment      IN    RAW,
    att_inline      IN    BOOLEAN DEFAULT TRUE,
    att_mime_type   IN    VARCHAR2 CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
    att_filename    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

### Parameters

**Table 273-3 SEND\_ATTACH\_RAW Procedure Parameters**

| Parameter  | Description                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------|
| sender     | Email address of the sender                                                                                         |
| recipients | Email addresses of the recipient(s), separated by commas                                                            |
| cc         | Email addresses of the CC recipient(s), separated by commas, default is NULL                                        |
| bcc        | Email addresses of the BCC recipient(s), separated by commas, default is NULL                                       |
| subject    | String to be included as email subject string, default is NULL                                                      |
| message    | Text message body                                                                                                   |
| mime_type  | Mime type of the message, default is 'text/plain; charset=us-ascii'                                                 |
| priority   | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| attachment | RAW attachment                                                                                                      |
| att_inline | Specifies whether the attachment is viewable inline with the message body, default is TRUE                          |

**Table 273-3 (Cont.) SEND\_ATTACH\_RAW Procedure Parameters**

| Parameter     | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| att_mime_type | Mime type of the attachment, default is 'application/octet'             |
| att_filename  | String specifying a filename containing the attachment, default is NULL |
| replyto       | Defines to whom the reply email is to be sent                           |

### 273.4.3 SEND\_ATTACH\_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

#### Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
    sender          IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients      IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc             IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type       IN    VARCHAR2 CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
    priority        IN    PLS_INTEGER DEFAULT 3,
    attachment      IN    VARCHAR2 CHARACTER SET ANY_CS, ,
    att_inline      IN    BOOLEAN DEFAULT TRUE,
    att_mime_type   IN    VARCHAR2 CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
    att_filename    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

#### Parameters

**Table 273-4 SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

| Parameter  | Description                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------|
| sender     | Email address of the sender                                                                                         |
| recipients | Email addresses of the recipient(s), separated by commas                                                            |
| cc         | Email addresses of the CC recipient(s), separated by commas, default is NULL                                        |
| bcc        | Email addresses of the BCC recipient(s), separated by commas, default is NULL                                       |
| subject    | String to be included as email subject string, default is NULL                                                      |
| message    | Text message body                                                                                                   |
| mime_type  | Mime type of the message, default is 'text/plain; charset=us-ascii'                                                 |
| priority   | Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3. |
| attachment | Text attachment                                                                                                     |
| att_inline | Specifies whether the attachment is inline, default TRUE                                                            |

**Table 273-4 (Cont.) SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

| Parameter     | Description                                                             |
|---------------|-------------------------------------------------------------------------|
| att_mime_type | Mime type of the attachment, default is 'text/plain; charset=us-ascii'  |
| att_filename  | String specifying a filename containing the attachment, default is NULL |
| replyto       | Defines to whom the reply email is to be sent                           |

## UTL\_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of UTL\\_MATCH Subprograms](#)

### 274.1 UTL\_MATCH Overview

`UTL_MATCH` can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, `s1` and `s2`. The distance is the number of insertions, deletions or substitutions required to transform `s1` to `s2`.

The Edit Distance between strings `shackleford` and `shackelford` = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance

**Table 274-1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms**

| String 1   | String 2  | Jaro Winkler | Edit Distance |
|------------|-----------|--------------|---------------|
| Dunningham | Cunnigham | 89           | 80            |
| Abroms     | Abrams    | 92           | 83            |
| Lampley    | Campley   | 90           | 86            |
| Marhta     | Martha    | 96           | 67            |
| Jonathon   | Jonathan  | 95           | 88            |
| Jeraldine  | Geraldine | 92           | 89            |

### 274.2 UTL\_MATCH Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

## 274.3 Summary of UTL\_MATCH Subprograms

This table lists the UTL\_MATCH subprograms and briefly describes them.

**Table 274-2 UTL\_MATCH Package Subprograms**

| Subprogram                                        | Description                                                                                                                                   |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EDIT_DISTANCE Function</a>            | Calculates the number of changes required to transform string-1 into string-2                                                                 |
| <a href="#">EDIT_DISTANCE_SIMILARITY Function</a> | Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match) |
| <a href="#">JARO_WINKLER Function</a>             | Calculates the measure of agreement between string-1 and string-2                                                                             |
| <a href="#">JARO_WINKLER_SIMILARITY Function</a>  | Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)             |

### 274.3.1 EDIT\_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

#### Syntax

```
UTL_MATCH.EDIT_DISTANCE (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

#### Parameters

**Table 274-3 EDIT\_DISTANCE Function Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| s1        | The string to be transformed                  |
| s2        | The string into which s1 is to be transformed |

#### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 2
```

### 274.3.2 EDIT\_DISTANCE\_SIMILARITY Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 274-4 EDIT\_DISTANCE\_SIMILARITY Function Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| s1        | The string to be transformed                  |
| s2        | The string into which s1 is to be transformed |

### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 82
```

## 274.3.3 JARO\_WINKLER Function

This function calculates the measure of agreement between two strings.

### Syntax

```
UTL_MATCH.JARO_WINKLER (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN BINARY_DOUBLE;
```

### Parameters

**Table 274-5 JARO\_WINKLER Function Parameters**

| Parameter | Description |
|-----------|-------------|
| s1        | Input       |
| s2        | input       |

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 9.818E-001
```

## 274.3.4 JARO\_WINKLER\_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.JARO_WINKLER_SIMILARITY (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 274-6 JARO\_WINKLER\_SIMILARITY Function Parameters**

| Parameter | Description |
|-----------|-------------|
| s1        | Input       |
| s2        | input       |

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 98
```

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

This chapter contains the following topics:

- [Overview](#)
- [Rules and Limits](#)
- [Security Model](#)
- [Subprogram Groups](#)
  - [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
  - [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
  - [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
  - [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
  - [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)
- [Summary of UTL\\_NLA Subprograms](#)

## 275.1 UTL\_NLA Overview

The `UTL_NLA` package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as `VARRAYS`.

### Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>  
<http://www.netlib.org/lapack/>

### Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

### Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS\\_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK\\_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures

that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The `UTL_NLA` package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

## 275.2 UTL\_NLA Rules and Limits

Vectors and matrices are stored in `VARRAYS` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size `RxC <= 1,000,000`.

## 275.3 UTL\_NLA Security Model

The `UTL_NLA` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

## 275.4 Subprogram Groups

The `UTL_NLA` package contains subprogram groups for BLAS and LAPACK operations.

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)

### 275.4.1 UTL\_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the `UTL_NLA` BLAS Level 1 Vector-Vector Operations subprograms.

**Table 275-1 BLAS Level 1 (Vector-Vector Operations) Subprograms**

| Subprogram                           | Description                                                      |
|--------------------------------------|------------------------------------------------------------------|
| <a href="#">BLAS_ASUM Functions</a>  | Computes the sum of the absolute values of the vector components |
| <a href="#">BLAS_AXPY Procedures</a> | Copies $\alpha X + Y$ into vector $Y$                            |
| <a href="#">BLAS_COPY Procedures</a> | Copies the contents of vector $X$ to vector $Y$                  |
| <a href="#">BLAS_DOT Functions</a>   | Returns the dot (scalar) product of two vectors $X$ and $Y$      |

**Table 275-1 (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms**

| Subprogram                           | Description                                                                             |
|--------------------------------------|-----------------------------------------------------------------------------------------|
| <a href="#">BLAS_IAMAX Functions</a> | Computes the index of the first element of a vector that has the largest absolute value |
| <a href="#">BLAS_NRM2 Functions</a>  | Computes the vector 2-norm (Euclidean norm)                                             |
| <a href="#">BLAS_ROT Procedures</a>  | Returns the plane rotation of points                                                    |
| <a href="#">BLAS_ROTG Procedures</a> | Returns the Givens rotation of points                                                   |
| <a href="#">BLAS_SCAL Procedures</a> | Scales a vector by a constant                                                           |
| <a href="#">BLAS_SWAP Procedures</a> | Swaps the contents of two vectors each of size n                                        |

## 275.4.2 UTL\_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

**Table 275-2 BLAS Level 2 (Matrix-Vector Operations) Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BLAS_GBMV Procedures</a> | Performs the matrix-vector operation $y := \alpha A^*x + \beta y$ or $y := \alpha A'^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals |
| <a href="#">BLAS_GEMV Procedures</a> | Performs the matrix-vector operations $y := \alpha A^*x + \beta y$ or $y := \alpha A'^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix                                                         |
| <a href="#">BLAS_GER Procedures</a>  | Performs a rank 1 operation $A := \alpha x^*y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix                                                                                  |
| <a href="#">BLAS_SBMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals                                        |
| <a href="#">BLAS_SPMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form                                              |
| <a href="#">BLAS_SPR Procedures</a>  | Performs a symmetric rank 1 operation $A := \alpha x^*x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form                                                             |
| <a href="#">BLAS_SPR2 Procedures</a> | Performs a symmetric rank 2 operation $A := \alpha x^*y' + \alpha y^*x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form                                            |
| <a href="#">BLAS_SBMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals                                        |
| <a href="#">BLAS_SYMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix                                                                       |

**Table 275-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BLAS_SYR Procedures</a>  | Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix                                                 |
| <a href="#">BLAS_SYR2 Procedures</a> | Performs a symmetric rank 2 operation $A := \alpha x y' + \alpha y x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix                                 |
| <a href="#">BLAS_TBMV Procedures</a> | Performs a matrix-vector operation $x := A^*x$ or $A'^*x = b$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals          |
| <a href="#">BLAS_TBSV Procedures</a> | Solves one of the systems of equation $A^*x = b$ or $A'^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals |
| <a href="#">BLAS_TPMV Procedures</a> | Performs a matrix-vector operation $x := A^*x$ or $x := A'^*x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form               |
| <a href="#">BLAS_TPSV Procedures</a> | Solves one of the systems of equation $A^*x = b$ or $A'^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form       |
| <a href="#">BLAS_TRMV Procedures</a> | Performs a matrix-vector operation $x := A^*x$ or $x := A'^*x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix                                        |
| <a href="#">BLAS_TRSV Procedures</a> | Solves one of the systems of equation $A^*x = b$ or $A'^*x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix                                |

## 275.4.3 UTL\_NLA BLAS Level 3 (Matrix-Matrix Operations) Subprograms

This table lists and briefly describes the UTL\_NLA BLAS Level 3 Matrix-Matrix Operations subprograms.

**Table 275-3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BLAS_GEMM Procedures</a> | Performs one of the matrix-vector operations $C := \alpha \text{op}(A) * \text{op}(B) + \beta C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $\text{op}(A)$ an $m$ by $k$ matrix, $\text{op}(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix |
| <a href="#">BLAS_SYMM Procedures</a> | Performs one of the matrix-vector operations $C := \alpha A^*B + \beta C$ or $C := \alpha B^*A + \beta C$ where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices                                                                                                                                            |

**Table 275-3 (Cont.) BLAS Level 3 (Matrix-Matrix Operations) Subprograms**

| Subprogram                            | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BLAS_SYR2K Procedures</a> | Performs one of the symmetric rank2 k operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ and $B$ are $n$ by $k$ matrices in the first case and $k$ by $n$ matrices in the second case |
| <a href="#">BLAS_SYRK Procedures</a>  | Performs one of the symmetric rank k operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ is an $n$ by $k$ matrix in the first case and a $k$ by $n$ matrix in the second case                                              |
| <a href="#">BLAS_TRMM Procedures</a>  | Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives                                                            |
| <a href="#">BLAS_TRSM Procedures</a>  | Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$                   |

## 275.4.4 UTL\_NLA LAPACK Driver Routines (Linear Equations) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (Linear Equations) subprograms.

**Table 275-4 LAPACK Driver Routines (Linear Equations) Subprograms**

| Subprogram                             | Description                                                                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LAPACK_GBSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ . |
| <a href="#">LAPACK_GESV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ . |
| <a href="#">LAPACK_GTSV Procedures</a> | This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.                                                                                                                |
| <a href="#">LAPACK_PBSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .     |
| <a href="#">LAPACK_POSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .          |

**Table 275-4 (Cont.) LAPACK Driver Routines (Linear Equations) Subprograms**

| Subprogram                             | Description                                                                                                                                                                                                                                                                |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LAPACK_PPSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ . |
| <a href="#">LAPACK_PTSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.                                                               |
| <a href="#">LAPACK_SPSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix stored in packed format, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .                |
| <a href="#">LAPACK_SYSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .                                        |

## 275.4.5 UTL\_NLA LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

This table lists and briefly describes the LAPACK Driver Routines (LLS and Eigenvalue) subprograms.

**Table 275-5 LAPACK Driver Routines (LLS and Eigenvalue Problems)**

| Subprogram                              | Description                                                                                                                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LAPACK_GEES Procedures</a>  | Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z * T * (Z^{**}T)$ .                                                             |
| <a href="#">LAPACK_GEEV Procedures</a>  | Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.                                                                                                                                                   |
| <a href="#">LAPACK_GELS Procedures</a>  | Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a $QR$ or $LQ$ factorization of $A$ . It is assumed that $A$ has full rank.                                                                            |
| <a href="#">LAPACK_GESDD Procedures</a> | Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic. |
| <a href="#">LAPACK_GESVD Procedures</a> | Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$ .                                                                        |
| <a href="#">LAPACK_SBEV Procedures</a>  | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$ .                                                                                                                                                                                 |
| <a href="#">LAPACK_SBEVD Procedures</a> | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.                                                     |

**Table 275-5 (Cont.) LAPACK Driver Routines (LLS and Eigenvalue Problems)**

| Subprogram                              | Description                                                                                                                                                                                                                                        |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LAPACK_SPEV Procedures</a>  | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix <i>A</i> in packed storage                                                                                                                                   |
| <a href="#">LAPACK_SPEVD Procedures</a> | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix <i>A</i> in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic. |
| <a href="#">LAPACK_STEV Procedures</a>  | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix <i>A</i>                                                                                                                                             |
| <a href="#">LAPACK_STEVD Procedures</a> | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix <i>A</i> . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.          |
| <a href="#">LAPACK_SYEV Procedures</a>  | Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix <i>A</i>                                                                                                                                                         |
| <a href="#">LAPACK_SYEVD Procedures</a> | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix <i>A</i> . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.                  |

## 275.5 Summary of UTL\_NLA Subprograms

This table lists the UTL\_NLA subprograms and briefly describes them.

**Table 275-6 UTL\_NLA Package Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                                                                                                                                    | Group                                                               |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">BLAS_ASUM Functions</a>  | Computes the sum of the absolute values of the vector components                                                                                                                                                                                                                                                               | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_AXPY Procedures</a> | Copies $\alpha * X + Y$ into vector <i>Y</i>                                                                                                                                                                                                                                                                                   | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_COPY Procedures</a> | Copies the contents of vector <i>X</i> to vector <i>Y</i>                                                                                                                                                                                                                                                                      | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_DOT Functions</a>   | Returns the dot (scalar) product of two vectors <i>X</i> and <i>Y</i>                                                                                                                                                                                                                                                          | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_GBMV Procedures</a> | Performs the matrix-vector operation $y := \alpha * A * x + \beta * y$ or $y := \alpha * A' * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, <i>x</i> and <i>y</i> are vectors and <i>A</i> is an <i>m</i> by <i>n</i> band matrix, with <i>k</i> <sub>l</sub> sub-diagonals and <i>k</i> <sub>u</sub> super-diagonals | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |

**Table 275-6 (Cont.) UTL\_NLA Package Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                                        | Group                                                               |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">BLAS_GEMM Procedures</a> | Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $\text{op}(A)$ an $m$ by $k$ matrix, $\text{op}(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix | <a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> |
| <a href="#">BLAS_GEMV Procedures</a> | Performs the matrix-vector operations $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix                                  | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_GER Procedures</a>  | Performs a rank 1 operation $A := \alpha x y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix                                                          | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_IAMAX Functions</a> | Computes the index of the first element of a vector that has the largest absolute value                                                                                                                                            | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_NRM2 Functions</a>  | Computes the vector 2-norm (Euclidean norm)                                                                                                                                                                                        | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_ROT Procedures</a>  | Returns the plane rotation of points                                                                                                                                                                                               | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_ROTG Procedures</a> | Returns the Givens rotation of points                                                                                                                                                                                              | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SBMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals                | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SCAL Procedures</a> | Scales a vector by a constant                                                                                                                                                                                                      | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SPMV Procedures</a> | Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form                      | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SPR Procedures</a>  | Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form                                     | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |

Table 275-6 (Cont.) UTL\_NLA Package Subprograms

| Subprogram                            | Description                                                                                                                                                                                                                                                                                                                                                             | Group                                                               |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">BLAS_SPR2 Procedures</a>  | Performs a symmetric rank 2 operation where <code>alpha</code> is a scalar, <code>x</code> and <code>y</code> are <code>n</code> element vectors, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix, supplied in packed form                                                                                                                   | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SWAP Procedures</a>  | Swaps the contents of two vectors each of size <code>n</code>                                                                                                                                                                                                                                                                                                           | <a href="#">BLAS Level 1 (Vector-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SYMM Procedures</a>  | Performs one of the matrix-vector operations where <code>alpha</code> and <code>beta</code> are scalars, <code>A</code> is a symmetric matrix, and <code>B</code> and <code>C</code> are <code>m</code> by <code>n</code> matrices                                                                                                                                      | <a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> |
| <a href="#">BLAS_SYMV Procedures</a>  | Performs a matrix-vector operation where <code>alpha</code> and <code>beta</code> are scalars, <code>x</code> and <code>y</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix                                                                                                                          | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SYR Procedures</a>   | Performs a symmetric rank 1 operation where <code>alpha</code> is a real scalar, <code>x</code> is an <code>n</code> element vector, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix                                                                                                                                                         | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SYR2 Procedures</a>  | Performs a symmetric rank 2 operation where <code>alpha</code> is a scalar, <code>x</code> and <code>y</code> are <code>n</code> element vectors, and <code>A</code> is an <code>n</code> by <code>n</code> symmetric matrix                                                                                                                                            | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_SYR2K Procedures</a> | Performs one of the symmetric rank2 <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> and <code>B</code> are <code>n</code> by <code>k</code> matrices in the first case and <code>k</code> by <code>n</code> matrices in the second case | <a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> |
| <a href="#">BLAS_SYRK Procedures</a>  | Performs one of the symmetric rank <code>k</code> operations where <code>alpha</code> and <code>beta</code> are scalars, <code>C</code> is an <code>n</code> by <code>n</code> symmetric matrix and <code>A</code> is an <code>n</code> by <code>k</code> matrix in the first case and a <code>k</code> by <code>n</code> matrix in the second case                     | <a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a> |
| <a href="#">BLAS_TBMV Procedures</a>  | Performs a matrix-vector operation where <code>x</code> is an <code>n</code> element vector and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals                                                                                                                                | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |
| <a href="#">BLAS_TBSV Procedures</a>  | Solves one of the systems of equation where <code>b</code> and <code>x</code> are <code>n</code> element vectors and <code>A</code> is an <code>n</code> by <code>n</code> unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals                                                                                                           | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a> |

**Table 275-6 (Cont.) UTL\_NLA Package Subprograms**

| Subprogram                             | Description                                                                                                                                                                                                                                                                                               | Group                                                                            |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <a href="#">BLAS_TPMV Procedures</a>   | Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form                                                                                                                               | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>              |
| <a href="#">BLAS_TPSV Procedures</a>   | Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form                                                                                                                     | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>              |
| <a href="#">BLAS_TRMM Procedures</a>   | Performs one of the matrix-vector operations where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $op(A)$ is one of two alternatives                                                                                                 | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>              |
| <a href="#">BLAS_TRMV Procedures</a>   | Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix                                                                                                                                                        | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>              |
| <a href="#">BLAS_TRSM Procedures</a>   | Performs one of the matrix-vector operations $op(A) * X = \alpha * B$ or $X * op(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $op(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$ | <a href="#">BLAS Level 3 (Matrix-Matrix Operations) Subprograms</a>              |
| <a href="#">BLAS_TRSV Procedures</a>   | Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix                                                                                                                                              | <a href="#">BLAS Level 2 (Matrix-Vector Operations) Subprograms</a>              |
| <a href="#">LAPACK_GBSV Procedures</a> | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .                                               | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_GEES Procedures</a> | Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z * T * (Z ** T)$ .                                                                                       | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |

**Table 275-6 (Cont.) UTL\_NLA Package Subprograms**

| Subprogram                              | Description                                                                                                                                                                                                                                                                      | Group                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <a href="#">LAPACK_GEEV Procedures</a>  | Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.                                                                                                                                                   | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_GELS Procedures</a>  | Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.                                                                                | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_GESDD Procedures</a> | Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic. | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_GESV Procedures</a>  | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .                      | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_GESVD Procedures</a> | Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$ .                                                                               | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_GTSV Procedures</a>  | This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.                                                                                                                                     | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_PBSV Procedures</a>  | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .                          | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_POSV Procedures</a>  | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .                               | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |

**Table 275-6 (Cont.) UTL\_NLA Package Subprograms**

| Subprogram                              | Description                                                                                                                                                                                                                                                                | Group                                                                            |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <a href="#">LAPACK_PPSV Procedures</a>  | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ . | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_PTSV Procedures</a>  | This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.                                                               | <a href="#">LAPACK Driver Routines (Linear Equations) Subprograms</a>            |
| <a href="#">LAPACK_SBEV Procedures</a>  | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$                                                                                                                                                                             | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_SBEVD Procedures</a> | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.                                               | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |
| <a href="#">LAPACK_SPEV Procedures</a>  | Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage                                                                                                                                                                | <a href="#">LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms</a> |

    x          IN          UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT

```

## Parameters

**Table 275-7 BLAS\_ASUM Function Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>( 1 + ( n - 1 ) * abs( incx ) )    |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |

## 275.5.2 BLAS\_AXPY Procedures

This procedure copies  $\alpha * X + Y$  into vector Y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_AXPY (
    n          IN          POSITIVEN,
    alpha      IN          SCALAR_DOUBLE,
    x          IN          UTL_NLA_ARRAY_DBL,
    incx       IN          POSITIVEN,
    y          IN OUT      UTL_NLA_ARRAY_DBL,
    incy       IN          POSITIVEN);
```

```
UTL_NLA.BLAS_AXPY (
    n          IN          POSITIVEN,
    alpha      IN          SCALAR_DOUBLE,
    x          IN          UTL_NLA_ARRAY_FLT,
    incx       IN          POSITIVEN,
    y          IN OUT      UTL_NLA_ARRAY_FLT,
    incy       IN          POSITIVEN);
```

## Parameters

**Table 275-8 BLAS\_AXPY Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| alpha     | Specifies the scalar alpha.                                                       |

**Table 275-8 (Cont.) BLAS\_AXPY Procedure Parameters**

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incx}))$ |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                    |
| y         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least<br>$(1 + (n - 1) * \text{abs}(\text{incy}))$ |
| incy      | Specifies the increment for the elements of y. incy must not be zero.                    |

## 275.5.3 BLAS\_COPY Procedures

This procedure copies the contents of vector x to vector y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_COPY (  
  n      IN      POSITIVEN,  
  x      IN      UTL_NLA_ARRAY_DBL,  
  incx   IN      POSITIVEN,  
  y      IN OUT  UTL_NLA_ARRAY_DBL,  
  incy   IN      POSITIVEN);
```

```
UTL_NLA.BLAS_COPY (  
  n      IN      POSITIVEN,  
  x      IN      UTL_NLA_ARRAY_FLT,  
  incx   IN      POSITIVEN,  
  y      IN OUT  UTL_NLA_ARRAY_FLT,  
  incy   IN      POSITIVEN);
```

### Parameters

**Table 275-9 BLAS\_COPY Procedure Parameters**

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero.        |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incx}))$ |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                    |

**Table 275-9 (Cont.) BLAS\_COPY Procedure Parameters**

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| y         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incy}))$ |
| incy      | Specifies the increment for the elements of y. incy must not be zero.                    |

## 275.5.4 BLAS\_DOT Functions

This function returns the dot (scalar) product of two vectors x and y.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_DOT (
    n      IN    POSITIVEN,
    x      IN    UTL_NLA_ARRAY_DBL,
    incx   IN    POSITIVEN,
    y      IN    UTL_NLA_ARRAY_DBL,
    incy   IN    POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_DOT (
    n      IN    POSITIVEN,
    x      IN    UTL_NLA_ARRAY_FLT,
    incx   IN    POSITIVEN,
    y      IN    UTL_NLA_ARRAY_FLT,
    incy   IN    POSITIVEN)
RETURN BINARY_FLOAT;
```

### Parameters

**Table 275-10 BLAS\_DOT Function Parameters**

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero.        |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incx}))$ |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                    |
| y         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incy}))$ |

**Table 275-10 (Cont.) BLAS\_DOT Function Parameters**

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| incy      | Specifies the increment for the elements of <i>y</i> . incy must not be zero. |

## 275.5.5 BLAS\_GBMV Procedures

This procedure performs one of the matrix-vector operations  $y := \alpha A x + \beta y$  or  $y := \alpha A^T x + \beta y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are vectors and  $A$  is an  $m$  by  $n$  band matrix, with  $kl$  sub-diagonals and  $ku$  super-diagonals.

### See Also:

```

## Parameters

**Table 275-11 BLAS\_GBMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n': <math>y := \alpha A^T x + \beta y</math></li> <li>trans = 'T' or 't': <math>y := \alpha A x + \beta y</math></li> <li>trans = 'C' or 'c': <math>y := \alpha A^H x + \beta y</math></li> </ul>                                                                                                                                                                                                                                                                    |
| m         | Specifies the number of rows of the matrix A. m must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| n         | Specifies the number of columns of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| kl        | Specifies the number of sub-diagonals of the matrix A. kl must satisfy $0 \leq kl$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ku        | Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n).</p> <p>Before entry, the leading <math>(kl + ku + 1)</math> by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on.</p> <p>Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.</p> |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $(kl + ku + 1)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| x         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> <p><math>(1 + (n - 1) * \text{abs}(\text{incx}))</math></p> <p>when trans = 'N' or 'n' and at least</p> <p><math>(1 + (m - 1) * \text{abs}(\text{incx}))</math></p> <p>otherwise. Before entry, the incremented array X must contain the vector x.</p>                                                                                                                                                                                                                                                            |
| incx      | Specifies the increment for the elements of x. Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| y         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> <p><math>(1 + (m - 1) * \text{abs}(\text{incy}))</math></p> <p>when trans = 'N' or 'n' and at least</p> <p><math>(1 + (n - 1) * \text{abs}(\text{incy}))</math></p> <p>otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.</p>                                                                                                                                                                                       |

**Table 275-11 (Cont.) BLAS\_GBMV Procedure Parameters**

| Parameter | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| incy      | Specifies the increment for the elements of <i>y</i> . Must not be zero.                                                                            |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul> |

## 275.5.6 BLAS\_GEMM Procedures

This procedure performs one of the matrix-matrix operations.

$C := \alpha * op(A) * op(B) + \beta * C$

where *op(X)* is one of

*op(X)* = *X*

or

*op(X)* = *X'*

where *alpha* and *beta* are scalars, and *A*, *B* and *C* are matrices, with *op(A)* an *m* by *k* matrix, *op(B)* a *k* by *n* matrix and *C* an *m* by *n* matrix.

## Parameters

**Table 275-12 BLAS\_GEMM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| transa    | Specifies the form of op (A) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n' : op (A) = 'A'</li> <li>transa = 'T' or 't' : op (A) = 'A'</li> <li>transa = 'C' or 'c' : op (A) = 'A'</li> </ul>                                 |
| transb    | Specifies the form of op (B) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transb = 'N' or 'n' : op (B) = B</li> <li>transb = 'T' or 't' : op (B) = B'</li> <li>transb = 'C' or 'c' : op (B) = B'</li> </ul>                                     |
| m         | Specifies the number of rows of the matrix op (A) and of the matrix C. m must be at least zero.                                                                                                                                                                                               |
| n         | Specifies the number of columns of the matrix op (B) and of the matrix C. n must be at least zero.                                                                                                                                                                                            |
| k         | Specifies the rows of the matrix op (A) and the number of columns of the matrix op (B). k must be at least zero.                                                                                                                                                                              |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                              |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max (1, k).                                                                                                                                                       |
| b         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = 'N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the array b must contain the matrix B. |
| ldb       | Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).                                                                                                                                                       |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.                                                                                                                                                                                |

**Table 275-12 (Cont.) BLAS\_GEMM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$ . |
| ldc       | Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, m)$ .                                                                                                                                                                                                 |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                              |

## 275.5.7 BLAS\_GEMV Procedures

This procedure performs one of the matrix-vector operations:  $y := \alpha * A * x + \beta * y$  or  $y := \alpha * A' * x + \beta * y$  where alpha and beta are scalars, x and y are vectors and A is an m by n matrix.

## Parameters

**Table 275-13 BLAS\_GEMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n', <math>y := \alpha * A * x + \beta * y</math></li> <li>trans = 'T' or 't', <math>y := \alpha * A^T * x + \beta * y</math></li> <li>trans = 'C' or 'c', <math>y := \alpha * A^C * x + \beta * y</math></li> </ul>                            |
| m         | Specifies the number of rows of the matrix A. m must be at least zero.                                                                                                                                                                                                                                                                         |
| n         | Specifies the number of columns of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                      |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                               |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.                                                                                                                                                                                                     |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$ .                                                                                                                                                                                                                               |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ <p>when trans = 'N' or 'n' and at least <math>(1 + (m - 1) * \text{abs}(\text{incx}))</math></p> <p>otherwise. Before entry, the incremented array X must contain the vector x.</p>                                                                      |
| incx      | Specifies the increment for the elements of x. Must not be zero.                                                                                                                                                                                                                                                                               |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.                                                                                                                                                                                                                                 |
| y         | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ <p>when trans = 'N' or 'n' and at least <math>(1 + (n - 1) * \text{abs}(\text{incy}))</math></p> <p>otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.</p> |
| incy      | Specifies the increment for the elements of y. Must not be zero.                                                                                                                                                                                                                                                                               |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                            |

# 275.5.8 BLAS\_GER Procedures

This procedure performs the rank 1 operation:  $A := \alpha * x * y' + A$  where  $\alpha$  is a scalar,  $x$  is an  $m$  element vector,  $y$  is an  $n$  element vector and  $A$  is an  $m$  by  $n$  matrix.

## 275.5.9 BLAS\_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_IAMAX (  
    n      IN    POSITIVEN,  
    x      IN    UTL_NLA_ARRAY_DBL,  
    incx   IN    POSITIVEN,  
    RETURN POSITIVEN;  
  
UTL_NLA.BLAS_IAMAX (  
    n      IN    POSITIVEN,  
    x      IN    UTL_NLA_ARRAY_FLT,  
    incx   IN    POSITIVEN,  
    RETURN POSITIVEN;
```

## Parameters

**Table 275-15 BLAS\_IAMAX Function Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least<br>( 1 + ( n - 1 ) * abs( incx ) )    |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |

## 275.5.10 BLAS\_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

## Syntax

```
UTL_NLA.BLAS_NRM2 (
    n      IN    POSITIVEN,
    x      IN    UTL_NLA_ARRAY_DBL,
    incx   IN    POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_NRM2 (
    n      IN    POSITIVEN,
    x      IN    UTL_NLA_ARRAY_FLT,
    incx   IN    POSITIVEN)
RETURN BINARY_FLOAT;
```

## Parameters

**Table 275-16 BLAS\_NRM2 Function Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>( 1 + ( n - 1 ) * abs( incx ) )    |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |

## 275.5.11 BLAS\_ROT Procedures

This procedure returns the plane rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ROT (
    n      IN      POSITIVEN,
    x      IN OUT  UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,
    y      IN OUT  UTL_NLA_ARRAY_DBL,
    incy   IN      POSITIVEN,
    c      IN      SCALAR_DOUBLE,
    s      IN      SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROT (
    n      IN      POSITIVEN,
    x      IN OUT  UTL_NLA_ARRAY_FLT,
    incx   IN      POSITIVEN,
    y      IN OUT  UTL_NLA_ARRAY_FLT,
    incy   IN      POSITIVEN,
    c      IN      SCALAR_DOUBLE,
    s      IN      SCALAR_DOUBLE);
```

### Parameters

**Table 275-17 BLAS\_ROT Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>(1+(n-1)* abs(incx))               |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |
| y         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least<br>(1+(n-1)*abs(incy))                |
| incy      | Specifies the increment for the elements of y. incy must not be zero.             |
| c         | SCALAR_FLOAT/DOUBLE.Specifies the scalar C.                                       |
| s         | SCALAR_FLOAT/DOUBLE.Specifies the scalar S.                                       |

## 275.5.12 BLAS\_ROTG Procedures

This procedure returns the Givens rotation of points.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ROTG (
    a    IN OUT  SCALAR_DOUBLE,
    b    IN OUT  SCALAR_DOUBLE,
    c    IN OUT  SCALAR_DOUBLE,
    s    IN OUT  SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROTG (
    a    IN OUT  SCALAR_FLOAT,
    b    IN OUT  SCALAR_FLOAT,
    c    IN OUT  SCALAR_FLOAT,
    s    IN OUT  SCALAR_FLOAT);
```

### Parameters

**Table 275-18 BLAS\_ROTG Procedure Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| a         | SCALAR_FLOAT/DOUBLE. Specifies the scalar A. |
| b         | SCALAR_FLOAT/DOUBLE. Specifies the scalar B. |
| c         | SCALAR_FLOAT/DOUBLE. Specifies the scalar C. |
| s         | SCALAR_FLOAT/DOUBLE. Specifies the scalar S. |

## 275.5.13 BLAS\_SCAL Procedures

This procedure scales a vector by a constant.

### See Also:

[BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SCAL (
    n      IN  POSITIVEN,
    alpha  IN  SCALAR_DOUBLE,
    x      IN  OUT UTL_NLA_ARRAY_DBL,
    incx   IN  POSITIVEN);
```

```
UTL_NLA.BLAS_SCAL (  
    n      IN  POSITIVEN,  
    alpha  IN  SCALAR_FLOAT,  
    x      IN  OUT UTL_NLA_ARRAY_FLT,  
    incx   IN  POSITIVEN);
```

**Parameters**

**Table 275-19    BLAS\_SCAL Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| alpha     | Specifies the scalar alpha.                                                       |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>(1+(n-1)*abs(incx))                |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |

275.5.14 BLAS\_SPMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha A x + \beta y$ , where alpha and beta are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form.

## 275.5.16 BLAS\_SPR2 Procedures

This procedure performs the rank 2 operation  $A := \alpha * x * y' + \alpha * y * x' + A$ , where  $\alpha$  is a scalar,  $x$  and  $y$  are  $n$  element vectors, and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

## 275.5.17 BLAS\_SBMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha A x + \beta y$ , where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric band matrix, with  $k$  super-diagonals.

### Parameters

**Table 275-23 BLAS\_SBMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the upper or lower triangular part of the band matrix $A$ is being supplied: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. The upper triangular part of <math>A</math> is supplied.</li> <li>uplo = 'L' or 'l'. The lower triangular part of <math>A</math> is supplied.</li> </ul> |
| n         | Specifies the order of the matrix $A$ . $n$ must be at least zero.                                                                                                                                                                                                                                                |
| k         | Specifies the number of super-diagonals of the matrix $A$ . $k$ must satisfy $0 \leq k$ .                                                                                                                                                                                                                         |

**Table 275-23 (Cont.) BLAS\_SBMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Unchanged on exit</p> |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| x         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> <p>(1+(n-1)*abs(incx))</p> <p>Before entry, the incremented array X must contain the n element vector x.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| incx      | Specifies the increment for the elements of x. Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| y         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> <p>(1+(n-1)*abs(incy))</p> <p>Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| incy      | Specifies the increment for the elements of y. Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 275.5.18 BLAS\_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

### Syntax

```

UTL_NLA.BLAS_SWAP (
    n      IN      POSITIVEN,
    x      IN OUT  UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,
    y      IN OUT  UTL_NLA_ARRAY_DBL,
    incy   IN      POSITIVEN);

```

```
UTL_NLA.BLAS_SWAP (  
    n      IN      POSITIVEN,  
    x      IN OUT  UTL_NLA_ARRAY_FLT,  
    incx   IN      POSITIVEN,  
    y      IN OUT  UTL_NLA_ARRAY_FLT,  
    incy   IN      POSITIVEN);
```

Parameters

Table 275-24 BLAS\_SWAP Procedure Parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| n         | Specifies the number of elements of the vectors x and y. n must be at least zero. |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>(1+(n-1)*abs(incx))                |
| incx      | Specifies the increment for the elements of x. incx must not be zero.             |
| y         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least<br>(1+(n-1)*abs(incy))                |
| incy      | Specifies the increment for the elements of y. incy must not be zero.             |

275.5.19 BLAS\_SYMM Procedures

This procedure performs one of the matrix-matrix operations  $C := \alpha A * B + \beta C$  or  $C := \alpha B * A + \beta C$ , where  $\alpha$  and  $\beta$  are scalars, A is a symmetric matrix, and B and C are m by n matrices.

## Parameters

**Table 275-25 BLAS\_SYMM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| side      | Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l': <math>C := \alpha * A * B + \beta * C</math></li> <li>side = 'R' or 'r': <math>C := \alpha * B * A + \beta * C</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| uplo      | Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u': Only the upper triangular part of the symmetric matrix is to be referenced.</li> <li>uplo = 'L' or 'l': Only the lower triangular part of the symmetric matrix is to be referenced.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| m         | Specifies the number of rows of the matrix C. m must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| n         | Specifies the number of columns of the matrix C. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is m when side = 'L' or 'l', and is n otherwise.</p> <p>Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.</p> <p>Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.</p> |

**Table 275-25 (Cont.) BLAS\_SYMM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lda       | Specifies the first dimension of <i>a</i> as declared in the calling (sub) program. When <i>side</i> = 'L' or 'l', <i>lda</i> must be at least $\max(1, m)$ , otherwise <i>lda</i> must be at least $\max(1, n)$ .                                                                                                                                  |
| b         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <i>ldb</i> , <i>n</i> ).<br>Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>B</i> must contain the matrix <i>B</i> .                                                                                                                                                                       |
| ldb       | Specifies the first dimension of <i>b</i> as declared in the calling (sub) program. <i>ldb</i> must be at least $\max(1, m)$ .                                                                                                                                                                                                                      |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>c</i> need not be set on input.                                                                                                                                                                                                                |
| c         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <i>ldc</i> , <i>n</i> ). Before entry, the leading <i>m</i> by <i>n</i> part of the array <i>C</i> must contain the matrix <i>C</i> , except when <i>beta</i> is zero, in which case <i>C</i> need not be set on entry. On exit, the array <i>C</i> is overwritten by the <i>m</i> by <i>n</i> updated matrix. |
| ldc       | Specifies the first dimension of <i>C</i> as declared in the calling (sub) program. <i>ldc</i> must be at least $\max(1, m)$ .                                                                                                                                                                                                                      |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                 |

## 275.5.20 BLAS\_SYMV Procedures

This procedure performs the matrix-vector operation  $y := \alpha A x + \beta y$ , where  $\alpha$  and  $\beta$  are scalars, *x* and *y* are *n* element vectors and *A* is an *n* by *n* symmetric matrix.

## 275.5.22 BLAS\_SYR2 Procedures

This procedure performs the rank 2 operation  $A := \alpha x y' + \alpha y x' + A$ , where  $\alpha$  is a scalar,  $x$  and  $y$  are  $n$  element vectors, and  $A$  is an  $n$  by  $n$  symmetric matrix.

## Parameters

**Table 275-28 BLAS\_SYR2 Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of A is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of A is to be referenced.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                           |
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| alpha     | Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incx}))$<br>Before entry, the incremented array X must contain the m element vector x.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| y         | UTL_NLA_ARRAY_FLT/DBL of dimension at least<br>$(1 + (n - 1) * \text{abs}(\text{incy}))$<br>Before entry, the incremented array Y must contain the m element vector y.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| incy      | Specifies the increment for the elements of y. incy must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n)<br>With uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix.<br>With uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least<br>$\max(1, n)$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 275.5.23 BLAS\_SYR2K Procedures

It performs one of the symmetric rank2 k operations  $C := \alpha A B' + \alpha B A' + \beta C$  or  $C := \alpha A' B + \alpha B' A + \beta C$ , where  $\alpha$  and  $\beta$  are scalars,  $C$  is an  $n$  by  $n$  symmetric matrix and  $A$  and  $B$  are  $n$  by  $k$  matrices in the first case and  $k$  by  $n$  matrices in the second case.

## Parameters

**Table 275-29 BLAS\_SYR2K Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the upper or lower triangular part of the array C is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.</li> </ul>                                                             |
| trans     | Specifies the operations to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n': <math>C := \alpha * A * B' + \alpha * B * A' + \beta * C</math></li> <li>trans = 'T' or 't': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> <li>trans = 'C' or 'c': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> </ul> |
| n         | Specifies the order of matrix C. n must be at least zero.                                                                                                                                                                                                                                                                                                                 |
| k         | On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.                                                                                                                                     |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                          |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is k when trans = 'N' or 'n', and is n otherwise.</p> <p>Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.</p>                                                                  |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least $\max(1, n)$ , otherwise lda must be at least $\max(1, k)$ .                                                                                                                                                                                   |
| b         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is k when trans = 'N' or 'n', and is n otherwise.</p> <p>Before entry with trans = 'N' or 'n', the leading n by k part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.</p>                                                                  |
| ldb       | Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least $\max(1, n)$ , otherwise ldb must be at least $\max(1, k)$ .                                                                                                                                                                                   |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.                                                                                                                                                                                                                                                                                                                           |

**Table 275-29 (Cont.) BLAS\_SYR2K Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| c         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n).</p> <p>Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix.</p> <p>Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.</p> |
| ldc       | Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, n)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 275.5.24 BLAS\_SYRK Procedures

This procedure performs one of the symmetric rank k operations  $C := \alpha A A^T + \beta C$  or  $C := \alpha A^T A + \beta C$ , where  $\alpha$  and  $\beta$  are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case.

## Parameters

**Table 275-30 BLAS\_SYRK Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the upper or lower triangular part of the array C is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| trans     | Specifies the operations to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n' : <math>C := \alpha * A * A' + \beta * C</math></li> <li>trans = 'T' or 't' : <math>C := \alpha * A' * A + \beta * C</math></li> <li>trans = 'C' or 'c' : <math>C := \alpha * A' * A + \beta * C</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| n         | Specifies the order of matrix C. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| k         | On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when trans = 'N' or 'n', and is n otherwise.<br>Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least $\max(1, n)$ , otherwise lda must be at least $\max(1, k)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| beta      | SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| c         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n).<br>Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix.<br>Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix. |
| ldc       | Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, n)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 275-30 (Cont.) BLAS\_SYRK Procedure Parameters**

| Parameter | Description                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul> |

## 275.5.25 BLAS\_TBMV Procedures

This procedure performs the matrix-vector operations  $x := A * x$  or  $x := A' * x$ , where  $x$  is an  $n$  element vector and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k+1)$  diagonals.

## Parameters

**Table 275-31 BLAS\_TBMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n' <math>x := A * x</math></li> <li>trans = 'T' or 't' <math>x := A' * x</math></li> <li>trans = 'C' or 'c' <math>x := A' * x</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| k         | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.</li> <li>with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.</li> </ul> K must satisfy $0 \leq k$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( lda, n ).</p> <p>Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.</p> |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| incx      | Specifies the increment for the elements of x. Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 275.5.26 BLAS\_TBSV Procedures

This procedure solves one of the systems of equations  $A*x = b$  or  $A'*x = b$ , where  $b$  and  $x$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k+1)$  diagonals.

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| k         | <p>Specifies whether or not A is unit triangular:</p> <ul style="list-style-type: none"> <li>with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.</li> <li>with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.</li> </ul> <p>K must satisfy <math>0 \leq k</math>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n).</p> <p>Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.</p> |
| lda       | On entry, lda specifies the first dimension of A as declared in the calling (sub) program. lda must be at least (k+1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| x         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> $(1 + (n - 1) * \text{abs}(\text{incx}))$ <p>Before entry, the incremented array X must contain the n element right-hand side vector b.</p> <p>On exit, X is overwritten with the solution vector x.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

# 275.5.27 BLAS\_TPMV Procedures

This procedure performs the matrix-vector operations  $x := A * x$  or  $x := A' * x$ , where  $x$  is an  $n$  element vector and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

## 275.5.28 BLAS\_TPSV Procedures

This procedure solves one of the systems of equations  $A*x = b$  or  $A'*x = b$ , where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

## Parameters

**Table 275-34 BLAS\_TPSV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : A is a lower triangular matrix.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n' : <math>A*x = b</math></li> <li>trans = 'T' or 't' : <math>A'*x = b</math></li> <li>trans = 'C' or 'c' : <math>A'*x = b</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u' : A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n' : A is not assumed to be unit triangular.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ap        | UTL_NLA_ARRAY_FLT/DBL of dimension at least $((n*(n+1))/2)$ <p>Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on.</p> <p>Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on.</p> <p>Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity.</p> |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ <p>Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| incx      | Specifies the increment for the elements of x. incx must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 275.5.29 BLAS\_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where alpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

## Parameters

**Table 275-35 BLAS\_TRMM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| side      | Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l': <math>B := \alpha * op(A) * B</math></li> <li>side = 'R' or 'r': <math>B := \alpha * B * op(A)</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                     |
| uplo      | Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u': A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l': A is a lower triangular matrix.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                             |
| transa    | Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n': <math>op(A) = A</math></li> <li>transa = 'T' or 't': <math>op(A) = A'</math></li> <li>transa = 'C' or 'c': <math>op(A) = A^H</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                                           |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u': A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n': A is not assumed to be unit triangular.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| m         | Specifies the number of rows of the B. m must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| n         | Specifies the number of columns of B. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| a         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'.<br><br>Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced.<br><br>Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.<br><br>Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity. |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$ , otherwise lda must be at least $\max(1, n)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| b         | UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n).<br><br>Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ldb       | Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 275.5.30 BLAS\_TRMV Procedures

This procedure performs the matrix-vector operations  $x := A * x$  or  $x := A' * x$ , where  $x$  is an  $n$  element vector and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular matrix.

### Parameters

**Table 275-36 BLAS\_TRMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>          |
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n' <math>x := A * x</math></li> <li>trans = 'T' or 't' <math>x := A' * x</math></li> <li>trans = 'C' or 'c' <math>x := A' * x</math></li> </ul> |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>                     |
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                   |

**Table 275-36 (Cont.) BLAS\_TRMV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry with <code>uplo = 'U' or 'u'</code>, the leading <code>n</code> by <code>n</code> upper triangular part of the array <code>A</code> must contain the upper triangular matrix and the strictly lower triangular part of <code>A</code> is not referenced.</p> <p>Before entry with <code>uplo = 'L' or 'l'</code>, the leading <code>n</code> by <code>n</code> lower triangular part of the array <code>A</code> must contain the lower triangular matrix and the strictly upper triangular part of <code>A</code> is not referenced.</p> <p>Note that when <code>diag = 'U' or 'u'</code>, the diagonal elements of <code>A</code> are not referenced either, but are assumed to be unity</p> |
| lda       | Specifies the first dimension of <code>a</code> as declared in the calling (sub) program. <code>lda</code> must be at least <code>max(1, n)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| x         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <code>(1 + (n-1) * as(incx))</code>.</p> <p>Before entry, the incremented array <code>X</code> must contain the <code>n</code> element vector <code>x</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| incx      | Specifies the increment for the elements of <code>x</code> . Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 275.5.31 BLAS\_TRSM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the matrix-matrix operations:

`op( A ) * X = alpha * B`

or

`X * op( A ) = alpha * B`

where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

`op( A ) = A`

or

`op( A ) = A'`

The matrix `X` is overwritten on `B`.

| Parameter | Description                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| side      | Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l': <math>op(A) * X = \alpha * B</math></li> <li>side = 'R' or 'r': <math>X * op(A) = \alpha * B</math></li> </ul>                             |
| uplo      | Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u': A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l': A is a lower triangular matrix.</li> </ul>                                   |
| transa    | Specifies the form of $op(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n': <math>op(A) = A</math></li> <li>transa = 'T' or 't': <math>op(A) = A'</math></li> <li>transa = 'C' or 'c': <math>op(A) = A^H</math></li> </ul> |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u': A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n': A is not assumed to be unit triangular.</li> </ul>                                                                  |
| m         | Specifies the number of rows of the B. m must be at least zero.                                                                                                                                                                                                                              |
| n         | Specifies the number of columns of B. n must be at least zero.                                                                                                                                                                                                                               |

**Table 275-37 (Cont.) BLAS\_TRSM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alpha     | SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'.</p> <p>Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.</p> <p>Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.</p> |
| lda       | Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max(1, n).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| b         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n).</p> <p>Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ldb       | Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 275.5.32 BLAS\_TRSV Procedures

This procedure solves one of the systems of equations  $A*x = b$  or  $A'*x = b$ , where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

## Parameters

**Table 275-38 BLAS\_TRSV Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uplo      | Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                  |
| trans     | Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n'. <math>A * x = b</math></li> <li>trans = 'T' or 't'. <math>A^T * x = b</math></li> <li>trans = 'C' or 'c'. <math>A^C * x = b</math></li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| diag      | Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                             |
| n         | Specifies the order of the matrix A. n must be at least zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| a         | <p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced.</p> <p>Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.</p> <p>Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.</p> |
| lda       | Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least $\max(1, n)$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| x         | <p>UTL_NLA_ARRAY_FLT/DBL of dimension at least</p> <p><math>(1 + (n - 1) * \text{abs}(\text{incx}))</math></p> <p>Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.</p>                                                                                                                                                                                                                                                                                                                                  |
| incx      | Specifies the increment for the elements of x. Must not be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## 275.5.33 LAPACK\_GBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is a band matrix of order  $n$  with  $kl$  sub diagonals and  $ku$  superdiagonals, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor  $A$  as

$$a = L * U$$

where  $L$  is a product of permutation and unit lower triangular matrices with  $kl$  sub diagonals, and  $U$  is upper triangular with  $kl+ku$  superdiagonals. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

## 275.5.34 LAPACK\_GEES Procedures

This procedure computes for an  $n$  by  $n$  real nonsymmetric matrix  $A$ , the eigenvalues, the real Schur form  $T$ , and, optionally, the matrix of Schur vectors  $Z$ .

This gives the Schur factorization  $A = Z * T * (Z^* T)^*$ .

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where  $b*c < 0$ . The eigenvalues of such a block are  $a \pm \sqrt{bc}$ .

## 275.5.35 LAPACK\_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an  $m$  by  $n$  matrix  $A$ , or its transpose, using a QR or LQ factorization of  $A$ . It is assumed that  $A$  has full rank.

The following options are provided:

- If TRANS = 'N' and  $m \geq n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem.  

$$\text{minimize } || B - A * X ||$$
- If TRANS = 'N' and  $m < n$ : find the minimum norm solution of an underdetermined system  

$$A * X = B.$$
- If TRANS = 'T' and  $m \geq n$ : find the minimum norm solution of an undetermined system  

$$A^{**T} * X = B.$$
- If TRANS = 'T' and  $m < n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem  $\text{minimize } || B - A^{**T} * X ||.$

## 275.5.36 LAPACK\_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real  $m \times n$  matrix **A**, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * SIGMA * \text{transpose}(V)$$

where **SIGMA** is an  $m \times n$  matrix which is zero except for its  $\min(m, n)$  diagonal elements, **U** is an  $m \times m$  orthogonal matrix, and **V** is an  $n \times n$  orthogonal matrix. The diagonal elements of **SIGMA** are the singular values of **A**, they are real and non-negative, and are returned in descending order. The first  $\min(m, n)$  columns of **U** and **V** are the left and right singular vectors of **A**.

Note that the routine returns  $V^{**T}$ , not **V**.

## 275.5.37 LAPACK\_GESV Procedure

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n matrix and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = P * L * U$$

where P is a permutation matrix, L is unit lower triangular, and U is upper triangular. The factored form of a is then used to solve the system of equations

$$a * x = b$$

## 275.5.38 LAPACK\_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real  $m$  by  $n$  matrix  $A$ , optionally computing the left and/or right singular vectors.

The SVD is written

$$A = U * SIGMA * \text{transpose}(V)$$

where  $SIGMA$  is an  $m$  by  $n$  matrix which is zero except for its  $\min(m, n)$  diagonal elements,  $U$  is an  $m$  by  $m$  orthogonal matrix, and  $V$  is an  $n$  by  $n$  orthogonal matrix. The diagonal elements of  $SIGMA$  are the singular values of  $A$ , they are real and non-negative, and are returned in descending order. The first  $\min(m, n)$  columns of  $U$  and  $V$  are the left and right singular vectors of  $A$ .

Note that the routine returns  $V^{**T}$ , not  $V$ .

## 275.5.39 LAPACK\_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector  $v(j)$  of A satisfies  $A * v(j) = \text{lambda}(j) * v(j)$  where  $\text{lambda}(j)$  is its eigenvalue.
- The left eigenvector  $u(j)$  of A satisfies  $u(j)^{*H} * A = \text{lambda}(j) * u(j)^{*H}$  where  $u(j)^{*H}$  denotes the conjugate transpose of  $u(j)$ .

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

## 275.5.40 LAPACK\_GTSV Procedure

This procedure solves the equation  $a * x = b$ , where  $a$  is an  $n$  by  $n$  tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation  $a * x = b$  may be solved by interchanging the order of the arguments `du` and `dl`.

| Parameter | Description                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n         | The order of the matrix a .n >= 0                                                                                                                                                                                                                                                                     |
| nrhs      | The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.                                                                                                                                                                                                            |
| dl        | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1).<br>On entry, dl must contain the (n-1) sub-diagonal elements of a.<br>On exit, dl is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix U from the LU factorization of a, in dl(1) , . . . , dl(n-2).              |
| d         | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n).<br>On entry, d must contain the diagonal elements of a.<br>On exit, d is overwritten by the n diagonal elements of U.                                                                                                                                           |
| du        | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1).<br>On entry, du must contain the (n-1) super-diagonal elements of a.<br>On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.                                                                                                    |
| b         | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs).<br>On entry, the n by nrhs matrix of right hand side matrix b.<br>On exit, if info = 0, the n by nrhs solution matrix X.                                                                                                                                |
| ldb       | The leading dimension of the array b.<br>ldb >= max (1, n)                                                                                                                                                                                                                                            |
| info      | <ul style="list-style-type: none"> <li>= 0 : successful exit</li> <li>&lt; 0 : if info = -i , the i-th argument had an illegal value</li> <li>&gt; 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.</li> </ul> |
| pack      | (Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                   |

## 275.5.41 LAPACK\_PBSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is an  $n$  by  $n$  symmetric positive definite band matrix and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The Cholesky decomposition is used to factor  $A$  as

$A = U^{**T} * U$  if  $UPLO = 'U'$

or

$A = L * L^{**T}$  if  $UPLO = 'L'$

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## 275.5.42 LAPACK\_POSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an  $n$  by  $n$  symmetric positive definite matrix and x and b are  $n$  by  $nrhs$  matrices.

The Cholesky decomposition is used to factor A as

$A = U^*U$  if `uplo = 'U'`

or

$A = L * L^*$  if `UPLO = 'L'`

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## 275.5.43 LAPACK\_PPSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$  where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

$A = U^{*T} * U$  if UPLO = 'U'

or

$A = L * L^{*T}$  if UPLO = 'L'

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations  $A * X = B$ .

## 275.5.44 LAPACK\_PTSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where  $a$  is an  $n$  by  $n$  symmetric positive definite tridiagonal matrix, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

$a$  is factored as  $A = L * D * L^{**T}$ , and the factored form of  $a$  is then used to solve the system of equations.

## 275.5.46 LAPACK\_SBEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

## 275.5.47 LAPACK\_SPEV Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix **A** in packed storage.

## 275.5.48 LAPACK\_SPEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm. The divide and conquer algorithm makes very mild assumptions about floating point arithmetic.

## 275.5.49 LAPACK\_SPSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric matrix stored in packed format, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$A = U * D * U^{*T}$ , if UPLO = 'U'

or

$A = L * D * L^{*T}$ , if UPLO = 'L'

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations  $A * X = B$ .

## 275.5.51 LAPACK\_STEVD Procedures

This procedure computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

## 275.5.53 LAPACK\_SYEVD Procedures

This procedure computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

### Syntax

```

UTL_NLA.LAPACK_SYEVD (
    jobz      IN      flag,
    uplo      IN      flag,
    n         IN      POSITIVE,
    a         IN OUT  UTL_NLA_ARRAY_DBL,
    lda       IN      POSITIVE,
    w         IN OUT  UTL_NLA_ARRAY_DBL,
    info      OUT     INTEGER,
    pack      IN      flag DEFAULT 'C');
  
```

```
UTL_NLA.LAPACK_SYEVD (  
    jobz      IN      flag,  
    uplo      IN      flag,  
    n         IN      POSITIVE,  
    a         IN OUT  UTL_NLA_ARRAY_FLT,  
    lda       IN      POSITIVE,  
    w         IN OUT  UTL_NLA_ARRAY_FLT,  
    info      OUT     INTEGER,  
    pack      IN      flag DEFAULT 'C');
```

Parameters

Table 275-59 LAPACK\_SYEVD Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

275.5.54 LAPACK\_SYSV Procedures

This procedure computes the solution to a real system of linear equations  $a * x = b$ , where a is an n by n symmetric matrix, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$A = U * D * U^{**T}$ , if UPLO = 'U'

or

$A = L * D * L^{**T}$ , if UPLO = 'L'

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations  $A * X = B$ .

| pack      | <p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# UTL\_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of UTL\\_RAW Subprograms](#)

## 276.1 UTL\_RAW Overview

This package is necessary because normal SQL functions do not operate on `RAW`s, and PL/SQL does not allow overloading between a `RAW` and a `CHAR` datatype. `UTL_RAW` also includes subprograms that convert various COBOL number formats to, and from, `RAW`s.

`UTL_RAW` is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix `UTL` has been given to the package, instead of `DBMS`.

## 276.2 UTL\_RAW Operational Notes

`UTL_RAW` allows a `RAW` "record" to be composed of many elements. By using the `RAW` datatype, character set conversion will not be performed, keeping the `RAW` in its original format when being transferred through remote procedure calls.

With the `RAW` functions, you can manipulate binary data that was previously limited to the `hexraw` and `rawtohex` functions.

### Note:

Notes on datatypes:

- The `PLS_INTEGER` and `BINARY_INTEGER` datatypes are identical. This document uses `BINARY_INTEGER` to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
- The `INTEGER` and `NUMBER(38)` datatypes are also identical. This document uses `INTEGER` throughout.

## 276.3 Summary of UTL\_RAW Subprograms

This table lists the `UTL_RAW` subprograms and briefly describes them.

**Table 276-1 UTL\_RAW Package Subprograms**

| Subprogram                                        | Description                                                                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BIT_AND Function</a>                  | Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW                                 |
| <a href="#">BIT_COMPLEMENT Function</a>           | Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW                               |
| <a href="#">BIT_OR Function</a>                   | Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW                                   |
| <a href="#">BIT_XOR Function</a>                  | Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW                        |
| <a href="#">CAST_FROM_BINARY_DOUBLE Function</a>  | Returns the RAW binary representation of a BINARY_DOUBLE value                                                                        |
| <a href="#">CAST_FROM_BINARY_FLOAT Function</a>   | Returns the RAW binary representation of a BINARY_FLOAT value                                                                         |
| <a href="#">CAST_FROM_BINARY_INTEGER Function</a> | Returns the RAW binary representation of a BINARY_INTEGER value                                                                       |
| <a href="#">CAST_FROM_NUMBER Function</a>         | Returns the RAW binary representation of a NUMBER value                                                                               |
| <a href="#">CAST_TO_BINARY_DOUBLE Function</a>    | Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE                                                           |
| <a href="#">CAST_TO_BINARY_FLOAT Function</a>     | Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT                                                             |
| <a href="#">CAST_TO_BINARY_INTEGER Function</a>   | Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER                                                         |
| <a href="#">CAST_TO_NUMBER Function</a>           | Casts the RAW binary representation of a NUMBER into a NUMBER                                                                         |
| <a href="#">CAST_TO_NVARCHAR2 Function</a>        | Converts a RAW value into a NVARCHAR2 value                                                                                           |
| <a href="#">CAST_TO_RAW Function</a>              | Converts a VARCHAR2 value into a RAW value                                                                                            |
| <a href="#">CAST_TO_VARCHAR2 Function</a>         | Converts a RAW value into a VARCHAR2 value                                                                                            |
| <a href="#">COMPARE Function</a>                  | Compares RAW r1 against RAW r2                                                                                                        |
| <a href="#">CONCAT Function</a>                   | Concatenates up to 12 RAWs into a single RAW                                                                                          |
| <a href="#">CONVERT Function</a>                  | Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW                              |
| <a href="#">COPIES Function</a>                   | Returns n copies of r concatenated together                                                                                           |
| <a href="#">LENGTH Function</a>                   | Returns the length in bytes of a RAW r                                                                                                |
| <a href="#">OVERLAY Function</a>                  | Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes |
| <a href="#">REVERSE Function</a>                  | Reverses a byte sequence in RAW r from end to end                                                                                     |
| <a href="#">SUBSTR Function</a>                   | Returns len bytes, starting at pos from RAW r                                                                                         |
| <a href="#">TRANSLATE Function</a>                | Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set                            |
| <a href="#">TRANSLITERATE Function</a>            | Converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set                          |

**Table 276-1 (Cont.) UTL\_RAW Package Subprograms**

| Subprogram                       | Description                                                                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">X RANGE Function</a> | Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code> |

## 276.3.1 BIT\_AND Function

This function performs bitwise logical "and" of the values in RAW `r1` with RAW `r2` and returns the "anded" result RAW.

### Syntax

```
UTL_RAW.BIT_AND (  
    r1 IN RAW,  
    r2 IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-2 BIT\_AND Function Parameters**

| Parameter       | Description                       |
|-----------------|-----------------------------------|
| <code>r1</code> | RAW to "and" with <code>r2</code> |
| <code>r2</code> | RAW to "and" with <code>r1</code> |

### Return Values

**Table 276-3 BIT\_AND Function Return Values**

| Return | Description                                                        |
|--------|--------------------------------------------------------------------|
| RAW    | Containing the "and" of <code>r1</code> and <code>r2</code>        |
| NULL   | Either <code>r1</code> or <code>r2</code> input parameter was NULL |

### Usage Notes

If `r1` and `r2` differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 276.3.2 BIT\_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complemented result RAW. The result length equals the input RAW *r* length.

### Syntax

```
UTL_RAW.BIT_COMPLEMENT (  
    r IN RAW)  
    RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-4 BIT\_COMPLEMENT Function Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| <i>r</i>  | RAW to perform "complement" operation |

### Return Values

**Table 276-5 BIT\_COMPLEMENT Function Return Values**

| Return | Description                          |
|--------|--------------------------------------|
| RAW    | The "complement" of <i>r1</i>        |
| NULL   | If <i>r</i> input parameter was NULL |

## 276.3.3 BIT\_OR Function

This function performs bitwise logical "or" of the values in RAW *r1* with RAW *r2* and returns the or'd result RAW.

### Syntax

```
UTL_RAW.BIT_OR (  
    r1 IN RAW,  
    r2 IN RAW)  
    RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-6 BIT\_OR Function Parameters**

| Parameters | Description                |
|------------|----------------------------|
| <i>r1</i>  | RAW to "or" with <i>r2</i> |

**Table 276-6 (Cont.) BIT\_OR Function Parameters**

| Parameters | Description         |
|------------|---------------------|
| r2         | RAW to "or" with r1 |

**Return Values****Table 276-7 BIT\_OR Function Return Values**

| Return | Description                              |
|--------|------------------------------------------|
| RAW    | Containing the "or" of r1 and r2         |
| NULL   | Either r1 or r2 input parameter was NULL |

**Usage Notes**

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 276.3.4 BIT\_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

**Syntax**

```
UTL_RAW.BIT_XOR (  
    r1 IN RAW,  
    r2 IN RAW)  
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 276-8 BIT\_XOR Function Parameters**

| Parameter | Description          |
|-----------|----------------------|
| r1        | RAW to "xor" with r2 |
| r2        | RAW to "xor" with r1 |

**Return Values****Table 276-9 BIT\_XOR Function Return Values**

| Return | Description                       |
|--------|-----------------------------------|
| RAW    | Containing the "xor" of r1 and r2 |

**Table 276-9 (Cont.) BIT\_XOR Function Return Values**

| Return | Description                                                           |
|--------|-----------------------------------------------------------------------|
| NULL   | If either <code>r1</code> or <code>r2</code> input parameter was NULL |

**Usage Notes**

If `r1` and `r2` differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## 276.3.5 CAST\_FROM\_BINARY\_DOUBLE Function

This function returns the RAW binary representation of a `BINARY_DOUBLE` value.

**Syntax**

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(  
    n          IN BINARY_DOUBLE,  
    endianness IN PLS_INTEGER DEFAULT 1)  
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 276-10 CAST\_FROM\_BINARY\_DOUBLE Function Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>n</code>          | <code>BINARY_DOUBLE</code> value                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>endianness</code> | A <code>BINARY_INTEGER</code> value indicating the endianness. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine. |

**Return Values**

The binary representation of the `BINARY_DOUBLE` value, or NULL if the input is NULL.

**Usage Notes**

- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56  
byte 1: bit 55 ~ bit 48  
byte 2: bit 47 ~ bit 40  
byte 3: bit 39 ~ bit 32  
byte 4: bit 31 ~ bit 24  
byte 5: bit 23 ~ bit 16  
byte 6: bit 15 ~ bit 8  
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

| endianess            | rb0 | rb1 | rb2 | rb3 | rb4 | rb5 | rb6 | rb7 |
|----------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| <b>big_endian</b>    | db0 | db1 | db2 | db3 | db4 | db5 | db6 | db7 |
| <b>little_endian</b> | db7 | db6 | db5 | db4 | db3 | db2 | db1 | db0 |

- In case of machine-endian, the 8 bytes of the `BINARY_DOUBLE` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 276.3.6 CAST\_FROM\_BINARY\_FLOAT Function

This function returns the `RAW` binary representation of a `BINARY_FLOAT` value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(  
    n          IN BINARY_FLOAT,  
    endianess  IN PLS_INTEGER DEFAULT 1)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-11** CAST\_FROM\_BINARY\_FLOAT Function Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>n</code>         | <code>BINARY_FLOAT</code> value                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>endianess</code> | A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine. |

### Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

### Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24  
byte 1: bit 23 ~ bit 16  
byte 2: bit 15 ~ bit 8  
byte 3: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

| Endianess            | rb0 | rb1 | rb2 | rb3 |
|----------------------|-----|-----|-----|-----|
| <b>big_endian</b>    | fb0 | fb1 | fb2 | fb3 |
| <b>little_endian</b> | fb3 | fb2 | fb1 | fb0 |

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 276.3.7 CAST\_FROM\_BINARY\_INTEGER Function

This function returns the `RAW` binary representation of a `BINARY_INTEGER` value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (  
    n          IN BINARY_INTEGER  
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-12** CAST\_FROM\_BINARY\_INTEGER Function Parameters

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>n</code>         | <code>BINARY_INTEGER</code> value.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>endianess</code> | A <code>BINARY_INTEGER</code> value indicating the endianess. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine. |

### Return Values

The binary representation of the `BINARY_INTEGER` value.

## 276.3.8 CAST\_FROM\_NUMBER Function

This function returns the `RAW` binary representation of a `NUMBER` value.

### Syntax

```
UTL_RAW.CAST_FROM_NUMBER (  
    n  IN NUMBER)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-13 CAST\_FROM\_NUMBER Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| n         | NUMBER value |

### Return Values

The binary representation of the NUMBER value.

## 276.3.9 CAST\_TO\_BINARY\_DOUBLE Function

This function casts the RAW binary representation of a BINARY\_DOUBLE into a BINARY\_DOUBLE.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (  
    r           IN RAW  
    endianness  IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_DOUBLE;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-14 CAST\_TO\_BINARY\_DOUBLE Function Parameters**

| Parameter  | Description                                                                                     |
|------------|-------------------------------------------------------------------------------------------------|
| r          | Binary representation of a BINARY_DOUBLE                                                        |
| endianness | A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian. |

### Return Values

The BINARY\_DOUBLE value.

### Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY\_DOUBLE\_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE\_ERROR exception is raised.
- An 8-byte binary\_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56  
byte 1: bit 55 ~ bit 48  
byte 2: bit 47 ~ bit 40
```

```
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

| Architecture         | rb0 | rb1 | rb2 | rb3 | rb4 | rb5 | rb6 | rb7 |
|----------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| <b>big_endian</b>    | db0 | db1 | db2 | db3 | db4 | db5 | db6 | db7 |
| <b>little_endian</b> | db7 | db6 | db5 | db4 | db3 | db2 | db1 | db0 |

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 276.3.10 CAST\_TO\_BINARY\_FLOAT Function

This function casts the `RAW` binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
    r          IN RAW
    endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-15 CAST\_TO\_BINARY\_FLOAT Function Parameters**

| Parameter              | Description                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>r</code>         | Binary representation of a <code>BINARY_FLOAT</code>                                                         |
| <code>endianess</code> | A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian. |

### Return Values

The `BINARY_FLOAT` value.

### Usage Notes

- If the `RAW` argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value `BINARY_FLOAT_NAN` is returned.
- If the `RAW` argument is less than 4 bytes, a `VALUE_ERROR` exception is raised.
- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```

- The parameter `endianess` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

| Endianness           | rb0 | rb1 | rb2 | rb3 |
|----------------------|-----|-----|-----|-----|
| <b>big_endian</b>    | fb0 | fb1 | fb2 | fb3 |
| <b>little_endian</b> | fb3 | fb2 | fb1 | fb0 |

- In case of machine-endian, the 4 bytes of the `RAW` argument are copied straight across into the `BINARY_FLOAT` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## 276.3.11 CAST\_TO\_BINARY\_INTEGER Function

This function casts the `RAW` binary representation of a `BINARY_INTEGER` into a `BINARY_INTEGER`.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
    r          IN RAW
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-16 CAST\_TO\_BINARY\_INTEGER Function Parameters**

| Parameter              | Description                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>r</code>         | Binary representation of a <code>BINARY_INTEGER</code>                                                       |
| <code>endianess</code> | A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian. |

### Return Values

The `BINARY_INTEGER` value

## 276.3.12 CAST\_TO\_NUMBER Function

This function casts the `RAW` binary representation of a `NUMBER` into a `NUMBER`.

### Syntax

```
UTL_RAW.CAST_TO_NUMBER (
    r IN RAW)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-17 CAST\_TO\_NUMBER function Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| <i>r</i>  | Binary representation of a NUMBER |

### Return Values

The NUMBER value.

## 276.3.13 CAST\_TO\_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

### Note:

When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

### Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (  
    r IN RAW)  
RETURN NVARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-18 CAST\_TO\_NVARCHAR2 Function Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| <i>r</i>  | RAW (without leading length field) to be changed to a NVARCHAR2) |

### Return Values

**Table 276-19 CAST\_TO\_NVARCHAR2 Function Return Values**

| Return    | Description                                      |
|-----------|--------------------------------------------------|
| NVARCHAR2 | Containing having the same data as the input RAW |
| NULL      | If <i>r</i> input parameter was NULL             |

## 276.3.14 CAST\_TO\_RAW Function

This function converts a `VARCHAR2` value represented using some number of data bytes into a `RAW` value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a `RAW` datatype.

### Syntax

```
UTL_RAW.CAST_TO_RAW (  
    c  IN VARCHAR2)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-20 CAST\_TO\_RAW Function Parameters**

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| c         | <code>VARCHAR2</code> to be changed to a <code>RAW</code> |

### Return Values

**Table 276-21 CAST\_TO\_RAW Function Return Values**

| Return            | Description                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>RAW</code>  | Containing the same data as the input <code>VARCHAR2</code> and equal byte length as the input <code>VARCHAR2</code> and without a leading length field |
| <code>NULL</code> | If c input parameter was <code>NULL</code>                                                                                                              |

## 276.3.15 CAST\_TO\_VARCHAR2 Function

This function converts a `RAW` value represented using some number of data bytes into a `VARCHAR2` value with that number of data bytes.

### Note:

When casting to a `VARCHAR2`, the current Globalization Support character set is used for the characters within that `VARCHAR2`.

### Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (  
    r  IN RAW)  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-22 CAST\_TO\_VARCHAR2 Function Parameters**

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| <i>r</i>  | RAW (without leading length field) to be changed to a VARCHAR2 |

### Return Values

**Table 276-23 CAST\_TO\_VARCHAR2 Function Return Values**

| Return   | Description                                      |
|----------|--------------------------------------------------|
| VARCHAR2 | Containing having the same data as the input RAW |
| NULL     | If <i>r</i> input parameter was NULL             |

## 276.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional *pad* parameter.

### Syntax

```
UTL_RAW.COMPARE (  
    r1 IN RAW,  
    r2 IN RAW,  
    pad IN RAW DEFAULT NULL)  
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-24 COMPARE Function Parameters**

| Parameter  | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| <i>r1</i>  | 1st RAW to be compared, may be NULL or 0 length                                                                   |
| <i>r2</i>  | 2nd RAW to be compared, may be NULL or 0 length                                                                   |
| <i>pad</i> | This is an optional parameter. Byte to extend whichever of <i>r1</i> or <i>r2</i> is shorter. The default: 'x'00' |

## Return Values

**Table 276-25 COMPARE Function Return Values**

| Return | Description                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------|
| NUMBER | Equals 0 if RAW byte strings are both NULL or identical; or,<br>Equals position (numbered from 1) of the first mismatched byte |

## 276.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

### Syntax

```
UTL_RAW.CONCAT (  
    r1  IN RAW DEFAULT NULL,  
    r2  IN RAW DEFAULT NULL,  
    r3  IN RAW DEFAULT NULL,  
    r4  IN RAW DEFAULT NULL,  
    r5  IN RAW DEFAULT NULL,  
    r6  IN RAW DEFAULT NULL,  
    r7  IN RAW DEFAULT NULL,  
    r8  IN RAW DEFAULT NULL,  
    r9  IN RAW DEFAULT NULL,  
    r10 IN RAW DEFAULT NULL,  
    r11 IN RAW DEFAULT NULL,  
    r12 IN RAW DEFAULT NULL)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

r1....r12 are the RAW items to concatenate.

## Return Values

**Table 276-26 CONCAT Function Return Values**

| Return | Description                       |
|--------|-----------------------------------|
| RAW    | Containing the items concatenated |

### Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

## 276.3.18 CONVERT Function

This function converts RAW *r* from character set *from\_charset* to character set *to\_charset* and returns the resulting RAW.

Both *from\_charset* and *to\_charset* must be supported character sets defined to the Oracle server.

### Syntax

```
UTL_RAW.CONVERT (  
    r                IN RAW,  
    to_charset       IN VARCHAR2,  
    from_charset     IN VARCHAR2)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-27    CONVERT Function Parameters**

| Parameter           | Description                                              |
|---------------------|----------------------------------------------------------|
| <i>r</i>            | RAW byte-string to be converted                          |
| <i>to_charset</i>   | Name of the character set to which <i>r</i> is converted |
| <i>from_charset</i> | Name of the character set in which <i>r</i> is supplied  |

### Return Values

**Table 276-28    CONVERT Function Return Values**

| Return | Description                                                               |
|--------|---------------------------------------------------------------------------|
| RAW    | Byte string <i>r</i> converted according to the specified character sets. |

### Exceptions

**Table 276-29    CONVERT Function Exceptions**

| Error     | Description                                                   |
|-----------|---------------------------------------------------------------|
| ORA-06502 | PL/SQL: numeric or value error                                |
| ORA-12703 | This character set conversion is not supported                |
| ORA-12705 | Cannot access NLS data files or invalid environment specified |

### Usage Notes

- The NLS\_LANG parameter form *language\_territory.character set* is also accepted for *to\_charset* and *from\_charset*. However, this form is deprecated and should be avoided. Note that *language* and *territory* are ignored by this subprogram.

- The converted value is silently truncated if it exceeds the maximum length of a RAW value, which is 32767 bytes. Do not convert values longer than  $\text{floor}(32767/4) = 8191$  bytes if you want to avoid this truncation for all possible combinations of `to_charset` and `from_charset`. You can use the maximum character width of the target character set `to_charset`, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is  $\text{floor}(32767/2) = 16383$  bytes. For single-byte target character sets, no truncation is ever necessary.

## 276.3.19 COPIES Function

This function returns `n` copies of `r` concatenated together.

### Syntax

```
UTL_RAW.COPIES (  
    r IN RAW,  
    n IN NUMBER)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-30 COPIES Function Parameters**

| Parameters     | Description                                        |
|----------------|----------------------------------------------------|
| <code>r</code> | RAW to be copied                                   |
| <code>n</code> | Number of times to copy the RAW (must be positive) |

### Return Values

This returns the RAW copied `n` times.

### Exceptions

**Table 276-31 COPIES Function Exceptions**

| Error       | Description                                                                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE_ERROR | Either: <ul style="list-style-type: none"><li>- <code>r</code> is missing, NULL or 0 length</li><li>- <code>n &lt; 1</code></li><li>- Length of result exceeds maximum length of a RAW</li></ul> |

## 276.3.20 LENGTH Function

This function returns the length in bytes of a RAW *r*.

### Syntax

```
UTL_RAW.LENGTH (  
    r    IN RAW)  
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-32** LENGTH Function Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| <i>r</i>  | RAW byte stream to be measured |

### Return Values

**Table 276-33** LENGTH Function Return Values

| Return | Description               |
|--------|---------------------------|
| NUMBER | Current length of the RAW |

## 276.3.21 OVERLAY Function

This function overlays the specified portion of *target* RAW with *overlay\_str* RAW, starting from byte position *pos* of *target* and proceeding for *len* bytes.

### Syntax

```
UTL_RAW.OVERLAY (  
    overlay_str IN RAW,  
    target      IN RAW,  
    pos         IN BINARY_INTEGER DEFAULT 1,  
    len         IN BINARY_INTEGER DEFAULT NULL,  
    pad         IN RAW              DEFAULT NULL)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-34** OVERLAY Function Parameters

| Parameters         | Description                        |
|--------------------|------------------------------------|
| <i>overlay_str</i> | Byte-string used to overlay target |

**Table 276-34 (Cont.) OVERLAY Function Parameters**

| Parameters | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| target     | Byte-string which is to be overlaid                                                    |
| pos        | Position in target (numbered from 1) to start overlay                                  |
| len        | The number of target bytes to overlay                                                  |
| pad        | Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length |

#### Defaults and Optional Parameters

**Table 276-35 OVERLAY Function Optional Parameters**

| Optional Parameter | Description                  |
|--------------------|------------------------------|
| pos                | 1                            |
| len                | To the length of overlay_str |
| pad                | x'00'                        |

#### Return Values

**Table 276-36 OVERLAY Function Return Values**

| Return | Description                                   |
|--------|-----------------------------------------------|
| RAW    | The target byte_string overlaid as specified. |

#### Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

#### Exceptions

**Table 276-37 OVERLAY Function Exceptions**

| Error       | Description                                                                                                                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE_ERROR | Either: <ul style="list-style-type: none"><li>- <code>overlay_str</code> is NULL or has 0 length</li><li>- Target is missing or undefined</li><li>- Length of target exceeds maximum length of a RAW</li><li>- <code>len</code> &lt; 0</li><li>- <code>pos</code> &lt; 1</li></ul> |

## 276.3.22 REVERSE Function

This function reverses a byte sequence in RAW *r* from end to end.

For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'. The result length is the same as the input RAW length.

### Syntax

```
UTL_RAW.REVERSE (  
    r IN RAW)  
    RETURN RAW;
```

### Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-38 REVERSE Function Parameters**

| Parameter | Description    |
|-----------|----------------|
| <i>r</i>  | RAW to reverse |

### Return Values

**Table 276-39 REVERSE Function Return Values**

| Return | Description                          |
|--------|--------------------------------------|
| RAW    | Containing the "reverse" of <i>r</i> |

### Exceptions

**Table 276-40 REVERSE Function Exceptions**

| Error       | Description                      |
|-------------|----------------------------------|
| VALUE_ERROR | <i>R</i> is NULL or has 0 length |

## 276.3.23 SUBSTR Function

This function returns *len* bytes, starting at *pos* from RAW *r*.

### Syntax

```
UTL_RAW.SUBSTR (  
    r    IN RAW,  
    pos  IN BINARY_INTEGER,  
    len  IN BINARY_INTEGER DEFAULT NULL)  
    RETURN RAW;
```

### Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 276-41 SUBSTR Function Parameters**

| Parameter        | Description                                                                     |
|------------------|---------------------------------------------------------------------------------|
| <code>r</code>   | RAW byte-string from which a portion is extracted                               |
| <code>pos</code> | Byte position in <code>r</code> at which to begin extraction                    |
| <code>len</code> | Number of bytes from <code>pos</code> to extract from <code>r</code> (optional) |

## Defaults and Optional Parameters

**Table 276-42 SUBSTR Function Optional Parameter**

| Optional Parameter | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <code>len</code>   | Position <code>pos</code> through to the end of <code>r</code> |

## Return Values

**Table 276-43 SUBSTR Function Return Values**

| Return                    | Description                                                   |
|---------------------------|---------------------------------------------------------------|
| portion of <code>r</code> | Beginning at <code>pos</code> for <code>len</code> bytes long |
| NULL                      | <code>r</code> input parameter was NULL                       |

## Usage Notes

- If `pos` is positive, then `SUBSTR` counts from the beginning of `r` to find the first byte. If `pos` is negative, then `SUBSTR` counts backward from the end of the `r`. The value `pos` cannot be 0.
- If `len` is omitted, then `SUBSTR` returns all bytes to the end of `r`. The value `len` cannot be less than 1.

## Exceptions

**Table 276-44 SUBSTR Function Exceptions**

| Error       | Description                                                                                                                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE_ERROR | VALUE_ERROR is returned if: <ul style="list-style-type: none"><li>• <code>pos</code> = 0 or &gt; length of <code>r</code></li><li>• <code>len</code> &lt; 1 or &gt; length of <code>r</code> - (<code>pos</code>-1)</li></ul> |

## 276.3.24 TRANSLATE Function

This function translates the bytes in the input RAW `r` according to the bytes in the translation RAWs `from_set` and `to_set`.

If a byte in `r` has a matching byte in `from_set`, then it is replaced by the byte in the corresponding position in `to_set`, or deleted.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored.

### Syntax

```
UTL_RAW.TRANSLATE (  
    r           IN RAW,  
    from_set    IN RAW,  
    to_set      IN RAW)  
RETURN RAW;
```

#### Note:

Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to TRANSLITERATE.

### Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 276-45 TRANSLATE Function Parameters**

| Parameter       | Description                                                                |
|-----------------|----------------------------------------------------------------------------|
| <i>r</i>        | RAW source byte-string to be translated                                    |
| <i>from_set</i> | RAW byte-codes to be translated, if present in <i>r</i>                    |
| <i>to_set</i>   | RAW byte-codes to which corresponding <i>from_str</i> bytes are translated |

### Return Values

**Table 276-46 TRANSLATE Function Return Values**

| Return | Description            |
|--------|------------------------|
| RAW    | Translated byte-string |

### Usage Notes

- If *to\_set* is shorter than *from\_set*, the extra *from\_set* bytes have no corresponding translation bytes. Bytes from the input RAW that match any such *from\_set* bytes are not translated or included in the result. They are effectively translated to NULL.
- If *to\_set* is longer than *from\_set*, the extra *to\_set* bytes are ignored.
- If a byte value is repeated in *from\_set*, the repeated occurrence is ignored.

 **Note:**

Differences from the [TRANSLITERATE Function](#):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

## Exceptions

**Table 276-47** TRANSLATE Function Exceptions

| Error       | Description                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALUE_ERROR | Either: <ul style="list-style-type: none"><li>- <code>r</code> is NULL or has 0 length</li><li>- <code>from_set</code> is NULL or has 0 length</li><li>- <code>to_set</code> is NULL or has 0 length</li></ul> |

## 276.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW `r` according to the bytes in the transliteration RAWs `from_set` and `to_set`.

Successive bytes in `r` are looked up in the `from_set`, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the `to_set`, or the `pad` byte when no correspondence exists.

Bytes in `r`, but undefined in `from_set`, are copied to the result. Only the first (leftmost) occurrence of a byte in `from_set` is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as `r`.

### Syntax

```
UTL_RAW.TRANSLITERATE (  
    r           IN RAW,  
    to_set      IN RAW DEFAULT NULL,  
    from_set    IN RAW DEFAULT NULL,  
    pad         IN RAW DEFAULT NULL)  
RETURN RAW;
```

 **Note:**

Be aware that `to_set` and `from_set` are reversed in the calling sequence compared to `TRANSLATE`.

## Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 276-48 TRANSLITERATE Function Parameters**

| Parameter             | Description                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------|
| <code>r</code>        | RAW input byte-string to be converted                                                        |
| <code>to_set</code>   | RAW byte-codes to which corresponding <code>from_set</code> bytes are converted (any length) |
| <code>from_set</code> | RAW byte-codes to be converted, if presenting <code>r</code> (any length)                    |
| <code>pad</code>      | 1 byte used when to-set is shorter than the <code>from_set</code>                            |

## Defaults and Optional Parameters

**Table 276-49 TRANSLITERATE Function Optional Parameters**

| Optional Parameter    | Description                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>to_set</code>   | To the NULL string and effectively extended with <code>pad</code> to the length of <code>from_set</code> as necessary |
| <code>from_set</code> | x'00' through x'fff'                                                                                                  |
| <code>pad</code>      | x'00'                                                                                                                 |

## Return Values

**Table 276-50 TRANSLITERATE Function Return Values**

| Return | Description            |
|--------|------------------------|
| RAW    | Converted byte-string. |

## Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such `from_set` bytes are converted in the result to the `pad` byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

**Note:**

Differences from the [TRANSLATE Function](#):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by pad in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

**Exceptions****Table 276-51 TRANSLITERATE Function Exceptions**

| Error       | Description               |
|-------------|---------------------------|
| VALUE_ERROR | R is NULL or has 0 length |

## 276.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

**Syntax**

```
UTL_RAW.XRANGE (  
    start_byte IN RAW DEFAULT NULL,  
    end_byte   IN RAW DEFAULT NULL)  
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

**Parameters****Table 276-52 XRANGE Function Parameters**

| Parameters              | Description                                                                          |
|-------------------------|--------------------------------------------------------------------------------------|
| <code>start_byte</code> | Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> . |
| <code>end_byte</code>   | Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> .    |

## Return Values

**Table 276-53** XRANGE Function Return Values

| Return | Description                                           |
|--------|-------------------------------------------------------|
| RAW    | Containing succession of 1-byte hexadecimal encodings |

# UTL\_RECOMP

The UTL\_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of UTL\\_RECOMP Subprograms](#)

## 277.1 UTL\_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP\\_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

## 277.2 UTL\_RECOMP Operational Notes

UTL\_RECOMP has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with `VALID` status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM` (`dbmsrand.sql`)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

## 277.3 UTL\_RECOMP Examples

These examples show various ways that UTL\_RECOMP can recompile objects.

- Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

- Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

- Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB\_QUEUE\_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

## 277.4 Summary of UTL\_RECOMP Subprograms

This table lists the UTL\_RECOMP subprograms and briefly describes them.

**Table 277-1 UTL\_RECOMP Package Subprograms**

| Subprogram                                | Description                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">RECOMP_PARALLEL Procedure</a> | Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel |
| <a href="#">RECOMP_SERIAL Procedure</a>   | Recompiles invalid objects in a given schema or all invalid objects in the database               |

### 277.4.1 RECOMP\_PARALLEL Procedure

This procedure uses the information exposed in the DBA\_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

#### Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(  
  threads IN PLS_INTEGER DEFAULT NULL,  
  schema  IN VARCHAR2     DEFAULT NULL,  
  flags   IN PLS_INTEGER DEFAULT 0);
```

#### Parameters

**Table 277-2 RECOMP\_PARALLEL Procedure Parameters**

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| threads   | The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.           |
| schema    | The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled. |

**Table 277-2 (Cont.) RECOMP\_PARALLEL Procedure Parameters**

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| flags     | Flag values are intended for internal testing and diagnosability only. |

**Usage Notes**

The UTL\_RECOMP\_COMPILED table is updated with objects that RECOMP\_PARALLEL has attempted to compile, or that it has compiled so far. If you monitor the progress of the recompilation, then the number of objects should increase with time. These tables are used internally by RECOMP\_PARALLEL to prevent an object from being compiled more than once.

**Table 277-3 Tables Generated by UTL\_RECOMP.RECOMP\_PARALLEL**

| Table                | Purpose                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UTL_RECOMP_ERRORS    | A table of objects that are sorted into groups, based on dependencies. It is used internally by RECOMP_PARALLEL to guide parallel recompilation.                                                                                                                                                                                                                                               |
| UTL_RECOMP_COMPILED  | A table of objects that RECOMP_PARALLEL has attempted to compile. It is used internally by recomp_parallel to prevent an object from being compiled more than once.                                                                                                                                                                                                                            |
| UTL_RECOMP_COMP_IDX1 | An index created on UTL_RECOMP_COMPILED, which uses object number as the primary key.                                                                                                                                                                                                                                                                                                          |
| UTL_RECOMP_SKIP_LIST | A table of objects that RECOMP_PARALLEL will not attempt to compile. Typical usage is for RECOMP_PARALLEL to call UTL_RECOMP.POPULATE_UTL_RECOMP_SKIP_LIST before the update starts so that this table is filled with previously identified invalid objects. Afterward, when RECOMP_PARALLEL is run after upgrade, it will not attempt to compile those previously identified invalid objects. |

**Table 277-4 Views Generated by UTL\_RECOMP.RECOMP\_PARALLEL**

| View                        | Purpose                                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| UTL_RECOMP_ALL_OBJECTS      | A view that includes all objects that can be compiled.                                                                                 |
| UTL_RECOMP_INVALID_ALL      | A view that selects invalid objects from UTL_RECOMP_ALL_OBJECTS that have not been compiled and are not on the skip list.              |
| UTL_RECOMP_INVALID_SEQ      | A view that selects objects from UTL_RECOMP_INVALID_ALL that must be compiled sequentially.                                            |
| UTL_RECOMP_INVALID_PARALLEL | A view that selects objects from UTL_RECOMP_INVALID_ALL that can be compiled in parallel.                                              |
| UTL_RECOMP_INVALID_JAVA_SYN | A view that selects from UTL_RECOMP_ALL_OBJECTS objects that are invalid JAVA synonyms.                                                |
| UTL_RECOMP_CIRCULAR_MV      | A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that have a circular dependency chain.                       |
| UTL_RECOMP_INVALID_MV       | A view that selects from UTL_RECOMP_ALL_OBJECTS materialized view objects that are invalid but don't have a circular dependency chain. |

**Table 277-4 (Cont.) Views Generated by UTL\_RECOMP.RECOMP\_PARALLEL**

| View                 | Purpose                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UTL_RECOMP_ALL_STUBS | A view that includes all stub objects that have not been compiled, and are not on the skip list. When this view is used in RECOMP_PARALLEL, it is restricted to show only stubs in the current edition. |

## 277.4.2 RECOMP\_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

### Syntax

```
UTL_RECOMP.RECOMP_SERIAL(  
    schema    IN    VARCHAR2    DEFAULT NULL,  
    flags     IN    PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 277-5 RECOMP\_SERIAL Procedure Parameters**

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| schema    | The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled. |
| flags     | Flag values are intended for internal testing and diagnosability only.                                         |

# UTL\_REF

The `UTL_REF` package provides PL/SQL procedures to support reference-based operations. Unlike `SQL`, `UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Summary of UTL\\_REF Subprograms](#)

## 278.1 UTL\_REF Overview

`UTL_REF` procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

## 278.2 UTL\_REF Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (`CONNECT /AS SYSDBA`). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

### Note:

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

## 278.3 UTL\_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (  
    name    VARCHAR2(20),  
    id      NUMBER,  
  
    member function GET_ID  
        (name VARCHAR2)  
        RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

## 278.4 UTL\_REF Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

**Table 278-1** *UTL\_REF Exceptions*

| Exceptions     | Description                                            |
|----------------|--------------------------------------------------------|
| errnum == 942  | Insufficient privileges.                               |
| errnum == 1031 | Insufficient privileges.                               |
| errnum == 8177 | Unable to serialize, if in a serializable transaction. |
| errnum == 60   | Deadlock detected.                                     |
| errnum == 1403 | No data found (if the REF is NULL, and so on.).        |

The `UTL_REF` package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

## 278.5 Summary of UTL\_REF Subprograms

This table lists the UTL\_REF subprograms and briefly describes them.

**Table 278-2 UTL\_REF Package Subprograms**

| Subprogram                              | Description                         |
|-----------------------------------------|-------------------------------------|
| <a href="#">DELETE_OBJECT Procedure</a> | Deletes an object given a reference |
| <a href="#">LOCK_OBJECT Procedure</a>   | Locks an object given a reference   |
| <a href="#">SELECT_OBJECT Procedure</a> | Selects an object given a reference |
| <a href="#">UPDATE_OBJECT Procedure</a> | Updates an object given a reference |

### 278.5.1 DELETE\_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

#### Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

#### Parameters

**Table 278-3 DELETE\_OBJECT Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| reference | Reference of the object to delete. |

#### Exceptions

May be raised.

#### Examples

The following example illustrates usage of the UTL\_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address\_t and others...

```
CREATE OR REPLACE TYPE Person_t (
    name    VARCHAR2(64),
    gender  CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);
```

```
CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
);
```

```
CREATE OR REPLACE TYPE Employee_t (
```

**Under Person\_t: Simulate implementation of inheritance using a REF to Person\_t and delegation of setAddress to it.**

```
    thePerson REF Person_t,
    empno      NUMBER(5),
    deptREF    Department_t,
    mgrREF     Employee_t,
    reminders  StringArray_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t),
    MEMBER procedure addReminder(reminder VARCHAR2);
);
```

```
CREATE TYPE BODY Employee_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
    BEGIN
```

**Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:**

```
        UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
        meAsPerson.setAddress(addr);
```

**Delegate to thePerson:**

```
        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN
```

**Give the manager a reminder:**

```
            UTL_REF.LOCK_OBJECT(mgr);
            UTL_REF.SELECT_OBJECT(mgr, myMgr);
            myMgr.addReminder
                ('Update address in the employee directory for' ||
                 thePerson.name || ', new address: ' || addr.asString);
            UTL_REF.UPDATE_OBJECT(mgr, myMgr);
        END IF;
    EXCEPTION
        WHEN OTHERS THEN
            errnum := SQLCODE;
            errmsg := SUBSTR(SQLERRM, 1, 200);
```

## 278.5.2 LOCK\_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
 FROM object_table t
```

```
WHERE REF(t) = reference
FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

### Syntax

```
UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

### Parameters

**Table 278-4 LOCK\_OBJECT Procedure Parameters**

| Parameter | Description                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------|
| reference | Reference of the object to lock.                                                                                         |
| object    | The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object. |

### Exceptions

May be raised.

## 278.5.3 SELECT\_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

### Parameters

**Table 278-5 SELECT\_OBJECT Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| reference | Reference to the object to select or retrieve. |

**Table 278-5 (Cont.) SELECT\_OBJECT Procedure Parameters**

| Parameter | Description                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| object    | The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object. |

**Exceptions**

May be raised.

## 278.5.4 UPDATE\_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

**Syntax**

```
UTL_REF.UPDATE_OBJECT (
    reference IN REF "<typename>",
    object    IN    "<typename>");
```

**Parameters****Table 278-6 UPDATE\_OBJECT Procedure Parameters**

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| reference | Reference of the object to update.                                                                                                      |
| object    | The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update. |

**Exceptions**

May be raised.

## UTL\_RPADV

The `UTL_RPADV` package provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment. This package uses the Oracle Replication Performance Advisor to gather statistics.

This chapter contains the following topic:

- [UTL\\_RPADV Overview](#)
- [DBMS\\_COMPARISON Security Model](#)
- [UTL\\_RPADV Operational Notes](#)
- [Summary of UTL\\_RPADV Subprograms](#)

### 279.1 UTL\_RPADV Overview

This package enables you to collect and analyze statistics about the performance of Oracle Replication components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Replication performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

### 279.2 DBMS\_COMPARISON Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Replication administrator and connect as the Oracle Replication administrator when using this package.

### 279.3 UTL\_RPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Replication administrator and run the `utlrpadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlrpadv.sql` script creates the following tables:

- [STREAMS\\$\\_PA\\_COMPONENT Table](#)
- [STREAMS\\$\\_PA\\_COMPONENT\\_LINK Table](#)
- [STREAMS\\$\\_PA\\_COMPONENT\\_PROP Table](#)
- [STREAMS\\$\\_PA\\_COMPONENT\\_STAT Table](#)

- [STREAMS\\$\\_PA\\_CONTROL Table](#)
- [STREAMS\\$\\_PA\\_DATABASE Table](#)
- [STREAMS\\$\\_PA\\_DATABASE\\_PROP Table](#)
- [STREAMS\\$\\_PA\\_MONITORING Table](#)
- [STREAMS\\$\\_PA\\_PATH\\_BOTTLENECK Table](#)
- [STREAMS\\$\\_PA\\_PATH\\_STAT Table](#)
- [STREAMS\\$\\_PA\\_SHOW\\_COMP\\_STAT Table](#)
- [STREAMS\\$\\_PA\\_SHOW\\_PATH\\_STAT Table](#)

The Oracle Replication Performance Advisor populates these tables when it is run.

### STREAMS\$\_PA\_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Replication components at each database.

**Table 279-1 STREAMS\$\_PA\_COMPONENT Table**

| Column                 | Datatype       | NULL     | Description                                                                                                                                                                                                                                                                                                                       |
|------------------------|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT_ID           | NUMBER         | NOT NULL | Identification number assigned to the component by the Oracle Replication Performance Advisor                                                                                                                                                                                                                                     |
| COMPONENT_NAME         | VARCHAR2 (194) |          | Name of the component                                                                                                                                                                                                                                                                                                             |
| COMPONENT_DB           | VARCHAR2 (128) |          | Name of the database that contains the component                                                                                                                                                                                                                                                                                  |
| COMPONENT_TYPE         | VARCHAR2 (20)  |          | Type of the component<br>The following types are possible: <ul style="list-style-type: none"> <li>• CAPTURE for a capture process</li> <li>• PROPAGATION_SENDER for a propagation sender</li> <li>• PROPAGATION_RECEIVER for a propagation receiver</li> <li>• APPLY for an apply process</li> <li>• QUEUE for a queue</li> </ul> |
| COMPONENT_CHANGED_TIME | DATE           |          | Time when the component was last changed                                                                                                                                                                                                                                                                                          |

### STREAMS\$\_PA\_COMPONENT\_LINK Table

The `STREAMS$_PA_COMPONENT_LINK` table displays information about how information flows between Oracle Replication components.

**Table 279-2 STREAMS\$\_PA\_COMPONENT\_LINK Table**

| Column  | Datatype | NULL     | Description                                                                              |
|---------|----------|----------|------------------------------------------------------------------------------------------|
| PATH_ID | NUMBER   | NOT NULL | Identification number assigned to the path by the Oracle Replication Performance Advisor |

**Table 279-2 (Cont.) STREAMS\$\_PA\_COMPONENT\_LINK Table**

| Column                   | Datatype        | NULL     | Description                                                                   |
|--------------------------|-----------------|----------|-------------------------------------------------------------------------------|
| PATH_KEY                 | VARCHAR2 (4000) |          | Unique key assigned to the path by the Oracle Replication Performance Advisor |
| SOURCE_COMPONENT_ID      | NUMBER          | NOT NULL | Source component ID for the path<br>The path starts with this component.      |
| DESTINATION_COMPONENT_ID | NUMBER          | NOT NULL | Destination component ID for the path<br>The path ends with this component.   |
| POSITION                 | NUMBER          |          | Position of the component in the path                                         |

**STREAMS\$\_PA\_COMPONENT\_PROP Table**

The `STREAMS$_PA_COMPONENT_PROP` table displays information about capture processes and apply processes necessary for analysis by the Replication Performance Advisor.

**Table 279-3 STREAMS\$\_PA\_COMPONENT\_PROP Table**

| Column       | Datatype | NULL     | Description                                                                                   |
|--------------|----------|----------|-----------------------------------------------------------------------------------------------|
| COMPONENT_ID | NUMBER   | NOT NULL | Identification number assigned to the component by the Oracle Replication Performance Advisor |

**Table 279-3 (Cont.) STREAMS\$\_PA\_COMPONENT\_PROP Table**

| Column     | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PROP_NAME  | VARCHAR2 (30) |      | <p>Property name</p> <p>For a capture process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>SOURCE_DATABASE - The source database for the changes captured by the capture process</li> <li>PARALLELISM - The setting for the parallelism capture process parameter</li> <li>OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0)</li> </ul> <p>For an apply process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>SOURCE_DATABASE - The source database for the messages applied by the apply process</li> <li>PARALLELISM - The setting for the parallelism apply process parameter</li> <li>APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO)</li> <li>MESSAGE_DELIVERY_MODE - Either buffered or persistent</li> </ul> |
| PROP_VALUE | VARCHAR2 (30) |      | Property value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**STREAMS\$\_PA\_COMPONENT\_STAT Table**

The STREAMS\$\_PA\_COMPONENT\_STAT table displays performance statistics and session statistics about each Oracle Replication component.

**Table 279-4 STREAMS\$\_PA\_COMPONENT\_STAT Table**

| Column           | Datatype | NULL | Description                                                                         |
|------------------|----------|------|-------------------------------------------------------------------------------------|
| ADVISOR_RUN_ID   | NUMBER   |      | Identification number of the Oracle Replication Performance Advisor run             |
| ADVISOR_RUN_TIME | DATE     |      | Time when the Oracle Replication Performance Advisor was run for the advisor run ID |

**Table 279-4 (Cont.) STREAMS\$\_PA\_COMPONENT\_STAT Table**

| Column             | Datatype      | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**STREAMS\$\_PA\_CONTROL Table**

The `STREAMS$_PA_CONTROL` table displays the parameters set for the `COLLECT_STATS` procedure in this package. The parameters control the monitoring behavior.

**Table 279-5 STREAMS\$\_PA\_CONTROL Table**

| Column           | Datatype        | NULL | Description                                                             |
|------------------|-----------------|------|-------------------------------------------------------------------------|
| ADVISOR_RUN_ID   | NUMBER          |      | Identification number of the Oracle Replication Performance Advisor run |
| ADVISOR_RUN_TIME | DATE            |      | Time when the Oracle Replication Performance Advisor was last run       |
| PARAM_NAME       | VARCHAR2 (30)   |      | The name of the parameter                                               |
| PARAM_VALUE      | VARCHAR2 (4000) |      | The value set for the parameter                                         |
| PARAM_UNIT       | VARCHAR2 (30)   |      | The unit of the parameter                                               |

**STREAMS\$\_PA\_DATABASE Table**

The `STREAMS$_PA_DATABASE` table displays information about each database that contains Oracle Replication components.

**Table 279-6 STREAMS\$\_PA\_DATABASE Table**

| Column        | Datatype        | NULL     | Description                                                                                              |
|---------------|-----------------|----------|----------------------------------------------------------------------------------------------------------|
| GLOBAL_NAME   | VARCHAR2 (128)  | NOT NULL | Global name of the database analyzed by the Oracle Replication Performance Advisor                       |
| LAST_QUERIED  | DATE            |          | The time when the Performance Advisor successfully collected information from a database in its last run |
| ERROR_NUMBER  | NUMBER          |          | The error number of the error encountered when the database was last queried                             |
| ERROR_MESSAGE | VARCHAR2 (4000) |          | The error message of the error encountered when the database was last queried                            |

**STREAMS\$\_PA\_DATABASE\_PROP Table**

The `STREAMS$_PA_DATABASE_PROP` table displays Oracle Replication database property information necessary for analysis by the Replication Performance Advisor.

**Table 279-7 STREAMS\$\_PA\_DATABASE\_PROP Table**

| Column      | Datatype       | NULL     | Description                                                                                                                                                                                                      |
|-------------|----------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL_NAME | VARCHAR2 (128) | NOT NULL | Global name of the database analyzed by the Oracle Replication Performance Advisor                                                                                                                               |
| PROP_NAME   | VARCHAR2 (30)  |          | Property name<br>The database properties include the following: <ul style="list-style-type: none"> <li>• VERSION</li> <li>• COMPATIBILITY</li> <li>• MANAGEMENT_PACK_ACCESS</li> <li>• DB_UNIQUE_NAME</li> </ul> |
| PROP_VALUE  | VARCHAR2 (30)  |          | Property value                                                                                                                                                                                                   |

**STREAMS\$\_PA\_MONITORING Table**

The STREAMS\$\_PA\_MONITORING table displays information about each monitoring job running in a database.

**Table 279-8 STREAMS\$\_PA\_MONITORING Table**

| Column           | Datatype      | NULL     | Description                                                                                                 |
|------------------|---------------|----------|-------------------------------------------------------------------------------------------------------------|
| JOB_NAME         | VARCHAR2 (30) | NOT NULL | Name of the monitoring job                                                                                  |
| CLIENT_NAME      | VARCHAR2 (30) |          | Name of the client that submitted the job<br><b>See Also:</b> " <a href="#">Full Monitoring Job Names</a> " |
| QUERY_USER_NAME  | VARCHAR2 (30) |          | User granted privileges to view the monitoring results                                                      |
| SHOW_STATS_TABLE | VARCHAR2 (30) |          | Name of the table used by the SHOW_STATS procedure to display statistics                                    |
| STARTED_TIME     | TIMESTAMP     |          | Time the monitoring job started                                                                             |
| STOPPED_TIME     | TIMESTAMP     |          | Time the monitoring job last stopped                                                                        |
| ALTERED_TIME     | TIMESTAMP     |          | Time the monitoring job was last altered                                                                    |
| STATE            | VARCHAR2 (30) |          | State of the monitoring job, either ENABLED or STOPPED                                                      |

**STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

The STREAMS\$\_PA\_PATH\_BOTTLENECK table displays information about Oracle Replication components that might be slowing down the flow of messages.

**Table 279-9 STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

| Column              | Datatype        | NULL | Description                                                                                              |
|---------------------|-----------------|------|----------------------------------------------------------------------------------------------------------|
| ADVISOR_RUN_ID      | NUMBER          |      | Identification number of the Oracle Replication Performance Advisor run                                  |
| ADVISOR_RUN_TIME    | DATE            |      | Time when the Oracle Replication Performance Advisor was last run                                        |
| ADVISOR_RUN_REASON  | VARCHAR2 (4000) |      | Reason for the bottleneck                                                                                |
| PATH_ID             | NUMBER          |      | Identification number assigned to the path by the Oracle Replication Performance Advisor                 |
| PATH_KEY            | VARCHAR2 (4000) |      | Unique key assigned to the path by the Oracle Replication Performance Advisor                            |
| COMPONENT_ID        | NUMBER          |      | Identification number assigned to the component by the Oracle Replication Performance Advisor            |
| TOP_SESSION_ID      | NUMBER          |      | Session ID of the top component. Query the V\$SESSION view for information about the session.            |
| TOP_SESSION_SERIAL# | NUMBER          |      | Session serial number of the top component. Query the V\$SESSION view for information about the session. |
| ACTION_NAME         | VARCHAR2 (32)   |      | Action name for the top session                                                                          |

**Table 279-9 (Cont.) STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

| Column                | Datatype      | NULL | Description                         |
|-----------------------|---------------|------|-------------------------------------|
| BOTTLENECK_IDENTIFIED | VARCHAR2 (30) |      | Whether a bottleneck was identified |

**STREAMS\$\_PA\_PATH\_STAT Table**

The STREAMS\$\_PA\_PATH\_STAT table displays performance statistics about each stream path.

**Table 279-10 STREAMS\$\_PA\_PATH\_STAT Table**

| Column           | Datatype        | NULL | Description                                                                              |
|------------------|-----------------|------|------------------------------------------------------------------------------------------|
| ADVISOR_RUN_ID   | NUMBER          |      | Identification number of the Oracle Replication Performance Advisor run                  |
| ADVISOR_RUN_TIME | DATE            |      | Time when the Oracle Replication Performance Advisor was run for the advisor run ID      |
| PATH_ID          | NUMBER          |      | Identification number assigned to the path by the Oracle Replication Performance Advisor |
| PATH_KEY         | VARCHAR2 (4000) |      | Unique key assigned to the path by the Oracle Replication Performance Advisor            |
| STATISTIC_TIME   | DATE            |      | Time when the statistic was recorded                                                     |
| STATISTIC_NAME   | VARCHAR2 (64)   |      | Name of the statistic                                                                    |
| STATISTIC_VALUE  | NUMBER          |      | Value recorded for the statistic                                                         |
| STATISTIC_UNIT   | VARCHAR2 (64)   |      | Unit of measurement for the statistic                                                    |

**STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

The STREAMS\$\_PA\_SHOW\_COMP\_STAT table displays statistics for Oracle Replication components.

**Table 279-11 STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

| Column           | Datatype       | NULL | Description                                                                                   |
|------------------|----------------|------|-----------------------------------------------------------------------------------------------|
| ADVISOR_RUN_ID   | NUMBER         |      | Identification number of the Oracle Replication Performance Advisor run                       |
| ADVISOR_RUN_TIME | DATE           |      | Time when the Oracle Replication Performance Advisor was last run                             |
| PATH_ID          | NUMBER         |      | Identification number assigned to the path by the Oracle Replication Performance Advisor      |
| POSITION         | NUMBER         |      | Position of the component in the path                                                         |
| COMPONENT_ID     | NUMBER         |      | Identification number assigned to the component by the Oracle Replication Performance Advisor |
| COMPONENT_NAME   | VARCHAR2 (194) |      | Name of the component                                                                         |

**Table 279-11 (Cont.) STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

| Column             | Datatype       | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| STATISTIC_NAME     | VARCHAR2 (128) |      | Name of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| STATISTIC_VALUE    | NUMBER         |      | Value recorded for the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATISTIC_UNIT     | VARCHAR2 (128) |      | Unit of measurement for the statistic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### STREAMS\$\_PA\_SHOW\_PATH\_STAT Table

The STREAMS\$\_PA\_SHOW\_PATH\_STAT table displays statistics for the stream paths in an Oracle Replication configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

**Table 279-12** STREAMS\$\_PA\_SHOW\_PATH\_STAT Table

| Column             | Datatype        | NULL | Description                                                                                                                                                                                                                            |
|--------------------|-----------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PATH_ID            | NUMBER          |      | Identification number assigned to the path by the Oracle Replication Performance Advisor                                                                                                                                               |
| ADVISOR_RUN_ID     | NUMBER          |      | Identification number of the Oracle Replication Performance Advisor run                                                                                                                                                                |
| ADVISOR_RUN_TIME   | DATE            |      | Time when the Oracle Replication Performance Advisor was last run                                                                                                                                                                      |
| SETTING            | VARCHAR2 (2000) |      | Setting for the Oracle Replication Performance Advisor Run                                                                                                                                                                             |
| STATISTICS         | VARCHAR2 (4000) |      | Component-level statistics                                                                                                                                                                                                             |
| SESSION_STATISTICS | VARCHAR2 (4000) |      | Session-level statistics                                                                                                                                                                                                               |
| OPTIMIZATION       | NUMBER          |      | Whether the path uses the combined capture and apply optimization<br>0 (zero) means that the path does not use the combined capture and apply optimization.<br>1 means that the path uses the combined capture and apply optimization. |

## 279.4 Summary of UTL\_RPADV Subprograms

This table lists the UTL\_RPADV subprograms and briefly describes them.

**Table 279-13** UTL\_RPADV Package Subprograms

| Subprogram                                 | Description                                                                                                                                                           |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_MONITORING Procedure</a> | Alters the monitoring job submitted by the current user.                                                                                                              |
| <a href="#">COLLECT_STATS Procedure</a>    | Uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment. |
| <a href="#">IS_MONITORING Function</a>     | Checks whether a monitoring job is currently running.                                                                                                                 |

| <a href="#">STOP_MONITORING Procedure</a>  | Stops a monitoring job.                                                                                                                                               |

## 279.4.1 ALTER\_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

### Syntax

```
UTL_RPADV.ALTER_MONITORING (
    interval                IN NUMBER  DEFAULT NULL,
    top_event_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time          IN NUMBER  DEFAULT NULL);
```

### Parameters

**Table 279-14 ALTER\_MONITORING Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval                      | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.                                                                                                                                                                                                                                                                                                                                                                                                     |
| top_event_threshold           | A percentage that determines whether a top wait event statistic is collected.<br>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.<br>If NULL, then the current value is not changed.                                                                                                                                                               |
| bottleneck_idle_threshold     | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its IDLE percentage.<br>The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.<br>If NULL, then the current value is not changed.                                    |
| bottleneck_flowctrl_threshold | A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.<br>The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.<br>If NULL, then the current value is not changed. |
| retention_time                | The number of hours to retain monitoring results.<br>If NULL, then the current value is not changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Exceptions

**Table 279-15 ALTER\_MONITORING Procedure Exceptions**

| Exception | Description                    |
|-----------|--------------------------------|
| ORA-20113 | no active monitoring job found |

## 279.4.2 COLLECT\_STATS Procedure

This procedure uses the Oracle Replication Performance Advisor to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

### Note:

This procedure commits.

## Syntax

```
UTL_RPADV.COLLECT_STATS (
    interval                IN NUMBER    DEFAULT 60,
    num_runs                IN NUMBER    DEFAULT 10,
    comp_stat_table         IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
    path_stat_table         IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    top_event_threshold     IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER   DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

## Parameters

**Table 279-16 COLLECT\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval        | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                       |
| num_runs        | The number of times that the Oracle Replication Performance Advisor is run by the procedure.                                                                                                                                                                                                                                                                                                                                                                                                             |
| comp_stat_table | <p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table STREAMS\$_ADVISOR_COMP_STAT.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p> |

**Table 279-16 (Cont.) COLLECT\_STATS Procedure Parameters**

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>path_stat_table</code>               | <p>The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name.]object_name</i>. If the schema is not specified, then the current user is the default.</p> <p>The procedure creates the specified table if it does not exist.</p> <p>Oracle recommends that you use the default table <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>                                                       |
| <code>top_event_threshold</code>           | <p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>                                                                                                                                                                                         |
| <code>bottleneck_idle_threshold</code>     | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>                                    |
| <code>bottleneck_flowctrl_threshold</code> | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p> |

#### Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

## 279.4.3 IS\_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

**See Also:**

["START\\_MONITORING Procedure"](#)

**Syntax**

```
UTL_RPADV.IS_MONITORING(  
    job_name      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',  
    client_name   IN VARCHAR2  DEFAULT NULL)  
RETURN BOOLEAN;
```

**Parameters****Table 279-17 IS\_MONITORING Function Parameters**

| Parameter   | Description                                    |
|-------------|------------------------------------------------|
| job_name    | The name of the job for which to check.        |
| client_name | The name of the client that submitted the job. |

## 279.4.4 SHOW\_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

**Note:**

This procedure does not commit.

**See Also:**

- ["COLLECT\\_STATS Procedure"](#)
- ["START\\_MONITORING Procedure"](#)

**Syntax**

```
UTL_RPADV.SHOW_STATS(  
    path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',  
    path_id         IN NUMBER    DEFAULT NULL,  
    bgn_run_id      IN NUMBER    DEFAULT -1,  
    end_run_id      IN NUMBER    DEFAULT -10,  
    show_path_id    IN BOOLEAN   DEFAULT TRUE,  
    show_run_id     IN BOOLEAN   DEFAULT TRUE,  
    show_run_time   IN BOOLEAN   DEFAULT TRUE,  
    show_optimization IN BOOLEAN  DEFAULT TRUE,  
    show_setting    IN BOOLEAN   DEFAULT FALSE,  
    show_stat       IN BOOLEAN   DEFAULT TRUE,
```

```
show_sess      IN BOOLEAN  DEFAULT FALSE,
show_legend    IN BOOLEAN  DEFAULT TRUE);
```

## Parameters

**Table 279-18** *SHOW\_STATS Procedure Parameters*

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path_stat_table   | <p>The name of the table that contains the stream path statistics. Specify the table name as <code>[schema_name].object_name</code>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>path_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p> |
| path_id           | <p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 279-18 (Cont.) *SHOW\_STATS Procedure Parameters***

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show_stat</code>   | <p>If <b>TRUE</b>, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes.</p> <p>If <b>FALSE</b>, then the component-level and subcomponent-level statistics are not included in the output.</p> |
| <code>show_sess</code>   | <p>If <b>TRUE</b>, then the session-level statistics are included in the output. Session-level statistics include <b>IDLE</b>, <b>FLOW CONTROL</b>, and <b>EVENT</b> statistics.</p> <p>If <b>FALSE</b>, then the session-level statistics are not included in the output.</p>                                                                                                                                                           |
| <code>show_legend</code> | <p>If <b>TRUE</b>, then the legend is included in the output. The legend describes the abbreviations used in the output.</p> <p>If <b>FALSE</b>, then the legend is not included in the output.</p>                                                                                                                                                                                                                                      |

### Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

## 279.4.5 SHOW\_STATS\_HTML Procedure

This procedure generates HTML output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

### Note:

This procedure does not commit.

### See Also:

- ["START\\_MONITORING Procedure"](#)

### Syntax

```
UTL_RPADV.SHOW_STATS_HTML(
    directory      IN VARCHAR2,
    reportname     IN VARCHAR2 DEFAULT 'RPADVREPORT.HTML',
```

```
comp_stat_table IN VARCHAR2 DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
path_id        IN NUMBER   DEFAULT NULL,
bgn_run_id     IN NUMBER   DEFAULT -1,
end_run_id     IN NUMBER   DEFAULT -10,
detailed       IN BOOLEAN  DEFAULT TRUE;
```

## Parameters

**Table 279-19 SHOW\_STATS\_HTML Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| directory       | <p>The directory object for the directory on the local computer system into which the generated HTML report is placed</p> <p>The specified directory object must be created using the SQL statement <code>CREATE DIRECTORY</code>, and the user who invokes the procedure must have <code>READ</code> and <code>WRITE</code> privilege on each one.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| reportname      | The name of the HTML report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| comp_stat_table | <p>The name of the table that stores the statistics collected for Oracle Replication components and subcomponents. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>comp_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_COMP_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p> <p>Oracle recommends that you start a monitoring job with the <code>START_MONITORING</code> procedure in this package and use the appropriate the <code>STREAMS\$_PA_SHOW_PATH_STAT</code> table.</p> |
| path_id         | <p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| bgn_run_id      | <p>The first Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| end_run_id      | <p>The last Oracle Replication Performance Advisor run ID to show in the range of runs.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| detailed        | <p>If TRUE, then the procedure generates component-level statistics.</p> <p>If FALSE, then the procedure does not generate component-level statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Replication Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Replication Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Replication Performance Advisor runs.

## 279.4.6 START\_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the `COLLECT_STATS` procedure to gather statistics about the Oracle Replication components and subcomponents in a distributed database environment.

### Note:

This procedure commits.

### See Also:

- ["COLLECT\\_STATS Procedure"](#)

### Syntax

```
UTL_RPADV.START_MONITORING (
  job_name          IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
  client_name       IN VARCHAR2  DEFAULT NULL,
  query_user_name   IN VARCHAR2  DEFAULT NULL,
  interval          IN NUMBER    DEFAULT 60,
  top_event_threshold IN NUMBER   DEFAULT 15,
  bottleneck_idle_threshold IN NUMBER DEFAULT 50,
  bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
  retention_time    IN NUMBER    DEFAULT 24);
```

### Parameters

**Table 279-20 START\_MONITORING Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>job_name</code>        | The name of the monitoring job to create.                                                                                                                                                                    |
| <code>client_name</code>     | The name of the client.                                                                                                                                                                                      |
| <code>query_user_name</code> | The user who will query the result tables.<br>This procedure grants privileges to the specified user to enable the user to query the result tables.                                                          |
| <code>interval</code>        | The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.<br>The specified interval is used for the interval parameter in the <code>COLLECT_STATS</code> procedure. |

**Table 279-20 (Cont.) START\_MONITORING Procedure Parameters**

| Parameter                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>top_event_threshold</code>           | <p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>                                                                                                                                                                                         |
| <code>bottleneck_idle_threshold</code>     | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>                                    |
| <code>bottleneck_flowctrl_threshold</code> | <p>A percentage that determines whether an Oracle Replication component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Replication component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p> |
| <code>retention_time</code>                | The number of hours to retain monitoring results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Exceptions

**Table 279-21 START\_MONITORING Procedure Exceptions**

| Exception | Description                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-20111 | <p>cannot start monitoring due to active EM monitoring job</p> <p>Stop the Oracle Enterprise Manager (EM) monitoring job, and run the <code>START_MONITORING</code> procedure again.</p> |
| ORA-20112 | <p>cannot start monitoring due to active Replication monitoring job</p> <p>Stop the Replication monitoring job, and run the <code>START_MONITORING</code> procedure again.</p>           |

## Usage Notes

The following are usage notes for the `START_MONITORING` procedure:

- [Requirements for the User Running the Procedure](#)
- [Full Monitoring Job Names](#)
- [Restrictions on Monitoring Jobs](#)

Requirements for the User Running the Procedure

The user who runs the `START_MONITORING` procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Replication components.
- The user must have been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_XSTREAM_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

#### Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

| Setting for <code>client_name</code> Parameter | Setting for <code>job_name</code> parameter | Full Monitoring Job Name     |
|------------------------------------------------|---------------------------------------------|------------------------------|
| NULL                                           | STREAMS\$_MONITORING_JOB                    | STREAMS\$_MONITORING_JOB     |
| EM                                             | STREAMS\$_MONITORING_JOB                    | EMSTREAMS\$_MONITORING_JOB   |
| strm                                           | STREAMS\$_MONITORING_JOB                    | strmSTREAMS\$_MONITORING_JOB |
| strm                                           | mjob1                                       | strmmjob1                    |

#### Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

## 279.4.7 STOP\_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

#### Syntax

```
UTL_RPADV.STOP_MONITORING(
    purge IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 279-22 STOP\_MONITORING Procedure Parameters**

| Parameter | Description                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| purge     | If TRUE, then the procedure purges information about the monitoring job from the result tables.<br>If FALSE, then the procedure retains information about the monitoring job in the result tables. |

# UTL\_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Reply Codes](#)
- [UTL\\_SMTP Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL\\_SMTP Subprograms](#)

## See Also:

*Oracle Database Development Guide*

## 280.1 UTL\_SMTP Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

`UTL_SMTP` provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition,

UTL\_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

## 280.2 UTL\_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

### Note:

For more information on managing fine-grained access, see *Oracle Database Security Guide*

## 280.3 UTL\_SMTP Constants

UTL\_SMTP defines several constants to use when specifying parameter values.

These are shown in the following table.

**Table 280-1 UTL\_SMTP Constants**

| Name                           | Type          | Value                  | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|---------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALL_SCHEMES                    | VARCHAR2(256) | 'CRAM-MD5 PLAIN LOGIN' | List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS). |
| NON_CLEARTEXT_PASSWORD_SCHEMES | VARCHAR2(256) | 'CRAM-MD5'             | List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.                                                                    |

## 280.4 UTL\_SMTP Types

UTL\_SMTP uses a CONNECTION record type and REPLY\_REPLIES record types.

### CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

## Syntax

```
TYPE connection IS RECORD (  
    host          VARCHAR2(255),  
    port          PLS_INTEGER,  
    tx_timeout    PLS_INTEGER,  
    private_tcp_con utl_tcp.connection,  
    private_state  PLS_INTEGER);
```

## Fields

**Table 280-2 CONNECTION Record Type Fields**

| Field           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host            | Name of the remote host when connection is established. <code>NULL</code> when no connection is established.                                                                                                                                                                                                                                                                                                                                        |
| port            | Port number of the remote SMTP server connected. <code>NULL</code> when no connection is established.                                                                                                                                                                                                                                                                                                                                               |
| tx_timeout      | Time in seconds that the <code>UTL_SMTP</code> package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. <code>NULL</code> indicates to wait forever. |
| private_tcp_con | Private, for implementation use only. You should not modify this field.                                                                                                                                                                                                                                                                                                                                                                             |
| private_state   | Private, for implementation use only. You should not modify this field.                                                                                                                                                                                                                                                                                                                                                                             |

## Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN\\_CONNECTION Functions](#). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

## REPLY\_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

## Syntax

```
TYPE reply IS RECORD (  
    code    PLS_INTEGER,  
    text    VARCHAR2(508));  
  
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

## Fields

**Table 280-3 REPLY, REPLIES Record Type Fields**

| Field | Description               |
|-------|---------------------------|
| code  | 3-digit reply code        |
| text  | Text message of the reply |

## 280.5 UTL\_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

**Table 280-4 SMTP Reply Codes**

| Reply Code | Meaning                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 211        | System status, or system help reply                                                                                                                     |
| 214        | Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]  |
| 220        | <domain> Service ready                                                                                                                                  |
| 221        | <domain> Service closing transmission channel                                                                                                           |
| 250        | Requested mail action okay, completed                                                                                                                   |
| 251        | User not local; forwards to <forward-path>                                                                                                              |
| 252        | OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery. |
| 253        | OK, <messages> pending messages for node <node> started                                                                                                 |
| 354        | Start mail input; end with <CRLF.CRLF>                                                                                                                  |
| 355        | Octet-offset is the transaction offset                                                                                                                  |

| 451        | Requested action terminated: local error in processing                                                                                                  |
| 452        | Requested action not taken: insufficient system storage                                                                                                 |
| 453        | You have no mail.                                                                                                                                       |
| 454        | TLS not available due to temporary reason. Encryption required for requested authentication mechanism.                                                  |
| 458        | Unable to queue messages for node <node>                                                                                                                |
| 459        | Node <node> not allowed: reason                                                                                                                         |
| 500        | Syntax error, command unrecognized (This may include errors such as command line too long.)                                                             |
| 501        | Syntax error in parameters or arguments                                                                                                                 |
| 502        | Command not implemented                                                                                                                                 |

**Table 280-4 (Cont.) SMTP Reply Codes**

| Reply Code | Meaning                                                                                          |
|------------|--------------------------------------------------------------------------------------------------|
| 503        | Bad sequence of commands                                                                         |
| 504        | Command parameter not implemented                                                                |
| 521        | <Machine> does not accept mail.                                                                  |
| 530        | Must issue a STARTTLS command first. Encryption required for requested authentication mechanism. |
| 534        | Authentication mechanism is too weak.                                                            |
| 538        | Encryption required for requested authentication mechanism.                                      |
| 550        | Requested action not taken: mailbox unavailable [for, mailbox not found, no access]              |
| 551        | User not local; please try <forward-path>                                                        |
| 552        | Requested mail action terminated: exceeded storage allocation                                    |
| 553        | Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]     |
| 554        | Transaction failed                                                                               |

## 280.6 UTL\_SMTP Operational Notes

An SMTP connection is initiated by a call to `OPEN_CONNECTION` Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

[HELO Function and Procedure](#) - identify the domain of the sender

[MAIL Function and Procedure](#)- start a mail, specify the sender

[RCPT Function](#) - specify the recipient

[OPEN\\_DATA Function and Procedure](#)- start the mail body

[WRITE\\_RAW\\_DATA Procedure](#) - write the mail body (multiple calls allowed)

[CLOSE\\_DATA Function and Procedure](#) - close the mail body and send the mail

The SMTP connection is closed by calling the `QUIT` Function and Procedure.

### Related Topics

- [OPEN\\_CONNECTION Functions](#)  
These functions open a connection to an SMTP server.
- [QUIT Function and Procedure](#)  
This subprogram terminates an SMTP session and disconnects from the server.

## 280.7 UTL\_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the `UTL_SMTP` package.

The network error is transferred to a reply code of 421- service not available.

**Table 280-5 UTL\_SMTP Exceptions**

| Exception         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INVALID_OPERATION | Raised when an invalid operation is made. In other words, calling API other than the <a href="#">WRITE_DATA Procedure</a> , the <a href="#">WRITE_RAW_DATA Procedure</a> or the <a href="#">CLOSE_DATA Function and Procedure</a> after the <a href="#">OPEN_DATA Function and Procedure</a> is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> . |
| TRANSIENT_ERROR   | Raised when receiving a reply code in 400 range                                                                                                                                                                                                                                                                                                                                                                                                    |
| PERMANENT_ERROR   | Raised when receiving a reply code in 500 range                                                                                                                                                                                                                                                                                                                                                                                                    |

## 280.8 UTL\_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL\_SMTP subprograms.

**Table 280-6 SMTP Size Limitation**

| Element           | Size Limitation                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| user              | Maximum total length of a user name is 64 characters                                                                                       |
| domain            | Maximum total length of a domain name or number is 64 characters                                                                           |
| path              | Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)                |
| command line      | Maximum total length of a command line including the command word and the <CRLF> is 512 characters                                         |
| reply line        | Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters                                             |
| text line         | Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency) |
| recipients buffer | Maximum total number of recipients that must be buffered is 100 recipients                                                                 |

## 280.9 UTL\_SMTP Examples

This example illustrates how UTL\_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;
```

```

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',      '"Sender" <sender@foo.com>');
  send_header('To',        '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
              -- a connection to the server. The QUIT call raises an
              -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

## 280.10 Summary of UTL\_SMTP Subprograms

This table lists the UTL\_SMTP subprograms and briefly describes them.

**Table 280-7 UTL\_SMTP Package Subprograms**

| Subprogram                                        | Description                                                                   |
|---------------------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">AUTH Function and Procedure</a>       | Sends the AUTH command to authenticate to the SMTP server                     |
| <a href="#">CLOSE_CONNECTION Procedure</a>        | Closes the SMTP connection, causing the current SMTP operation to terminate   |
| <a href="#">CLOSE_DATA Function and Procedure</a> | Closes the data session                                                       |
| <a href="#">COMMAND Function and Procedure</a>    | Performs a generic SMTP command                                               |
| <a href="#">COMMAND_REPLIES Function</a>          | Performs a generic SMTP command and retrieves multiple reply lines            |
| <a href="#">DATA Function and Procedure</a>       | Sends the e-mail body                                                         |
| <a href="#">EHLO Function and Procedure</a>       | Performs the initial handshake with SMTP server using the EHLO command        |
| <a href="#">HELO Function and Procedure</a>       | Performs the initial handshake with SMTP server using the HELO command        |
| <a href="#">HELP Function</a>                     | Sends HELP command                                                            |
| <a href="#">MAIL Function and Procedure</a>       | Initiates an e-mail transaction with the server, the destination is a mailbox |
| <a href="#">NOOP Function and Procedure</a>       | NULL command                                                                  |
| <a href="#">OPEN_CONNECTION Functions</a>         | Opens a connection to an SMTP server                                          |

**Table 280-7 (Cont.) UTL\_SMTP Package Subprograms**

| Subprogram                                       | Description                                                        |
|--------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">OPEN_DATA Function and Procedure</a> | Sends the DATA command                                             |
| <a href="#">QUIT Function and Procedure</a>      | Terminates an SMTP session and disconnects from the server         |
| <a href="#">RCPT Function</a>                    | Specifies the recipient of an e-mail message                       |
| <a href="#">RSET Function and Procedure</a>      | Terminates the current e-mail transaction                          |
| <a href="#">STARTTLS Function and Procedure</a>  | Sends STARTTLS command to secure the SMTP connection using SSL/TLS |
| <a href="#">VRFY Function</a>                    | Verifies the validity of a destination e-mail address              |
| <a href="#">WRITE_DATA Procedure</a>             | Writes a portion of the e-mail message                             |
| <a href="#">WRITE_RAW_DATA Procedure</a>         | Writes a portion of the e-mail message with RAW data               |

## 280.10.1 AUTH Function and Procedure

This subprogram sends the AUTH command to authenticate to the SMTP server. The UTL\_SMTP package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its EHLO reply, the user must call the [EHLO Function and Procedure](#). Otherwise, UTL\_SMTP uses the first scheme in the list.

### Syntax

```
UTL_SMTP.AUTH (  
    c          IN OUT NOCOPY connection,  
    username   IN          VARCHAR2,  
    password   IN          VARCHAR2,  
    schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)  
RETURN reply;  
  
UTL_SMTP.AUTH (  
    c          IN OUT NOCOPY connection,  
    username   IN          VARCHAR2,  
    password   IN          VARCHAR2,  
    schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);
```

### Parameters

**Table 280-8 AUTH Function and Procedure Parameters**

| Parameter | Description                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | SMTP connection                                                                                                                                                                     |
| username  | Username                                                                                                                                                                            |
| password  | Password                                                                                                                                                                            |
| schemes   | Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions. |

## Return Values

**Table 280-9 AUTH Function and Procedure Function Return Values**

| Return Value | Description                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

## Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL\_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the [EHLO Function and Procedure](#) again for UTL\_SMTP to update the list after the [STARTTLS Function and Procedure](#) is called.

## Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  UTL_SMTP.STARTTLS(c);
  UTL_SMTP.AUTH(
    c => c,
    username => 'scott',
    password => 'password',
    schemes => utl_smtp.all_schemes);
END;
```

## 280.10.2 CLOSE\_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the [QUIT Function and Procedure](#).

### Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
  c      IN OUT NOCOPY connection);
```

### Parameters

**Table 280-10 CLOSE\_CONNECTION Procedure Parameters**

| Parameter | Description     |
|-----------|-----------------|
| c         | SMTP connection |

## 280.10.3 CLOSE\_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

### Syntax

```
UTL_SMTP.CLOSE_DATA (  
    c          IN OUT NOCOPY connection)  
RETURN reply;  
  
UTL_SMTP.CLOSE_DATA (  
    c          IN OUT NOCOPY connection);
```

### Parameters

**Table 280-11** CLOSE\_DATA Function and Procedure Parameters

| Parameter | Description     |
|-----------|-----------------|
| c         | SMTP connection |

### Return Values

**Table 280-12** CLOSE\_DATA Function and Procedure Return Values

| Return Value | Description                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

### Usage Notes

The calls to OPEN\_DATA, WRITE\_DATA, WRITE\_RAW\_DATA and CLOSE\_DATA must be made in the right order. A program calls OPEN\_DATA to send the DATA command to the SMTP server. After that, it can call WRITE\_DATA or WRITE\_RAW\_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE\_DATA. After OPEN\_DATA is called, the only subprograms that can be called are WRITE\_DATA, WRITE\_RAW\_DATA, or CLOSE\_DATA. A call to other subprograms results in an INVALID\_OPERATION exception being raised.

CLOSE\_DATA must be called only after OPEN\_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE\_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE\_DATA.

## 280.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

### Syntax

```
UTL_SMTP.COMMAND (  
    c          IN OUT NOCOPY connection,
```

```
cmd    IN          VARCHAR2,  
arg    IN          VARCHAR2 DEFAULT NULL)  
RETURN reply;  
  
UTL_SMTP.COMMAND (  
c      IN OUT NOCOPY connection,  
cmd    IN          VARCHAR2,  
arg    IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 280-13** COMMAND Function and Procedure Parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| c         | SMTP connection                                                                  |
| cmd       | SMTP command to send to the server                                               |
| arg       | Optional argument to the SMTP argument. A space is inserted between cmd and arg. |

### Return Values

**Table 280-14** COMMAND Function and Procedure Return Values

| Return Value | Description                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

### Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 280.10.5 COMMAND\_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

### Syntax

```
UTL_SMTP.COMMAND_REPLIES (  
c      IN OUT NOCOPY connection,  
cmd    IN          VARCHAR2,  
arg    IN          VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

## Parameters

**Table 280-15** COMMAND\_REPLIES Function Parameters

| Parameter | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| c         | SMTP connection                                                                  |
| cmd       | SMTP command to send to the server                                               |
| arg       | Optional argument to the SMTP argument. A space is inserted between cmd and arg. |

## Return Values

**Table 280-16** COMMAND\_REPLIES Function Return Values

| Return Value | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| replies      | Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ) |

## Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## 280.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

### Syntax

```
UTL_SMTP.DATA (  
    c      IN OUT NOCOPY connection  
    body   IN  VARCHAR2 CHARACTER SET ANY_CS)  
RETURN reply;
```

```
UTL_SMTP.DATA (  
    c      IN OUT NOCOPY connection  
    body   IN  VARCHAR2 CHARACTER SET ANY_CS);
```

## Parameters

**Table 280-17** DATA Function and Procedure Parameters

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| c         | SMTP Connection                                                       |
| body      | Text of the message to be sent, including headers, in [RFC822] format |

## Return Values

**Table 280-18 DATA Function and Procedure Return Values**

| Return Value | Description                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

## Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in body to `<CR><LF>..<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The `DATA` subprogram must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL` and `RCPT` have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial `DATA` command is not returned to the caller.

## 280.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `EHLO` command.

### Syntax

```
UTL_SMTP.EHLO (  
    c          IN OUT NOCOPY connection,  
    domain     IN)  
RETURN replies;  
  
UTL_SMTP.EHLO (  
    c          IN OUT NOCOPY connection,  
    domain     IN);
```

### Parameters

**Table 280-19 EHLO Function and Procedure Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| c         | SMTP connection                                                            |
| domain    | Domain name of the local (sending) host. Used for identification purposes. |

## Return Values

**Table 280-20 EHLO Function and Procedure Return Values**

| Return Value | Description                                                                                |
|--------------|--------------------------------------------------------------------------------------------|
| replies      | Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ). |

## Usage Notes

The `EHLO` interface is identical to `HELO` except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with `HELO`, each line of text returned by the server begins with status code 250.

## Related Functions

[HELO Function and Procedure](#)

## 280.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the `HELO` command.

## Syntax

```
UTL_SMTP.HELO (  
    c          IN OUT NOCOPY  connection,  
    domain IN                VARCHAR2)  
RETURN reply;  
  
UTL_SMTP.HELO (  
    c          IN OUT NOCOPY  connection,  
    domain IN                VARCHAR2);
```

## Parameters

**Table 280-21 HELO Function and Procedure Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| c         | SMTP connection                                                            |
| domain    | Domain name of the local (sending) host. Used for identification purposes. |

## Return Values

**Table 280-22 HELO Function and Procedure Return Values**

| Return Value | Description                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES Record Types in UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

**Usage Notes**

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN\\_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

**Related Functions**

[EHLO Function and Procedure](#)

280.10.9 HELP Function

This function sends the `HELP` command.

**Syntax**

```
UTL_SMTP.HELP (  
    c          IN OUT NOCOPY  connection,  
    command    IN             VARCHAR2 DEFAULT NULL)  
RETURN replies;
```

**Parameters**

**Table 280-23**    **HELP Function Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| c         | SMTP connection                 |
| command   | Command to get the help message |

**Return Values**

**Table 280-24**    **HELP Function Return Values**

| Return Value | Description                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------|
| replies      | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> ) |

280.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

**Syntax**

```
UTL_SMTP.MAIL (  
    c          IN OUT NOCOPY  connection,  
    sender     IN             VARCHAR2,  
    parameters IN             VARCHAR2 DEFAULT NULL)  
RETURN reply;  
  
UTL_SMTP.MAIL (  
    c          IN OUT NOCOPY  connection,
```

```
sender      IN          VARCHAR2,  
parameters IN          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 280-25 MAIL Function and Procedure Parameters**

| Parameter  | Description                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------|
| c          | SMTP connection                                                                                                                    |
| sender     | E-mail address of the user sending the message.                                                                                    |
| parameters | Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)". |

### Return Values

**Table 280-26 MAIL Function and Procedure Return Values**

| Return Value | Description                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES</a> Record Types in <a href="#">UTI_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

### Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

## 280.10.11 NOOP Function and Procedure

This subprogram issues the `NULL` command.

### Syntax

```
UTL_SMTP.NOOP (  
    c IN OUT NOCOPY connection)  
RETURN reply;
```

```
UTL_SMTP.NOOP (  
    c IN OUT NOCOPY connection);
```

### Parameter

**Table 280-27 NOOP Function and Procedure Parameters**

| Parameter | Description     |
|-----------|-----------------|
| c         | SMTP connection |

## Return Values

**Table 280-28 NOOP Function and Procedure Return Values**

| Return Value | Description                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

## Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

## 280.10.12 OPEN\_CONNECTION Functions

These functions open a connection to an SMTP server.

### Syntax

```
UTL_SMTP.OPEN_CONNECTION (  
    host                IN  VARCHAR2,  
    port                IN  PLS_INTEGER DEFAULT 25,  
    c                   OUT connection,  
    tx_timeout          IN  PLS_INTEGER DEFAULT NULL,  
    wallet_path         IN  VARCHAR2 DEFAULT NULL,  
    wallet_password     IN  VARCHAR2 DEFAULT NULL,  
    secure_connection_before_smtp IN  BOOLEAN DEFAULT FALSE,  
    secure_host         IN  VARCHAR2 DEFAULT NULL)  
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (  
    host                IN  VARCHAR2,  
    port                IN  PLS_INTEGER DEFAULT 25,  
    tx_timeout          IN  PLS_INTEGER DEFAULT NULL,  
    wallet_path         IN  VARCHAR2 DEFAULT NULL,  
    wallet_password     IN  VARCHAR2 DEFAULT NULL,  
    secure_connection_before_smtp IN  BOOLEAN DEFAULT FALSE,  
    secure_host         IN  VARCHAR2 DEFAULT NULL)  
RETURN connection;
```

### Parameters

**Table 280-29 OPEN\_CONNECTION Functions Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| host      | Name of the SMTP server host                               |
| port      | Port number on which SMTP server is listening (usually 25) |
| c         | SMTP connection                                            |

**Table 280-29 (Cont.) OPEN\_CONNECTION Functions Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tx_timeout                    | Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever. |
| wallet_path                   | Directory path that contains the Oracle wallet for SSL/TLS. The format is file:<directory-path>                                                                                                                                                                                                                                                                                                                            |
| wallet_password               | Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.                                                                                                                                                                                                                                                                                                                       |
| secure_connection_before_smtp | If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.                                                                                                                                                                                                                                                                                                              |
| secure_host                   | The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like "*.example.com".<br><br>If NULL, the SMTP host name to connect to will be used.                                                                                                                                                                              |

### Return Values

**Table 280-30 OPEN\_CONNECTION Functions Return Values**

| Return Value | Description                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see REPLY_ REPLIES Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

### Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN\_CONNECTION that returns UTL\_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN\_CONNECTION that returns REPLY.
- tx\_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx\_timeout from governing write operations in the current release.

### Examples

```

DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
    host => 'smtp.example.com',
    port => 465,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => TRUE);
END;
```

## 280.10.13 OPEN\_DATA Function and Procedure

This subprogram sends the `DATA` command after which you can use `WRITE_DATA` and `WRITE_RAW_DATA` to write a portion of the e-mail message.

### Syntax

```
UTL_SMTP.OPEN_DATA (  
    c      IN OUT NOCOPY connection)  
RETURN reply;  
  
UTL_SMTP.OPEN_DATA (  
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 280-31 OPEN\_DATA Function and Procedure Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| c         | SMTP connection                                                                     |
| data      | Portion of the text of the message to be sent, including headers, in RFC822 format. |

### Return Values

**Table 280-32 OPEN\_DATA Function and Procedure Function Return Values**

| Return Value | Description                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <code>REPLY_REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

### Usage Notes

- The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- `OPEN_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

## 280.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

### Syntax

```
UTL_SMTP.QUIT (  
    c      IN OUT NOCOPY connection)
```

```
RETURN reply;

UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection);
```

Parameter

Table 280-33 QUIT Function and Procedure Parameters

| Parameter | Description     |
|-----------|-----------------|
| c         | SMTP connection |

Return Values

Table 280-34 QUIT Function and Procedure Function Return Values

| Return Value | Description                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

Related Functions

[RSET Function and Procedure](#)

280.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN               VARCHAR2,
    parameters IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
    c          IN OUT NOCOPY    connection,
    recipient  IN               VARCHAR2,
    parameters IN               VARCHAR2 DEFAULT NULL);
```

**Table 280-35 RCPT Function and Procedure Parameters**

| Parameter  | Description                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------|
| c          | SMTP connection                                                                                                                    |
| recipient  | E-mail address of the user to which the message is being sent                                                                      |
| parameters | Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ....)". |

#### Return Values

**Table 280-36 RCPT Function and Procedure Function Return Values**

| Return Value | Description                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <code>REPLY_ REPLIES</code> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

#### Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

## 280.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

#### Syntax

```
UTL_SMTP.RSET (  
    c IN OUT NOCOPY connection)  
RETURN reply;
```

```
UTL_SMTP.RSET (  
    c IN OUT NOCOPY connection);
```

#### Parameters

**Table 280-37 RSET Function and Procedure Parameters**

| Parameter | Description     |
|-----------|-----------------|
| c         | SMTP connection |

## Return Values

**Table 280-38 RSET Function and Procedure Return Values**

| Return Value | Description                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_ REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

## Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call `RSET` at any time after the connection to the SMTP server has been opened by means of `OPEN_CONNECTION` until `DATA` or `OPEN_DATA` is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to `RSET` with a message beginning with status code 250.

## Related Functions

[QUIT Function and Procedure](#)

## 280.10.17 STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Functions](#).

## Syntax

```
UTL_SMTP.STARTTLS (  
    c                IN OUT NOCOPY connection,  
    secure_host      IN      VARCHAR2 DEFAULT NULL)  
RETURN reply;  
  
UTL_SMTP.STARTTLS (  
    c                IN OUT NOCOPY connection,  
    secure_host      IN      VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 280-39 STARTTLS Function and Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c           | SMTP connection                                                                                                                                                                                                            |
| secure_host | The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like <code>"*.example.com"</code> .<br><br>If NULL, the SMTP host name to connect to will be used. |

Return Values

Table 280-40 STARTTLS Function and Procedure Return Values

| Return Value | Description |
|--------------|-------------|
| reply        | SMTP reply  |

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

280.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
  c          IN OUT NOCOPY connection
  recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

Table 280-41 VRFY Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| c         | SMTP connection               |
| recipient | E-mail address to be verified |

## Return Values

**Table 280-42 VRFY Function Return Values**

| Return Value | Description                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reply        | Reply of the command (see <a href="#">REPLY_REPLIES</a> Record Types in <a href="#">UTL_SMTP Types</a> ). In cases where there are multiple replies, the last reply is returned. |

## Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

## 280.10.19 WRITE\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

## Syntax

```
UTL_SMTP.WRITE_DATA (  
    c      IN OUT NOCOPY connection,  
    data   IN VARCHAR2 CHARACTER SET ANY_CS);
```

## Parameters

**Table 280-43 WRITE\_DATA Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| c         | SMTP connection                                                                      |
| data      | Portion of the text of the message to be sent, including headers, in [RFC822] format |

## Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body

to <CR><LF> . . <CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).
- Text (VARCHAR2) data sent using [WRITE\\_DATA](#) is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL\_RAW package, and then sending the RAW data using [WRITE\\_RAW\\_DATA](#).

## 280.10.20 WRITE\_RAW\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to [WRITE\\_RAW\\_DATA](#) appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_RAW_DATA (  
    c          IN OUT NOCOPY connection  
    data       IN RAW);
```

### Parameters

**Table 280-44** WRITE\_RAW\_DATA Procedure Parameters

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| c         | SMTP connection                                                                      |
| data      | Portion of the text of the message to be sent, including headers, in [RFC822] format |

### Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be made in the correct order. A program calls [OPEN\\_DATA](#) to send the DATA command to the SMTP server. After that, it can call [WRITE\\_DATA](#) or [WRITE\\_RAW\\_DATA](#) repeatedly to send the actual data. The data is terminated by calling [CLOSE\\_DATA](#). After [OPEN\\_DATA](#) is called, the only subprograms that can be called are [WRITE\\_DATA](#), [WRITE\\_RAW\\_DATA](#), or [CLOSE\\_DATA](#). A call to other subprograms results in an [INVALID\\_OPERATION](#) exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The [DATA](#) routine terminates the message with a <CR><LF> . <CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF> . <CR><LF> (single period) in the body

to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).

# UTL\_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)
- [Summary of UTL\\_TCP Subprograms](#)

## 281.1 UTL\_TCP Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

## 281.2 UTL\_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

**Note:**

For more information about managing fine-grained access, see *Oracle Database Security Guide*

## 281.3 UTL\_TCP Types

The `UTL_TCP` package includes a `CONNECTION` type and a carriage-return line-feed (CRLF) type.

**CONNECTION Type**

This is a PL/SQL record type used to represent a TCP/IP connection.

## Syntax

```
TYPE connection IS RECORD (  
    remote_host    VARCHAR2(255),  
    remote_port    PLS_INTEGER,  
    local_host     VARCHAR2(255),  
    local_port     PLS_INTEGER,  
    charset        VARCHAR2(30),  
    newline        VARCHAR2(2),  
    tx_timeout     PLS_INTEGER,  
    private_sd     PLS_INTEGER);
```

## Fields

**Table 281-1 Connection Record Type Fields**

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remote_host | Name of the remote host when connection is established. NULL when no connection is established.                                                                                                                                                                                                                                                                                                                                 |
| remote_port | Port number of the remote host connected. NULL when no connection is established.                                                                                                                                                                                                                                                                                                                                               |
| local_host  | Name of the local host used to establish the connection. NULL when no connection is established.                                                                                                                                                                                                                                                                                                                                |
| local_port  | Port number of the local host used to establish the connection. NULL when no connection is established.                                                                                                                                                                                                                                                                                                                         |
| charset     | The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network. |
| newline     | Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.                                                                                                                                                                                                                                                                                                   |
| tx_timeout  | Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.      |

## Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the UTL\_TCP package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the UTL\_TCP package.

## CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

## Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

## Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

## 281.4 UTL\_TCP Exceptions

UTL\_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

**Table 281-2 TCP/IP Exceptions**

| Exception              | Description                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------|
| BUFFER_TOO_SMALL       | Buffer is too small for input that requires look-ahead                                           |
| END_OF_INPUT           | Raised when no more data is available to read from the connection                                |
| NETWORK_ERROR          | Generic network error                                                                            |
| BAD_ARGUMENT           | Bad argument passed in an API call (for example, a negative buffer size)                         |
| TRANSFER_TIMEOUT       | No data is read and a read time out occurred                                                     |
| PARTIAL_MULTIBYTE_CHAR | No complete character is read and a partial multibyte character is found at the end of the input |

## 281.5 UTL\_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

## 281.6 UTL\_TCP Examples

Some possible uses for UTL\_TCP include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c utl_tcp.connection; -- TCP/IP connection to the Web server
```

```

    ret_val pls_integer;
BEGIN
    c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                                remote_port => 80,
                                charset      => 'US7ASCII'); -- open connection
    ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
    ret_val := utl_tcp.write_line(c);
    BEGIN
        LOOP
            dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
        END LOOP;
    EXCEPTION
        WHEN utl_tcp.end_of_input THEN
            NULL; -- end of input
    END;
    utl_tcp.close_connection(c);
END;

```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```

PROCEDURE send_mail (sender    IN VARCHAR2,
                    recipient IN VARCHAR2,
                    message   IN VARCHAR2) IS
    mailhost  VARCHAR2(30) := 'mailhost.mydomain.com';
    smtp_error EXCEPTION;
    mail_conn utl_tcp.connection;
    PROCEDURE smtp_command(command IN VARCHAR2,
                            ok      IN VARCHAR2 DEFAULT '250')
    IS
        response varchar2(3);
        len pls_integer;
    BEGIN
        len := utl_tcp.write_line(mail_conn, command);
        response := substr(utl_tcp.get_line(mail_conn), 1, 3);
        IF (response <> ok) THEN
            RAISE smtp_error;
        END IF;
    END;

BEGIN
    mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                        remote_port => 25,
                                        charset      => 'US7ASCII');

    smtp_command('HELO ' || mailhost);
    smtp_command('MAIL FROM: ' || sender);
    smtp_command('RCPT TO: ' || recipient);
    smtp_command('DATA', '354');
    smtp_command(message);
    smtp_command('QUIT', '221');
    utl_tcp.close_connection(mail_conn);
EXCEPTION
    WHEN OTHERS THEN
        -- Handle the error
END;

```

## 281.7 Summary of UTL\_TCP Subprograms

This table lists the UTL\_TCP subprograms and briefly describes them.

**Table 281-3 UTL\_TCP Package Subprograms**

| Subprogram                                      | Description                                                                            |
|-------------------------------------------------|----------------------------------------------------------------------------------------|
| <a href="#">AVAILABLE Function</a>              | Determines the number of bytes available for reading from a TCP/IP connection          |
| <a href="#">CLOSE_ALL_CONNECTIONS Procedure</a> | Closes all open TCP/IP connections                                                     |
| <a href="#">CLOSE_CONNECTION Procedure</a>      | Closes an open TCP/IP connection                                                       |
| <a href="#">FLUSH Procedure</a>                 | Transmits immediately to the server all data in the output buffer, if a buffer is used |
| <a href="#">GET_LINE Function</a>               | Returns the line of data read                                                          |
| <a href="#">GET_LINE_NCHAR Function</a>         | Returns the line of data read in NCHAR form                                            |
| <a href="#">GET_RAW Function</a>                | Return the data read instead of the amount of data read                                |
| <a href="#">GET_TEXT Function</a>               | Returns the text data read                                                             |
| <a href="#">GET_TEXT_NCHAR Function</a>         | Returns the text data read in NCHAR form                                               |
| <a href="#">OPEN_CONNECTION Function</a>        | Opens a TCP/IP connection to a specified service                                       |
| <a href="#">READ_LINE Function</a>              | Receives a text line from a service on an open connection                              |
| <a href="#">READ_RAW Function</a>               | Receives binary data from a service on an open connection                              |
| <a href="#">READ_TEXT Function</a>              | Receives text data from a service on an open connection                                |
| <a href="#">SECURE_CONNECTION Procedure</a>     | Secures a TCP/IP connection using SSL/TLS                                              |
| <a href="#">WRITE_LINE Function</a>             | Transmits a text line to a service on an open connection                               |
| <a href="#">WRITE_RAW Function</a>              | Transmits a binary message to a service on an open connection                          |
| <a href="#">WRITE_TEXT Function</a>             | Transmits a text message to a service on an open connection                            |

## 281.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

### Syntax

```
UTL_TCP.AVAILABLE (  
    c          IN OUT NOCOPY connection,  
    timeout    IN PLS_INTEGER DEFAULT 0)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-4 AVAILABLE Function Parameters**

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| c         | TCP connection to determine the amount of data that is available to be read |

**Table 281-4 (Cont.) AVAILABLE Function Parameters**

| Parameter | Description                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout   | Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever. |

### Return Values

The number of bytes available for reading without blocking

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
  c    utl_tcp.connection
  data VARCHAR2(256);
  len  PLS_INTEGER;
BEGIN
  c := utl_tcp.open_connection(...);
  LOOP
    IF (utl_tcp.available(c) > 0) THEN
      len := utl_tcp.read_text(c, data, 256);
    ELSE
      ---do some other things
      . . . . .
    END IF
  END LOOP;
END;
```

## 281.7.2 CLOSE\_ALL\_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

### Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

### Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

## 281.7.3 CLOSE\_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

### Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
    c IN OUT NOCOPY connection);
```

### Parameters

**Table 281-5 CLOSE\_CONNECTION Procedure Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| c         | TCP connection to close |

### Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

## 281.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

### Syntax

```
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

### Parameters

**Table 281-6 FLUSH Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| c         | TCP connection to which to send data |

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 281.7.5 GET\_LINE Function

This function returns the line of data read.

### Syntax

```
UTL_TCP.GET_LINE (  
    c          IN OUT NOCOPY connection,  
    remove_crlf IN          BOOLEAN DEFAULT FALSE,  
    peek       IN          BOOLEAN DEFAULT FALSE)  
RETURN VARCHAR2;
```

### Parameters

**Table 281-7 GET\_LINE Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c           | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| remove_crlf | If TRUE, then one or more trailing CRLF characters are removed from the received message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| peek        | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

### Return Values

The text line read

### Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

## 281.7.6 GET\_LINE\_NCHAR Function

This function returns the line of data read in NCHAR form.

### Syntax

```
UTL_TCP.GET_LINE_NCHAR (  
    c          IN OUT NOCOPY connection,  
    remove_crlf IN          BOOLEAN DEFAULT FALSE,  
    peek       IN          BOOLEAN DEFAULT FALSE)  
RETURN NVARCHAR2;
```

## Parameters

**Table 281-8 GET\_LINE\_NCHAR Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c           | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| remove_crlf | If TRUE, then one or more trailing CRLF characters are removed from the received message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| peek        | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

## Return Values

The text line read

## Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

## 281.7.7 GET\_RAW Function

This function returns the data read instead of the amount of data read.

## Syntax

```
UTL_TCP.GET_RAW (  
    c      IN OUT NOCOPY connection,  
    len    IN              PLS_INTEGER DEFAULT 1,  
    peek   IN              BOOLEAN      DEFAULT FALSE)  
RETURN RAW;
```

## Parameters

**Table 281-9 GET\_RAW Function Parameters**

| Parameter | Description                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------|
| c         | TCP connection from which to receive data                                                        |
| len       | The number of bytes (or characters for <code>VARCHAR2</code> ) of data to receive. Default is 1. |

**Table 281-9 (Cont.) GET\_RAW Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| peek        | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |
| remove_crlf | If <code>TRUE</code> , then one ore more trailing CRLF characters are removed from the received message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Return Values

The binary data read

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `read_*` API for character set conversion, buffer size, and multibyte character issues.

## 281.7.8 GET\_TEXT Function

This function returns the text data read.

### Syntax

```
UTL_TCP.GET_TEXT (
    c      IN OUT NOCOPY connection,
    len    IN          PLS_INTEGER DEFAULT 1,
    peek   IN          BOOLEAN      DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 281-10 GET\_TEXT Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| len       | Number of bytes (or characters for <code>VARCHAR2</code> ) of data to receive. Default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| peek      | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

**Table 281-10 (Cont.) GET\_TEXT Function Parameters**

| Parameter   | Description                                                                                |
|-------------|--------------------------------------------------------------------------------------------|
| remove_crlf | If TRUE, then one ore more trailing CRLF characters are removed from the received message. |

**Return Values**

The text data read

**Usage Notes**

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

## 281.7.9 GET\_TEXT\_NCHAR Function

This function returns the text data read in NCHAR form.

**Syntax**

```
UTL_TCP.GET_TEXT_NCHAR (  
    c      IN OUT NOCOPY connection,  
    len    IN          PLS_INTEGER DEFAULT 1,  
    peek   IN          BOOLEAN      DEFAULT FALSE)  
RETURN NVARCHAR2;
```

**Parameters****Table 281-11 GET\_TEXT\_NCHAR Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c           | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| len         | The number of bytes (or characters for <code>VARCHAR2</code> ) of data to receive. Default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| peek        | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |
| remove_crlf | If TRUE, then one ore more trailing CRLF characters are removed from the received message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Return Values**

The text data read

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

For all the `get_*` APIs described in this section, see the corresponding `read_*` API for the read time out issue. For `GET_TEXT` and `GET_LINE`, see the corresponding `READ_*` API for character set conversion, buffer size, and multibyte character issues.

## 281.7.10 OPEN\_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

### Syntax

```
UTL_TCP.OPEN_CONNECTION (
    remote_host      IN VARCHAR2,
    remote_port      IN PLS_INTEGER,
    local_host       IN VARCHAR2 DEFAULT NULL,
    local_port       IN PLS_INTEGER DEFAULT NULL,
    in_buffer_size   IN PLS_INTEGER DEFAULT NULL,
    out_buffer_size  IN PLS_INTEGER DEFAULT NULL,
    charset          IN VARCHAR2 DEFAULT NULL,
    newline          IN VARCHAR2 DEFAULT CRLF,
    tx_timeout       IN PLS_INTEGER DEFAULT NULL,
    wallet_path      IN VARCHAR2 DEFAULT NULL,
    wallet_password  IN VARCHAR2 DEFAULT NULL,
    RETURN connection;
```

### Parameters

**Table 281-12 OPEN\_CONNECTION Function Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>remote_host</code>     | Name of the host providing the service. When <code>remote_host</code> is <code>NULL</code> , it connects to the local host.                                                                                                                                                                                                                                                                                                                                 |
| <code>remote_port</code>     | Port number on which the service is listening for connections                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>local_host</code>      | Name of the host providing the service. <code>NULL</code> means does not care.                                                                                                                                                                                                                                                                                                                                                                              |
| <code>local_port</code>      | Port number on which the service is listening for connections. <code>NULL</code> means don't care.                                                                                                                                                                                                                                                                                                                                                          |
| <code>in_buffer_size</code>  | The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes. |
| <code>out_buffer_size</code> | The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A <code>NULL</code> value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.                   |

**Table 281-12 (Cont.) OPEN\_CONNECTION Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| charset         | The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using <code>READ_TEXT</code> , <code>READ_LINE</code> , <code>WRITE_TEXT</code> and <code>WRITE_LINE</code> . Set this parameter to <code>NULL</code> when no conversion is needed. |
| newline         | Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| tx_timeout      | Time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. <code>NULL</code> indicates to wait forever.                                                                                                                                                        |
| wallet_path     | Directory path that contains the Oracle wallet for SSL/TLS. The format is <code>file:directory-path</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| wallet_password | Password to open the wallet. When the wallet is auto-login enabled, the password may be set to <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Return Values

A connection to the targeted TCP/IP service

### Usage Notes

- Note that connections opened by this `UTL_TCP` package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

### Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
    host      => 'www.example.com',
    port     => 443,
```

```
wallet_path      => 'file:/oracle/wallets/smtp_wallet',  
wallet_password => '****');  
UTL_TCP.SECURE_CONNECTION (c => c);  
END;
```

## 281.7.11 READ\_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

### Syntax

```
UTL_TCP.READ_LINE (  
    c          IN OUT NOCOPY connection,  
    data       IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
    peek       IN          BOOLEAN DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-13 READ\_LINE Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c           | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| data        | Data received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| remove_crlf | If TRUE, then one or more trailing CRLF characters are removed from the received message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| peek        | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read

successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 281.7.12 READ\_RAW Function

This function receives binary data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_RAW (  
    c      IN OUT NOCOPY connection,  
    data   IN OUT NOCOPY RAW,  
    len    IN          PLS_INTEGER DEFAULT 1,  
    peek   IN          BOOLEAN      DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-14** READ\_RAW Function Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c                  | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| data (IN OUT COPY) | Data received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| len                | Number of bytes of data to receive                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| peek               | Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

### Return Values

The number of bytes of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## 281.7.13 READ\_TEXT Function

This function receives text data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_TEXT (  
    c      IN OUT NOCOPY connection,  
    data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,  
    len  IN          PLS_INTEGER DEFAULT 1,  
    peek IN          BOOLEAN      DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-15 READ\_TEXT Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | TCP connection from which to receive data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| data      | Data received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| len       | Number of characters of data to receive                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| peek      | Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer. |

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## 281.7.14 SECURE\_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Function](#).

### Syntax

```
UTL_TCP.SECURE_CONNECTION (  
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 281-16 SECURE\_CONNECTION Procedure Parameters**

| Parameter | Description                               |
|-----------|-------------------------------------------|
| c         | TCP connection from which to receive data |

## 281.7.15 WRITE\_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

### Syntax

```
UTL_TCP.WRITE_LINE (  
    c      IN OUT NOCOPY connection,  
    data IN          VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-17 WRITE\_LINE Function Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| c         | TCP connection to which to send data  |
| data      | Buffer containing the data to be sent |

### Return Values

The actual number of characters of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

## 281.7.16 WRITE\_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

### Syntax

```
UTL_TCP.WRITE_RAW (  
    c      IN OUT NOCOPY connection,  
    data IN          RAW,  
    len IN          PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 281-18** WRITE\_RAW Function Parameters

| Parameter | Description                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------|
| c         | TCP connection to which to send data                                                            |
| data      | Buffer containing the data to be sent                                                           |
| len       | The number of bytes of data to transmit. When len is NULL, the whole length of data is written. |

### Return Values

The number of bytes of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## 281.7.17 WRITE\_TEXT Function

This function transmits a text message to a service on an open connection.

### Syntax

```
UTL_TCP.WRITE_TEXT (  
    c      IN OUT NOCOPY connection,  
    data IN          VARCHAR2 CHARACTER SET ANY_CS,  
    len IN          PLS_INTEGER DEFAULT NULL)  
RETURN num_chars PLS_INTEGER;
```

## Parameters

**Table 281-19** WRITE\_TEXT Function Parameters

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | TCP connection to which to send data                                                                                                                                             |
| data      | Buffer containing the data to be sent                                                                                                                                            |
| len       | The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition. |

## Return Values

The actual number of characters of data transmitted

## Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

# UTL\_URL

The `UTL_URL` package has two functions: `ESCAPE` and `UNESCAPE`.

This chapter contains the following topics:

- [Overview](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of UTL\\_URL Subprograms](#)

**See Also:**

[UTL\\_HTTP](#)

## 282.1 UTL\_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), comma (,), and sharp (#)

The `UTL_URL` package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used to fetch a Web page by way of the `UTL_HTTP` package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the `x-www-form-urlencoded` encoding mechanism described in the HTML specification:

`http://www.w3.org/TR/html`

## 282.2 UTL\_URL Exceptions

UTL\_URL raises an exception when it encounter a processing issue.

The following table lists the exceptions that can be raised when the UTL\_URL package API is invoked.

**Table 282-1 UTL\_URL Exceptions**

| Exception               | Error Code | Reason                                                                     |
|-------------------------|------------|----------------------------------------------------------------------------|
| BAD_URL                 | 29262      | The URL contains badly formed escape code sequences                        |
| BAD_FIXED_WIDTH_CHARSET | 29274      | Fixed-width multibyte character set is not allowed as a URL character set. |

## 282.3 UTL\_URL Examples

UTL\_URL can be used for encoding and decoding.

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (  
    data    IN VARCHAR2,  
    charset IN VARCHAR2) RETURN VARCHAR2 AS  
BEGIN  
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE  
END;
```

For decoding data encoded with the `form-URL-encode` scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(  
    data    IN VARCHAR2,  
    charset IN VARCHAR2) RETURN VARCHAR2 AS  
BEGIN  
    RETURN utl_url.unescape(  
        replace(data, '+', ' '),  
        charset);  
END;
```

## 282.4 Summary of UTL\_URL Subprograms

This table lists and briefly describes the UTL\_URL subprograms.

**Table 282-2 UTL\_URL Package Subprograms**

| Subprogram                        | Description                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ESCAPE Function</a>   | Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format                            |
| <a href="#">UNESCAPE Function</a> | Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters |

## 282.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

### Syntax

```
UTL_URL.ESCAPE (  
    url                      IN VARCHAR2 CHARACTER SET ANY_CS,  
    escape_reserved_chars    IN BOOLEAN  DEFAULT FALSE,  
    url_charset              IN VARCHAR2 DEFAULT utl_http.body_charset)  
RETURN VARCHAR2;
```

### Parameters

**Table 282-3 ESCAPE Function Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url                   | The original URL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| escape_reserved_chars | Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.                                                                                                                                                                                                                                                                                                   |
| url_charset           | When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention. |

### Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using `escape_url`. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An `escape_url` cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=HR/<password>` into the query string of a URL, escape the `$` and `/` separately as `%24logon=HR%2F<password>` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://www.acme.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape  
( 'Is the use of the "$" sign okay?', TRUE );
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

## 282.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

### Syntax

```
UTL_URL.UNESCAPE (  
    url           IN VARCHAR2 CHARACTER SET ANY_CS,  
    url_charset   IN VARCHAR2 DEFAULT utl_http.body_charset)  
    RETURN VARCHAR2;
```

### Parameters

**Table 282-4 UNESCAPE Function Parameters**

| Parameter | Description         |
|-----------|---------------------|
| url       | The URL to unescape |

**Table 282-4 (Cont.) UNESCAPE Function Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>url_charset</code> | After a character is unescaped, the character is assumed to be in the <code>source_charset</code> character set and it will be converted from the <code>source_charset</code> to the database character set before the URL is returned. If <code>source_charset</code> is <code>NULL</code> , the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the <code>UTL_HTTP</code> package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention. |

**Usage Notes**

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

# WPG\_DOCLOAD

The `WPG_DOCLOAD` package provides an interface to download files, `BLOBS` and `BFILES`.

## See Also:

For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Constants](#)
- [Summary of WPG\\_DOCLOAD Subprograms](#)

## 283.1 WPG\_DOCLOAD Constants

`WPG_DOCLOAD` defines several constants to use when specifying parameter values.

The `WPG_DOCLOAD` constants are listed below:

- `NAME_COL_LEN`
- `MIMET_COL_LEN`
- `MAX_DOCTABLE_NAME_LEN`

### NAME\_COL\_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

### MIMET\_COL\_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

### MAX\_DOCTABLE\_NAME\_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

## 283.2 Summary of WPG\_DOCLOAD Subprograms

The `WPG_DOCLOAD` package uses one subprogram, the `DOWNLOAD_FILE` procedure.

**Table 283-1 WPG\_DOCLOAD Package Subprograms**

| Subprogram                               | Description                       |
|------------------------------------------|-----------------------------------|
| <a href="#">DOWNLOAD_FILE Procedures</a> | Downloads files, BLOBS and BFILES |

## 283.2.1 DOWNLOAD\_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

### Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_filename      IN          VARCHAR2,
    p_bcaching      IN          BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_blob          IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE (
    p_bfile         IN OUT          BFILE);
```

### Parameters

**Table 283-2 DOWNLOAD\_FILE Procedure Parameters**

| Parameter               | Description                                                            |
|-------------------------|------------------------------------------------------------------------|
| <code>p_filename</code> | The file to download from the document table.                          |
| <code>p_blob</code>     | The BLOB to download.                                                  |
| <code>p_bfile</code>    | The BFILE to download (see <a href="#">Usage Notes</a> ).              |
| <code>p_bcaching</code> | Whether browser caching is enabled (see <a href="#">Usage Notes</a> ). |

### Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.

- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

# ANYDATA TYPE

An **ANYDATA TYPE** contains an instance of a given type, plus a description of the type. In this sense, an **ANYDATA** is self-describing. An **ANYDATA** can be persistently stored in the database.

This chapter contains the following topics:

- [Restrictions](#)
- [Operational Notes](#)
- [Summary of ANYDATA Subprograms](#)

## 284.1 ANYDATA TYPE Restrictions

Persistent storage of **ANYDATA** instances whose type contains embedded LOBs other than **BFILES** is not currently supported.

## 284.2 ANYDATA TYPE Operational Notes

This section contains notes related to **ANYDATA TYPE** construction and access.

### Construction

There are 2 ways to construct an **ANYDATA**. The **CONVERT\*** calls enable construction of the **ANYDATA** in its entirety with a single call. They serve as explicit **CAST** functions from any type in the Oracle ORDBMS to **ANYDATA**.

```

STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertUrowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,

```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET\* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET\* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

### Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
    DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
    DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNvarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

## 284.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.

**Table 284-1 ANYDATA Type Subprograms**

| Subprogram                                   | Description                              |
|----------------------------------------------|------------------------------------------|
| <a href="#">BEGINCREATE Static Procedure</a> | Begins creation process on a new ANYDATA |

**Table 284-1 (Cont.) ANYDATA Type Subprograms**

| Subprogram                                  | Description                                                                                                                                         |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ENDCREATE Member Procedure</a>  | Ends creation of an ANYDATA                                                                                                                         |
| <a href="#">GET* Member Functions</a>       | Gets the current data value (which should be of appropriate type)                                                                                   |
| <a href="#">GETTYPE Member Function</a>     | Gets the Type of the ANYDATA                                                                                                                        |
| <a href="#">GETTYPENAME Member Function</a> | Get the fully qualified type name for the ANYDATA                                                                                                   |
| <a href="#">PIECEWISE Member Procedure</a>  | Sets the <code>MODE</code> of access of the current data value to be an attribute at a time (if the data value is of <code>TYPECODE_OBJECT</code> ) |
| <a href="#">SET* Member Procedures</a>      | Sets the current data value.                                                                                                                        |

## 284.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

### Syntax

```
STATIC PROCEDURE BeginCreate(  
    dtype          IN OUT NOCOPY AnyType,  
    adata          OUT NOCOPY ANYDATA);
```

### Parameters

**Table 284-2 BEGINCREATE Procedure Parameters**

| Parameter          | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| <code>dtype</code> | The type of the ANYDATA. (Should correspond to <code>OCI_TYPECODE_OBJECT</code> or a Collection typecode.) |
| <code>adata</code> | ANYDATA being constructed.                                                                                 |

### Exception

`DBMS_TYPES.INVALID_PARAMETERS`: `dtype` is invalid (not fully constructed, and similar deficits.)

### Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

## 284.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE EndCreate(  
    self          IN OUT NOCOPY ANYDATA);
```

## Parameters

**Table 284-3    ENDCREATE Procedure Parameter**

| Parameter | Description |
|-----------|-------------|
| self      | An ANYDATA. |

## 284.3.3 GET\* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the `PIECEWISE` call is invoked).

If `PIECEWISE` has NOT been called, the `ANYDATA` is accessed in its entirety and the type of the data value should match the type of the `ANYDATA`.

If `PIECEWISE` has been called, the `ANYDATA` is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GetBDouble(  
    self          IN ANYDATA,  
    dbl           OUT NOCOPY BINARY_DOUBLE)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GetBfile(  
    self          IN ANYDATA,  
    b             OUT NOCOPY BFILE)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetBFloat(  
    self          IN ANYDATA,  
    fl           OUT NOCOPY BINARY_FLOAT)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GetBlob(  
    self          IN ANYDATA,  
    b             OUT NOCOPY BLOB)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetChar(  
    self          IN ANYDATA,  
    c             OUT NOCOPY CHAR)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetClob(  
    self          IN ANYDATA,  
    c             OUT NOCOPY CLOB)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetCollection(  
    self          IN ANYDATA,  
    col           OUT NOCOPY "<collection_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetDate(  
    self          IN ANYDATA,  
    dt            OUT NOCOPY DATE)  
RETURN          PLS_INTEGER;
```

```

        self      IN ANYDATA,
        dat       OUT NOCOPY DATE)
    RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
    self      IN ANYDATA,
    inv       OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
    self      IN ANYDATA,
    inv       OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self      IN ANYDATA,
    nc        OUT NOCOPY NCHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self      IN ANYDATA,
    nc        OUT NOCOPY NCLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self      IN ANYDATA,
    num       OUT NOCOPY NUMBER)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
    self      IN ANYDATA,
    nc        OUT NOCOPY NVARCHAR2)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self      IN ANYDATA,
    obj       OUT NOCOPY "<object_type>")
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self      IN ANYDATA,
    r         OUT NOCOPY RAW)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self      IN ANYDATA,
    rf        OUT NOCOPY REF "<object_type>")
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)

```

```
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self      IN ANYDATA,
    c         OUT NOCOPY VARCHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
    self      IN ANYDATA,
    c         OUT NOCOPY VARCHAR2)
RETURN      PLS_INTEGER;
```

### Parameters

**Table 284-4** GET\* Function Parameter

| Parameter | Description                |
|-----------|----------------------------|
| self      | An ANYDATA.                |
| num       | The number to be obtained. |

### Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

### Exceptions

DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage.

## 284.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

### Syntax

```
MEMBER FUNCTION GETTYPE(
    self      IN ANYDATA,
    typ       OUT NOCOPY AnyType)
RETURN      PLS_INTEGER;
```

### Parameters

**Table 284-5** GETTYPE Function Parameter

| Parameter | Description |
|-----------|-------------|
| self      | An ANYDATA. |

**Table 284-5 (Cont.) GETTYPE Function Parameter**

| Parameter        | Description                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------|
| <code>typ</code> | The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type. |

**Return Values**

The typecode corresponding to the type of the ANYDATA.

## 284.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

**Syntax**

```
MEMBER FUNCTION GETTYPENAME(  
    self          IN ANYDATA)  
    RETURN        VARCHAR2;
```

**Parameters****Table 284-6 GETTYPENAME Function Parameter**

| Parameter         | Description |
|-------------------|-------------|
| <code>self</code> | An ANYDATA. |

**Return Values**

Type name of the ANYDATA.

## 284.3.6 PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE\_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET\* and GET\* will sequentially obtain individual attributes or collection elements.

**Syntax**

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATA);
```

## Parameters

**Table 284-7   PIECEWISE Procedure Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| self      | The current data value. |

## Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS
- DBMS\_TYPES.INCORRECT\_USAGE: On incorrect usage.

## Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

## 284.3.7 SET\* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

## Syntax

```
MEMBER PROCEDURE SETBDOUBLE(  
    self          IN OUT NOCOPY ANYDATA,  
    dbl           IN BINARY_DOUBLE,  
    last_elem     IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBFILE(  
    self          IN OUT NOCOPY ANYDATA,  
    b             IN BFILE,  
    last_elem     IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBFLOAT(  
    self          IN OUT NOCOPY ANYDATA,  
    fl            IN          BINARY_FLOAT,  
    last_elem     IN          boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBLOB(  
    self          IN OUT NOCOPY ANYDATA,  
    b             IN BLOB,  
    last_elem     IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    c             IN CHAR,  
    last_elem     IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCLOB(  
    self          IN OUT NOCOPY ANYDATA,  
    c             IN CLOB,
```

```

        last_elem    IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self            IN OUT NOCOPY ANYDATA,
    col             IN "<collection_type>",
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self            IN OUT NOCOPY ANYDATA,
    dat             IN DATE,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self            IN OUT NOCOPY ANYDATA,
    inv             IN INTERVAL DAY TO SECOND,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self            IN OUT NOCOPY ANYDATA,
    inv             IN INTERVAL YEAR TO MONTH,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self            IN OUT NOCOPY ANYDATA,
    nc              IN NCHAR,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self            IN OUT NOCOPY ANYDATA,
    nc              IN NClob,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self            IN OUT NOCOPY ANYDATA,
    num             IN NUMBER,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self            IN OUT NOCOPY ANYDATA,
    nc              IN NVarchar2,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self            IN OUT NOCOPY ANYDATA,
    obj             IN "<object_type>",
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self            IN OUT NOCOPY ANYDATA,
    r               IN RAW,
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self            IN OUT NOCOPY ANYDATA,
    rf              IN REF "<object_type>",
    last_elem       IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self            IN OUT NOCOPY ANYDATA,
    ts              IN TIMESTAMP,
    last_elem       IN BOOLEAN DEFAULT FALSE);

```

```
MEMBER PROCEDURE SETTIMESTAMP TZ(self IN OUT NOCOPY ANYDATA,  
    ts          IN TIMESTAMP WITH TIME ZONE,  
    last_elem   IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMP LTZ(  
    self IN OUT NOCOPY ANYDATA,  
    ts IN TIMESTAMP WITH LOCAL TIME ZONE,  
    last_elem IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETVARCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    c             IN VARCHAR,  
    last_elem     IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETVARCHAR2(  
    self          IN OUT NOCOPY ANYDATA,  
    c             IN VARCHAR2,  
    last_elem     IN boolean DEFAULT FALSE);
```

## Parameters

**Table 284-8 SET\* Procedure Parameters**

| Parameter | Description                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| self      | An ANYDATA.                                                                                                                    |
| num       | The number, and associated information, that is to be set.                                                                     |
| last_elem | Relevant only if ANYDATA represents a collection.<br>Set to TRUE if it is the last element of the collection, FALSE otherwise. |

## Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage.
- DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

## Usage Notes

When BEGINCREATE is called, construction has already begun in a piece-wise fashion. Subsequent calls to SET\* will set the successive attribute values.

If the ANYDATA is a standalone collection, the SET\* call will set the successive collection elements.

# ANYDATASET TYPE

An `ANYDATASET` TYPE contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

## 285.1 ANYDATASET TYPE Construction

The `ANYDATASET` needs to be constructed value by value, sequentially.

For each data instance (of the type of the `ANYDATASET`), the `ADDINSTANCE` function must be invoked. This adds a new data instance to the `ANYDATASET`. Subsequently, `SET*` can be called to set each value in its entirety.

The `MODE` of construction/access can be changed to attribute/collection element wise by making calls to `PIECEWISE`.

- If the type of the `ANYDATASET` is `TYPECODE_OBJECT`, individual attributes will be set with subsequent `SET*` calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent `SET*` calls. Likewise on access. This call is very similar to `ANYDATA.PIECEWISE` call defined for the type `ANYDATA`.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

`ENDCREATE` should be called to finish the construction process (before which no access calls can be made).

## 285.2 Summary of ANYDATASET TYPE Subprograms

This table lists the `ANYDATASET` Type subprograms and briefly describes them.

**Table 285-1** *ANYDATASET Type Subprograms*

| Subprogram                                   | Description                                                                                                                |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDINSTANCE</a> Member Procedure | Adds a new data instance to an <code>ANYDATASET</code> .                                                                   |
| <a href="#">BEGINCREATE</a> Static Procedure | Creates a new <code>ANYDATASET</code> which can be used to create a set of data values of the given <code>ANYTYPE</code> . |
| <a href="#">ENDCREATE</a> Member Procedure   | Ends Creation of a <code>ANYDATASET</code> . Other creation functions cannot be called after this call.                    |

**Table 285-1 (Cont.) ANYDATASET Type Subprograms**

| Subprogram                                  | Description                                                                                                                               |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET* Member Functions</a>       | Gets the current data value (which should be of appropriate type).                                                                        |
| <a href="#">GETCOUNT Member Function</a>    | Gets the number of data instances in an ANYDATASET.                                                                                       |
| <a href="#">GETINSTANCE Member Function</a> | Gets the next instance in an ANYDATASET.                                                                                                  |
| <a href="#">GETTYPE Member Function</a>     | Gets the ANYTYPE describing the type of the data instances in an ANYDATASET.<br>current data value (which should be of appropriate type). |
| <a href="#">GETTYPENAME Member Function</a> | Gets the AnyType describing the type of the data instances in an ANYDATASET.                                                              |
| <a href="#">PIECEWISE Member Procedure</a>  | Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).           |
| <a href="#">SET* Member Procedures</a>      | Sets the current data value.                                                                                                              |

## 285.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

### Syntax

```
MEMBER PROCEDURE AddInstance(  
    self          IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 285-2 ADDINSTANCE Procedure Parameter**

| Parameter | Description                       |
|-----------|-----------------------------------|
| self      | The ANYDATASET being constructed. |

### Exceptions

DBMS\_TYPES.invalid\_parameters: Invalid parameters.  
DBMS\_TYPES.incorrect\_usage: On incorrect usage.

### Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call `PIECEWISE` if a piece-wise construction of the instance is intended.

## 285.2.2 BEGINCREATE Static Procedure

This procedure creates a new `ANYDATASET` which can be used to create a set of data values of the given `ANYTYPE`.

### Syntax

```
STATIC PROCEDURE BeginCreate(  
    typecode    IN PLS_INTEGER,  
    rtype       IN OUT NOCOPY AnyType,  
    aset        OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 285-3 BEGINCREATE Procedure Parameter**

| Parameter | Description                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| typecode  | The typecode for the type of the <code>ANYDATASET</code> .                                                                                                 |
| dtype     | The type of the data values. This parameter is a must for user-defined types like <code>TYPECODE_OBJECT</code> , Collection typecodes, and similar others. |
| aset      | The <code>ANYDATASET</code> being constructed.                                                                                                             |

### Exceptions

`DBMS_TYPES.invalid_parameters`: dtype is invalid (not fully constructed, and like errors.)

## 285.2.3 ENDCREATE Member Procedure

This procedure ends creation of a `ANYDATASET`. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self        IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 285-4 ENDCREATE Procedure Parameter**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| self      | The <code>ANYDATASET</code> being constructed. |

## 285.2.4 GET\* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the `MODE` used for accessing it (depending on how the `PIECEWISE` call is invoked). If `PIECEWISE` has not been called, the instance is accessed in its entirety, and the type of the data value should match the type of the `ANYDATASET`.

If `PIECEWISE` has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GETBDOUBLE(  
    self          IN ANYDATASET,  
    dbl           OUT NOCOPY BINARY_DOUBLE)  
    RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETBFLOAT(  
    self          IN ANYDATASET,  
    fl            OUT NOCOPY BINARY_FLOAT)  
    RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETBFILE(  
    self          IN ANYDATASET,  
    b             OUT NOCOPY BFILE)  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETBLOB(  
    self          IN ANYDATASET,  
    b             OUT NOCOPY BLOB)  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETCHAR(  
    self          IN ANYDATASET,  
    c             OUT NOCOPY CHAR)  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETCLOB(  
    self          IN ANYDATASET,  
    c             OUT NOCOPY CLOB)  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETCOLLECTION(  
    self          IN ANYDATASET,  
    col           OUT NOCOPY "<collection_type>")  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETDATE(  
    self          IN ANYDATASET,  
    dat           OUT NOCOPY DATE)  
    RETURN        PLS_INTEGER;  
  
MEMBER FUNCTION GETINTERVALDS(  
    self          IN ANYDATASET,  
    inv           IN OUT NOCOPY INTERVAL DAY TO SECOND)  
    RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETINTERVALYM(  
    self          IN ANYDATASET,  
    inv           IN OUT NOCOPY INTERVAL YEAR TO MONTH)  
    RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCHAR(  
    self          IN ANYDATASET,  
    nc            OUT NOCOPY NCHAR)  
    RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCLOB(  
    self          IN ANYDATASET,
```

```

        nc          OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
    self          IN ANYDATASET,
    num          OUT NOCOPY NUMBER)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
    self          IN ANYDATASET,
    nc          OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
    self          IN ANYDATASET,
    obj          OUT NOCOPY "<object_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GETRAW(
    self          IN ANYDATASET,
    r            OUT NOCOPY RAW)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GETREF(
    self          IN ANYDATASET,
    rf           OUT NOCOPY REF "<object_type>")
RETURN          PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
    self          IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPSTZ(
    self          IN ANYDATASET,
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPTZ(
    self          IN ANYDATASET,
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
    self          IN ANYDATASET,
    rid          OUT NOCOPY UROWID)
RETURN PLS_INTEGER

MEMBER FUNCTION GETVARIABLE(
    self          IN ANYDATASET,
    c            OUT NOCOPY VARCHAR)
RETURN          PLS_INTEGER;

MEMBER FUNCTION GETVARIABLE2(
    self          IN ANYDATASET,
    c            OUT NOCOPY VARCHAR2)
RETURN          PLS_INTEGER;

```

## Parameters

**Table 285-5 GET\* Function Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| self      | The ANYDATASET being accessed.                                   |
| num       | The number, and associated information., that is to be obtained. |

## Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage

DBMS\_TYPES.TYPE\_MISMATCH: When the expected type is different from the passed in type.

## 285.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

### Syntax

```
MEMBER FUNCTION GetCount(
    self      IN ANYDATASET)
RETURN      PLS_INTEGER;
```

### Parameter

**Table 285-6 GETCOUNT Function Parameter**

| Parameter | Description                    |
|-----------|--------------------------------|
| self      | The ANYDATASET being accessed. |

## Return Values

The number of data instances.

## 285.2.6 GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed.

After this function has been called, the `GET*` functions can be invoked on the ANYDATASET to access the current instance. If `PIECEWISE` is called before doing the `GET*` calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the `ANYDATASET` is fully created.

### Syntax

```
MEMBER FUNCTION GETINSTANCE (  
    self          IN OUT NOCOPY ANYDATASET)  
    RETURN        PLS_INTEGER;
```

### Parameters

**Table 285-7** GETINSTANCE Function Parameter

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| self      | The <code>ANYDATASET</code> being accessed. |

### Return Values

`DBMS_TYPES.SUCCESS` or `DBMS_TYPES.NO_DATA`

`DBMS_TYPES.NO_DATA` signifies the end of the `ANYDATASET` (all instances have been accessed).

### Usage Notes

This function should be called even before accessing the first instance.

## 285.2.7 GETTYPE Member Function

This function gets the `AnyType` describing the type of the data instances in an `ANYDATASET`.

### Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATASET,  
    typ           OUT NOCOPY AnyType)  
    RETURN        PLS_INTEGER;
```

### Parameters

**Table 285-8** GETTYPE Function Parameter

| Parameter | Description                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| self      | The <code>ANYDATASET</code> .                                                                                                                   |
| typ       | The <code>ANYTYPE</code> corresponding to the <code>AnyData</code> . May be <code>NULL</code> if it does not represent a user-defined function. |

### Return Values

The typecode corresponding to the type of the `ANYDATA`.

## 285.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the `ANYDATASET`.

If the `ANYDATASET` is based on a built-in, this function will return `NUMBER` and associated information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return `NULL`.

### Syntax

```
MEMBER FUNCTION GETTYPENAME(  
    self          IN ANYDATASET)  
    RETURN        VARCHAR2;
```

### Parameter

**Table 285-9** GETTYPENAME Function Parameter

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| <code>self</code> | The ANYDATASET being constructed. |

### Return Values

Type name of the ANYDATASET.

## 285.2.9 PIECEWISE Member Procedure

This procedure sets the `MODE` of construction, access of the data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the `MODE` of construction, access of the data value to be a collection element at a time (if the data value is of a collection `TYPE`). Once this call has been made, subsequent `SET*` and `GET*` calls will sequentially obtain individual attributes or collection elements.

### Syntax

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 285-10** PIECEWISE Procedure Parameter

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| <code>self</code> | The ANYDATASET being constructed. |

### Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters.

`DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

### Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

## 285.2.10 SET\* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(  
    self          IN OUT NOCOPY ANYDATASET,  
    dbl           IN BINARY_DOUBLE,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBFLOAT(  
    self          IN OUT NOCOPY ANYDATASET,  
    fl            IN BINARY_FLOAT,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBFILE(  
    self          IN OUT NOCOPY ANYDATASET,  
    b             IN BFILE,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETBLOB(  
    self          IN OUT NOCOPY ANYDATASET,  
    b             IN BLOB,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCHAR(  
    self          IN OUT NOCOPY ANYDATASET,  
    c             IN CHAR,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCLOB(  
    self          IN OUT NOCOPY ANYDATASET,  
    c             IN CLOB,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETCOLLECTION(  
    self          IN OUT NOCOPY ANYDATASET,  
    col           IN "<collection_type>",  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETDATE(  
    self          IN OUT NOCOPY ANYDATASET,  
    dat           IN DATE,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALDS(  
    self          IN OUT NOCOPY ANYDATASET,  
    inv           IN INTERVAL DAY TO SECOND,  
    last_elem     IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETINTERVALYM(  
    self          IN OUT NOCOPY ANYDATASET,  
    inv           IN INTERVAL YEAR TO MONTH,

c             IN VARCHAR2,  
last_elem    BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 285-11 SET\* Procedure Parameters**

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| self      | The ANYDATASET being accessed.                                                                                                                                                             |
| num       | The number, and associated information, that is to be set.                                                                                                                                 |
| last_elem | Relevant only if <code>PIECEWISE</code> has been already called (for a collection).<br>Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise. |

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

# ANYTYPE TYPE

An `ANYTYPE` `TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERSISTENT` static function.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

## 286.1 Summary of ANYTYPE Subprograms

This table lists the `ANYTYPE` subprograms in alphabetical order and briefly describes them.

**Table 286-1** *ANYTYPE Subprograms*

| Subprogram                                        | Description                                                                                                                                                                                                                      |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BEGINCREATE Static Procedure</a>      | Creates a new instance of <code>ANYTYPE</code> which can be used to create a transient type description.                                                                                                                         |
| <a href="#">SETINFO Member Procedure</a>          | Sets any additional information required for constructing a <code>COLLECTION</code> or builtin type.                                                                                                                             |
| <a href="#">ADDATTR Member Procedure</a>          | Adds an attribute to an <code>ANYTYPE</code> (of typecode <code>DBMS_TYPES.TYPECODE_OBJECT</code> ).                                                                                                                             |
| <a href="#">ENDCREATE Member Procedure</a>        | Ends creation of a transient <code>ANYTYPE</code> . Other creation functions cannot be called after this call.                                                                                                                   |
| <a href="#">GETINFO Member Function</a>           | Gets the type information for the <code>ANYTYPE</code> .                                                                                                                                                                         |
| <a href="#">GETATTRELEMINFO Member Function</a>   | Gets the type information for an attribute of the type (if it is of <code>TYPECODE_OBJECT</code> ). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.              |
| <a href="#">GETANYTYPEFROMPERSISTENT Function</a> | This standalone function replaces the old static function <code>GETPERSISTENT</code> . This returns an <code>ANYTYPE</code> corresponding to a persistent type created earlier using the <code>CREATE TYPE SQL</code> statement. |

## 286.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of `ANYTYPE` which can be used to create a transient type description.

### Syntax

```
STATIC PROCEDURE BEGINCREATE(  
    typecode      IN      PLS_INTEGER,  
    atype         OUT NOCOPY ANYTYPE);
```

### Parameters

**Table 286-2 BEGINCREATE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| typecode  | Use a constant from <code>DBMS_TYPES</code> package.<br>Typecodes for user-defined type: <ul style="list-style-type: none"><li>• <code>DBMS_TYPES.TYPECODE_OBJECT</code></li><li>• <code>DBMS_TYPES.TYPECODE_VARRAY</code> or</li><li>• <code>DBMS_TYPES.TYPECODE_TABLE</code></li></ul> Typecodes for builtin types: <ul style="list-style-type: none"><li>• <code>DBMS_TYPES.TYPECODE_NUMBER</code>, and similar types.</li></ul> |
| atype     | <code>ANYTYPE</code> for a transient type                                                                                                                                                                                                                                                                                                                                                                                           |

## 286.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a `COLLECTION` or builtin type.

### Syntax

```
MEMBER PROCEDURE SETINFO(  
    self          IN OUT NOCOPY ANYTYPE,  
    prec          IN PLS_INTEGER,  
    scale         IN PLS_INTEGER,  
    len           IN PLS_INTEGER,  
    csid          IN PLS_INTEGER,  
    csfrm         IN PLS_INTEGER,  
    atype         IN ANYTYPE DEFAULT NULL,  
    elem_tc       IN PLS_INTEGER DEFAULT NULL,  
    elem_count    IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 286-3 SETINFO Procedure Parameters**

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| self      | The transient <code>ANYTYPE</code> that is being constructed.                                                     |
| prec      | Optional. Required if typecode represents a <code>NUMBER</code> .<br>Give precision and scale. Ignored otherwise. |

**Table 286-3 (Cont.) SETINFO Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scale     | Optional. Required if typecode represents a NUMBER.<br>Give precision and scale. Ignored otherwise.                                                                                                                                                                  |
| len       | Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.                                                                                                                                                                      |
| csid      | Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.                                                                                                                                                            |
| csfrm     | Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.                                                                                                                                                            |
| atype     | Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise. |

The Following Parameters Are Required For Collection Types

**Table 286-4 SETINFO Procedure Parameters - Collection Types**

| Parameter  | Description                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| elem_tc    | Must be of the collection element's typecode (from DBMS_TYPES package).                                                                        |
| elem_count | Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY. |

### Exceptions

- DBMS\_TYPES.INVALID\_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

### Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

## 286.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS\_TYPES.TYPECODE\_OBJECT).

### Syntax

```
MEMBER PROCEDURE ADDATTR(  
    self          IN OUT NOCOPY ANYTYPE,  
    aname         IN VARCHAR2,  
    typecode      IN PLS_INTEGER,  
    prec          IN PLS_INTEGER,  
    scale         IN PLS_INTEGER,  
    len           IN PLS_INTEGER,  
    csid          IN PLS_INTEGER,
```

```
csfrm          IN PLS_INTEGER,  
attr_type      IN ANYTYPE DEFAULT NULL);
```

## Parameters

**Table 286-5 ADDATTR Procedure Parameters**

| Parameter | Description                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| self      | The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.                                |
| aname     | Optional. Attribute's name. Could be NULL.                                                                                  |
| typecode  | Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).                                   |
| prec      | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.                            |
| scale     | Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.                            |
| len       | Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.                              |
| csid      | Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.       |
| csfrm     | Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.       |
| attr_type | Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type. |

## Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

## 286.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

## Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self          IN OUT NOCOPY ANYTYPE);
```

## Parameter

**Table 286-6 ENDCREATE Procedure Parameter**

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| self      | The transient ANYTYPE that is being constructed. |

## 286.1.5 GETINFO Member Function

This function gets the type information for the `ANYTYPE`.

### Syntax

```
MEMBER FUNCTION GETINFO (  
    self      IN ANYTYPE,  
    prec      OUT PLS_INTEGER,  
    scale     OUT PLS_INTEGER,  
    len       OUT PLS_INTEGER,  
    csid      OUT PLS_INTEGER,  
    csfrm     OUT PLS_INTEGER,  
    schema_name OUT VARCHAR2,  
    type_name  OUT VARCHAR2,  
    version   OUT varchar2,  
    numelems  OUT PLS_INTEGER)  
RETURN      PLS_INTEGER;
```

### Parameters

**Table 286-7** GETINFO Function Parameters

| Parameter                | Description                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>self</code>        | The <code>ANYTYPE</code> .                                                                                                                                                            |
| <code>prec</code>        | If typecode represents a number. Gives precision and scale. Ignored otherwise.                                                                                                        |
| <code>scale</code>       | If typecode represents a number. Gives precision and scale. Ignored otherwise.                                                                                                        |
| <code>len</code>         | If typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.                                                   |
| <code>csid</code>        | If typecode represents a type requiring character information such as: <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .                                          |
| <code>csid</code>        | If typecode represents a type requiring character information such as: <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .                                          |
| <code>schema_name</code> | Type's schema (if persistent).                                                                                                                                                        |
| <code>type_name</code>   | Type's typename.                                                                                                                                                                      |
| <code>version</code>     | Type's version.                                                                                                                                                                       |
| <code>numelems</code>    | If <i>self</i> is a <code>TYPECODE_VARRAY</code> , this gives the <code>VARRAY</code> count. If <i>self</i> is of <code>TYPECODE_OBJECT</code> , this gives the number of attributes. |

### Return Values

The typecode of *self*.

### Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the `ANYTYPE` is not properly Constructed).

## 286.1.6 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

### Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (  
    self          IN ANYTYPE,  
    pos           IN PLS_INTEGER,  
    prec          OUT PLS_INTEGER,  
    scale         OUT PLS_INTEGER,  
    len           OUT PLS_INTEGER,  
    csid          OUT PLS_INTEGER,  
    csfrm         OUT PLS_INTEGER,  
    attr_elt_type OUT ANYTYPE  
    aname         OUT VARCHAR2)  
RETURN          PLS_INTEGER;
```

### Parameters

**Table 286-8** GETATTRELEMINFO Function Parameters

| Parameter                  | Description                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>self</i>                | The ANYTYPE.                                                                                                                                                                             |
| <i>pos</i>                 | If <i>self</i> is of <code>TYPECODE_OBJECT</code> , this gives the attribute position (starting at 1). It is ignored otherwise.                                                          |
| <i>prec</i>                | If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.                                                                |
| <i>scale</i>               | If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.                                                                |
| <i>len</i>                 | If typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.                                                      |
| <i>csid</i> , <i>csfrm</i> | If typecode represents a type requiring character information such as: <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> . Gives character set ID, character set form. |
| <i>attr_elt_type</i>       | If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .         |
| <i>aname</i>               | Attribute name (if it is an attribute of an object type, <code>NULL</code> otherwise).                                                                                                   |

### Return Values

The typecode of the attribute or collection element.

### Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

## 286.1.7 GETANYTYPEFROMPERSISTENT Function

This standalone function returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement. Starting with Oracle Database 19c, the `GETANYTYPEFROMPERSISTENT` function replaces the `GETPERISTENT` static function.

### Syntax

```
GETANYTYPEFROMPERSISTENT(  
    schema_name      IN VARCHAR2,  
    type_name        IN VARCHAR2)  
RETURN              ANYTYPE;
```

### Parameters

**Table 286-9** GETANYTYPEFROMPERSISTENT Function Parameters

| Parameter                | Description              |
|--------------------------|--------------------------|
| <code>schema_name</code> | Schema name of the type. |
| <code>type_name</code>   | Type name.               |

### Return Values

An `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement.

# Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)

## See Also:

*Oracle Database Advanced Queuing User's Guide* for information about using Oracle Database Advanced Queuing.

## 287.1 Advanced Queuing (AQ) Types Security Model

`PUBLIC` is granted `EXECUTE` privilege on the types described in this chapter.

## 287.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- [AQ\\$\\_AGENT Type](#)
- [AQ\\$\\_AGENT\\_LIST\\_T Type](#)
- [AQ\\$\\_DESCRIPTOR Type](#)
- [AQ\\$\\_NTFN\\_DESCRIPTOR Type](#)
- [AQ\\$\\_NTFN\\_MSGID\\_ARRAY Type](#)
- [AQ\\$\\_POST\\_INFO Type](#)
- [AQ\\$\\_POST\\_INFO\\_LIST Type](#)
- [AQ\\$\\_PURGE\\_OPTIONS\\_T Type](#)
- [AQ\\$\\_RECIPIENT\\_LIST\\_T Type](#)
- [AQ\\$\\_REG\\_INFO Type](#)
- [AQ\\$\\_REG\\_INFO\\_LIST Type](#)
- [AQ\\$\\_SUBSCRIBER\\_LIST\\_T Type](#)
- [DEQUEUE\\_OPTIONS\\_T Type](#)

- [ENQUEUE\\_OPTIONS\\_T Type](#)
- [QUEUE\\_PROPS\\_T Type](#)
- [SYS.MSG\\_PROP\\_T Type](#)
- [MESSAGE\\_PROPERTIES\\_T Type](#)
- [MESSAGE\\_PROPERTIES\\_ARRAY\\_T Type](#)
- [MSGID\\_ARRAY\\_T Type](#)

## 287.2.1 AQ\$\_AGENT Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
    name          VARCHAR2(512),
    address        VARCHAR2(1024),
    protocol       NUMBER);
```

### Attributes

**Table 287-1 AQ\$\_AGENT Attributes**

| Attribute | Description                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.                                                                                                                             |
| address   | Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code> .<br><br>For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code> |
| protocol  | Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.                                                            |

## 287.2.2 AQ\$\_AGENT\_LIST\_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

### See Also:

["AQ\\$\\_AGENT Type"](#)

### Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 287.2.3 AQ\$\_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:**

"MESSAGE\_PROPERTIES\_T Type"

### Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
    queue_name      VARCHAR2(261),
    consumer_name   VARCHAR2(512),
    msg_id          RAW(16),
    msg_prop        MSG_PROP_T,
    gen_desc        AQ$_NTFN_DESCRIPTOR,
    msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
    ntfnRecdInGrp   NUMBER);
```

### Attributes

**Table 287-2 AQ\$\_DESCRIPTOR Attributes**

| Attribute     | Description                                                                            |
|---------------|----------------------------------------------------------------------------------------|
| queue_name    | Name of the queue in which the message was enqueued which resulted in the notification |
| consumer_name | Name of the consumer for the multiconsumer queue                                       |
| msg_id        | Identification number of the message                                                   |
| msg_prop      | Message properties specified by the MSG_PROP_T type                                    |
| gen_desc      | Indicates the timeout specifications                                                   |
| msgid_array   | Group notification message ID list                                                     |
| ntfnRecdInGrp | Notifications received in group                                                        |

## 287.2.4 AQ\$\_NTFN\_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

### Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT( ntfn_flags NUMBER)
```

**Attributes****Table 287-3 AQ\$\_NTFN\_DESCRIPTOR Attributes**

| Attribute  | Description                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------|
| ntfn_flags | Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0. |

## 287.2.5 AQ\$\_NTFN\_MSGID\_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value  $2^{30}$  which is the max varray size.

**Syntax**

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY AS VARRAY(1073741824) OF RAW(16);
```

## 287.2.6 AQ\$\_POST\_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

**Syntax**

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
    name          VARCHAR2(512),
    namespace     NUMBER,
    payload       RAW(32767));
```

**Attributes****Table 287-4 AQ\$\_POST\_INFO Attributes**

| Attribute | Description                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the anonymous subscription to which you want to post                                                                                                                              |
| namespace | To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> |
| payload   | The payload to be posted to the anonymous subscription                                                                                                                                    |

## 287.2.7 AQ\$\_POST\_INFO\_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

**See Also:**

[AQ\\$\\_POST\\_INFO Type](#)

**Syntax**

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

## 287.2.8 AQ\$\_PURGE\_OPTIONS\_T Type

This type specifies the options available for purging a queue table.

**See Also:**

[PURGE\\_QUEUE\\_TABLE Procedure.](#)

**Syntax**

```
TYPE AQ$_PURGE_OPTIONS_T IS RECORD (
    block          BOOLEAN          DEFAULT FALSE
    delivery_mode   PLS_INTEGER     DEFAULT PERSISTENT);
```

**Table 287-5 AQ\$\_PURGE\_OPTIONS\_T Type Attributes**

| Attribute     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| block         | <p>TRUE/FALSE.</p> <ul style="list-style-type: none"> <li>If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>.</li> <li>The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> </ul> |
| delivery_mode | <p>Kind of messages to purge, either <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 287.2.9 AQ\$\_RECIPIENT\_LIST\_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

**See Also:**

["AQ\\$\\_AGENT Type"](#)

**Syntax**

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
    INDEX BY BINARY_INTEGER;
```

## 287.2.10 AQ\$\_REG\_INFO Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
    name                VARCHAR2(512),
    namespace           NUMBER,
    callback            VARCHAR2(4000),
    context             RAW(2000) DEFAULT NULL,
    anyctx             ANYDATA,
    ctxtype            NUMBER,
    payloadcbk         VARCHAR2(4000),
    timeout            NUMBER,
    ntfn_grouping_class NUMBER,
    ntfn_grouping_value NUMBER DEFAULT 600,
    ntfn_grouping_type  NUMBER,
    ntfn_grouping_start_time TIMESTAMP(6) WITH TIME ZONE,
    ntfn_grouping_repeat_count NUMBER);
```

### Attributes

**Table 287-6 AQ\$\_REG\_INFO Type Attributes**

| Attribute | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.                                                                                                                                                                                                                                             |
| namespace | Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .                                                                                                                |
| callback  | Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> . |
| context   | Specifies the context that is to be passed to the callback function                                                                                                                                                                                                                                                                                                                                                                                                                     |
| anyctx    | Specifies the <code>ANYDATA</code> type context that is passed to the callback function                                                                                                                                                                                                                                                                                                                                                                                                 |
| ctxtype   | Specifies the context type. Valid values are 0 (RAW) or 1 (ANYDATA)                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 287-6 (Cont.) AQ\$\_REG\_INFO Type Attributes**

| Attribute                  | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| payloadcbk                 | Specifies payload for the callback function                                                                                                                                                                                                                                                                                                                                                                             |
| timeout                    | Specifies the time in seconds                                                                                                                                                                                                                                                                                                                                                                                           |
| ntfn_grouping_class        | Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntfn_grouping_class is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <li>NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</li> </ul> |
| ntfn_grouping_value        | Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntfn_grouping_repeat_count is exhausted.                                                                                                                                                                                                                                |
| ntfn_grouping_type         | <ul style="list-style-type: none"> <li>NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default)</li> <li>NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.</li> </ul>                                                                                                                                                                           |
| ntfn_grouping_start_time   | Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If ntfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone                                                                                                                                                      |
| ntfn_grouping_repeat_count | Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to <ul style="list-style-type: none"> <li>NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</li> </ul>                                                                       |

**Usage Notes**

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 287-7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 287-8](#) shows the actions performed when XML presentation is specified.

**Table 287-7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified**

| Queue Payload Type | OCI Callback                                       | E-mail        | PL/SQL Callback                                       |
|--------------------|----------------------------------------------------|---------------|-------------------------------------------------------|
| RAW                | OCI callback receives the RAW data in the payload. | Not supported | PL/SQL callback receives the RAW data in the payload. |
| Oracle object type | Not supported                                      | Not supported | Not supported                                         |

**Table 287-8 Actions Performed for Nonpersistent Queues When XML Presentation Specified**

| Queue Payload Type | OCI Callback                                       | E-mail                                                                                 | PL/SQL Callback                                       |
|--------------------|----------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------------------------------|
| RAW                | OCI callback receives the XML data in the payload. | XML data is formatted as a SOAP message and e-mailed to the registered e-mail address. | PL/SQL callback receives the XML data in the payload. |
| Oracle object type | OCI callback receives the XML data in the payload. | XML data is formatted as a SOAP message and e-mailed to the registered e-mail address. | PL/SQL callback receives the XML data in the payload. |

## 287.2.11 AQ\$\_REG\_INFO\_LIST Type

Identifies the list of registrations to a queue.

**See Also:**

"AQ\$\_REG\_INFO Type"

### Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

## 287.2.12 AQ\$\_SUBSCRIBER\_LIST\_T Type

This type identifies the list of subscribers that subscribe to a queue.

**See Also:**

"AQ\$\_AGENT Type"

### Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;
```

## 287.2.13 DEQUEUE\_OPTIONS\_T Type

DEQUEUE\_OPTIONS\_T specifies the options available for the dequeue operation.

### Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
    consumer_name    VARCHAR2(30)    DEFAULT NULL,
    dequeue_mode     BINARY_INTEGER  DEFAULT REMOVE,
    navigation       BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
    visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
    wait             BINARY_INTEGER  DEFAULT FOREVER,
    msgid            RAW(16)         DEFAULT NULL,
    correlation       VARCHAR2(128)   DEFAULT NULL,
    deq_condition     VARCHAR2(4000)  DEFAULT NULL,
    signature         aq$_sig_prop    DEFAULT NULL,
    transformation    VARCHAR2(61)    DEFAULT NULL,
    delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

### Attributes

**Table 287-9 DEQUEUE\_OPTIONS\_T Attributes**

| Attribute     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| consumer_name | <p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.</p>                                                                                                                                                                                                                                                                                                                                              |
| dequeue_mode  | <p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p> |

**Table 287-9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes**

| Attribute   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| navigation  | <p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p><b>NEXT_MESSAGE:</b> Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p><b>NEXT_TRANSACTION:</b> Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p><b>FIRST_MESSAGE:</b> Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p><b>FIRST_MESSAGE_MULTI_GROUP:</b> indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p> <p><b>NEXT_MESSAGE_MULTI_GROUP:</b> indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p> |
| visibility  | <p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p><b>ON_COMMIT:</b> The dequeue will be part of the current transaction. This setting is the default.</p> <p><b>IMMEDIATE:</b> The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| wait        | <p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p><b>FOREVER:</b> Wait forever. This setting is the default.</p> <p><b>NO_WAIT:</b> Do not wait.</p> <p><b>NUMBER:</b> Wait time in seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| msgid       | Specifies the message identifier of the message to be dequeued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| correlation | Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 287-9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes**

| Attribute      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| deq_condition  | <p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table.</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p> |
| signature      | Currently not implemented                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| transformation | Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| delivery_mode  | The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 287.2.14 ENQUEUE\_OPTIONS\_T Type

`ENQUEUE_OPTIONS_T` Type specifies the options available for the enqueue operation.

### Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
    visibility      BINARY_INTEGER  DEFAULT ON_COMMIT,
    relative_msgid  RAW(16)         DEFAULT NULL,
    sequence_deviation BINARY_INTEGER DEFAULT NULL,
    transformation  VARCHAR2(61)    DEFAULT NULL,
    delivery_mode   PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

### Attributes

**Table 287-10 ENQUEUE\_OPTIONS\_T Attributes**

| Attribute  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| visibility | <p>Specifies the transactional behavior of the enqueue request. Possible settings are:</p> <p><code>ON_COMMIT</code>: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.</p> <p><code>IMMEDIATE</code>: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.</p> |

**Table 287-10 (Cont.) ENQUEUE\_OPTIONS\_T Attributes**

| Attribute          | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| relative_msgid     | Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if <code>BEFORE</code> is specified in <code>sequence_deviation</code> . This parameter is ignored if sequence deviation is not specified.                                                                           |
| sequence_deviation | Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:<br><code>BEFORE</code> : The message is enqueued ahead of the message specified by <code>relative_msgid</code> .<br><code>TOP</code> : The message is enqueued ahead of any other messages.                         |
| transformation     | Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.                                                                                                                                                                                        |
| delivery_mode      | The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> . The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'. |

## 287.2.15 QUEUE\_PROPS\_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

### Syntax

```

TYPE QUEUE_PROPS_T IS RECORD (
    retry_delay      NUMBER          DEFAULT 0,
    retention_time   NUMBER          DEFAULT 0,
    sort_list        VARCHAR2(30)    DEFAULT NULL,
    cache_hint       BINARY_INTEGER DEFAULT AUTO
);

```

### Attributes

**Table 287-11 QUEUE\_PROPS\_T Attributes**

| Attribute      | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retry_delay    | Specifies the number of seconds after which this message is scheduled for processing again after an application rollback                                                                                                                                                                                                                                                                                                               |
| retention_time | Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue                                                                                                                                                                                                                                                                                                                           |
| sort_list      | Sharded queues can be sorted by <code>ENQ_TIME</code> or <code>PRIORITY</code> , <code>ENQ_TIME</code> .                                                                                                                                                                                                                                                                                                                               |
| cache_hint     | Specifies a hint to sharded queue whether to cache messages or not. User can specify following: <ul style="list-style-type: none"> <li><code>UNCACHED</code>: Message cache will not cache messages</li> <li><code>CACHED</code>: Message cache will cache messages and give preference to those queues with <code>CACHED</code> hint.</li> <li><code>AUTO</code>: Message cache does best effort based on available memory</li> </ul> |

## 287.2.16 SYS.MSG\_PROP\_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

### Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
    priority          NUMBER,
    delay             NUMBER,
    expiration        NUMBER,
    correlation       VARCHAR2(128),
    attempts          NUMBER,
    exception_queue   VARCHAR2(51),
    enqueue_time      DATE,
    state             NUMBER,
    sender_id         aq$_agent,
    original_msgid    RAW(16),
    delivery_mode     NUMBER);
```

### Parameters

**Table 287-12 SYS.MSG\_PROP\_T Type Attributes**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>priority</code>    | Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>delay</code>       | <p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p>number: The number of seconds to delay the message</p> |
| <code>expiration</code>  | <p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p><code>NEVER</code>: The message does not expire</p> <p>number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.</p>                                                                                                              |
| <code>correlation</code> | Returns the identifier supplied by the producer of the message at enqueue time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>attempts</code>    | Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 287-12 (Cont.) SYS.MSG\_PROP\_T Type Attributes

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exception_queue | <p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue.</p> <p>Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> <li>A message was not dequeued before the expiration time elapsed.</li> <li>Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p> |
| enqueue_time    | <p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| state           | <p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>DBMS_AQ.READY: The message is ready to be processed.</li> <li>DBMS_AQ.WAITING: The message delay has not yet been reached.</li> <li>DBMS_AQ.PROCESSED: The message has been processed and is retained.</li> <li>DBMSAQ.EXPIRED: The message has been moved to the exception queue.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| sender_id      | <p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p> |
| original_msgid | This parameter is used by Oracle Database Advanced Queuing for propagating messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| delivery_mode  | DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 287.2.17 MESSAGE\_PROPERTIES\_T Type

This type is defined inside the DBMS\_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

**See Also:**

[AQ\\$\\_RECIPIENT\\_LIST\\_T Type](#)

### Syntax

```

TYPE message_properties_t IS RECORD (
    priority          BINARY_INTEGER NOT NULL DEFAULT 1,
    delay             BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
    expiration        BINARY_INTEGER NOT NULL DEFAULT NEVER,
    correlation       VARCHAR2(128)   DEFAULT NULL,
    attempts          BINARY_INTEGER,
    recipient_list    AQ$_RECIPIENT_LIST_T,
    exception_queue   VARCHAR2(61)    DEFAULT NULL,
    enqueue_time      DATE,
    state             BINARY_INTEGER,
    sender_id         SYS.AQ$_AGENT   DEFAULT NULL,
    original_msgid    RAW(16)         DEFAULT NULL,
    signature         aq$_sig_prop    DEFAULT NULL,
    transaction_group VARCHAR2(30)    DEFAULT NULL,
    user_property     SYS.ANYDATA     DEFAULT NULL,
    delivery_mode     PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);

```

## Attributes

**Table 287-13 MESSAGE\_PROPERTIES\_T Attributes**

| Attribute      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| priority       | Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| delay          | <p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p>number: The number of seconds to delay the message</p> |
| expiration     | <p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p><code>NEVER</code>: The message does not expire</p> <p>number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.</p>                                                                                                              |
| correlation    | Returns the identifier supplied by the producer of the message at enqueue time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| attempts       | Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| recipient_list | <p>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.</p> <p>For type definition, see the "<a href="#">AQ\$_AGENT Type</a>".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 287-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes

| Attribute       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exception_queue | <p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <ul style="list-style-type: none"> <li>A message was not dequeued before the expiration time elapsed.</li> <li>Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</p> |
| enqueue_time    | <p>The enqueue_time attribute specifies the time the message was enqueued. This value is always in Universal Coordinated Time (UTC), and is determined by the system and cannot be set by the user at enqueue time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| state           | <p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>DBMS_AQ.READY: The message is ready to be processed.</li> <li>DBMS_AQ.WAITING: The message delay has not yet been reached.</li> <li>DBMS_AQ.PROCESSED: The message has been processed and is retained.</li> <li>DBMSAQ.EXPIRED: The message has been moved to the exception queue.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 287-13 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

| Attribute         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sender_id         | <p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call.</p> <p>Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p> |
| original_msgid    | This parameter is used by Oracle Database Advanced Queuing for propagating messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| signature         | Currently not implemented                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| transaction_group | Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.                                                                                                                                                                                                                                                                                                                                                                   |
| user_property     | This optional attribute is used to store additional information about the payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| delivery_mode     | The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 287.2.18 MESSAGE\_PROPERTIES\_ARRAY\_T Type

This type is used by dbms\_aq.enqueue\_array and dbms\_aq.dequeue\_array calls to hold the set of message properties.

Each element in the payload\_array should have a corresponding element in the MESSAGE\_PROPERTIES\_ARRAY\_T VARRAY.

**See Also:**

"MESSAGE\_PROPERTIES\_T Type"

### Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
  OF MESSAGE_PROPERTIES_T;
```

## 287.2.19 MSGID\_ARRAY\_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

### Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

# DBFS Content Interface Types

DBFS Content Interface Types are public types that support the `DBMS_DBFS_CONTENT` interface.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Data Structures](#)

## Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 288.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the `DBMS_DBFS_CONTENT` interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

## 288.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the `DBFS_ROLE`. This role can be granted to users as needed.

## 288.3 DBFS Content Interface Types —Data Structures

Types that support the `DBMS_DBFS_CONTENT` interface include both Object and Table types.

### Object Types

- [DBMS\\_DBFS\\_CONTENT\\_CONTEXT\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T](#) Object Type

### Table Types

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_RAW\\_T](#) Table Type

## 288.3.1 DBMS\_DBFS\_CONTENT\_CONTEXT\_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
AUTHID DEFINER
AS OBJECT (
    principal    VARCHAR2(32),
    acl          VARCHAR2(1024),
    owner        VARCHAR2(32),
    asof         TIMESTAMP,
    read_only    INTEGER);
```

### Fields

**Table 288-1** DBMS\_DBFS\_CONTENT\_CONTEXT\_T Fields

| Field                  | Description                           |
|------------------------|---------------------------------------|
| <code>principal</code> | File system user                      |
| <code>acl</code>       | Access control list                   |
| <code>owner</code>     | Path item owner                       |
| <code>asof</code>      | Timestamp                             |
| <code>read_only</code> | Nonzero if the path item is read-only |

## 288.3.2 DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type

This type describes a type to assist in listing the contents of a directory.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);
```

### Fields

**Table 288-2** DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Fields

| Field                  | Description                                          |
|------------------------|------------------------------------------------------|
| <code>path</code>      | Path to the path item                                |
| <code>item_name</code> | Name of the path item                                |
| <code>item_type</code> | Type of path item. (See <a href="#">Table 53-4</a> ) |

### 288.3.3 DBMS\_DBFS\_CONTENT\_PROPERTY\_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
AUTHID DEFINER
AS OBJECT (
    propname    VARCHAR2(32),
    propvalue   VARCHAR2(1024),
    typecode    INTEGER);
```

#### Fields

**Table 288-3 DBMS\_DBFS\_CONTENT\_PROPERTY\_T Fields**

| Field      | Description                                 |
|------------|---------------------------------------------|
| prop_name  | Name of property                            |
| prop_value | Value of property                           |
| typecode   | Property type (See Constants in DBMS_TYPES) |

### 288.3.4 DBMS\_DBFS\_CONTENT\_LIST\_ITEMS\_T Table Type

This type is a variable-sized array of DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

#### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
TABLE OF dbms_dbfs_content_list_item_t;
```

#### Related Topics

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T Object Type](#)  
This type describes a type to assist in listing the contents of a directory.
- [DBMS\\_DBFS\\_CONTENT](#)  
The DBMS\_DBFS\_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## 288.3.5 DBMS\_DBFS\_CONTENT\_PROPERTIES\_T Table Type

This type is a variable-sized array of property tuples of `DBMS_DBFS_CONTENT_PROPERTY_T` Object Type. It is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS  
    TABLE OF dbms_dbfs_content_property_t;
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T Object Type](#)  
This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

## 288.3.6 DBMS\_DBFS\_CONTENT\_RAW\_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the `DBMS_DBFS_CONTENT` interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS  
    TABLE OF RAW(32767);
```

### Related Topics

- [DBMS\\_DBFS\\_CONTENT](#)  
The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

## Database URI TYPES

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- [Summary of URITYPE Supertype Subprograms](#)
- [Summary of HTTPURITYPE Subtype Subprograms](#)
- [Summary of DBURITYPE Subtype Subprograms](#)
- [Summary of XDBURITYPE Subtype Subprograms](#)
- [Summary of URIFACTORY Package Subprograms](#)

### 289.1 Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

**Table 289-1** URITYPE Type Subprograms

| Method                  | Description                                                                |
|-------------------------|----------------------------------------------------------------------------|
| <a href="#">GETBLOB</a> | Returns the <code>BLOB</code> located at the address specified by the URL. |
| <a href="#">GETCLOB</a> | Returns the <code>CLOB</code> located at the address specified by the URL. |

**Table 289-1 (Cont.) URITYPE Type Subprograms**

| Method                         | Description                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">GETCONTENTTYPE</a> | Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.     |
| <a href="#">GETEXTERNALURL</a> | Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.     |
| <a href="#">GETURL</a>         | Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance. |
| <a href="#">GETXML</a>         | Returns the <code>XMLType</code> located at the address specified by the URL.            |

## 289.1.1 UriType Supertype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `BLOB` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()  
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)  
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)  
    RETURN BLOB;
```

**Table 289-2 UriType Supertype GETBLOB Parameters**

| Parameter            | IN / OUT | Description                                                                                                |
|----------------------|----------|------------------------------------------------------------------------------------------------------------|
| <code>content</code> | (OUT)    | Content type of the document to which URI is pointing.                                                     |
| <code>csid</code>    | (IN)     | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error |

## 289.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getClob()  
    RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)  
    RETURN CLOB;
```

**Table 289-3 UriType Supertype GETCLOB Parameters**

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentType()  
    RETURN VARCHAR2;
```

## 289.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the UriType instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
    RETURN varchar2;
```

## 289.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## 289.1.6 UriType Supertype GETXML

This function returns the `XMLType` located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

**Table 289-4** UriType Supertype GETXML Parameters

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.2 Summary of HTTPURITYPE Subtype Subprograms

The `HTTPURITYPE` is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

**Table 289-5** HTTPURITYPE Type Subprorgams

| Method                    | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| <a href="#">CREATEURI</a> | Creates an instance of <code>HTTPURITYPE</code> from the given URI.        |
| <a href="#">GETBLOB</a>   | Returns the <code>BLOB</code> located at the address specified by the URL. |

**Table 289-5 (Cont.) HTTPURITYPE Type Subprorgams**

| Method                         | Description                                                                 |
|--------------------------------|-----------------------------------------------------------------------------|
| <a href="#">GETCLOB</a>        | Returns the CLOB located at the address specified by the URL.               |
| <a href="#">GETCONTENTTYPE</a> | Returns the content type of the document pointed to by the URI.             |
| <a href="#">GETEXTERNALURL</a> | Returns the URL, in escaped format, stored inside the UriType instance.     |
| <a href="#">GETURL</a>         | Returns the URL, in non-escaped format, stored inside the UriType instance. |
| <a href="#">GETXML</a>         | Returns the XMLType located at the address specified by the URL             |
| <a href="#">HTTPURITYPE</a>    | Creates an instance of HTTPURITYPE from the given URI.                      |

## 289.2.1 HttpUriType Subtype CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN HTTPURITYPE;
```

**Table 289-6 HttpUriType Subtype CREATEURI Parameters**

| Parameter        | IN / OUT | Description                                                 |
|------------------|----------|-------------------------------------------------------------|
| <code>url</code> | (IN)     | The URL string containing a valid HTTP URL; escaped format. |

## 289.2.2 HttpUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETBLOB are described below.

This function returns the BLOB located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getBlob()  
RETURN BLOB;
```

This function returns the BLOB located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)  
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
RETURN BLOB;
```

**Table 289-7** HttpUriType Subtype GETBLOB Parameters

| Parameter | IN / OUT | Description                                                                                                 |
|-----------|----------|-------------------------------------------------------------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing.                                                      |
| csid      | (IN)     | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

## 289.2.3 HttpUriType Subtype GETCLOB

This function returns the `CLOB` located by the HTTP URL address. If a temporary `CLOB` is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the `CLOB` located at the address specified by the HTTP URL.

### Syntax

```
MEMBER FUNCTION getClob()
RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the HTTP URL and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
RETURN CLOB;
```

**Table 289-8** HttpUriType Subtype GETCLOB Parameters

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

### Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

## 289.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function.

The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## 289.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## 289.2.7 HttpUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype `HttpUriType` member subprogram `GETXML` are described below.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

**Table 289-9** HttpUriType Subtype GETXML Parameters

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE (  
    url IN VARCHAR2);
```

**Table 289-10** HttpUriType Subtype HTTPURITYPE Parameters

| Parameter | IN / OUT | Description                                                                                                                                                                                                    |
|-----------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url       | (IN)     | The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters. |

## 289.3 Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri`-refs. A `DBUri`-ref is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

**Table 289-11** DBURITYPE Type Subprograms

| Method                         | Description                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">CREATEURI</a>      | Constructs a <code>DBURITYPE</code> instance.                                                          |
| <a href="#">DBURITYPE</a>      | Creates an instance of <code>DBURITYPE</code> from the given URI.                                      |
| <a href="#">GETBLOB</a>        | Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance. |
| <a href="#">GETCLOB</a>        | Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance. |
| <a href="#">GETCONTENTTYPE</a> | Returns the content type of the document pointed to by the URI.                                        |
| <a href="#">GETEXTERNALURL</a> | Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.                 |
| <a href="#">GETURL</a>         | Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.             |
| <a href="#">GETXML</a>         | Returns the <code>XMLType</code> located at the address specified by the URL.                          |

## 289.3.1 DBUriType Subtype CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN DBURITYPE;
```

**Table 289-12** DBUriType Subtype CREATEURI Parameters

| Parameter | IN / OUT | Description                                                                    |
|-----------|----------|--------------------------------------------------------------------------------|
| url       | (IN)     | The URL string, in escaped format, containing a valid <code>DBURITYPE</code> . |

## 289.3.2 DBUriType Subtype DBURITYPE

This constructs a `DBURITYPE` instance.

### Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(  
    url IN varchar2);
```

**Table 289-13** DBUriType Subtype DBURITYPE Parameters

| Parameter | IN / OUT | Description                                                                                                                                                                                                                   |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url       | (IN)     | The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters. |

## 289.3.3 DBUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the URL.

The subprograms of the URI Subtype `DBURITYPE` member subprogram `GETBLOB` are described below. The options are described in the following table.

This function returns the `BLOB` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()  
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)  
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

### Syntax

```
FUNCTION getBlob(csid IN NUMBER)
RETURN BLOB;
```

**Table 289-14** DBUriType Subtype GETBLOB Parameters

| Parameter | IN / OUT | Description                                                                                                 |
|-----------|----------|-------------------------------------------------------------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing.                                                      |
| csid      | (IN)     | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

## 289.3.4 DBUriType Subtype GETCLOB

This function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

If a temporary `CLOB` is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getClob()
RETURN CLOB;
```

The following function returns the `CLOB` located at the address specified by the `DBURITYPE` instance and the content type.

### Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
RETURN CLOB;
```

**Table 289-15** DBUriType Subtype GETCLOB Parameters

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

### Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

## 289.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## 289.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the `DBURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## 289.3.8 DBUriType Subtype GETXML

This function returns the `XMLType` located at the address specified by the URL.

The subprograms of the URI Subtype `DBPURITYPE` member subprogram `GETXML` are described below. The options are described in the following table.

This function returns the `XMLType` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the `XMLType` located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

**Table 289-16 DBUriType Subtype GETXML Parameters**

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.4 Summary of XDBURITYPE Subtype Subprograms

`XDBURITYPE` is a new subtype of `URITYPE`. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any `URITYPE` column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

**Table 289-17 XDBURITYPE Type Subprograms**

| Method                         | Description                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATEURI</a>      | Returns the <code>UriType</code> corresponding to the specified URL.                                                           |
| <a href="#">GETBLOB</a>        | Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance. |
| <a href="#">GETCLOB</a>        | Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance. |
| <a href="#">GETCONTENTTYPE</a> | Returns the content type of the document pointed to by the URI.                                                                |
| <a href="#">GETEXTERNALURL</a> | Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.                                        |
| <a href="#">GETURL</a>         | Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.                                    |
| <a href="#">GETXML</a>         | Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.                           |
| <a href="#">XDBURITYPE</a>     | Creates an instance of <code>XDBURITYPE</code> from the given URI.                                                             |

## 289.4.1 XDBUriType Subtype CREATEURI

This static function constructs a `XDBURITYPE` instance. It parses the given URL and creates a `XDBURITYPE` instance.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN XDBURITYPE
```

| Parameter        | IN / OUT | Description                                                                     |
|------------------|----------|---------------------------------------------------------------------------------|
| <code>url</code> | (IN)     | The URL string, in escaped format, containing a valid <code>XDBURITYPE</code> . |

## 289.4.2 XDBUriType Subtype GETBLOB

This function returns the `BLOB` located at the address specified by the `XDBURITYPE` instance.

The subprograms of the URI Subtype `XDBURITYPE` member subprogram `GETBLOB` are described below. The options are described in the following table.

This function returns the `BLOB` located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getBlob()  
RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL and the content type.

## Syntax

```
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the `BLOB` located at the address specified by the URL in the specified character set.

## Syntax

```
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

**Table 289-18 XDBUriType Subtype GETBLOB Parameters**

| Parameter | IN / OUT | Description                                                                                                 |
|-----------|----------|-------------------------------------------------------------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing.                                                      |
| csid      | (IN)     | Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error. |

## 289.4.3 XDBUriType Subtype GETCLOB

This function returns the `CLOB` located at the address specified by the `XDBURITYPE` instance. If a temporary `CLOB` is returned, it must be freed.

The subprograms of the URI Subtype `XDBURITYPE` member subprogram `GETCLOB` are described below. The options are described in the following table.

Returns the `CLOB` located at the address specified by the `XDBUriType` instance.

## Syntax

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

Returns the `CLOB` located at the address specified by the `XDBUriType` instance and the content type.

## Syntax

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;
```

**Table 289-19 XDBUriType Subtype GETCLOB Parameters**

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

## 289.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## 289.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## 289.4.7 XDBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETXML are described below. The options are described in the following table.

This function returns the XMLType located at the address specified by the URL.

### Syntax

```
MEMBER FUNCTION getXML()  
RETURN XMLType;
```

This function returns the XMLType located at the address specified by the URL and the content type.

### Syntax

```
MEMBER FUNCTION getXML(content OUT VARCHAR2)  
RETURN XMLType;
```

**Table 289-20 XDBUriType Subtype GETXML Parameters**

| Parameter | IN / OUT | Description                                            |
|-----------|----------|--------------------------------------------------------|
| content   | (OUT)    | Content type of the document to which URI is pointing. |

## 289.4.8 XDBUriType subtype XDBURITYPE

This constructs a `XDBURITYPE` instance.

### Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(  
    url      IN   VARCHAR2,  
    flags    IN   RAW := NULL)  
RETURN self AS RESULT;
```

**Table 289-21** XDBUriType subtype XDBURITYPE Parameters

| Parameter | IN / OUT | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url       | (IN)     | The URL string containing a valid <code>XDBUriType</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.                                                                                                                                                                                                                       |
| flags     | (IN)     | Possible values are: <ul style="list-style-type: none"><li>1 - Expand all <code>XInclude</code> elements before returning the result contents. If any <code>XInclude</code> element cannot be successfully resolved according to the <code>XInclude</code> fallback semantics, then an error is raised.</li><li>2 - Indicates that any errors during document retrieval should be suppressed</li><li>3 - Both flag bits (1, 2) are enabled</li></ul> |

## 289.5 Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

**Table 289-22** URIFACTORY Type Subprograms

| Method                               | Description                                                     |
|--------------------------------------|-----------------------------------------------------------------|
| <a href="#">GETURI</a>               | Returns the correct URL handler for the given URL string.       |
| <a href="#">ESCAPEURI</a>            | Returns a URL in escaped format.                                |
| <a href="#">UNESCAPEURI</a>          | Returns a URL in unescaped format.                              |
| <a href="#">REGISTERURLHANDLER</a>   | Registers a particular type name for handling a particular URL. |
| <a href="#">UNREGISTERURLHANDLER</a> | Unregisters a URL handler.                                      |

## 289.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

### Syntax

```
FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;
```

**Table 289-23** UriFactory Package GETURI Parameters

| Parameter | IN / OUT | Description                                                     |
|-----------|----------|-----------------------------------------------------------------|
| uri       | (IN)     | The URL string, in escaped format, containing a valid HTTP URL. |

## 289.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

### Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

**Table 289-24** UriFactory Package ESCAPEURI Parameters

| Parameter | IN / OUT | Description                                      |
|-----------|----------|--------------------------------------------------|
| url       | (IN)     | The URL string to be returned in escaped format. |

## 289.5.3 UriFactory Package UNESCAPEURI

This function returns a URL in unescaped format.

This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

### Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

**Table 289-25 UriFactory Package UNESCAPEURI Parameters**

| Parameter | IN / OUT | Description                                        |
|-----------|----------|----------------------------------------------------|
| url       | (IN)     | The URL string to be returned in unescaped format. |

## 289.5.4 UriFactory Package REGISTERURLHANDLER

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

### Syntax

```
PROCEDURE registerUrlHandler(  
    prefix IN varchar2,  
    schemaName IN varchar2,  
    typename IN varchar2,  
    ignoreCase IN boolean := true,  
    stripprefix IN boolean := true);
```

**Table 289-26 UriFactory Package REGISTERURLHANDLER Parameters**

| Parameter   | IN / OUT | Description                                                |
|-------------|----------|------------------------------------------------------------|
| prefix      | (IN)     | The prefix to handle; for example, <code>http://</code> .  |
| schemaName  | (IN)     | Name of the schema where the type resides; case sensitive. |
| typename    | (IN)     | The name of the type to handle the URL; case sensitive.    |
| ignoreCase  | (IN)     | Ignore case when matching prefixes.                        |
| stripprefix | (IN)     | Strip prefix before generating the instance of the type.   |

## 289.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

### Syntax

```
PROCEDURE unregisterUrlHandler(  
    prefix IN VARCHAR2);
```

**Table 289-27 UriFactory Package UNREGISTERURLHANDLER Parameters**

| Parameter | IN / OUT | Description                    |
|-----------|----------|--------------------------------|
| prefix    | (IN)     | The prefix to be unregistered. |

# JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Java Versus PL/SQL Datatypes](#)
- [More on Bytes\\_ Stream and Map Messages](#)
- [Upcasting and Downcasting Between General and Specific Messages](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [JMS Types Error Reporting](#)
- [Oracle JMS Type Constants](#)
- [CONVERT\\_JMS\\_SELECTOR](#)
- [Summary of JMS Types](#)

## 290.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules

## 290.2 JMS Types Security Model

`PUBLIC` is granted `EXECUTE` privilege in these JMS types.

- `SYS.AQ$_JMS_MESSAGE` Type
- `SYS.AQ$_JMS_TEXT_MESSAGE` Type
- `SYS.AQ$_JMS_BYTES_MESSAGE` Type
- `SYS.AQ$_JMS_MAP_MESSAGE` Type
- `SYS.AQ$_JMS_STREAM_MESSAGE` Type
- `SYS.AQ$_JMS_OBJECT_MESSAGE` Type
- `SYS.AQ$_JMS_NAMEARRAY` Type
- `SYS.AQ$_JMS_VALUE` Type
- `SYS.AQ$_JMS_EXCEPTION` Type

## 290.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

### See Also:

JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

### New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any datatype that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

## 290.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionality that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the Jserv Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

### Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

### Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

#### Note:

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

### Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

### Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

### Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

### Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.  
This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.

3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.

2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

### Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

### Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support utf-8 encoding.

#### Note:

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation [JavaSoft.com](http://JavaSoft.com) for details on how the data is encoded into bytes.

### Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

## 290.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

## 290.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

**Table 290-1 Oracle JMS Types Errors**

| ORA error number | dbms_jms_plsql package constants | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-24190        | ERROR_DATA_OVERFLOW              | The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .                                                                                                                                                                                                                                                                                                                                    |
| ORA-24191        | ERROR_PROP_NAME_EXIST            | Setting a property that is previous set                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ORA-24192        | ERROR_PROP_NAME_NULL             | Occurs when setting a property with null property name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ORA-24193        | ERROR_EXCEED_RANGE               | PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.                                                                                                                                                                                                                      |
| ORA-24194        | ERROR_TYPE_MISMATCH              | The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ORA-24195        | ERROR_MAP_TOO_LARGE              | The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.                                                                                                                                                                                                                                                                                                                                                                    |
| ORA-24196        | ERROR_WRONG_MODE                 | The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ORA-24197        | ERROR_JAVA_EXCEPTION             | ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure.<br><br>A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side. |
| ORA-24198        | ERROR_INVALID_ID                 | An invalid operation ID is being provided to access a message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ORA-24199        | ERROR_STORE_OVERFLOW             | The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.                                                                                                                                                                       |

## 290.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

### DBMS\_AQ Package Constants

DBMS\_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE     CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE  CONSTANT BINARY_INTEGER;
```

### SYS.DBMS\_JMS\_PLSQL Package Constants

SYS.DBMS\_JMS\_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

```
DESTLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTLOAD_USERADT  CONSTANT PLS_INTEGER;
DESTLOAD_ANYDATA  CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE          CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT         CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER       CONSTANT PLS_INTEGER;
DATA_TYPE_LONG          CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT         CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE        CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN       CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER     CONSTANT PLS_INTEGER;
DATA_TYPE_STRING        CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES         CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW    CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST  CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL   CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE     CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH    CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE    CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE       CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION   CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID       CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW   CONSTANT PLS_INTEGER := -24199;
```

## 290.8 CONVERT\_JMS\_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in `ADD_SUBSCRIBER`

operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

### Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

#### Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

#### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

#### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

#### Syntax

```
Function convert_jms_selector(  
    selector IN VARCHAR2,  
    dest_pload_type IN PLS_INTEGER)  
RETURN VARCHAR2
```

#### Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

#### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

**Syntax**

```
Function convert_jms_selector(  
    selector          IN  VARCHAR2,  
    dest_pload_type  IN  PLS_INTEGER,  
    compliant         IN  BOOLEAN )
```

**Returns**

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

**Exceptions**

ORA-24197 if the Java stored procedure throws an exception during execution.

## 290.9 Summary of JMS Types

This lists shows the JMS types.

- [SYS.AQ\\$\\_JMS\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_TEXT\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_BYTES\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_MAP\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_STREAM\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_OBJECT\\_MESSAGE Type](#)
- [SYS.AQ\\$\\_JMS\\_NAMEARRAY Type](#)
- [SYS.AQ\\$\\_JMS\\_VALUE Type](#)
- [SYS.AQ\\$\\_JMS\\_EXCEPTION Type](#)

### 290.9.1 SYS.AQ\$\_JMS\_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- [CONSTRUCT Static Functions](#)
- [Cast Methods](#)

MEMBER PROCEDURE get_bytes      (payload OUT RAW),
MEMBER PROCEDURE get_bytes      (payload OUT BLOB));

```

## CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

### STATIC FUNCTION `construct (mtype IN INT) RETURN aq$_jms_message`

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (`TextMessage`, `BytesMessage`, `MapMessage`, `StreamMessage` or `ObjectMessage`). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)":

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

### STATIC FUNCTION `construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message`

Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

### STATIC FUNCTION `construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_jms_message;`

Creates an `aq$_jms_message` from an `aq$_jms_bytes_message`.

### STATIC FUNCTION `construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;`

Creates an `aq$_jms_message` from an `aq$_jms_stream_message`.

### STATIC FUNCTION `construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;`

Creates an `aq$_jms_message` from an `aq$_jms_map_message`.

### STATIC FUNCTION `construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;`

Creates an `aq$_jms_message` from an `aq$_jms_object_message`.

## Cast Methods

### `cast_to_bytes_msg RETURN aq$_jms_bytes_message`

Casts an `aq$_jms_message` to an `aq$_jms_bytes_message`. Returns an `aq$_jms_bytes_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_BYTES_MESSAGE`. This function raises `ORA-24198` if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_BYTES_MESSAGE`.

### `cast_to_map_msg RETURN aq$_jms_map_message`

Casts an `aq$_jms_message` to an `aq$_jms_map_message`. Returns an `aq$_jms_map_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_MAP_MESSAGE`.

This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_MAP_MESSAGE`.

**cast\_to\_object\_msg RETURN aq\$\_jms\_object\_message**

Casts an `aq$_jms_message` to an `aq$_jms_object_message`. Returns an `aq$_jms_object_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_OBJECT_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_OBJECT_MESSAGE`.

**cast\_to\_stream\_msg RETURN aq\$\_jms\_stream\_message**

Casts an `aq$_jms_message` to an `aq$_jms_stream_message`. Returns an `aq$_jms_stream_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_STREAM_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_STREAM_MESSAGE`.

**cast\_to\_text\_msg RETURN aq\$\_jms\_text\_message**

Casts an `aq$_jms_message` to an `aq$_jms_text_message`. Returns an `aq$_jms_text_message` or null if the `message_type` attribute of the `aq$_jms_message` is not `DBMS_AQ.JMS_TEXT_MESSAGE`. This function raises ORA-24198 if the `message_type` field of the `aq$_jms_message` is not `DBMS_AQJMS.JMS_TEXT_MESSAGE`.

**JMS Header Methods****set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the `replyto` parameter, which corresponds to `JMSReplyTo`.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text and corresponds to `JMSType`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods****set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID`.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID`.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID`.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN VARCHAR**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB),**

Sets the payload, a `CLOB` value, to an internal representation.

**set\_bytes (payload IN RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload IN BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

**get\_bytes (payload OUT RAW)**

Puts the internal representation of the payload into a `RAW` variable payload.

**get\_bytes (payload OUT BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

## 290.9.2 SYS.AQ\$\_JMS\_TEXT\_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_text\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)

MEMBER PROCEDURE get_text (payload OUT CLOB);

```

### **CONSTRUCT aq\$\_jms\_text\_message Function**

#### **STATIC FUNCTION construct RETURN aq\$\_jms\_text\_message**

Creates an empty aq\$\_jms\_text\_message.

### **JMS Header Methods**

#### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

#### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

#### **get\_replyto RETURN sys.aq\$\_agent**

Returns replyto, which corresponds to JMSReplyTo.

#### **get\_type RETURN VARCHAR**

Returns type, which corresponds to JMSType.

### **System Properties Methods**

#### **set\_userid (userid IN VARCHAR)**

Sets userid, which corresponds to JMSXUserID in JMS.

#### **set\_appid (appid IN VARCHAR)**

Sets appid, which corresponds to JMSXAppID in JMS.

#### **set\_groupid (groupid IN VARCHAR)**

Sets groupid, which corresponds to JMSXGroupID in JMS.

#### **set\_groupseq (groupseq IN INT)**

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

#### **get\_userid RETURN VARCHAR**

Returns userid, which corresponds to JMSXUserID.

#### **get\_appid RETURN VARCHAR**

Returns appid, which corresponds to JMSXAppID.

#### **get\_groupid RETURN VARCHAR**

Returns groupid, which corresponds to JMSXGroupID.

#### **get\_groupseq RETURN INT**

Returns groupseq, which corresponds to JMSXGroupSeq.

## User Properties Methods

### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB)**

Sets the payload, a `CLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

## 290.9.3 SYS.AQ\$\_JMS\_BYTES\_MESSAGE Type

The `SYS.AQ$_JMS_BYTES_MESSAGE` type is the ADT used to store a `BytesMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_bytes\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)

- [User Properties Methods](#)
- [Payload Methods](#)

## Syntax

```

TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(
  header      aq$_jms_header,
  bytes_len   INT,
  bytes_raw   raw(2000),
  bytes_lob   blob,
  STATIC FUNCTION construct RETURN aq$_jms_bytes_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),

MEMBER PROCEDURE write_utf     (id IN PLS_INTEGER, value IN CLOB));

```

### CONSTRUCT aq\$\_jms\_bytes\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_bytes\_message

Creates an empty aq\$\_jms\_bytes\_message.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

#### get\_replyto RETURN sys.aq\$\_agent

Returns replyto, which corresponds to JMSReplyTo.

#### get\_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

### System Properties Methods

#### set\_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

#### set\_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

#### set\_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods**

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****set\_bytes (payload in RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload in BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_bytes (payload out RAW)**

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

**get\_bytes (payload out BLOB)**

Puts the internal representation of the payload into a BLOB variable payload.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID. This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or

`SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_bytes (id IN PLS\_INTEGER, value OUT NO COPY BLOB, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN INT**

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-

only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_utf (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN PLS\_INTEGER, length IN PLS\_INTEGER)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197

if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 290.9.4 SYS.AQ\$\_JMS\_MAP\_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_map\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```
TYPE aq$_jms_map_message AS object(
  header      aq$_jms_header,
  bytes_len   int,
  bytes_raw   raw(2000),
  bytes_lob   blob,
  STATIC FUNCTION construct RETURN aq$_jms_map_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type    (type    IN VARCHAR),
  MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,
  MEMBER FUNCTION get_type    RETURN VARCHAR,
  MEMBER PROCEDURE set_userid  (userid  IN VARCHAR),
  MEMBER PROCEDURE set_appid   (appid   IN VARCHAR),
  MEMBER PROCEDURE set_groupid (groupid IN VARCHAR),

### CONSTRUCT aq\$\_jms\_map\_message Function

**STATIC FUNCTION construct RETURN aq\$\_jms\_map\_message**  
Creates an empty aq\$\_jms\_map\_message object.

### JMS Header Methods

**set\_replyto (replyto IN sys.aq\$\_agent)**  
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

**set\_type (type IN VARCHAR)**  
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

**get\_replyto RETURN sys.aq\$\_agent**  
Returns replyto, which corresponds to JMSReplyTo.

**get\_type RETURN VARCHAR**  
Returns type, which corresponds to JMSType.

### System Properties Methods

**set\_userid (userid IN VARCHAR)**  
Sets userid, which corresponds to JMSXUserID in JMS.

**set\_appid (appid IN VARCHAR)**  
Sets appid, which corresponds to JMSXAppID in JMS.

**set\_groupid (groupid IN VARCHAR)**  
Sets groupid, which corresponds to JMSXGroupID in JMS.

**set\_groupseq (groupseq IN INT)**  
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

**get\_userid RETURN VARCHAR**  
Returns userid, which corresponds to JMSXUserID.

**get\_appid RETURN VARCHAR**  
Returns appid, which corresponds to JMSXAppID.

**get\_groupid RETURN VARCHAR**  
Returns groupid, which corresponds to JMSXGroupID.

**get\_groupseq RETURN NUMBER**  
Returns groupseq, which corresponds to JMSXGroupSeq.

## User Properties Methods

### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

### **set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

### **set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

### **set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods**

**set\_bytes (payload IN RAW)**

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_byte (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java

`IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_char (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CHAR)**

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_double (id IN PLS\_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_float (id IN PLS\_INTEGER, name IN VARCHAR2, value IN FLOAT)**

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_int (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_long (id IN PLS\_INTEGER, name IN VARCHAR2, value IN NUMBER)**

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_short (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CLOB))**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_byte (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)**

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_char (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN CHAR**

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_double (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION**

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_float (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN FLOAT**

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_int (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_long (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN NUMBER**

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_short (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_names (id IN PLS\_INTEGER) RETURN aq\$\_jms\_namearray**

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get\_names (id IN PLS\_INTEGER, names OUT aq\$\_jms\_namearray, offset IN PLS\_INTEGER, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_object (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_size (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item\_exists (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Indicates that an item exists in this map message by returning `TRUE`. Raises exception

ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

## 290.9.5 SYS.AQ\$\_JMS\_STREAM\_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- [CONSTRUCT aq\\$\\_jms\\_stream\\_message Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```
TYPE aq$_jms_stream_message AS object(
  header      aq$_jms_header,

### CONSTRUCT aq\$\_jms\_stream\_message Function

#### STATIC FUNCTION construct RETURN aq\$\_jms\_stream\_message

Creates an empty aq\$\_jms\_stream\_message object.

### JMS Header Methods

#### set\_replyto (replyto IN sys.aq\$\_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

#### set\_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods**

**set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods**

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of type `aq$jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

**set\_bytes (payload IN RAW)**

Sets the internal payload as the `RAW` variable without any interpretation. The payload of type `aq$jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID. This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either

`SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_bytes (id IN PLS\_INTEGER) RETURN BLOB**

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_bytes (id IN PLS\_INTEGER, value OUT NOCOPY BLOB)**

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `SHORT`. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_string RETURN CLOB**

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion

between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_string (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_object (id IN PLS\_INTEGER, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See [Table 290-2](#) for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN INT)**

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a `Java IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## 290.9.6 SYS.AQ\$\_JMS\_OBJECT\_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Database Advanced Queuing queue.

### Syntax

```
TYPE aq$_jms_object_message AS object(  
    header      aq$_jms_header,  
    bytes_len   int,  
    bytes_raw   raw(2000),  
    bytes_lob   blob);
```

## 290.9.7 SYS.AQ\$\_JMS\_NAMEARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`.

The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```

### Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,  
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

## 290.9.8 SYS.AQ\$\_JMS\_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(  
    type        number(2),  
    num_val     number,  
    char_val    char(1),  
    text_val    clob,  
    bytes_val   blob);
```

**Table 290-2** AQ\$\_JMS\_VALUE Type Fields and Java Fields

| Type                          | Java Type | aq\$_jms_value Data Field |
|-------------------------------|-----------|---------------------------|
| DBMS_JMS_PLSQL.DATA_TYPE_BYTE | byte      | num_val                   |

**Table 290-2 (Cont.) AQ\$\_JMS\_VALUE Type Fields and Java Fields**

| Type                               | Java Type        | aq\$_jms_value Data Field   |
|------------------------------------|------------------|-----------------------------|
| DBMS_JMS_PLSQL.DATA_TYPE_SHORT     | short            | num_val                     |
| DBMS_JMS_PLSQL.DATA_TYPE_INTEGER   | int              | num_val                     |
| DBMS_JMS_PLSQL.DATA_TYPE_LONG      | long             | num_val                     |
| DBMS_JMS_PLSQL.DATA_TYPE_FLOAT     | float            | num_val                     |

## 290.9.9 SYS.AQ\$\_JMS\_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (  
    id          number, -- Reserved and not used. Right now always return 0.  
    exp_name    varchar(200),  
    err_msg     varchar(500),  
    stack       varchar(4000));
```

# JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures.

- [JSON\\_ELEMENT\\_T Object Type](#)
- [JSON\\_OBJECT\\_T Object Type](#)
- [JSON\\_ARRAY\\_T Object Type](#)
- [JSON\\_SCALAR\\_T Object Type](#)
- [JSON\\_KEY\\_LIST Type](#)

## Related Topics

- [Oracle Database JSON Developer's Guide](#)
- [The JSON standard](#)

## 291.1 JSON\_ELEMENT\_T Object Type

`JSON_ELEMENT_T` is the supertype for the `JSON_OBJECT_T`, `JSON_SCALAR_T`, and `JSON_ARRAY_T` object types.

### Description

Note the following:

- To create an instance of `JSON_ELEMENT_T`, use the `parse` function. See the “Constructors” section below for details.
- You cannot create an empty `JSON_ELEMENT_T` instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a `JSON_ELEMENT_T` into a subtype (for example, `JSON_OBJECT_T`), you need to perform an explicit cast using `TREAT AS`. For example:

```
TREAT (elem AS JSON_OBJECT_T)
```

### Constructors

You create a `JSON_ELEMENT_T` instance using the `parse` function. The function takes as input `VARCHAR2`, `CLOB`, or `BLOB` data, and returns a `JSON_ELEMENT_T` instance.

```
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json CLOB)      RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json BLOB)      RETURN JSON_ELEMENT_T
```

Only UTF8-encoded JSON is passed as a `BLOB`.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition.

## Serialization

Serialization is the inverse of the `parse` function. The serialization operation takes the in-memory representation of the JSON data and prints it to a string. The serialization functions and procedures are:

```
MEMBER FUNCTION to_String      RETURN VARCHAR2
MEMBER FUNCTION to_Number     RETURN NUMBER
MEMBER FUNCTION to_Date       RETURN DATE
MEMBER FUNCTION to_Timestamp  RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean    RETURN BOOLEAN
MEMBER FUNCTION to_Clob       RETURN CLOB
MEMBER FUNCTION to_Blob       RETURN BLOB
```

```
MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)
```

The `to_Clob` and `to_Blob` *procedures* accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, `EMPTY_LOB` can be provided. The input LOB cannot be NULL.

If the `to_Clob` *function* is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the `to_Clob` or `to_Blob` *functions*, which take no parameter and generate a temp lob.

`to_Blob` serializes to UTF8 format only.

## Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```
MEMBER FUNCTION is_Object      RETURN BOOLEAN
MEMBER FUNCTION is_Array      RETURN BOOLEAN
MEMBER FUNCTION is_Scalar     RETURN BOOLEAN
MEMBER FUNCTION is_String     RETURN BOOLEAN
MEMBER FUNCTION is_Number     RETURN BOOLEAN
MEMBER FUNCTION is_Boolean    RETURN BOOLEAN
MEMBER FUNCTION is_True       RETURN BOOLEAN
MEMBER FUNCTION is_False      RETURN BOOLEAN
MEMBER FUNCTION is_Null       RETURN BOOLEAN
MEMBER FUNCTION is_Date       RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp  RETURN BOOLEAN
MEMBER FUNCTION get_Size      RETURN NUMBER
```

The return value of the `get_size` function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. The DOM API enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the `is_Date` and `is_Timestamp` functions return true. If a date has been added as a string (e.g. as ISO 8601), then the `is_Date` and `is_Timestamp` functions return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

## Error Handling

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a `get` call.

The default is to not raise an error but to return `NULL` instead.

You invoke `On_error` on a `JSON_ELEMENT_T` instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

**Table 291-1 Values for the value Parameter in the ON\_ERROR Procedure**

| Value | Description                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------|
| 0     | Reset to the default behavior, which is to return <code>NULL</code> instead of raising an error.                   |
| 1     | Raise all errors.                                                                                                  |
| 2     | Raise an error if no value is detected.                                                                            |
| 3     | Raise an error if the data types do not match, for example, if you call <code>GET_NUMBER</code> on a string value. |
| 4     | Raise an error if the input is invalid, for example, if the array is out of bounds.                                |

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of “a” is “xyz”, which cannot be converted to a number. If the `on_Error` procedure had not been called, then `NULL` would be returned, and no error would be raised.

```
declare
    jo JSON_OBJECT_T;
begin
    jo := JSON_OBJECT_T.parse('{a:"xyz"}');
    jo.On_error(1);
    dbms_output.put_line(jo.get_Number('a'));
end;
/
```

## 291.2 JSON\_OBJECT\_T Object Type

`JSON_OBJECT_T` is a subtype of the `JSON_ELEMENT_T` object type. It corresponds to the JSON object structure.

### Constructors

You can create an empty `JSON_OBJECT_T` instance using the following constructor.

```
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a `JSON_OBJECT_T` instance using one of the following `parse` functions:

```

STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json CLOB)      RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json BLOB)      RETURN JSON_OBJECT_T

```

You can also create a JSON\_OBJECT\_T instance using one of the following constructors:

```

CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn VARCHAR2) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn CLOB)   RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(jsn BLOB)   RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON object:

```

MEMBER FUNCTION get(key VARCHAR2)          RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2)   RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2)   RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2)     RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(key VARCHAR2)  RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2)     RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2)     RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2)   RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2)    RETURN JSON_ARRAY_T

MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)

```

Note:

- The `get` function has reference semantics. This means that if the returned JSON\_ELEMENT\_T is modified, then the containing JSON\_ELEMENT\_T is also changed. See the [Reference Semantics](#) section below for details.
- The `GET_STRING` function converts the value to a string if it is not already a string. Thus, the `GET_STRING` function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

```

MEMBER PROCEDURE put(key VARCHAR2, val JSON_ELEMENT_T)
MEMBER PROCEDURE put(key VARCHAR2, val VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, val NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, val BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, val DATE)
MEMBER PROCEDURE put(key VARCHAR2, val TIMESTAMP)
MEMBER PROCEDURE put_Null(key VARCHAR2)

```

## Introspection Functions

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

```

MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Type(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Keys RETURN JSON_KEY_LIST

```

The `get_Keys` function returns an object type of `JSON_KEY_LIST`, which is a varray of `VARCHAR2(4000)`. The varray contains the names of keys in the JSON object. The `get_Keys` function returns at most 32767 field names for a given JSON object. An error is raised if it is applied to an object with more than 32767 fields.

The example below walks through the items of the varray to build a `JSON_ARRAY_T` object that contains all key names.

```

declare
  jo JSON_OBJECT_T;
  ja JSON_ARRAY_T;
  keys JSON_KEY_LIST;
  keys_string VARCHAR2(100);

begin
  ja := new JSON_ARRAY_T;
  jo := JSON_OBJECT_T.parse('{"name":"fred",
                             "jobTitle":"codemonkey",
                             "projects":["json", "xml"]}');

  keys := jo.get_keys;
  for i in 1..keys.count loop
    ja.append(keys(i));
  end loop;

  keys_string := ja.to_string;
  dbms_output.put_line(keys_string);
end;
/

```

The output is:

```
["name","jobTitle","projects"]
```

## Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

```

MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_Key(keyOld VARCHAR2, keyNew VARCHAR2)

```

Duplicate key names are not supported and will raise an error.

## Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

```
MEMBER FUNCTION clone RETURN JSON_OBJECT_T
```

## Reference Semantics

Calling the `get` function that returns a `JSON_ELEMENT_T` object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```
declare
    data    JSON_OBJECT_T;
    address JSON_OBJECT_T;
    zip     number;

begin

    data := new JSON_OBJECT_T('{
        "first": "John",
        "last": "Doe",
        "address": {
            "country": "USA",
            "zip": "94065"
        }
    }');

    address := data.get_object('address');
    dbms_output.put_line(address.to_string);

    -- 1) VALUE SEMANTICS for scalar values
    -- (changing the value has no effect on container)
    zip := address.get_number('zip');
    dbms_output.put_line(zip);
    zip := 12345;
    dbms_output.put_line(zip);
    -- address is still the same
    dbms_output.put_line(address.to_string);

    -- 2) REFERENCE SEMANTICS for complex values
    -- 'address' is a reference to the complex address values inside 'data'
    address.put('zip', 12345);
    address.put('street', 'Detour Road');
    dbms_output.put_line(data.to_string);
end;
/
```

In cases where you do not want the reference semantics, you can use the `clone` function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

```
address := data.get_object('address');
```

with this line:

```
address := data.get_object('address').clone;
```

After this, changing the address will have no effect on the value of the ‘data’ containing object.

### Update Example

The following example updates the price of an item by 10%.

```

WITH
  FUNCTION updatePrice(jsonTxt in VARCHAR2 ) RETURN VARCHAR2 IS
    jo JSON_OBJECT_T;
    oldPrice NUMBER;

  BEGIN
    jo := new JSON_OBJECT_T(jsonTxt);
    oldPrice := jo.get_number('price');
    jo.put('price', oldPrice * 1.1);
    RETURN jo.to_string();
  END;
SELECT updatePrice(col)
FROM   tl;

```

## 291.3 JSON\_ARRAY\_T Object Type

JSON\_ARRAY\_T is a subtype of the JSON\_ELEMENT\_T object type. JSON\_ARRAY\_T corresponds to the JSON array structure.

### Constructors

You can create an empty JSON\_ARRAY\_T instance using the following constructor.

```

CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT

```

You can create a JSON\_ARRAY\_T instance using one the following parse functions:

```

STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json CLOB)      RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json BLOB)      RETURN JSON_ARRAY_T

```

You can also create a JSON\_ARRAY\_T instance using one the following constructors:

```

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT

```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

### Get Functions and Procedures

The following functions and procedures enable you to retrieve the value of the JSON array:

|                                           |                       |
|-------------------------------------------|-----------------------|
| MEMBER FUNCTION get(pos NUMBER)           | RETURN JSON_ELEMENT_T |
| MEMBER FUNCTION get_String(pos NUMBER)    | RETURN VARCHAR2       |
| MEMBER FUNCTION get_Number(pos NUMBER)    | RETURN NUMBER         |
| MEMBER FUNCTION get_Date(pos NUMBER)      | RETURN DATE           |
| MEMBER FUNCTION get_Timestamp(pos NUMBER) | RETURN TIMESTAMP      |
| MEMBER FUNCTION get_Boolean(pos NUMBER)   | RETURN BOOLEAN        |
| MEMBER FUNCTION get_Clob(pos NUMBER)      | RETURN CLOB           |
| MEMBER FUNCTION get_Blob(pos NUMBER)      | RETURN BLOB           |

```
MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)
```

Note:

- The `get` function has reference semantics. This means that if the returned `JSON_ELEMENT_T` is modified, then the containing `JSON_ELEMENT_T` is changed too.
- The `GET_STRING` function converts the value to a string if it is not already a string. The function returns a non-null value even if `IS_STRING` returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what `ON_ERROR` is set to.

The `GET_CLOB` and `GET_BLOB` *procedures*, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, `EMPTY_LOB` can be provided. If you use the `GET_CLOB` *function* instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the `GET_CLOB` or `GET_BLOB` functions, which take no parameter and generates a temp LOB.

`GET_BLOB` serializes to UTF8 format only.

### Set Procedures

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

```
MEMBER PROCEDURE put(pos NUMBER, value VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)
```

The following procedures append the specified value to the end of the JSON array:

```
MEMBER PROCEDURE append(value JSON_ELEMENT_T)
MEMBER PROCEDURE append(value VARCHAR2)
MEMBER PROCEDURE append(value NUMBER)
MEMBER PROCEDURE append(value BOOLEAN)
MEMBER PROCEDURE append(value DATE)
MEMBER PROCEDURE append(value TIMESTAMP)
MEMBER PROCEDURE append_Null
```

### Introspection Function

Introspection enables you to discover properties of the JSON array without modifying them.

```
MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2
```

### Modification Procedure

The following procedure enables you to remove the value at the specified position in the JSON array.

```
MEMBER PROCEDURE remove(pos NUMBER)
```

### Clone Function

This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

MEMBER FUNCTION clone RETURN JSON\_ARRAY\_T

## 291.4 JSON\_SCALAR\_T Object Type

JSON\_SCALAR\_T is a subtype of the JSON\_ELEMENT\_T object type.

### Description

A JSON\_SCALAR\_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON\_ELEMENT\_T. You cannot create an instance of this type directly.

## 291.5 JSON\_KEY\_LIST Type

JSON\_KEY\_LIST is a varray of VARCHAR2(4000).

### Description

This type is used by the `get_Keys` function in the [JSON\\_OBJECT\\_T Object Type](#).

# Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$\\_DDL\\_RECORD and LCR\\$\\_ROW\\_RECORD](#)

## 292.1 Logical Change Record TYPEs Overview

In Replication (Oracle GoldenGate and XStream), logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Replication (Oracle GoldenGate and XStream), the capture process captures changes in the form of LCRs and enqueues them into a queue. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

## 292.2 Logical Change Record Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

## 292.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

**Table 292-1 Logical Change Record (LCR) Types**

| Type                                  | Description                                                               |
|---------------------------------------|---------------------------------------------------------------------------|
| <a href="#">LCR\$_DDL_RECORD Type</a> | Represents a data definition language (DDL) change to a database object   |
| <a href="#">LCR\$_ROW_RECORD Type</a> | Represents a data manipulation language (DML) change to a database object |
| <a href="#">LCR\$_ROW_LIST Type</a>   | Identifies a list of column values for a row in a table                   |
| <a href="#">LCR\$_ROW_UNIT Type</a>   | Identifies the value for a column in a row                                |

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS\_APPLY\_ADM
- DBMS\_AQ

- DBMS\_AQADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_RULE
- DBMS\_RULE\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_TRANSFORM

## 292.3.1 LCR\$\_DDL\_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

### Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

### LCR\$\_DDL\_RECORD Constructor

Creates a SYS.LCR\$\_DDL\_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
    source_database_name IN VARCHAR2,
    command_type         IN VARCHAR2,
    object_owner         IN VARCHAR2,
    object_name          IN VARCHAR2,
    object_type          IN VARCHAR2,
    ddl_text             IN CLOB,
    logon_user           IN VARCHAR2,
    current_schema       IN VARCHAR2,
    base_table_owner     IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    tag                  IN RAW      DEFAULT NULL,
    transaction_id       IN VARCHAR2 DEFAULT NULL,
    scn                  IN NUMBER  DEFAULT NULL,
    position             IN RAW      DEFAULT NULL,
    edition_name         IN VARCHAR2 DEFAULT NULL,

```

```
root_name          IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR\$\_DDL\_RECORD Constructor Function Parameters

Table 292-2 Constructor Function Parameters for LCR\$\_DDL\_RECORD

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database_name | <p>The database where the DDL statement occurred</p> <p>If the LCRs originated in a multitenant container database (CDB), then this field specifies the global name of the container where the DDL change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>                                                                                                                                                                                  |
| command_type         | <p>The type of command executed in the DDL statement</p> <p>Set this parameter to a non-NULL value.</p> <p><b>See Also:</b> The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types</p> <p>The following command types <i>are not supported</i> in DDL LCRs:</p> <div>ALTER MATERIALIZED VIEW<br/>ALTER MATERIALIZED VIEW LOG<br/>ALTER SUMMARY<br/>CREATE SCHEMA<br/>CREATE MATERIALIZED VIEW<br/>CREATE MATERIALIZED VIEW LOG<br/>CREATE SUMMARY<br/>DROP MATERIALIZED VIEW<br/>DROP MATERIALIZED VIEW LOG<br/>DROP SUMMARY<br/>RENAME</div> <p>The snapshot equivalents of the materialized view command types are also not supported.</p> |
| object_owner         | <p>The user who owns the object on which the DDL statement was executed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| object_name          | <p>The database object on which the DDL statement was executed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 292-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_type      | <p>The type of object on which the DDL statement was executed</p> <p>The following are valid object types:</p> <p>CLUSTER<br/>FUNCTION<br/>INDEX<br/>LINK<br/>OUTLINE<br/>PACKAGE<br/>PACKAGE BODY<br/>PROCEDURE<br/>SEQUENCE<br/>SYNONYM<br/>TABLE<br/>TRIGGER<br/>TYPE<br/>USER<br/>VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p> |
| ddl_text         | <p>The text of the DDL statement</p> <p>Set this parameter to a non-NULL value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| logon_user       | The user whose session executed the DDL statement                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| current_schema   | <p>The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text</p> <p>If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text.</p> <p>Set this parameter to a non-NULL value.</p>                                                                                                                                                                                |
| base_table_owner | If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.                                                                                                                                                                                                                                  |
| base_table_name  | If the DDL statement is a table-related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.                                                                                                                                                                                                                                     |
| tag              | <p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.</p>                                                                                                                                                                                                                                                                                                                    |
| transaction_id   | The identifier of the transaction                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| scn              | <p>The SCN at the time when the change record for a captured LCR was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>                                                                                                                                                                                                                                                                                                                                                 |

**Table 292-2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

| Parameter    | Description                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| position     | The position of the LCR<br>LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> |
| edition_name | The name of the edition in which the DDL statement was executed                                                                                                                                                             |
| root_name    | If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB.<br>If the LCR is associated with a non-CDB, then this field is NULL.                                                |

### Summary of LCR\$\_DDL\_RECORD Subprograms

**Table 292-3 LCR\$\_DDL\_RECORD Type Subprograms**

| Subprogram                                            | Description                                                                                                                                                                      |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EXECUTE Member Procedure</a>              | Executes the LCR under the security domain of the current user                                                                                                                   |
| <a href="#">GET_BASE_TABLE_NAME Member Function</a>   | Gets the base (dependent) table name                                                                                                                                             |
| <a href="#">GET_BASE_TABLE_OWNER Member Function</a>  | Gets the base (dependent) table owner                                                                                                                                            |
| <a href="#">GET_CURRENT_SCHEMA Member Function</a>    | Gets the default schema (user) name                                                                                                                                              |
| <a href="#">GET_DDL_TEXT Member Procedure</a>         | Gets the DDL text in a CLOB                                                                                                                                                      |
| <a href="#">GET_EDITION_NAME Member Function</a>      | Gets the name of the edition in which the DDL statement was executed                                                                                                             |

| <a href="#">SET_LOGON_USER Member Procedure</a>       | Sets the logon user name                                                                                                                                                         |
| <a href="#">SET_OBJECT_TYPE Member Procedure</a>      | Sets the object type                                                                                                                                                             |
| Common Subprograms                                    | See " <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> " for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types |

### EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

#### Syntax

```
MEMBER PROCEDURE EXECUTE;
```

### GET\_BASE\_TABLE\_NAME Member Function

Gets the base (dependent) table name.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()  
RETURN VARCHAR2;
```

### GET\_BASE\_TABLE\_OWNER Member Function

Gets the base (dependent) table owner.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()  
RETURN VARCHAR2;
```

### GET\_CURRENT\_SCHEMA Member Function

Gets the current schema name.

#### Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()  
RETURN VARCHAR2;
```

### GET\_DDL\_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)  
IS  
    ddl_text    CLOB;  
BEGIN  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_OUTPUT.PUT_LINE( ' Displaying DDL text in a DDL LCR: ' );  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);  
    ddl_lcr.GET_DDL_TEXT(ddl_text);  
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);  
    DBMS_LOB.FREETEMPORARY(ddl_text);  
END;  
/
```

**Note:**

GET\_DDL\_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

**Syntax**

```
MEMBER FUNCTION GET_DDL_TEXT(  
    ddl_text IN/OUT CLOB);
```

**Parameter****Table 292-4 GET\_DDL\_TEXT Procedure Parameter**

| Parameter | Description                 |
|-----------|-----------------------------|
| ddl_text  | The DDL text in the DDL LCR |

**GET\_EDITION\_NAME Member Function**

Gets the name of the edition in which the DDL statement was executed.

**See Also:**

*Oracle Database Development Guide*

**Syntax**

```
MEMBER FUNCTION GET_EDITION_NAME()  
RETURN VARCHAR2;
```

**GET\_LOGON\_USER Member Function**

Gets the logon user name.

**Syntax**

```
MEMBER FUNCTION GET_LOGON_USER()  
RETURN VARCHAR2;
```

**GET\_OBJECT\_TYPE Member Function**

Gets the type of the object involved for the DDL.

**Syntax**

```
MEMBER FUNCTION GET_OBJECT_TYPE()  
RETURN VARCHAR2;
```

**SET\_BASE\_TABLE\_NAME Member Procedure**

Sets the base (dependent) table name.

## Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(  
    base_table_name IN VARCHAR2);
```

## Parameter

**Table 292-5 SET\_BASE\_TABLE\_NAME Procedure Parameter**

| Parameter       | Description                |
|-----------------|----------------------------|
| base_table_name | The name of the base table |

## SET\_BASE\_TABLE\_OWNER Member Procedure

Sets the base (dependent) table owner.

## Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(  
    base_table_owner IN VARCHAR2);
```

## Parameter

**Table 292-6 SET\_BASE\_TABLE\_OWNER Procedure Parameter**

| Parameter        | Description                      |
|------------------|----------------------------------|
| base_table_owner | The name of the base table owner |

## SET\_CURRENT\_SCHEMA Member Procedure

Sets the default schema (user) name.

## Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(  
    current_schema IN VARCHAR2);
```

## Parameter

**Table 292-7 SET\_CURRENT\_SCHEMA Procedure Parameter**

| Parameter      | Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------|
| current_schema | The name of the schema to set as the current schema<br>Set this parameter to a non-NULL value. |

## SET\_DDL\_TEXT Member Procedure

Sets the DDL text.

## Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(  
    ddl_text IN CLOB);
```

## Parameter

**Table 292-8 SET\_DDL\_TEXT Procedure Parameter**

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| ddl_text  | The DDL text<br>Set this parameter to a non-NULL value. |

## SET\_EDITION\_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

### See Also:

*Oracle Database Development Guide*

## Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(  
    edition_name IN VARCHAR2);
```

## Parameter

**Table 292-9 SET\_EDITION\_NAME Procedure Parameter**

| Parameter    | Description         |
|--------------|---------------------|
| edition_name | Name of the edition |

## SET\_LOGON\_USER Member Procedure

Sets the logon user name.

## Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(  
    logon_user IN VARCHAR2);
```

## Parameter

**Table 292-10 SET\_LOGON\_USER Procedure Parameter**

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| logon_user | The name of the schema to set as the logon user |

## SET\_OBJECT\_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(  
    object_type IN VARCHAR2);
```

Parameter

Table 292-11 SET\_OBJECT\_TYPE Procedure Parameter

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_type | <p>The object type</p> <p>The following are valid object types:</p> <p>CLUSTER<br/>FUNCTION<br/>INDEX<br/>LINK<br/>OUTLINE<br/>PACKAGE<br/>PACKAGE BODY<br/>PROCEDURE<br/>SEQUENCE<br/>SYNONYM<br/>TABLE<br/>TRIGGER<br/>TYPE<br/>USER<br/>VIEW</p> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p> |

292.3.2 LCR\$\_ROW\_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$\_ROW\_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the command\_type attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.

### Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

## LCR\$\_ROW\_RECORD Constructor

Creates a SYS.LCR\$\_ROW\_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
    source_database_name IN VARCHAR2,
    command_type         IN VARCHAR2,
    object_owner         IN VARCHAR2,
    object_name          IN VARCHAR2,
    tag                  IN RAW          DEFAULT NULL,
    transaction_id       IN VARCHAR2    DEFAULT NULL,
    scn                  IN NUMBER      DEFAULT NULL,
    old_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
    new_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
    position             IN RAW          DEFAULT NULL,

    statement            IN VARCHAR2    DEFAULT NULL,

    bind_variables       IN SYS.LCR$_ROW_LIST DEFAULT NULL,

    bind_by_position     IN VARCHAR2    DEFAULT 'N',

    root_name            IN VARCHAR2    DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

## LCR\$\_ROW\_RECORD Constructor Function Parameters

**Table 292-12 Constructor Function Parameters for LCR\$\_ROW\_RECORD**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database_name | <p>The database where the row change occurred</p> <p>If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>                                                                                                                                                                                                                                                                                                       |
| command_type         | <p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <pre> INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM </pre> <p>If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p> <p>If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty.</p> <p>If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty.</p> <p>If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p> |
| object_owner         | <p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| object_name          | <p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| tag                  | <p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| transaction_id       | <p>The identifier of the transaction</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| scn                  | <p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| old_values           | <p>The column values for the row before the DML change</p> <p>If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 292-12 (Cont.) Constructor Function Parameters for LCR\$\_ROW\_RECORD**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>new_values</code>       | <p>The column values for the row after the DML change</p> <p>If the DML statement is an <code>UPDATE</code> or an <code>INSERT</code> statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a <code>DELETE</code> statement, then there are no new values.</p> <p>If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.</p> |
| <code>position</code>         | <p>The position of the LCR</p> <p>LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product.</p> <p><b>See Also:</b> <i>Oracle Database XStream Guide</i></p>                                                                                                                                                                                                                                      |
| <code>statement</code>        | This parameter is reserved for internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>bind_variables</code>   | This parameter is reserved for internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>bind_by_position</code> | This parameter is reserved for internal use only.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>root_name</code>        | <p>If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB.</p> <p>If the LCR is associated with a non-CDB, then this field is <code>NULL</code>.</p>                                                                                                                                                                                                                                                                            |

#### Summary of LCR\$\_ROW\_RECORD Subprograms

**Table 292-13 LCR\$\_ROW\_RECORD Type Subprograms**

| Subprogram                                                 | Description                                                                                                                                                    |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COLUMN Member Procedure</a>                | Adds the value as old or new, depending on the value type specified, for the column                                                                            |
| <a href="#">CONVERT_LONG_TO_LOB_CHUNK Member Procedure</a> | Converts <code>LONG</code> data in a row LCR into fixed width <code>CLOB</code> , or converts <code>LONG RAW</code> data in a row LCR into a <code>BLOB</code> |
| <a href="#">DELETE_COLUMN Member Procedure</a>             | Deletes the old value, the new value, or both, for the specified column, depending on the value type specified                                                 |
| <a href="#">EXECUTE Member Procedure</a>                   | Executes the LCR under the security domain of the current user                                                                                                 |
| <a href="#">GET_LOB_INFORMATION Member Function</a>        | Gets the LOB information for the column                                                                                                                        |
| <a href="#">GET_LOB_OFFSET Member Function</a>             | Gets the LOB offset for the specified column                                                                                                                   |
| <a href="#">GET_LOB_OPERATION_SIZE Member Function</a>     | Gets the operation size for the LOB column                                                                                                                     |
| <a href="#">GET_LONG_INFORMATION Member Function</a>       | Gets the <code>LONG</code> information for the column                                                                                                          |

| <a href="#">GET_VALUE Member Function</a>                  | Gets the old or new value for the specified column, depending on the value type specified                                                                      |
| <a href="#">GET_VALUES Member Function</a>                 | Gets a list of old or new values, depending on the value type specified                                                                                        |

**Table 292-13 (Cont.) LCR\$\_ROW\_RECORD Type Subprograms**

| Subprogram                                              | Description                                                                                                                                                                  |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_WHERE_CLAUSE Member Procedure</a>       | Gets a WHERE clause for the change that is encapsulated in the row LCR                                                                                                       |
| <a href="#">GET_XML_INFORMATION Member Function</a>     | Gets the XML information for the specified column                                                                                                                            |
| <a href="#">IS_STATEMENT_LCR Member Function</a>        | Reserved for internal use only                                                                                                                                               |
| <a href="#">KEEP_COLUMNS Member Procedure</a>           | Keeps a list of columns a row LCR                                                                                                                                            |
| <a href="#">RENAME_COLUMN Member Procedure</a>          | Renames a column in an LCR                                                                                                                                                   |
| <a href="#">SET_LOB_INFORMATION Member Procedure</a>    | Sets LOB information for the column                                                                                                                                          |
| <a href="#">SET_LOB_OFFSET Member Procedure</a>         | Sets the LOB offset for the specified column                                                                                                                                 |
| <a href="#">SET_LOB_OPERATION_SIZE Member Procedure</a> | Sets the operation size for the LOB column                                                                                                                                   |
| <a href="#">SET_ROW_TEXT Member Procedure</a>           | Reserved for internal use only                                                                                                                                               |
| <a href="#">SET_VALUE Member Procedure</a>              | Overwrites the value of the specified column                                                                                                                                 |
| <a href="#">SET_VALUES Member Procedure</a>             | Replaces the existing old or new values for the LCR, depending on the value type specified                                                                                   |
| <a href="#">SET_XML_INFORMATION Member Procedure</a>    | Sets the XML information for the column                                                                                                                                      |
| Common Subprograms                                      | See <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types |

**ADD\_COLUMN Member Procedure**

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

**Note:**

To set a column value that already exists, run `SET_VALUE`.

**See Also:**

[SET\\_VALUE Member Procedure](#)

**Considerations for LOB Columns**

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

## Syntax

```
MEMBER PROCEDURE ADD_COLUMN(  
    value_type    IN  VARCHAR2,  
    column_name   IN  VARCHAR2,  
    column_value  IN  ANYDATA);
```

## Parameters

**Table 292-14** `ADD_COLUMN` Procedure Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>value_type</code>   | The type of value to add for the column<br>Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.                                                                                                                                                                                                     |
| <code>column_name</code>  | The column name<br>This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.                                                                                                                                                                                                                                    |
| <code>column_value</code> | The value of the column<br>If <code>NULL</code> , then this procedure raises an error.<br>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified.<br>A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper. |

## `CONVERT_LONG_TO_LOB_CHUNK` Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

### Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

### DELETE\_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

### Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(  
    column_name IN VARCHAR2,  
    value_type  IN VARCHAR2 DEFAULT '*');
```

### Parameters

**Table 292-15 DELETE\_COLUMN Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>column_name</code> | The column name<br>An error is raised if the column does not exist in the LCR.                                                                                                                                                                                        |
| <code>value_type</code>  | The type of value to delete for the column<br>Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values. |

### EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

**Note:**

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lob` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lob` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lob` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(  
    conflict_resolution IN BOOLEAN);
```

Parameters

Table 292-16 EXECUTE Procedure Parameters

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>conflict_resolution</code> | <p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p> |

GET\_LOB\_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

|                                  |                                    |
|----------------------------------|------------------------------------|
| <code>DBMS_LCR.NOT_A_LOB</code>  | <code>CONSTANT NUMBER := 1;</code> |
| <code>DBMS_LCR.NULL_LOB</code>   | <code>CONSTANT NUMBER := 2;</code> |
| <code>DBMS_LCR.INLINE_LOB</code> | <code>CONSTANT NUMBER := 3;</code> |
| <code>DBMS_LCR.EMPTY_LOB</code>  | <code>CONSTANT NUMBER := 4;</code> |

```
DBMS_LCR.LOB_CHUNK      CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

### Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

### Parameters

**Table 292-17 GET\_LOB\_INFORMATION Function Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>value_type</code>  | The type of value to return for the column, either <code>old</code> or <code>new</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>column_name</code> | The name of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>use_old</code>     | <p>If <code>Y</code> and <code>value_type</code> is <code>new</code>, and no new value exists, then the function returns the corresponding old value. If <code>N</code> and <code>value_type</code> is <code>new</code>, then the function does not return the old value if no new value exists.</p> <p>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code>, then the function ignores the value of the <code>use_old</code> parameter.</p> <p><code>NULL</code> is not a valid specification for the <code>use_old</code> parameter.</p> |

### GET\_LOB\_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-`NULL` value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is `DBMS_LCR.LAST_LOB_CHUNK` or `DBMS_LCR.LOB_CHUNK`
- The command type is `LOB ERASE` or `LOB WRITE`

Otherwise, returns `NULL`.

### Syntax

```
GET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 292-18 GET\_LOB\_OFFSET Function Parameters**

| Parameter   | Description                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------|
| value_type  | The type of value to return for the column<br>Currently, only <code>new</code> can be specified. |
| column_name | The name of the LOB column                                                                       |

## GET\_LOB\_OPERATION\_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for `CLOB` columns and the number of bytes for `BLOB` columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is `LOB ERASE` or `LOB TRIM`
- The information is `DBMS_LCR.LAST_LOB_CHUNK`

Otherwise, returns `NULL`.

## Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(  
    value_type IN VARCHAR2,  
    column_name IN VARCHAR2)  
RETURN NUMBER;
```

## Parameters

**Table 292-19 GET\_LOB\_OPERATION\_SIZE Function Parameters**

| Parameter   | Description                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------|
| value_type  | The type of value to return for the column<br>Currently, only <code>new</code> can be specified. |
| column_name | The name of the LOB column                                                                       |

## GET\_LONG\_INFORMATION Member Function

Gets the `LONG` information for the column.

The return value can be one of the following:

|                                       |                                    |
|---------------------------------------|------------------------------------|
| <code>DBMS_LCR.NOT_A_LONG</code>      | <code>CONSTANT NUMBER := 1;</code> |
| <code>DBMS_LCR.NULL_LONG</code>       | <code>CONSTANT NUMBER := 2;</code> |
| <code>DBMS_LCR.INLINE_LONG</code>     | <code>CONSTANT NUMBER := 3;</code> |
| <code>DBMS_LCR.LONG_CHUNK</code>      | <code>CONSTANT NUMBER := 4;</code> |
| <code>DBMS_LCR.LAST_LONG_CHUNK</code> | <code>CONSTANT NUMBER := 5;</code> |

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

### Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(  
    value_type    IN  VARCHAR2,  
    column_name   IN  VARCHAR2,  
    use_old       IN  VARCHAR2  DEFAULT 'Y')  
RETURN NUMBER;
```

### Parameters

**Table 292-20 GET\_LONG\_INFORMATION Function Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>value_type</code>  | The type of value to return for the column, either <code>old</code> or <code>new</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>column_name</code> | The name of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>use_old</code>     | If <code>Y</code> and <code>value_type</code> is <code>new</code> , and no new value exists, then the function returns the corresponding old value. If <code>N</code> and <code>value_type</code> is <code>new</code> , then the function does not return the old value if no new value exists.<br><br>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code> , then the function ignores the value of the <code>use_old</code> parameter.<br><br><code>NULL</code> is not a valid specification for the <code>use_old</code> parameter. |

### GET\_ROW\_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

The following procedure returns the SQL statement in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(  
    row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a `CLOB` datatype.

```
MEMBER PROCEDURE GET_ROW_TEXT(  
    row_text      IN/OUT  CLOB,  
    variable_list IN/OUT  LCR$_ROW_LIST,  
    bind_var_syntax IN     VARCHAR2  DEFAULT ':');
```

## Parameters

**Table 292-21 GET\_ROW\_TEXT Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>row_text</code>        | The SQL statement for the change that is encapsulated in the LCR                                                                                                                                                                                                                                                                              |
| <code>variable_list</code>   | The values for the bind variables in the order of the bind variables                                                                                                                                                                                                                                                                          |
| <code>bind_var_syntax</code> | <p>The syntax for the bind variables</p> <p>One of the following values is valid:</p> <ul style="list-style-type: none"> <li>Specify <code>:</code>, the default, for bind values to be in the form <code>:1</code>, <code>:2</code>, and so on.</li> <li>Specify <code>?</code> for bind values to be in the form <code>?</code>.</li> </ul> |

## GET\_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of a column.

## Syntax

```
MEMBER FUNCTION GET_VALUE(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

## Parameters

**Table 292-22 GET\_VALUE Function Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>value_type</code>  | <p>The type of value to return for the column</p> <p>Specify <code>old</code> to get the old value for the column. Specify <code>new</code> to get the new value for the column.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>column_name</code> | <p>The column name</p> <p>If the column is present and has a <code>NULL</code> value, then the function returns an <code>ANYDATA</code> instance containing a <code>NULL</code> value. If the column value is absent, then the function returns a <code>NULL</code>.</p>                                                                                                                                                                                                                                                                                                                                              |
| <code>use_old</code>     | <p>If <code>Y</code> and <code>value_type</code> is <code>new</code>, and no new value exists, then the function returns the corresponding old value.</p> <p>If <code>N</code> and <code>value_type</code> is <code>new</code>, then the function returns <code>NULL</code> if no new value exists.</p> <p>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code>, then the function ignores the value of the <code>use_old</code> parameter.</p> <p><code>NULL</code> is not a valid specification for the <code>use_old</code> parameter.</p> |

## GET\_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the values of all columns.

### Syntax

```
MEMBER FUNCTION GET_VALUES(
    value_type IN VARCHAR2,
    use_old    IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

### Parameters

**Table 292-23 GET\_VALUES Function Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>value_type</code> | The type of values to return<br>Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>use_old</code>    | If <code>Y</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.<br>If <code>N</code> and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR without returning any old values.<br>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not <code>UPDATE</code> , then the function ignores the value of the <code>use_old</code> parameter.<br><code>NULL</code> is not a valid specification for the <code>use_old</code> parameter. |

### GET\_WHERE\_CLAUSE Member Procedure

Gets a `WHERE` clause for the change that is encapsulated in the row LCR.

Use the `WHERE` clause returned by `GET_WHERE_CLAUSE` instead of using the `ROWID`, because the `ROWID` is not ANSI compatible. The generated `WHERE` clause might not match the `WHERE` clause in the original DML operation.

The `ROWID` of an `INSERT` statement is the `ROWID` of the new row created by the `INSERT`. The `WHERE` clause generated for an `INSERT` operation identifies the new row. Therefore, the generated `WHERE` clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (
    department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated `WHERE` clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated `WHERE` clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The `ROWID` of an `UPDATE` statement is the `ROWID` of the row that was updated. The `WHERE` clause generated for an `UPDATE` operation identifies the row after the `UPDATE` executes. The generated `WHERE` clause is based on the old and new values of the `UPDATE`.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
      manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT\_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

## Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
  where_clause IN/OUT CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB datatype.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
  where_clause IN/OUT CLOB,
  variable_list IN/OUT LCR$_ROW_LIST,
  bind_var_syntax IN VARCHAR2 DEFAULT ':');;
```

## Parameters

**Table 292-24 GET\_WHERE\_CLAUSE Procedure Parameters**

| Parameter                  | Description                                                                          |
|----------------------------|--------------------------------------------------------------------------------------|
| <code>where_clause</code>  | The WHERE clause of the SQL statement for the change that is encapsulated in the LCR |
| <code>variable_list</code> | The values for the bind variables in the order of the bind variables                 |

**Table 292-24 (Cont.) GET\_WHERE\_CLAUSE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bind_var_syntax | <p>The syntax for the bind variables</p> <p>One of the following values is valid:</p> <ul style="list-style-type: none"> <li>Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>Specify ? for bind values to be in the form ?.</li> </ul> |

### GET\_XML\_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC    CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

```
DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;
```

DBMS\_LCR.NOT\_XML indicates that the column is not an XMLType column.

DBMS\_LCR.XML\_DOC indicates that the column contains an XML document.

DBMS\_LCR.XML\_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.

DBMS\_LCR.XML\_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

### Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER;
```

### Parameter

**Table 292-25 GET\_XML\_INFORMATION Function Parameter**

| Parameter   | Description     |
|-------------|-----------------|
| column_name | The column name |

### IS\_STATEMENT\_LCR Member Function

This function is reserved for internal use only.

### KEEP\_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

## Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(  
    column_list IN VARCHAR2,  
    value_type  IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 292-26 KEEP\_COLUMNS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| column_list | The names of the columns kept for the row LCR<br>Specify a comma-delimited list of type <code>VARCHAR2</code> . This procedure removes columns that are not in the list from the current row LCR.                                                                                                                                                                                                               |
| value_type  | The type of value for which to keep the columns<br>Specify <code>old</code> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR.<br>Specify <code>new</code> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR.<br>If <code>*</code> is specified, then the procedure keeps both the old and the new columns. |

## RENAME\_COLUMN Member Procedure

Renames a column in a row LCR.

## Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(  
    from_column_name IN VARCHAR2,  
    to_column_name   IN VARCHAR2,  
    value_type       IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 292-27 RENAME\_COLUMN Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| from_column_name | The existing column name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| to_column_name   | The new column name<br>An error is raised if a column with the specified name already exists.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| value_type       | The type of value for which to rename the column<br>Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR.<br>Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR.<br>If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR. |

## SET\_LOB\_INFORMATION Member Procedure

Sets LOB information for the column.

**Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

**Syntax**

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type      IN  VARCHAR2,
    column_name     IN  VARCHAR2,
    lob_information IN  NUMBER);
```

**Parameters**

**Table 292-28 SET\_LOB\_INFORMATION Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------|-------------------|-----------------------|---------------------|-----------------------|--------------------|-----------------------|--------------------|-----------------------|-------------------------|-----------------------|
| value_type              | The type of value to set for the column, either old or new<br>Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.                                                                                                                                                                                                                                                                                                                                                    |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |
| column_name             | The name of the column.<br>An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.                                                                                                                                                                                                                                                                                                                                    |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |
| lob_information         | Specify one of the following values: <table> <tr> <td>DBMS_LCR.NOT_A_LOB</td><td>CONSTANT NUMBER := 1;</td></tr> <tr> <td>DBMS_LCR.NULL_LOB</td><td>CONSTANT NUMBER := 2;</td></tr> <tr> <td>DBMS_LCR.INLINE_LOB</td><td>CONSTANT NUMBER := 3;</td></tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td><td>CONSTANT NUMBER := 4;</td></tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td><td>CONSTANT NUMBER := 5;</td></tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td><td>CONSTANT NUMBER := 6;</td></tr> </table> | DBMS_LCR.NOT_A_LOB | CONSTANT NUMBER := 1; | DBMS_LCR.NULL_LOB | CONSTANT NUMBER := 2; | DBMS_LCR.INLINE_LOB | CONSTANT NUMBER := 3; | DBMS_LCR.EMPTY_LOB | CONSTANT NUMBER := 4; | DBMS_LCR.LOB_CHUNK | CONSTANT NUMBER := 5; | DBMS_LCR.LAST_LOB_CHUNK | CONSTANT NUMBER := 6; |

**SET\_LOB\_OFFSET Member Procedure**

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

**Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

**Syntax**

```
MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type      IN  VARCHAR2,
    column_name     IN  VARCHAR2,
    lob_offset      IN  NUMBER);
```

## Parameters

**Table 292-29 SET\_LOB\_OFFSET Procedure Parameters**

| Parameter   | Description                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| value_type  | The type of value to set for the column<br>Currently, only <code>new</code> can be specified.                                              |
| column_name | The column name<br>An error is raised if the column value does not exist in the LCR.                                                       |
| lob_offset  | The LOB offset number<br>Valid values are <code>NULL</code> or a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . |

## SET\_LOB\_OPERATION\_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for `CLOB` columns and bytes for `BLOB` columns.

### Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

## Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(  
    value_type      IN  VARCHAR2,  
    column_name     IN  VARCHAR2,  
    lob_operation_size IN  NUMBER);
```

## Parameters

**Table 292-30 SET\_LOB\_OPERATION\_SIZE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_type         | The type of value to set for the column<br>Currently, only <code>new</code> can be specified.                                                                                                                                                                                                                                                                                                                                                       |
| column_name        | The name of the LOB column<br>An exception is raised if the column value does not exist in the LCR.                                                                                                                                                                                                                                                                                                                                                 |
| lob_operation_size | If <code>lob_information</code> for the LOB is or will be <code>DBMS_LCR.LAST_LOB_CHUNK</code> , then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> . A LOB TRIM value must be a nonnegative integer less than or equal to <code>DBMS_LOB.LOBMAXSIZE</code> .<br>Otherwise, set to <code>NULL</code> . |

### SET\_ROW\_TEXT Member Procedure

This procedure is reserved for internal use only.

### SET\_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

#### Note:

To add a column to a row LCR, run `ADD_COLUMN`.

#### See Also:

[ADD\\_COLUMN Member Procedure](#)

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

#### Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.

## Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column\_value parameter. The SET\_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

### Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

## Syntax

```
MEMBER PROCEDURE SET_VALUE(
    value_type    IN  VARCHAR2,
    column_name   IN  VARCHAR2,
    column_value  IN  ANYDATA);
```

## Parameters

**Table 292-31 SET\_VALUE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                         |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_type   | The type of value to set<br>Specify old to set the old value of the column. Specify new to set the new value of the column.                                                                                                                                                                                         |
| column_name  | The column name<br>An error is raised if the specified column_value does not exist in the LCR for the specified column_type.                                                                                                                                                                                        |
| column_value | The new value of the column<br>If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance.<br>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns. |

### SET\_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

#### Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

 **Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.

#### Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

**Syntax**

```
MEMBER PROCEDURE SET_VALUES(  
    value_type IN VARCHAR2,  
    value_list IN SYS.LCR$_ROW_LIST);
```

**Parameters****Table 292-32 SET\_VALUES Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| value_type | The type of values to replace<br>Specify <code>old</code> to replace the old values. Specify <code>new</code> to replace the new values.                                                                                                                                    |
| value_list | List of values to replace the existing list<br>Use a <code>NULL</code> or an empty list to remove all values.<br>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns. |

**SET\_XML\_INFORMATION Member Procedure**

Sets the XML information for the column.

**Syntax**

```
MEMBER PROCEDURE SET_XML_INFORMATION(  
    column_name IN VARCHAR2,  
    xml_information IN NUMBER);
```

**Parameters****Table 292-33 SET\_XML\_INFORMATION Procedure Parameters**

| Parameter   | Description                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------|
| column_name | The name of the column<br>An exception is raised if the column value does not exist in the LCR. |

**Table 292-33 (Cont.) SET\_XML\_INFORMATION Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xml_information | <p>Specify one of the following values:</p> <p>DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;<br/> DBMS_LCR.XML_DOC    CONSTANT NUMBER := 2;<br/> DBMS_LCR.XML_DIFF    CONSTANT NUMBER := 3;</p> <p>DBMS_LCR.XML_DIFF    CONSTANT NUMBER := 3;</p> <p>DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.</p> <p>DBMS_LCR.XML_DOC indicates that the column contains an XML document.</p> <p>DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.</p> <p>DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.</p> |

## 292.3.3 Common Subprograms for LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD

These functions and procedures are common to both the LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD type.

### See Also:

For descriptions of the subprograms for these types that are exclusive to each type:

- "LCR\$\_DDL\_RECORD Type"
- "LCR\$\_ROW\_RECORD Type"

**Table 292-34 Summary of Common Subprograms for DDL and Row LCR Types**

| Subprogram                                                   | Description                                                                                                    |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_COMMAND_TYPE Member Function</a>             | Gets the command type of the logical change record (LCR)                                                       |
| <a href="#">GET_COMMIT_SCN Member Function</a>               | Gets the commit system change number (SCN) of the transaction to which the current LCR belongs                 |
| <a href="#">GET_COMMIT_SCN_FROM_POSITION Static Function</a> | Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server |
| <a href="#">GET_COMMIT_TIME</a>                              | Gets the commit time of the transaction to which the current LCR belongs                                       |
| <a href="#">GET_COMPATIBLE Member Function</a>               | Gets the minimal database compatibility required to support the LCR                                            |

**Table 292-34 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types**

| Subprogram                                                | Description                                                                                                                                                               |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_EXTRA_ATTRIBUTE Member Function</a>       | Gets the value for the specified extra attribute in the LCR                                                                                                               |
| <a href="#">GET_OBJECT_NAME Member Function</a>           | Gets the name of the object that is changed by the LCR                                                                                                                    |
| <a href="#">GET_OBJECT_OWNER Member Function</a>          | Gets the owner of the object that is changed by the LCR                                                                                                                   |
| <a href="#">GET_POSITION Member Function</a>              | Gets the position of the current LCR                                                                                                                                      |
| <a href="#">GET_ROOT_NAME Member Function</a>             | Gets the global name of the root for a CDB.                                                                                                                               |
| <a href="#">GET_SCN Member Function</a>                   | Gets the SCN of the LCR                                                                                                                                                   |
| <a href="#">GET_SCN_FROM_POSITION Static Function</a>     | Gets the SCN from the input position, which is generated by an XStream outbound server                                                                                    |
| <a href="#">GET_SOURCE_DATABASE_NAME Member Function</a>  | Gets the source database name.                                                                                                                                            |
| <a href="#">GET_SOURCE_TIME Member Function</a>           | Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created |
| <a href="#">GET_TAG Member Function</a>                   | Gets the tag for the LCR                                                                                                                                                  |
| <a href="#">GET_THREAD_NUMBER Member Function</a>         | Gets the thread number of the database instance that made the change that is encapsulated in the LCR                                                                      |
| <a href="#">GET_TRANSACTION_ID Member Function</a>        | Gets the transaction identifier of the LCR                                                                                                                                |
| <a href="#">IS_NULL_TAG Member Function</a>               | Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL                                                                                 |
| <a href="#">SET_COMMAND_TYPE Member Procedure</a>         | Sets the command type in the LCR                                                                                                                                          |
| <a href="#">SET_EXTRA_ATTRIBUTE Member Procedure</a>      | Sets the value for the specified extra attribute in the LCR                                                                                                               |
| <a href="#">SET_OBJECT_NAME Member Procedure</a>          | Sets the name of the object that is changed by the LCR                                                                                                                    |
| <a href="#">SET_OBJECT_OWNER Member Procedure</a>         | Sets the owner of the object that is changed by the LCR                                                                                                                   |
| <a href="#">SET_ROOT_NAME Member Procedure</a>            | Sets the global name of the root in a CDB.                                                                                                                                |
| <a href="#">SET_SOURCE_DATABASE_NAME Member Procedure</a> | Sets the source database name of the object that is changed by the LCR                                                                                                    |
| <a href="#">SET_TAG Member Procedure</a>                  | Sets the tag for the LCR                                                                                                                                                  |

#### **GET\_COMMAND\_TYPE Member Function**

Gets the command type of the LCR.

#### **See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

## Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

## GET\_COMMIT\_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

## Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

## GET\_COMMIT\_SCN\_FROM\_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

## Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;
```

## Parameters

**Table 292-35 GET\_COMMIT\_SCN\_FROM\_POSITION Function Parameter**

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| position  | The position<br><br>You can obtain the position by using the <code>GET_POSITION</code> member function or by querying the <code>DBA_XSTREAM_OUTBOUND_PROGRESS</code> data dictionary view. |

### Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

## GET\_COMMIT\_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

### Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()  
RETURN DATE;
```

### GET\_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

| Return Value                              | COMPATIBLE Initialization Parameter Equivalent |
|-------------------------------------------|------------------------------------------------|
| <code>DBMS_STREAMS.COMPATIBLE_9_2</code>  | 9.2.0                                          |
| <code>DBMS_STREAMS.COMPATIBLE_10_1</code> | 10.1.0                                         |
| <code>DBMS_STREAMS.COMPATIBLE_10_2</code> | 10.2.0                                         |
| <code>DBMS_STREAMS.COMPATIBLE_11_1</code> | 11.1.0                                         |
| <code>DBMS_STREAMS.COMPATIBLE_11_2</code> | 11.2.0                                         |

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions in the `DBMS_STREAMS` package for constant compatibility return values:

- The `COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.
- The `COMPATIBLE_11_2` function returns `DBMS_STREAMS.COMPATIBLE_11_2` constant.
- The `MAX_COMPATIBLE` function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

#### See Also:

- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

## Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()  
RETURN NUMBER;
```

## GET\_EXTRA\_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

### See Also:

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#)

## Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(  
    attribute_name IN VARCHAR2)  
RETURN ANYDATA;
```

## Parameters

**Table 292-36 GET\_EXTRA\_ATTRIBUTE Function Parameter**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_name | <p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"><li>row_id<br/>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</li><li>serial#<br/>The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li><li>session#<br/>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li><li>thread#<br/>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li><li>tx_name<br/>The name of the transaction that includes the LCR. The type is VARCHAR2.</li><li>username<br/>The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li></ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p>If no value exists for the specified extra attribute, then the function returns a NULL.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p> |

## GET\_OBJECT\_NAME Member Function

Gets the name of the object that is changed by the LCR.

### Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()  
RETURN VARCHAR2;
```

## GET\_OBJECT\_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

### Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()  
RETURN VARCHAR2;
```

### GET\_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

#### Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

#### Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

### GET\_ROOT\_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

#### Syntax

```
MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;
```

### GET\_SCN Member Function

Gets the system change number (SCN) of the LCR.

#### Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

### GET\_SCN\_FROM\_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

#### Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;
```

#### Parameters

**Table 292-37 GET\_SCN\_FROM\_POSITION Function Parameter**

| Parameter | Description                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| position  | The position<br>You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view. |

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**GET\_SOURCE\_DATABASE\_NAME Member Function**

Gets the global name of the source database. The source database is the database where the change occurred.

**Syntax**

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()  
RETURN VARCHAR2;
```

**GET\_SOURCE\_TIME Member Function**

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

**Syntax**

```
MEMBER FUNCTION GET_SOURCE_TIME()  
RETURN DATE;
```

**GET\_TAG Member Function**

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

**Syntax**

```
MEMBER FUNCTION GET_TAG()  
RETURN RAW;
```

**GET\_THREAD\_NUMBER Member Function**

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

**See Also:**

*Oracle Real Application Clusters Administration and Deployment Guide*

**Syntax**

```
MEMBER FUNCTION GET_THREAD_NUMBER()  
RETURN NUMBER;
```

**GET\_TRANSACTION\_ID Member Function**

Gets the transaction identifier of the LCR.

## Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

## IS\_NULL\_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

## Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

## SET\_COMMAND\_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

### See Also:

- The description of the `command_type` parameter in [LCR\\$\\_DDL\\_RECORD Constructor Function Parameters](#)
- The description of the `command_type` parameter in [LCR\\$\\_ROW\\_RECORD Type](#)
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

## Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);
```

## Parameter

**Table 292-38 SET\_COMMAND\_TYPE Procedure Parameter**

| Parameter                 | Description                                                 |
|---------------------------|-------------------------------------------------------------|
| <code>command_type</code> | The command type<br>Set this parameter to a non-NULL value. |

## SET\_EXTRA\_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

### See Also:

[INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#)

## Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN ANYDATA);
```

## Parameters

**Table 292-39 SET\_EXTRA\_ATTRIBUTE Procedure Parameter**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_name  | <p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>row_id<br/>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is NUMBER.</li> <li>session#<br/>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>thread#<br/>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>tx_name<br/>The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>username<br/>The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p> |
| attribute_value | <p>The value to which the specified extra attribute is set</p> <p>If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## SET\_OBJECT\_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

## Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
    object_name IN VARCHAR2);
```

## Parameter

**Table 292-40 SET\_OBJECT\_NAME Procedure Parameter**

| Parameter   | Description            |
|-------------|------------------------|
| object_name | The name of the object |

## SET\_OBJECT\_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

### Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner IN VARCHAR2);
```

## Parameter

**Table 292-41 SET\_OBJECT\_OWNER Procedure Parameter**

| Parameter    | Description                         |
|--------------|-------------------------------------|
| object_owner | The schema that contains the object |

## SET\_ROOT\_NAME Member Procedure

Sets the global name of the root in a CDB. The setting is the root name for the LCR.

### Syntax

```
MEMBER PROCEDURE SET_ROOT_NAME(
    root_name IN VARCHAR2);
```

## Parameter

**Table 292-42 SET\_ROOT\_NAME Procedure Parameter**

| Parameter | Description                  |
|-----------|------------------------------|
| root_name | The global name of the root. |

## SET\_SOURCE\_DATABASE\_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

### Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name IN VARCHAR2);
```

## Parameter

**Table 292-43 SET\_SOURCE\_DATABASE\_NAME Procedure Parameter**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database_name | The source database of the change<br>If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value. |

## SET\_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

## Syntax

```
MEMBER PROCEDURE SET_TAG(  
    tag IN RAW);
```

## Parameter

**Table 292-44 SET\_TAG Procedure Parameter**

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| tag       | The binary tag for the LCR<br>The size limit for a tag value is two kilobytes. |

## 292.3.4 LCR\$\_ROW\_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR\$\_ROW\_UNIT type and is used in the LCR\$\_ROW\_RECORD type.

### See Also:

- [LCR\\$\\_ROW\\_UNIT Type](#)
- [LCR\\$\\_ROW\\_RECORD Type](#)

## Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT  
/
```

## 292.3.5 LCR\$\_ROW\_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR\$\_ROW\_LIST type.

**See Also:**

[LCR\\$\\_ROW\\_LIST Type](#)

### Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (  
    column_name      VARCHAR2(4000),  
    data             ANYDATA,  
    lob_information   NUMBER,  
    lob_offset        NUMBER,  
    lob_operation_size NUMBER  
    long_information  NUMBER);  
/
```

### Attributes

**Table 292-45** LCR\$\_ROW\_UNIT Attributes

| Attribute               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------|-------------------|-----------------------|---------------------|-----------------------|--------------------|-----------------------|--------------------|-----------------------|-------------------------|-----------------------|
| column_name             | The name of the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |
| data                    | The data contained in the column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                    |                       |                   |                       |                     |                       |                    |                       |                    |                       |                         |                       |

## MGD\_ID Package Types

The `MGD_ID` package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The `MGD_ID` Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The `MGD_ID` package contains several predefined types.

### See Also:

*Oracle Database Development Guide* for more information.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of Types](#)
- [Summary of MGD\\_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

### 293.1 MGD\_ID Package Types Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

## 293.2 Summary of Types

This table lists and briefly describes the `MGD_ID` Package object types.

**Table 293-1** `MGD_ID` Package Object Types

| Object Type Name                                    | Description                                                                                                                                                      |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">MGD_ID_COMPONENT Object Type</a>        | Datatype that specifies the name and value pair attributes that define a component                                                                               |
| <a href="#">MGD_ID_COMPONENT_VARRAY Object Type</a> | Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object |
| <a href="#">MGD_ID Object Type</a>                  | Represents an <code>MGD_ID</code> object that specifies the category identifier for the code category for this identity code and its list of components          |

### 293.2.1 `MGD_ID_COMPONENT` Object Type

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

#### Syntax

```
MGD_ID_COMPONENT as object (name VARCHAR2(256),  
                             value VARCHAR2(1024));
```

#### Attributes

**Table 293-2** `MGD_ID_COMPONENT` Attributes

| Attribute          | Description                           |
|--------------------|---------------------------------------|
| <code>name</code>  | Name of component                     |
| <code>value</code> | Value of the component as a character |

#### Examples

See the [MGD\\_ID Constructor Function](#) for an example.

### 293.2.2 `MGD_ID_COMPONENT_VARRAY` Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

#### Syntax

```
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```

#### Examples

See the [MGD\\_ID Constructor Function](#) for an example.

## 293.2.3 MGD\_ID Object Type

The `MGD_ID` type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

### Syntax

```
MGD_ID as object (category_id  VARCHAR2(256),  
                  components   MGD_ID_COMPONENT_VARRAY);
```

### Attributes

**Table 293-3 MGD\_ID Object Type Attributes**

| Attribute                | Description                                            |
|--------------------------|--------------------------------------------------------|
| <code>category_id</code> | Category identifier for the code category of this code |
| <code>components</code>  | List of components as name-value attributes            |

### Methods

[Table 293-5](#) describes the methods of the `MGD_ID` object type.

**Table 293-4 MGD\_ID Methods**

| Method                                   | Description                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>MGD_ID</code> constructor function | Creates an <code>MGD_ID</code> object based on the parameters passed in and returns self as a result             |
| <code>FORMAT</code> function             | Returns the string representation of the <code>MGD_ID</code> in the specified format                             |
| <code>GET_COMPONENT</code> function      | Returns the string value of the specified <code>MGD_ID</code> component                                          |
| <code>TO_STRING</code> function          | Returns the string value of semicolon (;) separated component name value pairs of the <code>MGD_ID</code> object |
| <code>TRANSLATE</code> function          | Returns the result of the conversion of the identifier from one format to the specified format                   |

### Examples

See the [Summary of MGD\\_ID Subprograms](#) section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.

## 293.3 Summary of MGD\_ID Subprograms

This table describes the subprograms in the `MGD_ID` object type.

All the values and names passed to the procedures defined in the `MGD_ID` object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 293-5 MGD\_ID Object Type Subprograms**

| Subprogram                                  | Description                                                                                         |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <a href="#">MGD_ID Constructor Function</a> | Creates an MGD_ID object based on the parameters passed in and returns self as a result             |
| <a href="#">FORMAT Function</a>             | Returns the string representation of the MGD_ID object in the specified format                      |
| <a href="#">GET_COMPONENT Function</a>      | Returns the string value of the specified MGD_ID component                                          |
| <a href="#">TO_STRING Function</a>          | Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object |
| <a href="#">TRANSLATE Function</a>          | Returns the result of the conversion of the identifier from one format to the specified format      |

## 293.3.1 MGD\_ID Constructor Function

This constructor function constructs an identity code type object, MGD\_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Constructs an MGD\_ID object type based on the category ID and a list of components.

```
MGD_ID (
    category_id      IN VARCHAR2,
    components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD\_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
    category_id      VARCHAR2,
    identifier        VARCHAR2,
    parameter_list    VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD\_ID object type based on the category name, category version, and a list of components.

```
MGD_ID (
    category_name     VARCHAR2,
    category_version  VARCHAR2,
    components        MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD\_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
MGD_ID (
    category_name     VARCHAR2,
    category_version  VARCHAR2,
    identifier        VARCHAR2,
    parameter_list    VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

## Parameters

**Table 293-6 MGD\_ID Constructor Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| category_id      | Category identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| components       | List of component name value pairs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| category_name    | Category name, such as EPC                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| category_version | Category version. If NULL, the latest version for the specified category name will be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| identifier       | <p>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY.</p> <p>Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</p> |
| parameter_list   | <p>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:</p> <p><code>filter=3;companyprefixlength=7;taglength=96</code></p>                                                                                                                                                                                                                                                        |

## Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is NULL, the `bit_length` is 8\* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

## Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
  MGD_ID_COMPONENT_VARRAY (
    MGD_ID_COMPONENT('companyprefix','0037000'),
    MGD_ID_COMPONENT('itemref','030241'),
    MGD_ID_COMPONENT('serial','1041970'),
    MGD_ID_COMPONENT('schemes','SGTIN-64')
  )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

**Constructs an MGD\_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.**

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

**Construct an MGD\_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.**

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
             MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix', '0037000'),
               MGD_ID_COMPONENT('itemref', '030241'),
               MGD_ID_COMPONENT('serial', '1041970'),
               MGD_ID_COMPONENT('schemes', 'SGTIN-64')
             )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

.  
. .  
.

Constructs an MGD\_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('filter', '3'),
                                         MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                         MGD_ID_COMPONENT('companyprefixlength', '7'),
                                         MGD_ID_COMPONENT('companyprefix', '0037000'),
                                         MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                         MGD_ID_COMPONENT('serial', '1041970'),
                                         MGD_ID_COMPONENT('itemref', '030241'))
.
.
.
```

293.3.2 FORMAT Function

This function returns the string representation of the MGD\_ID object in the specified format.

Syntax

```
FORMAT (parameter_list IN VARCHAR2,
       output_format IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 293-7    FORMAT Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter_list | List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:<br><br>filter=3;companyprefixlength=7;taglength=96 |

**Table 293-7 (Cont.) FORMAT Function Parameters**

| Parameter     | Description                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| output_format | One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"><li>BINARY</li><li>LEGACY</li><li>TAG_ENCODING</li><li>PURE_IDENTITY</li><li>ONS_HOSTNAME</li></ul> |

### Examples

See the example for the [GET\\_COMPONENT Function](#).

## 293.3.3 GET\_COMPONENT Function

This function returns the value of the specified MGD\_ID component.

### Syntax

```
GET_COMPONENT (  
    component_name IN VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 293-8 GET\_COMPONENT Function Parameter**

| Parameter      | Description       |
|----------------|-------------------|
| component_name | Name of component |

### Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

### Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file  
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');  
DECLARE  
id MGD_ID;  
BEGIN  
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);  
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));  
    -----  
    --PURE_IDENTIT  
    -----  
    dbms_output.put_line('..Testing constructor with pure identity');
```

```

-----
-- PURE_IDENTITY representation can be translated to BINARY and
-- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
-----
id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
dbms_output.put_line(id.to_string);
dbms_output.put_line('filter          = ' || id.get_component('filter'));
dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
dbms_output.put_line('itemref       = ' || id.get_component('itemref'));
dbms_output.put_line('serial        = ' || id.get_component('serial'));
dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));

## 293.3.4 TO\_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD\_ID object.

### Syntax

```

TO_STRING
RETURN VARCHAR2;

```

### Examples

The following example converts the MGD\_ID object into a string value:

```

-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
dbms_output.put_line('..Testing to_string');
id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
DBMS_OUTPUT.PUT_LINE(id.to_string);
END;

```

```

/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

## 293.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an `MGD_ID` object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```

TRANSLATE (
    category_name    IN VARCHAR2,
    identifier        IN VARCHAR2,
    parameter_list    IN VARCHAR2,
    output_format     IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```

TRANSLATE (
    category_name    IN VARCHAR2,
    category_version IN VARCHAR2,
    identifier        IN VARCHAR2,
    parameter_list    IN VARCHAR2,
    output_format     IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;

```

### Parameters

**Table 293-9 TRANSLATE Function Parameters**

| Parameter                     | Description                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------|
| <code>category_name</code>    | Name of category                                                                                         |
| <code>category_version</code> | Category version. If <code>NULL</code> , the latest version of the specified category name will be used. |

**Table 293-9 (Cont.) TRANSLATE Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| identifier     | EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme. |
| parameter_list | List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:<br><br><code>filter=3;companyprefixlength=7;taglength=96</code>                   |
| output_format  | One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> <li>BINARY</li> <li>LEGACY</li> <li>TAG_ENCODING</li> <li>PURE_IDENTITY</li> <li>ONS_HOSTNAME</li> </ul>                                                                                                                                                            |

**Usage Notes**

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

**Examples**

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '0011010100000000000010010000100010000000000001110110001000010000000000000011111110011000110010'
, NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '0011010100000000000010010000100010000000000001110110001000010000000000000011111110011000110010'
, NULL, 'PURE_IDENTITY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '0011010100000000000010010000100010000000000001110110001000010000000000000011111110011000110010'
, NULL, 'TAG_ENCODING'));
  dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC', NULL,
'urn:epc:tag:gid-96:0037000.30241.1041970',

# Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of Rule Types](#)

## 294.1 Rule TYPEs Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

 **See Also:**

- [DBMS\\_RULE](#)
- [DBMS\\_RULE\\_ADM](#)

## 294.2 Rule TYPEs Security Model

`PUBLIC` is granted `EXECUTE` privilege on these `RULE` types.

 **See Also:**

*Oracle Database Security Guide* for more information about user group `PUBLIC`

## 294.3 Summary of Rule Types

This table lists the `Rule Types` and briefly describes them.

**Table 294-1   Rule Types**

| Type                                          | Description                                 |
|-----------------------------------------------|---------------------------------------------|
| <a href="#">RE\$ATTRIBUTE_VALUE Type</a>      | Specifies the value of a variable attribute |
| <a href="#">RE\$ATTRIBUTE_VALUE_LIST Type</a> | Identifies a list of attribute values       |
| <a href="#">RE\$COLUMN_VALUE Type</a>         | Specifies the value of a table column       |
| <a href="#">RE\$COLUMN_VALUE_LIST Type</a>    | Identifies a list of column values          |
| <a href="#">RE\$NAME_ARRAY Type</a>           | Identifies a list of names                  |

**Table 294-1 (Cont.) Rule Types**

| Type                                         | Description                                                                                                                                                                                 |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">RE\$NAME_ARRAY Type</a>          | Identifies a list of name-value pairs                                                                                                                                                       |
| <a href="#">RE\$NV_LIST Type</a>             | Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule |
| <a href="#">RE\$NV_NODE Type</a>             | Identifies a name-value pair                                                                                                                                                                |
| <a href="#">RE\$RULE_HIT Type</a>            | Specifies a rule found because of evaluation                                                                                                                                                |
| <a href="#">RE\$RULE_HIT_LIST Type</a>       | Identifies a list of rules found because of evaluation                                                                                                                                      |
| <a href="#">RE\$RULE_NAME Type</a>           | Allows users to pass a list of rule as argument.                                                                                                                                            |
| <a href="#">RE\$RULE_NAME_LIST Type</a>      | Identifies a list of Rule Name values                                                                                                                                                       |
| <a href="#">RE\$TABLE_ALIAS Type</a>         | Provides the table corresponding to an alias used in a rule evaluation context                                                                                                              |
| <a href="#">RE\$TABLE_ALIAS_LIST Type</a>    | Identifies a list of table aliases used in a rule evaluation context                                                                                                                        |
| <a href="#">RE\$TABLE_VALUE Type</a>         | Specifies the value of a table row using a ROWID                                                                                                                                            |
| <a href="#">RE\$TABLE_VALUE_LIST Type</a>    | Identifies a list of table values                                                                                                                                                           |
| <a href="#">RE\$VALUE Type</a>               | Represents one datapoint value element                                                                                                                                                      |
| <a href="#">RE\$VALUE_LIST Type</a>          | Defines a list of RE\$VALUE type                                                                                                                                                            |
| <a href="#">RE\$VARIABLE_TYPE Type</a>       | Provides the type of a variable used in a rule evaluation context                                                                                                                           |
| <a href="#">RE\$VARIABLE_TYPE_LIST Type</a>  | Identifies a list of variables and their types used in a rule evaluation context                                                                                                            |
| <a href="#">RE\$VARIABLE_VALUE Type</a>      | Specifies the value of a variable                                                                                                                                                           |
| <a href="#">RE\$VARIABLE_VALUE_LIST Type</a> | Identifies a list of variable values                                                                                                                                                        |

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Replication (Oracle GoldenGate and XStream), rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Replication (Oracle GoldenGate and XStream) packages use rules:

- `DBMS_APPLY_ADM`
- `DBMS_CAPTURE_ADM`
- `DBMS_PROPAGATION_ADM`

## 294.3.1 RE\$ATTRIBUTE\_VALUE Type

RE\$ATTRIBUTE\_VALUE type specifies the value of a variable attribute.

### Note:

Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (  
    variable_name    VARCHAR2(32),  
    attribute_name    VARCHAR2(4000),  
    attribute_value    ANYDATA);
```

### Attributes

**Table 294-2 RE\$ATTRIBUTE\_VALUE Attributes**

| Attribute       | Description                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------|
| variable_name   | Specifies the variable used in a rule                                                             |
| attribute_name  | Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3. |
| attribute_value | Specifies the attribute value                                                                     |

## 294.3.2 RE\$ATTRIBUTE\_VALUE\_LIST Type

The RE\$ATTRIBUTE\_VALUE\_LIST type identifies a list of attribute values.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

## 294.3.3 RE\$COLUMN\_VALUE Type

RE\$COLUMN\_VALUE type specifies the value of a table column.

### Note:

Enclose the column name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE (  
    table_alias    VARCHAR2(32),
```

```
column_name  VARCHAR2(4000),  
column_value ANYDATA);
```

### Attributes

**Table 294-3** RE\$COLUMN\_VALUE Attributes

| Attribute    | Description                                      |
|--------------|--------------------------------------------------|
| table_alias  | Specifies the alias used for the table in a rule |
| column_name  | Specifies the column name                        |
| column_value | Specifies the column value                       |

## 294.3.4 RE\$COLUMN\_VALUE\_LIST Type

RE\$COLUMN\_VALUE\_LIST type identifies a list of column values.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

## 294.3.5 RE\$NAME\_ARRAY Type

RE\$NAME\_ARRAY type identifies a list of names.

### Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

## 294.3.6 RE\$NV\_ARRAY Type

RE\$NV\_ARRAY type identifies a list of name-value pairs.

### Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

## 294.3.7 RE\$NV\_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

### Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(  
    actx_list SYS.RE$NV_ARRAY);
```

## Attributes

**Table 294-4 RE\$NV\_LIST Attributes**

| Attribute | Description                  |
|-----------|------------------------------|
| actx_list | The list of name-value pairs |

## RE\$NV\_LIST Subprograms

This section describes the following member procedures and member functions of the `SYS.RE$NV_LIST` type:

- [ADD\\_PAIR Member Procedure](#)
- [GET\\_ALL\\_NAMES Member Function](#)
- [GET\\_VALUE Member Function](#)
- [REMOVE\\_PAIR Member Procedure](#)

### ADD\_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

#### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

## Syntax

```
MEMBER PROCEDURE ADD_PAIR(  
    name    IN VARCHAR2,  
    value   IN ANYDATA);
```

## Parameters

**Table 294-5 ADD\_PAIR Procedure Parameters**

| Parameter | Description                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|
| name      | The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error. |
| value     | The value in the name-value pair being added to the list                                                                      |

### GET\_ALL\_NAMES Member Function

Returns a list of all the names in the name-value pair list.

## Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()  
RETURN SYS.RE$NAME_ARRAY;
```

## GET\_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

## Syntax

```
MEMBER FUNCTION GET_VALUE(  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

## Parameters

**Table 294-6** GET\_VALUE Function Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| name      | The name whose value to return |

## REMOVE\_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

## Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(  
    name IN VARCHAR2);
```

## Parameters

**Table 294-7** REMOVE\_PAIR Procedure Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| name      | The name of the pair to remove |

## 294.3.8 RE\$NV\_NODE Type

RE\$COLUMN\_VALUE type identifies a name-value pair.

### Note:

Enclose the name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$NV_NODE (  
    nvn_name    VARCHAR2(30),  
    nvn_value   ANYDATA);
```

### Attributes

**Table 294-8 RE\$NV\_NODE Attributes**

| Attribute | Description                                |
|-----------|--------------------------------------------|
| nvn_name  | Specifies the name in the name-value pair  |
| nvn_value | Specifies the value in the name-value pair |

## 294.3.9 RE\$RULE\_HIT Type

The RE\$RULE\_HIT type specifies a rule found because of an evaluation.

### See Also:

- [CREATE\\_RULE Procedure](#)
- [ALTER\\_RULE Procedure](#)

### Syntax

```
TYPE SYS.RE$RULE_HIT (  
    rule_name    VARCHAR2(65),  
    rule_action_context RE$NV_LIST);
```

### Attributes

**Table 294-9 RE\$RULE\_HIT Attributes**

| Attribute | Description                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name | The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <i>employee_rule</i> in the <i>hr</i> schema is returned in the form "hr"."employee_rule". |

**Table 294-9 (Cont.) RE\$RULE\_HIT Attributes**

| Attribute           | Description                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| rule_action_context | The rule action context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package |

## 294.3.10 RE\$RULE\_HIT\_LIST Type

The RE\$RULE\_HIT\_LIST type identifies a list of rules found because of an evaluation.

### Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

## 294.3.11 RE\$RULE\_NAME Type

The RE\$RULE\_HIT type is create to allow use to pass a list of rule as argument.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT(  
    rule_name          IN          varchar2,  
    evaluation_context IN          varchar2);
```

### Attributes

**Table 294-10 RE\$RULE\_NAME Attributes**

| Attribute          | Description                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name          | The rule name in the form <i>SCHEMA_NAME.RULE_NAME</i> . For example, a rule named employee_rule in the hr schema is returned in the form "hr"."employee_rule". |
| Evaluation_context | The evaluation context as specified in the CREATE_RULE or ALTER_RULE procedure of the DBMS_RULE_ADM package                                                     |

## 294.3.12 RE\$RULE\_NAME\_LIST Type

RE\$RULE\_HIT\_LIST type Identifies a list of Rule Name values.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;
```

## 294.3.13 RE\$TABLE\_ALIAS Type

RE\$TABLE\_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

**Note:**

Enclose the table name in double quotation marks (") if the name contains special characters.

**See Also:**

*Oracle Database SQL Language Reference* for information about schema object naming rules

**Syntax**

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(  
    table_alias  VARCHAR2(32),  
    table_name   VARCHAR2(194));
```

**Attributes**

**Table 294-11 RE\$TABLE\_ALIAS Attributes**

| Attribute   | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_alias | The alias used for the table in a rule                                                                                                                                                                                                                                                                                                                                                                           |
| table_name  | <p>The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema.</p> <p>The format is one of the following:</p> <p><i>schema_name.table_name</i></p> <p><i>table_name</i></p> <p>For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i>, then enter the following:</p> <p><i>hr.employees</i></p> |

### 294.3.14 RE\$TABLE\_ALIAS\_LIST Type

The RE\$TABLE\_ALIAS\_LIST type identifies a list of table aliases used in a rule evaluation context.

**Syntax**

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

## 294.3.15 RE\$TABLE\_VALUE Type

The RE\$TABLE\_VALUE type specifies the value of a table row using a ROWID.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE (  
    table_alias  VARCHAR2(32),  
    table_rowid  VARCHAR2(18));
```

### Attributes

**Table 294-12** RE\$TABLE\_VALUE Attributes

| Attribute   | Description                                      |
|-------------|--------------------------------------------------|
| table_alias | Specifies the alias used for the table in a rule |
| table_rowid | Specifies the rowid for the table row            |

## 294.3.16 RE\$TABLE\_VALUE\_LIST Type

The RE\$TABLE\_VALUE\_LIST type identifies a list of table values.

### Note:

Each table alias in the list in the list must be unique.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

## 294.3.17 RE\$VALUE Type

The RE\$VALUE type represents one datapoint value element.

### Syntax

```
TYPE SYS.RE$VALUE (  
    table_values      IN      SYS.RE$TABLE_VALUE_LIST:= NULL,  
    column_values     IN      SYS.RE$COLUMN_VALUE_LIST:=NULL,  
    variable_values   IN      SYS.RE$VARIABLE_VALUE_LIST:=NULL,  
    attribute_values  IN      SYS.RE$ATTRIBUTE_VALUE_LIST:=NULL)
```

### Attributes

**Table 294-13** RE\$VALUE Attributes

| Attribute     | Description                                  |
|---------------|----------------------------------------------|
| table_values  | ROWID of table row for expression evaluation |
| column_values | Values of columns referred in the expression |

**Table 294-13 (Cont.) RE\$VALUE Attributes**

| Attribute        | Description                                 |
|------------------|---------------------------------------------|
| variable_values  | Values of variables referred in expressio   |
| attribute_values | Values of attributes referred in expression |

## 294.3.18 RE\$VALUE\_LIST Type

RE\$TABLE\_VALUE\_LIST type is a varray for defining a list of RE\$VALUE type. It represents a list of datapoint element.

### Syntax

```
CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;
```

## 294.3.19 RE\$VARIABLE\_TYPE Type

The RE\$VARIABLE\_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

### Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

### See Also:

*Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (  
    variable_name          VARCHAR2(32),  
    variable_type          VARCHAR2(4000),  
    variable_value_function VARCHAR2(228),  
    variable_method_function VARCHAR2(228));
```

### Attributes

**Table 294-14 RE\$VARIABLE\_TYPE Attributes**

| Attribute     | Description                      |
|---------------|----------------------------------|
| variable_name | The variable name used in a rule |

**Table 294-14 (Cont.) RE\$VARIABLE\_TYPE Attributes**

| Attribute                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| variable_type            | The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.                                                                                                                                                                                                                                                                                 |
| variable_value_function  | A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.<br>See the " <a href="#">Usage Notes</a> " for more information.                                                                                                                                                                        |
| variable_method_function | Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function.<br>The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.<br>See the " <a href="#">Usage Notes</a> " for more information. |

### Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: `schema_name`, `package_name`, and `@dblink`.

For example, if the `schema_name` is `hr`, the `package_name` is `var_pac`, the `function_name` is `func_value`, and the `dblink` is `dbs1.net`, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

### Signature for variable\_value\_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
    evaluation_context_schema IN VARCHAR2,
    evaluation_context_name   IN VARCHAR2,
    variable_name              IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

### Signature for variable\_method\_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
    evaluation_context_schema IN VARCHAR2,
```

```
evaluation_context_name    IN VARCHAR2,  
variable_value             IN SYS.RE$VARIABLE_VALUE,  
method_name               IN VARCHAR2,  
event_context              IN SYS.RE$NV_LIST)  
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

## 294.3.20 RE\$VARIABLE\_TYPE\_LIST Type

The `RE$VARIABLE_TYPE_LIST` type identifies a list of variables and their types used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

## 294.3.21 RE\$VARIABLE\_VALUE Type

The `RE$VARIABLE_VALUE` type specifies the value of a variable.

### Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (  
    variable_name  VARCHAR2(32),  
    variable_data  ANYDATA);
```

### Attributes

**Table 294-15 RE\$VARIABLE\_VALUE Attributes**

| Attribute     | Description                                |
|---------------|--------------------------------------------|
| variable_name | Specifies the variable name used in a rule |
| variable_data | Specifies the data for the variable value  |

## 294.3.22 RE\$VARIABLE\_VALUE\_LIST Type

The `RE$VARIABLE_VALUE_LIST` type identifies a list of variable values.

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

# SODA Types

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

This chapter contains the following topics:

- [SODA Types Overview](#)
- [SODA Types Security Model](#)
- [Summary of SODA Types](#)

## 295.1 SODA Types Overview

There are several SODA types: `SODA_DOCUMENT_T`, `SODA_COLLECTION_T`, `SODA_OPERATION_T`, and `SODA_CURSOR_T`. `SODA_DOCUMENT_T` and `SODA_COLLECTION_T` represent two primary abstractions provided by SODA: document and collections. `SODA_OPERATION_T` is used for specifying condition of operations on the collection. `SODA_CURSOR_T` is a cursor over results of read operations on the collection.

- [DBMS\\_SODA](#)

## 295.2 SODA Types Security Model

The SODA Types are available to users with the `SODA_APP` role.

All SODA types are SYS types. PUBLIC is granted EXECUTE privilege on the SODA types described in this chapter:

- `TYPE SODA_Collection_T`
- `TYPE SODA_Document_T`
- `TYPE SODA_Operation_T`
- `TYPE SODA_Cursor_T`

## 295.3 Summary of SODA Types

This chapter lists the SODA types and describes them.

**Table 295-1 SODA Types**

| Type                                   | Description                                                                                                                                                                    |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SODA_COLLECTION_T Type</a> | This SODA type represents a SODA collection. This type is not persistable.                                                                                                     |
| <a href="#">SODA_DOCUMENT_T Type</a>   | This SODA type represents a document with content, usually in JSON format. This type is not persistable.                                                                       |
| <a href="#">SODA_OPERATION_T Type</a>  | This SODA type performs read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection. This type is not persistable. |
| <a href="#">SODA_CURSOR_T Type</a>     | This SODA type represents the result set of documents. This type is not persistable.                                                                                           |

### 295.3.1 SODA\_COLLECTION\_T Type

This SODA type represents a SODA collection. A reference of SODA collection can only be obtained by either calling `DBMS_SODA.CREATE_COLLECTION()` or `DBMS_SODA.OPEN_COLLECTION()`.

**Table 295-2 SODA\_COLLECTION\_T Type Subprograms**

| Subprogram                                   | Description                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_INDEX Function</a>        | Creates an index using an index specification expressed in JSON.<br><br>Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.                                                                                      |
| <a href="#">CREATE_VIEW_FROM_DG Function</a> | This function creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide enabled JSON search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid. |
| <a href="#">DROP_INDEX Function</a>          | Drops the named index.                                                                                                                                                                                                                                                                                     |
| <a href="#">FIND Function</a>                | Returns the <code>SODA_OPERATION_T</code> object. This is the only way to get the reference of <code>SODA_Operation_T</code> as there is no constructor.                                                                                                                                                   |
| <a href="#">FIND_ONE Function</a>            | Fetches the document matching the key.                                                                                                                                                                                                                                                                     |
| <a href="#">GET_DATA_GUIDE Function</a>      | Returns the JSON data guide as a CLOB.                                                                                                                                                                                                                                                                     |
| <a href="#">GET_METADATA Function</a>        | Returns the metadata of the collection in JSON format.                                                                                                                                                                                                                                                     |
| <a href="#">GET_NAME Function</a>            | Returns the name of the collection.                                                                                                                                                                                                                                                                        |

**Table 295-2 (Cont.) SODA\_COLLECTION\_T Type Subprograms**

| Subprogram                                   | Description                                                                                                                                                                                                                                                                                        |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">INSERT_ONE Function</a>          | Inserts a document into the collection.                                                                                                                                                                                                                                                            |
| <a href="#">INSERT_ONE_AND_GET Function</a>  | Inserts a document into the collection and returns a result document with all components except for content.                                                                                                                                                                                       |
| <a href="#">REMOVE_ONE Function</a>          | Removes the document matching the key.                                                                                                                                                                                                                                                             |
| <a href="#">REPLACE_ONE Function</a>         | Replaces the content and (optionally) the media type of the document matching the key.                                                                                                                                                                                                             |
| <a href="#">REPLACE_ONE_AND_GET Function</a> | Replaces the content and (optionally) the media type of the document matching the key and returns a result document with all components (except content).                                                                                                                                          |
| <a href="#">SAVE Function</a>                | This function saves a document into the collection. This function is equivalent to <code>INSERT_ONE(document)</code> Function except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. |
| <a href="#">SAVE_AND_GET Function</a>        | This function saves a document into the collection. This method is equivalent to <code>INSERT_ONE_AND_GET(document)</code> except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document.    |
| <a href="#">TRUNCATE Function</a>            | This function deletes all documents in the collection.                                                                                                                                                                                                                                             |

### 295.3.1.1 CREATE\_INDEX Function

This function creates an index using an index specification expressed in JSON. Three types of specifications are supported. Each specifying a different type of index: for B-tree, JSON search with Data Guide, and Spatial.

#### Syntax

```
CREATE_INDEX (  
    specification VARCHAR2)  
RETURN NUMBER;
```

#### Parameters

**Table 295-3 CREATE\_INDEX Function Parameters**

| Parameter                  | Description              |
|----------------------------|--------------------------|
| <code>specification</code> | The index specification. |

### Example 295-1 Return Values

The function returns:

- 1—if the index was successfully created
- 0—if the index was not created

### Exceptions

**Error**—If an error occurs creating the index.

#### See Also:

For more information about SODA Index specifications, see:

- Overview of SODA Indexing
- SODA Index Specifications (Reference)

## 295.3.1.2 CREATE\_VIEW\_FROM\_DG Function

This function creates a view with relational columns, using scalar `JSON` fields as specified in the data guide. A data guide enabled `JSON` search index is not required for this function; the data guide is passed to the function. An error is thrown if the data guide passed to the function is invalid.

This procedure is available only for Autonomous Database starting 19c release.

### Syntax

```
CREATE_VIEW_FROM_DG (  
    view_name          VARCHAR2,  
    data_guide          CLOB)  
RETURN NUMBER;
```

### Parameters

**Table 295-4 CREATE\_VIEW\_FROM\_DG Function Parameters**

| Parameter               | Description                     |
|-------------------------|---------------------------------|
| <code>view_name</code>  | Name of the view to be created. |
| <code>data_guide</code> | Data guide of the collection.   |

### Return Values

The function returns:

- 1—if the procedure is successfully completed
- 0—if the procedure could not be successfully completed

### Exceptions

**Error**—If an error occurs while creating the view.

**See Also:**

For more info on the JSON data guide, see [JSON Data Guide](#)

### 295.3.1.3 DROP\_INDEX Function

This function drops the named index.

**Syntax**

```
DROP_INDEX (  
    index_Name IN VARCHAR2,  
    force      IN BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

**Example 295-2 Parameters**

**Table 295-5 DROP\_INDEX Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| index_Name | The name of the index.                                                                                                                                                                                                               |
| force      | The force parameter can be <code>TRUE</code> or <code>FALSE</code> . Should only be set to <code>TRUE</code> for dropping a JSON search index or spatial index (not B-tree index). For more information, see <code>DROP INDEX</code> |

**Return Values**

The function returns:

- 1—If the index was successfully dropped
- 0—If the index was not dropped. For example, if there was no existing index with the specified name.

**Exceptions**

Error—if an error occurs while dropping the index.

### 295.3.1.4 FIND Function

This function returns the operation type for the collection. The operation type allows building and executing various read/write operations. This is the only way to get the reference of `SODA_Operation_T` as there is no constructor.

**Syntax**

```
FIND ()  
RETURN SODA_Operation_T;
```

**Return Values**

This function returns `SODA_OPERATION_T` object.

### Exceptions

This function does not throw any exception.

## 295.3.1.5 FIND\_ONE Function

This function fetches the document matching the given key.

### Syntax

```
FIND_ONE (  
    key          IN VARCHAR2)  
RETURN SODA_Document_T;
```

### Parameters

**Table 295-6** FIND\_ONE Function Parameters

| Parameter | Description                            |
|-----------|----------------------------------------|
| key       | The key of the document to be fetched. |

### Return Values

This function returns the document that matches the key. Returns `NULL` if no match is found.

### Exceptions

**Error**—If an error occurs while finding the document.

## 295.3.1.6 GET\_DATA\_GUIDE Function

This function fetches the JSON data guide as a CLOB. The JSON data guide is essentially inferred schema for the JSON documents in the collection. In order to be able to return the JSON data guide, a collection must have a JSON Search Index defined on it, with the data guide enabled.

### Syntax

```
GET_DATA_GUIDE ()  
RETURN CLOB;
```

### Return Values

The function returns the JSON data guide as a CLOB.

#### See Also:

For more info on the JSON data guide, see [JSON Data Guide](#)

### Exceptions

**Error**—If an error occurs while fetching the data guide.

### 295.3.1.7 GET\_METADATA Function

This function returns the metadata of the collection in JSON format.

#### Syntax

```
GET_METADATA ()  
RETURN VARCHAR2;
```

#### Return Values

This function returns the metadata of the collection in JSON format.

### 295.3.1.8 GET\_NAME Function

This function returns the name of the collection.

#### Syntax

```
GET_NAME ()  
RETURN NVARCHAR2;
```

#### Return Values

This function returns the name of the collection.

### 295.3.1.9 INSERT\_ONE Function

This function inserts a document into the collection.

#### Syntax

```
INSERT_ONE (  
    document          IN SODA_Document_T)  
RETURN NUMBER;
```

#### Parameters

**Table 295-7 INSERT\_ONE Function Parameters**

| Parameter | Description         |
|-----------|---------------------|
| document  | The input document. |

#### Return Values

The function returns a number—1 if the doc was inserted successfully, 0 otherwise.

#### Exceptions

**Error**—If an error occurs while inserting the document into the collection.

### 295.3.1.10 INSERT\_ONE\_AND\_GET Function

This function inserts a document into the collection.

### Syntax

```
INSERT_ONE_AND_GET (  
    document      IN SODA_Document_T,  
    hint          IN VARCHAR2 DEFAULT NULL)  
RETURN SODA_Document_T;
```

### Parameters

**Table 295-8** INSERT\_ONE\_AND\_GET Function Parameters

| Parameter | Description                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------|
| document  | The input document.                                                                               |
| hint      | A hint string in Oracle SQL format, without the enclosing /*+ and */. This parameter is optional. |

### Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

### Exceptions

**Error**—If an error occurs while inserting the document into the collection.

## 295.3.1.11 REMOVE\_ONE Function

This function removes the document matching the given key.

### Syntax

```
REMOVE_ONE (  
    key          IN VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 295-9** REMOVE\_ONE Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| key       | The key of the document. |

### Return Values

This function returns the following values:

- 1—If the document was successfully removed.
- 0—If the document with the specified key was not found.

### Exceptions

**Error**—If an error occurs while deleting the document from the collection.

### 295.3.1.12 REPLACE\_ONE Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

#### Syntax

```
REPLACE_ONE (
    key          IN VARCHAR2,
    document     IN SODA_Document_T)
RETURN NUMBER;
```

#### Parameters

**Table 295-10 REPLACE\_ONE Parameters**

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| key       | The key of the document.                                                 |
| document  | The document with the new content and media type to replace the old one. |

#### Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

#### Exceptions

**Error**—If an error occurs while replacing the document in the collection.

### 295.3.1.13 REPLACE\_ONE\_AND\_GET Function

This function updates the existing document with a new content and media type using the key. Any components set in `document` with the exception of content and media type are not used during the replace. They are ignored.

#### Syntax

```
REPLACE_ONE_AND_GET (
    key          IN VARCHAR2,
    document     IN SODA_Document_T)
RETURN SODA_Document_T;
```

#### Parameters

**Table 295-11 REPLACE\_ONE\_AND\_GET Function Parameters**

| Parameter | Description                                                              |
|-----------|--------------------------------------------------------------------------|
| key       | The key of the document.                                                 |
| document  | The document with the new content and media type to replace the old one. |

### Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

### Exceptions

**Error**—If an error occurs while replacing the document in the collection.

## 295.3.1.14 SAVE Function

This function saves a document into the collection. This function is equivalent to the `INSERT_ONE(document)` function except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key is automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

### Syntax

```
SAVE (  
    document IN SODA_Document_T)  
RETURN NUMBER;
```

### Parameters

**Table 295-12** SAVE Parameters

| Parameter | Description                              |
|-----------|------------------------------------------|
| document  | The input document. This cannot be null. |

### Return Values

The function returns a number- 1 if the function successfully completed, 0 otherwise.

### Exceptions

**Error**—If an error occurs while saving the document.

## 295.3.1.15 SAVE\_AND\_GET Function

This function saves a document into the collection. This method is equivalent to `INSERT_ONE_AND_GET(document)` except that if client-assigned keys are used, and the document with the specified key already exists in the collection, it will be replaced with the input document. The key will be automatically created, unless this collection is configured with client-assigned keys and the key is provided in the input document.

### Syntax

```
SAVE_AND_GET (  
    document      IN SODA_Document_T,  
    hint          IN VARCHAR2 DEFAULT NULL)  
RETURN SODA_Document_T;
```

## Parameters

**Table 295-13** SAVE\_AND\_GET Function Parameters

| Parameter | Description                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------|
| document  | The input document. This cannot be null.                                                                                     |
| hint      | A hint string in Oracle SQL format, without the enclosing <code>/*+</code> and <code>*/</code> . This parameter is optional. |

## Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content.

## Exceptions

**Error**—If an error occurs while saving or getting the document.

## 295.3.1.16 TRUNCATE Function

This function deletes all documents in the collection.

## Syntax

```
TRUNCATE ( )  
RETURN Number;
```

## Return Values

The function returns:

- 1—if the function is successfully completed
- 0—if the function could not be successfully completed

## Exceptions

**Error**—if an error occurs while deleting the documents in the collection.

## 295.3.2 SODA\_DOCUMENT\_T Type

This SODA type represents a document with content, that is usually in JSON format.

This type is not persistable `pl/sql` type. However, SODA is a system that basically provides persistence — it has read and write operations. So you do not persist `SODA_DOCUMENT_T` directly, but you pass it to a write operation (like `insert` or `replace`), which is defined on `SODA_COLLECTION_T`, in order to write the document content and other components to the database.

A document has the following components:

- key
- content
- created-on timestamp
- last-modified timestamp

- version
- media type

**Table 295-14 SODA\_DOCUMENT\_T Type Subprograms**

| Subprogram                                 | Description                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">GET_BLOB Function</a>          | Fetches the BLOB content of a BLOB-based document.                          |
| <a href="#">GET_CLOB Function</a>          | Fetches the CLOB content of a CLOB-based document.                          |
| <a href="#">GET_CREATED_ON Function</a>    | Fetches the created-on timestamp in VARCHAR2.                               |
| <a href="#">GET_DATA_TYPE Function</a>     | Fetches the SQL datatype of the document content with which it was created. |
| <a href="#">GET_KEY Function</a>           | Fetches the document key in VARCHAR2.                                       |
| <a href="#">GET_LAST_MODIFIED Function</a> | Fetches the last modified timestamp in VARCHAR2.                            |
| <a href="#">GET_MEDIA_TYPE Function</a>    | Fetches the media type of the document content in VARCHAR2.                 |
| <a href="#">GET_VARCHAR2 Function</a>      | Fetches the VARCHAR2 content of a VARCHAR2-based document.                  |
| <a href="#">GET_VERSION Function</a>       | Fetches the version of the document in VARCHAR2.                            |

### 295.3.2.1 GET\_BLOB Function

This functions fetches the BLOB content of the document. It assumes that the document was constructed with BLOB content, or was returned from a collection with BLOB content. Otherwise, an error is returned.

#### Syntax

```
GET_BLOB ()  
RETURN BLOB;
```

#### Return Values

This function returns the BLOB content of a document.

#### Exceptions

**SODA Error:** If the document was initially not created with BLOB content.

### 295.3.2.2 GET\_CLOB Function

The function fetches CLOB content of the document. It assumes that the document was constructed with CLOB content, or was returned from a collection with CLOB content. Otherwise, an error is returned.

#### Syntax

```
GET_CLOB ()  
RETURN CLOB;
```

### Return Values

This function returns the CLOB content of a document.

### Exceptions

**SODA Error:** If the document was initially not created with CLOB content.

## 295.3.2.3 GET\_CREATED\_ON Function

This function fetches the created-on timestamp. The timestamp string is in ISO-8601 format, in particular this form: YYYY-MM-DDThh:mm:ss.ssssssZ format. As indicated by the Z at the end, timestamps are returned in UTC (Z indicates zero UTC offset).

### Syntax

```
GET_CREATED_ON ()  
RETURN VARCHAR2;
```

### Return Values

This function returns the created-on timestamp.

## 295.3.2.4 GET\_DATA\_TYPE Function

This function fetches the SQL datatype of the document content with which it was created.

### Syntax

```
GET_DATA_TYPE ()  
RETURN PLS_INTEGER;
```

### Return Values

**Table 295-15** GET\_DATA\_TYPE Return Values

| Constant                             | Value | Description |
|--------------------------------------|-------|-------------|
| DOC_VARCHAR2 CONSTANT<br>PLS_INTEGER | 1     | VARCHAR2    |
| DOC_BLOB CONSTANT<br>PLS_INTEGER     | 2     | BLOB        |
| DOC_CLOB CONSTANT<br>PLS_INTEGER     | 3     | CLOB        |

## 295.3.2.5 GET\_KEY Function

This function fetches the document key.

### Syntax

```
GET_KEY ()  
RETURN VARCHAR2;
```

### Return Values

This function returns the document key.

## 295.3.2.6 GET\_LAST\_MODIFIED Function

This function fetches the last modified timestamp. The timestamp string is in ISO-8601 format, in particular this form: `YYYY-MM-DDThh:mm:ss.ssssssZ` format. As indicated by the `Z` at the end, timestamps are returned in UTC (`Z` indicates zero UTC offset).

### Syntax

```
GET_LAST_MODIFIED ()  
RETURN VARCHAR2;
```

### Return Values

This function returns the last modified timestamp.

## 295.3.2.7 GET\_MEDIA\_TYPE Function

This function fetches the media type of the document content.

### Syntax

```
GET_MEDIA_TYPE ()  
RETURN VARCHAR2;
```

### Return Values

This function returns the media type of the document content. `application/JSON` is the media type for `JSON` documents (default).

## 295.3.2.8 GET\_VARCHAR2 Function

This function fetches the `VARCHAR2` content of the document. It assumes that the document was constructed with `VARCHAR2` content, or was returned from a collection with `VARCHAR2` content. Otherwise, an error is returned.

### Syntax

```
GET_VARCHAR2 ()  
RETURN VARCHAR2;
```

### Return Values

This function returns the `VARCHAR2` content of a document.

### Exceptions

**SODA Error:** If the document was initially not created with `VARCHAR2` content.

## 295.3.2.9 GET\_VERSION Function

This function fetches the version of the document.

**Syntax**

```
GET_VERSION ()  
RETURN VARCHAR2;
```

**Return Values**

This function returns the version of the document.

### 295.3.3 SODA\_OPERATION\_T Type

This SODA type is used to perform read/write operations, such as document finds with filtering and pagination, removes, and replaces on a SODA collection.

**Table 295-16 SODA\_OPERATION\_T Type Subprograms**

| Subprogram                               | Description                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACQUIRE_LOCK Function</a>    | This function ensures that the document(s) affected by a read operation are locked for update (which is equivalent to SQL 'select for update').                                                                                                                                                                      |
| <a href="#">AS_OF_SCN Function</a>       | This function sets the SCN value for the operation.                                                                                                                                                                                                                                                                  |
| <a href="#">AS_OF_TIMESTAMP Function</a> | This function sets the the timestamp value for the operation.                                                                                                                                                                                                                                                        |
| <a href="#">COUNT Function</a>           | Returns a count of the number of documents in the collection that match the criteria. If skip(...) or limit(...) were chained together with this count(), an exception is raised.                                                                                                                                    |
| <a href="#">FILTER Function</a>          | Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same SODA_OPERATION_T object so that further criteria can be chained together if required.                                                                                                                            |
| <a href="#">GET_CURSOR Function</a>      | Returns a SODA_CURSOR_T object that can be used to iterate over the documents that match the criteria.                                                                                                                                                                                                               |
| <a href="#">GET_DATA_GUIDE Function</a>  | This function gets the data guide.                                                                                                                                                                                                                                                                                   |
| <a href="#">GET_ONE Function</a>         | Returns a single SODA_DOCUMENT_T object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.                                                                                                                                                         |
| <a href="#">HINT Function</a>            | This function sets the hint attribute of the operation.                                                                                                                                                                                                                                                              |
| <a href="#">KEY Function</a>             | Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and KEYS(...), when they appear in the same chain, to be ignored.<br><br>Returns the same SODA_OPERATION_T object so that further operation criteria can be chained together, if needed. |

Table 295-16 (Cont.) SODA\_OPERATION\_T Type Subprograms

| Subprogram                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">KEYS Function</a>                | <p>Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and <code>KEY(...)</code>, when they appear in the same chain, to be ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object, so that further operation criteria can be chained together, if needed.</p>                                                                                                                                                                                                                                                                                                                                                                                             |
| <a href="#">LIMIT Function</a>               | <p>Sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <a href="#">REMOVE Function</a>              | <p>Removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <a href="#">REPLACE_ONE Function</a>         | <p>Replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p>                                                                                                                                                                                                                                                                                                                     |
| <a href="#">REPLACE_ONE_AND_GET Function</a> | <p>Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, <code>NULL</code> otherwise.</p> <p>Currently, before calling this function, you must call the function <code>KEY(...)</code> to uniquely identify the document being replaced.</p> <p>This function is similar to <code>REPLACE_ONE</code>. The only difference is that <code>REPLACE_ONE_AND_GET</code> also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component.</p> <p>Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.</p> |
| <a href="#">SAMPLE Function</a>              | <p>Sets the sampling parameters to be used for the operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 295-16 (Cont.) SODA\_OPERATION\_T Type Subprograms

| Subprogram                       | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SKIP Function</a>    | <p>Sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as <code>GET_CURSOR</code>. For write operations, any value set using this method is ignored.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p> |
| <a href="#">VERSION Function</a> | <p>Specifies that only documents with the supplied version should be returned. Typically, this is chained together with <code>KEY(...)</code> to implement optimistic locking for write operations such as <code>REMOVE</code> and <code>REPLACE</code>.</p> <p>Returns the same <code>SODA_OPERATION_T</code> object so that further operation criteria can be chained together, if needed.</p>             |

### 295.3.3.1 ACQUIRE\_LOCK Function

This function ensures that the the document(s) affected by a read operation are locked for update (which is equivalent to SQL 'select for update'). An operation involving `LOCK()` would be followed by another operation that updates the document in the collection. For example, via `REPLACE` or `REMOVE` functions. The lock will prevent other transactions from modifying the document in the meantime.

The next commit or rollback, performed after the operation involving this `ACQUIRE_LOCK()` function, will unlock the document, i.e. commit or rollback the transaction which is holding the lock on this document.

This function should only be used in conjunction with read operations, other than `COUNT()` and `GET_DATA_GUIDE()` functions.

Specifying it in conjunction with `SKIP` and `LIMIT` functions is also not allowed (an error is thrown).

If specified in conjunction with a write operation, such as, `REPLACE` or `REMOVE`, it's simply ignored and has no effect.

#### Syntax

```
ACQUIRE_LOCK ( )  
RETURN SODA_Operation_T;
```

#### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

### 295.3.3.2 AS\_OF\_SCN Function

This function sets the SCN value for the operation.

### Syntax

```
AS_OF_SCN (  
    scn          IN NUMBER)  
RETURN SODA_Operation_T;
```

### Parameters

**Table 295-17 AS\_OF\_SCN Function Parameters**

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| scn       | The input value for SCN. This cannot be NULL. |

### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

## 295.3.3.3 AS\_OF\_TIMESTAMP Function

This function sets the the timestamp value for the operation.

### Syntax

```
AS_OF_TIMESTAMP (  
    timestamp      IN VARCHAR2)  
RETURN SODA_Operation_T;
```

### Parameters

**Table 295-18 AS\_OF\_TIMESTAMP Function Parameters**

| Parameter | Description                               |
|-----------|-------------------------------------------|
| timestamp | The input timestamp. This cannot be NULL. |

### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

## 295.3.3.4 COUNT Function

This function returns a count of the number of documents in the collection that match the criteria. If `skip(...)` or `limit(...)` were chained together with this `count()`, an exception is raised.

### Syntax

```
COUNT ()  
RETURN NUMBER;
```

### Return Values

This function returns the number of documents matching the criteria specified in the operation.

### Exceptions

**Error**—If an error occurs while finding the count.

### 295.3.3.5 FILTER Function

Sets the filter (also known as QBE or query-by-example) criteria on the operation. Returns the same `SODA_OPERATION_T` object so that further criteria can be attached if needed.

#### Syntax

```
FILTER (  
    qbe          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

#### Parameters

**Table 295-19** FILTER Function Parameters

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| qbe       | The string representing the query by example. |

#### Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on.

#### See Also:

- Overview of SODA Filter Specifications (QBEs)
- SODA Filter Specifications (Reference)

### 295.3.3.6 GET\_CURSOR Function

Returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the criteria.

#### Syntax

(Optional) Enter syntax information here.

```
GET_CURSOR ()  
RETURN SODA_Cursor_T;
```

#### Return Values

This function returns a `SODA_CURSOR_T` object that can be used to iterate over the documents that match the read operation criteria.

#### Exceptions

`SODA_Error`: If an error occurs while fetching the cursor.

### 295.3.3.7 GET\_DATA\_GUIDE Function

This function gets the data guide.

**Syntax**

```
GET_DATA_GUIDE (  
    format      IN PLS_INTEGER DEFAULT 1,  
    flag        IN PLS_INTEGER DEFAULT 0)  
RETURN CLOB;
```

**Parameters**

**Table 295-20 GET\_DATA\_GUIDE Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>The format of the data guide. This parameter can have one of the following values:</p> <ul style="list-style-type: none"><li>DBMS_SODA.DATAGUIDE_FORMAT_HIERARCHICAL CONSTANT PLS_INTEGER := 1;</li><li>DBMS_SODA.DATAGUIDE_FORMAT_FLAT CONSTANT PLS_INTEGER := 2;</li></ul> <p>The default value is 1.</p>                      |
| flag      | <p>This parameter can have one of the following values:</p> <ul style="list-style-type: none"><li>DBMS_SODA.DATAGUIDE_PRETTY CONSTANT PLS_INTEGER := 1;</li><li>DBMS_SODA.DATAGUIDE_GEOJSON CONSTANT PLS_INTEGER := 2;</li><li>DBMS_SODA.DATAGUIDE_GATHER_STATS CONSTANT PLS_INTEGER := 4;</li></ul> <p>The default value is 0.</p> |

**Return Values**

This function returns the same SODA\_OPERATION\_T object it was invoked on.

295.3.3.8 GET\_ONE Function

Returns a single SODA\_DOCUMENT\_T object that matches the criteria. Note that, if multiple documents match the criteria, only the first document is returned.

**Syntax**

```
GET_ONE (  
    RETURN SODA_Document_T;
```

**Return Values**

The first matching document.

**Exceptions**

Error—If an error occurs while fetching the document.

295.3.3.9 HINT Function

This function sets the hint attribute of the operation.

**Syntax**

```
HINT (  
    hint          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

**Parameters**

**Table 295-21 HINT Function Parameters**

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| hint      | A hint string in Oracle SQL format, with out the enclosing /*+ and */. |

**Return Values**

This function returns the same SODA\_OPERATION\_T object it was invoked on.

295.3.3.10 KEY Function

Specifies that the document with the specified key should be returned. This causes any previous calls made to this function and KEYS(...), when they appear in the same chain, to be ignored. Returns the same SODA\_OPERATION\_T object so that further operation criteria can be chained together, if needed.

**Syntax**

```
KEY (  
    key          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

**Parameters**

**Table 295-22 KEY Function Parameters**

| Parameter | Description                            |
|-----------|----------------------------------------|
| key       | The key to be used for the operations. |

**Return Values**

This function returns the same SODA\_OPERATION\_T object it was invoked on.

295.3.3.11 KEYS Function

Specifies that documents that match the keys supplied to this function should be returned. This causes any previous calls made to this function and key(...), when they appear in the same chain, to be ignored. Returns the same SODA\_OPERATION\_T object, so that further operation criteria can be chained together, if needed.

**Syntax**

```
KEYS (  
    key_List IN SODA_Key_List_T)  
RETURN SODA_Operation_T;
```

## Parameters

**Table 295-23 KEYS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key_list  | The parameter is a SODA_Key_List_T which is a list of VARCHAR2 values representing keys.<br><br>Assuming key_list is a variable of type SODA_Key_List_T, it can be initialized as follows:<br><br>key_list := SODA_Key_List_T('key1', 'key2', 'key3', etc); |

## Return Values

This function returns the same SODA\_OPERATION\_T object it was invoked on.

### 295.3.3.12 LIMIT Function

This function sets a limit on the specified number of documents the operation should return. This setting is only usable for read operations such as GET\_CURSOR. For write operations, any value set using this method is ignored. Returns the same SODA\_OPERATION\_T object so that further operation criteria can be chained together, if needed.

## Syntax

```
LIMIT (  
    limit          IN NUMBER)  
RETURN SODA_Operation_T;
```

## Parameters

**Table 295-24 LIMIT Function Parameters**

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| limit     | A limit on the number of results returned by read operations. |

## Return Values

This function returns the same SODA\_OPERATION\_T object it was invoked on.

### 295.3.3.13 REMOVE Function

This function removes all of the documents in the collection that match the criteria. Returns the number of documents that was removed.

## Syntax

```
REMOVE (  
    RETURN NUMBER;
```

## Return Values

This function returns the number of matching documents that were removed in the operation.

## Exceptions

**Error**—If an error occurs while removing the documents.

### 295.3.3.14 REPLACE\_ONE Function

This function replaces a single document in the collection with the specified document. Returns a number that indicates if the document was replaced or not. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

## Syntax

```
REPLACE_ONE (  
    document IN SODA_Document_T)  
RETURN NUMBER;
```

## Parameters

**Table 295-25 REPLACE\_ONE Function Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| document  | The document object with the new content and media type to be used for replacement. |

## Return Values

This function returns a number—1 if the document was replaced, 0 otherwise.

## Exceptions

**Error**—If an error occurs while updating the collection.

### 295.3.3.15 REPLACE\_ONE\_AND\_GET Function

Replaces a single document in the collection with the specified document. Returns a result document if the document was replaced, `NULL` otherwise. Currently, before calling this function, you must call the function `KEY(...)` to uniquely identify the document being replaced. This function is similar to `REPLACE_ONE`. The only difference is that `REPLACE_ONE_AND_GET` also returns the result document with updated components, such as version and last-modified timestamp. The result document does not contain the content component. Any components set in the input document with the exception of content and media type are not used during the replace. They are ignored.

## Syntax

```
REPLACE_ONE_AND_GET (  
    document IN SODA_Document_T)  
RETURN SODA_Document_T;
```

Parameters

Table 295-26 REPLACE\_ONE\_AND\_GET Function Parameters

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| document  | The document object with the new content and media type to be used for replacement. |

Return Values

The function returns the result document containing all document components supported by the given collection, with the exception of content. Last-modified and version components, if supported by the given collection, will be updated with new values. If no document in the collection had the supplied key, `NULL` is returned instead of the result document.

Exceptions

Error—If an error occurs while updating the collection

295.3.3.16 SAMPLE Function

This function sets the sampling parameters to be used for the operation.

Syntax

```
SAMPLE (  
    pct      IN    DOUBLE,  
    seed     IN    NUMBER          DEFAULT NULL,  
    method  IN    PLS_INTEFER DEFAULT DBMS_SODA.SAMPLE_ROW)  
RETURN SODA_Operation_T;
```

Parameters

Table 295-27 SAMPLE Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pct       | <p>The percentage of the total documents or block count to be included in the sample. The value must be in the range .000001 to, but not including, 100.</p> <p>This percentage indicates the probability of each row or each cluster of rows in the case of block sampling, being selected as part of the sample. It does not mean that the database will retrieve exactly the percentage of documents in the collection.</p> |
| seed      | <p>Specify this attribute to instruct the database to attempt to return the same sample from one execution to the next.</p> <p>The seed value must be an integer between 0 and 4294967295. If you omit this attribute, then the resulting sample will change from one execution to the next.</p>                                                                                                                               |

**Table 295-27 (Cont.) SAMPLE Function Parameters**

| Parameter | Description                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method    | The type of sampling method to be used. Valid values are: <ul style="list-style-type: none"><li>• DBMS_SODA.SAMPLE_ROW</li><li>• DBMS_SODA.SAMPLE_BLOCK</li></ul> |

**Return Values**

This function returns the `SELF` operation object.

### 295.3.3.17 SKIP Function

This function sets the number of documents that match the operation criteria that will be skipped from the operation result. This setting is only usable for read operations such as `GET_CURSOR`. For write operations, any value set using this method is ignored. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

**Syntax**

```
SKIP (  
    offset          IN NUMBER)  
RETURN SODA_Operation_T;
```

**Parameters****Table 295-28 SKIP Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| offset    | The number of documents to skip. |

**Return Values**

This function returns the same `SODA_OPERATION_T` object it was invoked on

### 295.3.3.18 VERSION Function

This function specifies that only documents with the supplied version should be returned. Typically, this is chained together with `KEY(...)` to implement optimistic locking for write operations such as `REMOVE` and `REPLACE`. Returns the same `SODA_OPERATION_T` object so that further operation criteria can be chained together, if needed.

**Syntax**

```
VERSION (  
    version          IN VARCHAR2)  
RETURN SODA_Operation_T;
```

## Parameters

**Table 295-29** VERSION Function Parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| version   | Document version to be used for the operation. |

## Return Values

This function returns the same `SODA_OPERATION_T` object it was invoked on

## 295.3.4 SODA\_CURSOR\_T Type

This `SODA` type is used to represent a result set of documents.

**Table 295-30** SODA\_CURSOR\_T Type Subprograms

| Subprogram                        | Description                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLOSE Function</a>    | Closes the cursor.                                                                                                    |
| <a href="#">HAS_NEXT Function</a> | Returns <code>TRUE</code> , if the next document is available for the cursor. Otherwise, returns <code>FALSE</code> . |
| <a href="#">NEXT Function</a>     | Returns the next <code>SODA</code> document pointed by the cursor.                                                    |

### 295.3.4.1 CLOSE Function

This function closes the cursor.

#### Syntax

```
CLOSE ()  
RETURN BOOLEAN;
```

#### Example 295-3 Return Values

This function returns a boolean value.

### 295.3.4.2 HAS\_NEXT Function

This function returns `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

#### Syntax

```
HAS_NEXT ()  
RETURN BOOLEAN;
```

#### Return Values

This function returns a boolean value. `TRUE`, if the next document is available for the cursor. Otherwise, returns `FALSE`.

### Exceptions

**Error**—If an error occurs while checking if the next document is available.

## 295.3.4.3 NEXT Function

This function returns the next SODA document pointed by the cursor.

### Syntax

```
NEXT ()  
RETURN SODA_Document_T;
```

### Return Values

This function returns the next SODA document pointed by the cursor. Returns `NULL` when the `HAS_NEXT` function returns `FALSE`.

### Exceptions

**Error**—If an error occurs while getting the next document.

# UTL Streams Types

UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of UTL Binary Streams Types](#)

 **See Also:**

For more information, see Oracle XML DB Developer's Guide

## 296.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

## 296.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

Table 296-1 UTL Streams Types

| Type                                           | Description                       |
|------------------------------------------------|-----------------------------------|
| <a href="#">UTL_BINARYINPUTSTREAM Type</a>     | Reads bytes and closes a stream.  |
| <a href="#">UTL_BINARYOUTPUTSTREAM Type</a>    | Writes bytes and closes a stream. |
| <a href="#">UTL_CHARACTERINPUTSTREAM Type</a>  | Reads chars and closes a stream.  |
| <a href="#">UTL_CHARACTEROUTPUTSTREAM Type</a> | Writes chars and closes a stream. |

### 296.2.1 UTL\_BINARYINPUTSTREAM Type

This type is similar to java.io.InputStream in that it can only read and close a stream.

#### Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (  
  
    MEMBER FUNCTION available (  

```

```

        self    IN OUT NOCOPY  Utl_BinaryInputStream)
    RETURN INTEGER,

    MEMBER FUNCTION read (                                -- #1
        self    IN OUT NOCOPY  Utl_BinaryInputStream,
        numBytes IN            INTEGER DEFAULT 1)
    RETURN RAW,

    MEMBER PROCEDURE read (                                -- #2
        self    IN OUT NOCOPY  Utl_BinaryInputStream,
        bytes    IN OUT NOCOPY RAW,
        numBytes IN OUT        INTEGER),

    MEMBER PROCEDURE read (                                -- #3
        self    IN OUT NOCOPY  Utl_BinaryInputStream,
        bytes    IN OUT NOCOPY RAW,
        offset    IN INTEGER,
        numBytes IN OUT        INTEGER),

    member function close (
        self    In Out Nocopy  Utl_BinaryInputStream)

) NOT FINAL;

```

## Attributes

| Member Subprogram | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVAILABLE         | Returns the number of bytes available to be read                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| READ              | <ul style="list-style-type: none"> <li>#1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a <code>RAW</code>. If there are no remaining bytes a value of <code>NULL</code> is returned.</li> <li>#2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read.</li> <li>#3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.</li> </ul> |
| CLOSE             | Releases all resources held on the node to support the stream                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 296.2.2 UTL\_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

    MEMBER FUNCTION write (                                -- #1
        self    IN OUT NOCOPY  sys.utl_BinaryOutputStream,
        bytes    IN            RAW,
        numBytes IN            INTEGER DEFAULT 1)
    RETURN INTEGER,

    MEMBER PROCEDURE write (                                -- #2
        self    IN OUT NOCOPY  sys.utl_BinaryOutputStream,

```

```

        bytes      IN NOCOPY      RAW,
        numBytes   IN OUT         INTEGER),

    MEMBER PROCEDURE write (
        self       IN OUT NOCOPY utl_BinaryOutputStream,
        bytes      IN NOCOPY      RAW,
        offset     IN              INTEGER,
        numBytes   IN OUT         INTEGER),

    MEMBER PROCEDURE flush (
        self       IN OUT NOCOPY utl_BinaryOutputStream),

    MEMBER PROCEDURE close (
        self       IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;

```

### Attributes

| Member Subprogram | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRITE             | <ul style="list-style-type: none"> <li>#1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from RAW into the stream. The actual number of bytes written is returned.</li> <li>#2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter <code>bytes</code> to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> <li>#3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> </ul> |
| FLUSH             | Insures that any buffered bytes are copied to the node destination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLOSE             | Frees all resources associated with the stream                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 296.2.3 UTL\_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

### Syntax

```

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

    MEMBER FUNCTION available (
        self       IN OUT NOCOPY utl_CharacterInputStream)
    RETURN INTEGER,

    MEMBER FUNCTION read (
        self       IN OUT NOCOPY utl_CharacterInputStream,
        numChars   IN              INTEGER DEFAULT 1,
        lineFeed   IN              BOOLEAN DEFAULT FALSE)
    RETURN VARCHAR2,

    MEMBER PROCEDURE read (
        self       IN OUT NOCOPY utl_CharacterInputStream,
        chars      IN OUT NOCOPY VARCHAR2,
        numChars   IN OUT         INTEGER),

)

```

```

        lineFeed    IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read (                                -- #3
    self          IN OUT NOCOPY    utl_CharacterInputStream,
    chars         IN OUT NOCOPY    VARCHAR2,
    offset        IN                INTEGER,
    numChars      IN OUT           INTEGER,
    lineFeed      IN                BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
    self          IN OUT NOCOPY    utl_CharacterInputStream)
) NOT FINAL;

```

If the value of <code>lineFeed</code> is <code>true</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character .</li> </ul> |
| FLUSH             | Copies all characters that may be contained within buffers to the node value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CLOSE             | Releases all resources held by the stream                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLAGG` SQL function.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#)

## 297.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of `XMLType`.

**Table 297-1 XMLTYPE Subprograms**

| Method                                 | Description                                                                                                                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATENONSCHMABASEDXML</a> | Creates a non schema based XML from the input schema based instance.                                                                                                                                        |
| <a href="#">CREATESCHMABASEDXML</a>    | Creates a schema based <code>XMLType</code> instance from the non-schema based instance using the input schema URL.                                                                                         |
| <a href="#">CREATEXML</a>              | Static function for creating and returning an <code>XMLType</code> instance.                                                                                                                                |
| <a href="#">EXISTSNODE</a>             | Takes a <code>XMLType</code> instance and a <code>XPath</code> and returns 1 or 0 indicating if applying the <code>XPath</code> returns a non-empty set of nodes.                                           |
| <a href="#">EXTRACT</a>                | Takes a <code>XMLType</code> instance and an <code>XPath</code> , applies the <code>XPath</code> expression and returns the results as an <code>XMLType</code> .                                            |
| <a href="#">GETBLOBVAL</a>             | Returns the value of the <code>XMLType</code> instance as a <code>BLOB</code>                                                                                                                               |
| <a href="#">GETCLOBVAL</a>             | Returns the value of the <code>XMLType</code> instance as a <code>CLOB</code> .                                                                                                                             |
| <a href="#">GETNAMESPACE</a>           | Returns the namespace for the top level element in a schema based document.                                                                                                                                 |
| <a href="#">GETNUMBERVAL</a>           | Returns the value of the <code>XMLType</code> instance as a <code>NUMBER</code> . This is only valid if the input <code>XMLType</code> instance contains a simple text node and is convertible to a number. |
| <a href="#">GETROOTELEMENT</a>         | Returns the root element of the input instance. Returns <code>NULL</code> if the instance is a fragment                                                                                                     |
| <a href="#">GETSCHEMAURL</a>           | Returns the XML schema URL if the input is an XML Schema based.                                                                                                                                             |

**Table 297-1 (Cont.) XMLType Subprograms**

| Method                             | Description                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GETSTRINGVAL</a>       | Returns the value of the XMLType instance as a string.                                                                                            |
| <a href="#">ISFRAGMENT</a>         | Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.                    |
| <a href="#">ISSCHEMABASED</a>      | Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.                                                             |
| <a href="#">ISSCHEMAVALID</a>      | Checks if the input instance is schema valid according to the given schema URL.                                                                   |
| <a href="#">ISSCHEMAVALIDATED</a>  | Checks if the instance has been validated against the schema.                                                                                     |
| <a href="#">SCHEMAVALIDATE</a>     | Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.                                 |
| <a href="#">SETSCHEMAVALIDATED</a> | Sets the schema valid flag to avoid costly schema validation.                                                                                     |
| <a href="#">TOOBJECT</a>           | Converts the XMLType instance to an object type.                                                                                                  |
| <a href="#">TRANSFORM</a>          | Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML. |
| <a href="#">XMLTYPE</a>            | Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.                 |

## 297.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

### Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML  
return XMLType deterministic;
```

## 297.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

### Syntax

```
MEMBER FUNCTION createSchemaBasedXML(  
schema IN varchar2 := NULL)  
return XMLType deterministic;
```

**Table 297-2 CREATESCHEMABASEDXML Subprogram Parameters**

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| schema    | Optional XMLSchema URL used to convert the value to the specified schema. |

## 297.1.3 CREATEXML

This static function creates and returns an `XMLType` instance. The string and `CLOB` parameters used to pass in the data must contain well-formed and valid XML documents.

The options are described in the following table.

**Table 297-3 CREATEXML Subprograms**

| Syntax                                                                                                                                                                                                                  | Description                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <pre>STATIC FUNCTION createXML(<br/>    xmlData IN varchar2)<br/>RETURN XMLType deterministic;</pre>                                                                                                                    | Creates the <code>XMLType</code> instance from a string.                                                                      |
| <pre>STATIC FUNCTION createXML(<br/>    xmlData IN clob)<br/>RETURN XMLType deterministic;</pre>                                                                                                                        | Creates the <code>XMLType</code> instance from a <code>CLOB</code> .                                                          |
| <pre>STATIC FUNCTION createXML (<br/>    xmlData IN clob,<br/>    schema IN varchar2,<br/>    validated IN number := 0,<br/>    wellformed IN number := 0 )<br/>RETURN XMLType deterministic;</pre>                     | This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters. |
| <pre>STATIC FUNCTION createXML (<br/>    xmlData IN varchar2,<br/>    schema IN varchar2,<br/>    validated IN number := 0,<br/>    wellformed IN number := 0)<br/>RETURN XMLType deterministic;</pre>                  | This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters. |
| <pre>STATIC FUNCTION createXML (<br/>    xmlData IN "&lt;ADT_1&gt;",<br/>    schema IN varchar2 := NULL,<br/>    element IN varchar2 := NULL,<br/>    validated IN NUMBER := 0)<br/>RETURN XMLType deterministic;</pre> | Creates an XML instance from an instance of an user-defined type.                                                             |
| <pre>STATIC FUNCTION createXML (<br/>    xmlData IN SYS_REFCURSOR,<br/>    schema in varchar2 := NULL,<br/>    element in varchar2 := NULL,<br/>    validated in number := 0)<br/>RETURN XMLType deterministic;</pre>   | Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a <code>CURSOR</code> .           |

**Table 297-3 (Cont.) CREATEXML Subprograms**

| Syntax                                                                                                                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> STATIC FUNCTION createXML (     xmlData IN AnyData,     schema IN varchar2 := NULL,     element IN varchar2 := NULL,     validated IN number := 0) RETURN sys.XMLType deterministic parallel_enable </pre> | <p>Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p> |
| <pre> STATIC FUNCTION createXML (     xmlData IN blob,     csid IN number,     schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0) return sys.XMLType deterministic </pre>          | <p>Creates an XML instance from a BLOB.</p>                                                                                                                                                                                                                                                                                                                                               |
| <pre> STATIC FUNCTION createXML (     xmlData IN bfile,     csid IN number,     Schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0) return sys.XMLType deterministic </pre>         | <p>Creates an XML instance from a BFILE.</p>                                                                                                                                                                                                                                                                                                                                              |

**Table 297-4 CREATEXML Parameters**

| Parameter  | Description                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xmlData    | The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.                                                                                                                                           |
| schema     | Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).                 |
| validated  | Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)                                                                                                                                      |
| wellformed | Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)                                                                                     |
| element    | Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ). |
| csid       | The character set id of input XML data.                                                                                                                                                                                            |

## 297.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

| Syntax                                                                                                                        | Description                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>MEMBER FUNCTION existsNode(<br/>    xpath IN varchar2)<br/>RETURN number deterministic;</pre>                            | Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.                                     |
| <pre>MEMBER FUNCTION existsNode(<br/>    xpath in varchar2,<br/>    nsmap in varchar2)<br/>RETURN number deterministic;</pre> | This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not. |

**Table 297-5 EXISTSNODE Subprogram Parameters**

| Parameter          | Description                   |
|--------------------|-------------------------------|
| <code>xpath</code> | The XPath expression to test. |
| <code>nsmap</code> | Optional namespace mapping.   |

## 297.1.5 EXTRACT

This member function extracts an XMLType fragment and returns an XMLType instance containing the result nodes. If the XPath does not result in any nodes, it then returns `NULL`.

The options are described in the following table.

| Syntax                                                                                                                      | Description                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>MEMBER FUNCTION extract(<br/>    xpath IN varchar2)<br/>RETURN XMLType deterministic;</pre>                            | Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.                                                       |
| <pre>MEMBER FUNCTION extract(<br/>    xpath IN varchar2,<br/>    nsmap IN varchar2)<br/>RETURN XMLType deterministic;</pre> | This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment. |

**Table 297-6 EXTRACT Subprogram Parameters**

| Parameter          | Description                                       |
|--------------------|---------------------------------------------------|
| <code>xpath</code> | The XPath expression to apply.                    |
| <code>nsmap</code> | Optional prefix to namespace mapping information. |

## 297.1.6 GETBLOBVAL

This member function returns a `BLOB` containing the serialized XML representation. If the `BLOB` returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getBlobVal(  
    csid    IN    NUMBER)  
    RETURN BLOB DETERMINISTIC;
```

**Table 297-7** GETBLOBVAL Subprogram Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| <code>csid</code> | The desired character set ID of output <code>BLOB</code> |

## 297.1.7 GETCLOBVAL

This member function returns a `CLOB` containing the serialized XML representation. If the `CLOB` returned is temporary, it must be freed after use. The `CLOBs` returned by this function are read-only.

### Syntax

```
MEMBER FUNCTION getClobVal()  
    RETURN clob deterministic;
```

## 297.1.8 GETNAMESPACE

`GETNAMESPACE` is a member function. It returns the namespace of the top level element in the instance. It returns `NULL` if the input is a fragment or is a non-schema based instance.

### Syntax

```
MEMBER FUNCTION getNamespace  
    return varchar2 deterministic;
```

## 297.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value.

The options are described in the following table.

### Syntax

```
MEMBER FUNCTION getNumberVal()  
    RETURN number deterministic;
```

## 297.1.10 GETROOTELEMENT

this member function gets the root element of the `XMLType` instance. It returns `NULL` if the instance is a fragment.

### Syntax

```
MEMBER FUNCTION getRootElement  
return varchar2 deterministic;
```

## 297.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise, it returns `NULL`.

### Syntax

```
MEMBER FUNCTION getSchemaURL  
return varchar2 deterministic;
```

## 297.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the `VARCHAR2` maximum size (4000), then an error is raised at run time.

### Syntax

```
MEMBER FUNCTION getStringVal()  
RETURN varchar2 deterministic;
```

## 297.1.13 ISFRAGMENT

`ISFRAGMENT` determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

### Syntax

```
MEMBER FUNCTION isFragment()  
RETURN number deterministic;
```

## 297.1.14 ISSCHEMABASED

This member function determines whether the `XMLType` instance is schema-based or not. It returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

### Syntax

```
MEMBER FUNCTION isSchemaBased  
return number deterministic;
```

## 297.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

### Syntax

```
member function isSchemaValid(  
  schurl IN VARCHAR2 := NULL,  
  elem IN VARCHAR2 := NULL)  
return NUMBER deterministic;
```

**Table 297-8 ISSCHEMAVALID Subprogram Parameters**

| Parameter | IN / OUT | Description                                                                                                                                                                                                                  |
|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schurl    | (IN)     | The URL of the XML Schema against which to check conformance.                                                                                                                                                                |
| elem      | (IN)     | Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements. |

## 297.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the XMLType instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

### Syntax

```
MEMBER FUNCTION isSchemaValidated  
return NUMBER deterministic;
```

## 297.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

### Syntax

```
MEMBER PROCEDURE schemaValidate(  
  self IF OUT NOCOPY XMLType);
```

**Table 297-9 SCHEMAVALIDATE Subprogram Parameters**

| Parameter | IN / OUT | Description                                      |
|-----------|----------|--------------------------------------------------|
| self      | (OUT)    | XML instance being validated against the schema. |

## 297.1.18 SETSCHEMAVALIDATED

This member function sets the `VALIDATION` state of the input XML instance.

### Syntax

```
MEMBER PROCEDURE setSchemaValidated(  
  self IF OUT NOCOPY XMLType,  
  flag IN BINARY_INTEGER := 1);
```

**Table 297-10** SERTSSCHEMAVALIDATED Subprogram Parameters

| Parameter | IN / OUT | Description                                |
|-----------|----------|--------------------------------------------|
| self      | (OUT)    | XML instance.                              |
| flag      | (IN)     | 0 - NOT VALIDATED; 1 - VALIDATED (Default) |

## 297.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

### Syntax

```
MEMBER PROCEDURE toObject(  
  SELF in XMLType,  
  object OUT "<ADT_1>",  
  schema in varchar2 := NULL,  
  element in varchar2 := NULL);
```

**Table 297-11** TOOBJECT Subprogram Parameters

| Parameter | IN / OUT | Description                                                                                                                                                                                                                                                                               |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SELF      | (IN)     | Instance to be converted. Implicit if used as a member procedure.                                                                                                                                                                                                                         |
| object    | (IN)     | Converted object. An object instance of the required type may be passed in to this function                                                                                                                                                                                               |
| schema    | (IN)     | Schema URL. The mapping of the <code>XMLType</code> instance to the converted object instance may be specified using a schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).                       |
| element   | (IN)     | Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ). |

## 297.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is `NULL`, then a `NULL` is returned.

**Syntax**

```
MEMBER FUNCTION transform(
  xsl IN XMLType,
  parammap IN VARCHAR2 := NULL)
RETURN XMLType DETERMINISTIC;
```

**Table 297-12 TRANSFORM Subprogram Parameters**

| Parameter | IN / OUT | Description                                                  |
|-----------|----------|--------------------------------------------------------------|
| xsl       | (IN)     | The XSL stylesheet describing the transformation             |
| parammap  | (IN)     | Top level parameters to the XSL - string of name=value pairs |

## 297.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.

**Table 297-13 XMLTYPE Member Subprogram Parameters**

| Syntax                                                                                                                                                                                                 | Description                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <pre>constructor function XMLType(   xmlData IN CLOB,   schema IN VARCHAR2 := NULL,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return self as result DETERMINISTIC;</pre>                | This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters. |
| <pre>constructor function XMLType(   xmlData IN VARCHAR2,   schema IN VARCHAR2 := NULL,   validated IN NUMBER := 0,   wellformed IN NUMBER := 0) return self as result DETERMINISTIC;</pre>            | This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters. |
| <pre>constructor function XMLType (   xmlData IN "w&lt;ADT_1&gt;",   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) return self as result DETERMINISTIC;</pre> | This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.           |
| <pre>constructor function XMLType(   xmlData IN SYS_REFCURSOR,   schema IN VARCHAR2 := NULL,   element IN VARCHAR2 := NULL,   validated IN NUMBER := 0) return self as result DETERMINISTIC;</pre>     | This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.            |

**Table 297-13 (Cont.) XMLTYPE Member Subprogram Parameters**

| Syntax                                                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> constructor function XMLType(     xmlData IN AnyData,     schema IN varchar2 := NULL,     element IN varchar2 := NULL,     validated IN number := 0) return self as result deterministic parallel_enable </pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p> |
| <pre> constructor function XMLType(     xmlData IN blob, csid IN number,     schema IN varchar2 := NULL,     validated IN number := 0,     wellformed IN number := 0) return self as result deterministic </pre>      | <p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>                                                                                                                                                                                                                                                                                                                                                 |
| <pre> constructor function XMLType(     xmlData IN bfile,     csid IN number,     schema IN varchar2 := NULL,     validated IN number := 0,     wellformed IN number := 0) return self as result deterministic </pre> | <p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>                                                                                                                                                                                                                                                                                                                                                |

**Table 297-14 XMLTYPE Constructor Subprogram Parameters**

| Parameter  | Description                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xmlData    | The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.                                                                                                                                                        |
| schema     | Optional Schema URL to be used to make the input conform to the given schema. <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ).                 |
| validated  | Indicates that the instance is valid to the given XML Schema.                                                                                                                                                                      |
| wellformed | Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.                                                                                                           |
| element    | Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL). <b>Caution:</b> Oracle does not support use of types generated by Schema Registration (see <i>Oracle XML DB Developer's Guide</i> ). |
| csid       | The character set id of input XML data.                                                                                                                                                                                            |
