## PL/SQL Packages and Types Reference

19c  
E96430-32  
July 2025

ORACLE®

Contributing Authors: Prashant Kannan, Louise Morin, Denis Raphaely, Lance Ashdown, Drue Baker, Donna Carver, Maitreyee Chaliha, Beethoven Cheng, Rhonda Day, Steve Fogel, Bryn Llewellyn, Paul Lane, David McDermid, Tony Morales, Anne Murphy, Chuck Murray, Sue Pelski, Kathy Rich, Antonio Romero, Vivian Schupmann, Cathy Shea, Margaret Taft, Kathy Taylor, Randy Urbano, Pat Huey, Drew Adams, Sarika Surumpudi, Rodney Ward, Rajesh Bhatiya, Tanmay Choudhury, Roopesh Ashok Kumar, Atif Chaudhry

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

## Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

---

|                                                      |       |
|------------------------------------------------------|-------|
| Changes in Oracle Database Release 19c, Version 19.1 | cxlii |
|------------------------------------------------------|-------|

## 1 Introduction to Oracle Supplied PL/SQL Packages & Types

---

|                                                          |     |
|----------------------------------------------------------|-----|
| 1.1 Package Overview                                     | 1-1 |
| 1.1.1 Package Components                                 | 1-2 |
| 1.1.2 Using Oracle Supplied Packages                     | 1-2 |
| 1.1.3 Creating New Packages                              | 1-2 |
| 1.1.3.1 Separating the Specification and Body            | 1-3 |
| 1.1.4 Referencing Package Contents                       | 1-5 |
| 1.2 Summary of Oracle Supplied PL/SQL Packages and Types | 1-5 |

## 2 Oracle Application Express Packages APEX\_APPLICATION Through APEX\_ZIP

---

## 3 CTX\_ADM

---

## 4 CTX\_ANL

---

## 5 CTX\_CLS

---

|         |                                        |       |
|---------|----------------------------------------|-------|
| 6       | CTX_DDL                                |       |
| 7       | CTX_DOC                                |       |
| 8       | CTX_ENTITY                             |       |
| 9       | CTX_OUTPUT                             |       |
| 10      | CTX_QUERY                              |       |
| 11      | CTX_REPORT                             |       |
| 12      | CTX_THES                               |       |
| 13      | CTX_ULEXER                             |       |
| 14      | DBMS_ADDM                              |       |
| 14.1    | DBMS_ADDM Security Model               | 14-1  |
| 14.2    | Summary of DBMS_ADDM Subprograms       | 14-1  |
| 14.2.1  | ANALYZE_DB Procedure                   | 14-2  |
| 14.2.2  | ANALYZE_INST Procedure                 | 14-3  |
| 14.2.3  | ANALYZE_PARTIAL Procedure              | 14-5  |
| 14.2.4  | COMPARE_CAPTURE_REPLAY_REPORT Function | 14-6  |
| 14.2.5  | COMPARE_DATABASES Function             | 14-6  |
| 14.2.6  | COMPARE_INSTANCES Function             | 14-7  |
| 14.2.7  | COMPARE_REPLAY_REPLAY_REPORT Function  | 14-8  |
| 14.2.8  | DELETE Procedure                       | 14-9  |
| 14.2.9  | DELETE_FINDING_DIRECTIVE Procedure     | 14-9  |
| 14.2.10 | DELETE_PARAMETER_DIRECTIVE Procedure   | 14-10 |
| 14.2.11 | DELETE_SEGMENT_DIRECTIVE Procedure     | 14-10 |
| 14.2.12 | DELETE_SQL_DIRECTIVE Procedure         | 14-11 |

|         |                                      |       |
|---------|--------------------------------------|-------|
| 14.2.13 | GET_ASH_QUERY Function               | 14-11 |
| 14.2.14 | GET_REPORT Function                  | 14-12 |
| 14.2.15 | INSERT_FINDING_DIRECTIVE Procedure   | 14-12 |
| 14.2.16 | INSERT_PARAMETER_DIRECTIVE Procedure | 14-13 |
| 14.2.17 | INSERT_SEGMENT_DIRECTIVE Procedure   | 14-14 |
| 14.2.18 | INSERT_SQL_DIRECTIVE Procedure       | 14-15 |
| 14.2.19 | REAL_TIME_ADDM_REPORT Function       | 14-16 |

## 15 DBMS\_ADVANCED\_REWRITE

---

|        |                                              |      |
|--------|----------------------------------------------|------|
| 15.1   | DBMS_ADVANCED_REWRITE Security Model         | 15-1 |
| 15.2   | Summary of DBMS_ADVANCED_REWRITE Subprograms | 15-1 |
| 15.2.1 | ALTER_REWRITE_EQUIVALENCE Procedure          | 15-2 |
| 15.2.2 | BUILD_SAFE_REWRITE_EQUIVALENCE Procedure     | 15-3 |
| 15.2.3 | DECLARE_REWRITE_EQUIVALENCE Procedures       | 15-3 |
| 15.2.4 | DROP_REWRITE_EQUIVALENCE Procedure           | 15-5 |
| 15.2.5 | VALIDATE_REWRITE_EQUIVALENCE Procedure       | 15-6 |

## 16 DBMS\_ADVISOR

---

|         |                                     |       |
|---------|-------------------------------------|-------|
| 16.1    | DBMS_ADVISOR Deprecated Subprograms | 16-1  |
| 16.2    | DBMS_ADVISOR Security Model         | 16-2  |
| 16.3    | Summary of DBMS_ADVISOR Subprograms | 16-2  |
| 16.3.1  | ADD_SQLWKLD_REF Procedure           | 16-5  |
| 16.3.2  | ADD_SQLWKLD_STATEMENT Procedure     | 16-6  |
| 16.3.3  | ADD_STS_REF Procedure               | 16-8  |
| 16.3.4  | CANCEL_TASK Procedure               | 16-9  |
| 16.3.5  | COPY_SQLWKLD_TO_STS Procedure       | 16-10 |
| 16.3.6  | CREATE_FILE Procedure               | 16-11 |
| 16.3.7  | CREATE_OBJECT Procedure             | 16-12 |
| 16.3.8  | CREATE_SQLWKLD Procedure            | 16-14 |
| 16.3.9  | CREATE_TASK Procedures              | 16-15 |
| 16.3.10 | DELETE_SQLWKLD Procedure            | 16-17 |
| 16.3.11 | DELETE_SQLWKLD_REF Procedure        | 16-18 |
| 16.3.12 | DELETE_SQLWKLD_STATEMENT Procedure  | 16-19 |
| 16.3.13 | DELETE_STS_REF Procedure            | 16-20 |
| 16.3.14 | DELETE_TASK Procedure               | 16-21 |
| 16.3.15 | EXECUTE_TASK Procedure              | 16-21 |
| 16.3.16 | GET_REC_ATTRIBUTES Procedure        | 16-23 |
| 16.3.17 | GET_TASK_REPORT Function            | 16-24 |
| 16.3.18 | GET_TASK_SCRIPT Function            | 16-25 |
| 16.3.19 | IMPLEMENT_TASK Procedure            | 16-26 |

|         |                                         |       |
|---------|-----------------------------------------|-------|
| 16.3.20 | IMPORT_SQLWKLD_SCHEMA Procedure         | 16-27 |
| 16.3.21 | IMPORT_SQLWKLD_SQLCACHE Procedure       | 16-28 |
| 16.3.22 | IMPORT_SQLWKLD_STS Procedure            | 16-30 |
| 16.3.23 | IMPORT_SQLWKLD_SUMADV Procedure         | 16-31 |
| 16.3.24 | IMPORT_SQLWKLD_USER Procedure           | 16-33 |
| 16.3.25 | INTERRUPT_TASK Procedure                | 16-34 |
| 16.3.26 | MARK_RECOMMENDATION Procedure           | 16-35 |
| 16.3.27 | QUICK_TUNE Procedure                    | 16-36 |
| 16.3.28 | RESET_SQLWKLD Procedure                 | 16-38 |
| 16.3.29 | RESET_TASK Procedure                    | 16-39 |
| 16.3.30 | SET_DEFAULT_SQLWKLD_PARAMETER Procedure | 16-39 |
| 16.3.31 | SET_DEFAULT_TASK_PARAMETER Procedure    | 16-40 |
| 16.3.32 | SET_SQLWKLD_PARAMETER Procedure         | 16-41 |
| 16.3.33 | SET_TASK_PARAMETER Procedure            | 16-43 |
| 16.3.34 | TUNE_MVIEW Procedure                    | 16-57 |
| 16.3.35 | UPDATE_OBJECT Procedure                 | 16-59 |
| 16.3.36 | UPDATE_REC_ATTRIBUTES Procedure         | 16-61 |
| 16.3.37 | UPDATE_SQLWKLD_ATTRIBUTES Procedure     | 16-62 |
| 16.3.38 | UPDATE_SQLWKLD_STATEMENT Procedure      | 16-63 |
| 16.3.39 | UPDATE_TASK_ATTRIBUTES Procedure        | 16-65 |

## 17 DBMS\_ALERT

---

|        |                                   |      |
|--------|-----------------------------------|------|
| 17.1   | DBMS_ALERT Overview               | 17-1 |
| 17.2   | DBMS_ALERT Security Model         | 17-1 |
| 17.3   | DBMS_ALERT Constants              | 17-1 |
| 17.4   | DBMS_ALERT Restrictions           | 17-2 |
| 17.5   | DBMS_ALERT Exceptions             | 17-2 |
| 17.6   | DBMS_ALERT Operational Notes      | 17-2 |
| 17.7   | DBMS_ALERT Examples               | 17-3 |
| 17.8   | Summary of DBMS_ALERT Subprograms | 17-4 |
| 17.8.1 | REGISTER Procedure                | 17-4 |
| 17.8.2 | REMOVE Procedure                  | 17-5 |
| 17.8.3 | REMOVEALL Procedure               | 17-5 |
| 17.8.4 | SET_DEFAULTS Procedure            | 17-5 |
| 17.8.5 | SIGNAL Procedure                  | 17-6 |
| 17.8.6 | WAITANY Procedure                 | 17-6 |
| 17.8.7 | WAITONE Procedure                 | 17-7 |

## 18 DBMS\_APP\_CONT

---

|        |                                      |      |
|--------|--------------------------------------|------|
| 18.1   | DBMS_APP_CONT Overview               | 18-1 |
| 18.2   | DBMS_APP_CONT Security Model         | 18-2 |
| 18.3   | Summary of DBMS_APP_CONT Subprograms | 18-2 |
| 18.3.1 | APPLY_REPLAY_RULE Procedure          | 18-2 |
| 18.3.2 | GET_LTXID_OUTCOME Procedure          | 18-3 |
| 18.3.3 | GET_REPLAY_RULES Function            | 18-4 |
| 18.3.4 | RESET_REPLAY_RULES Procedure         | 18-5 |

## 19 DBMS\_APP\_CONT\_ADMIN

---

|        |                                            |      |
|--------|--------------------------------------------|------|
| 19.1   | DBMS_APP_CONT_ADMIN Security Model         | 19-1 |
| 19.2   | Summary of DBMS_APP_CONT_ADMIN Subprograms | 19-1 |
| 19.2.1 | ACCHK_PURGE Procedure                      | 19-1 |
| 19.2.2 | ACCHK_SET Procedure                        | 19-2 |
| 19.2.3 | ADD_SQL_CONNECTION_TEST Procedure          | 19-4 |
| 19.2.4 | DELETE_SQL_CONNECTION_TEST Procedure       | 19-5 |
| 19.2.5 | DISABLE_CONNECTION_TEST Procedure          | 19-5 |
| 19.2.6 | ENABLE_CONNECTION_TEST Procedure           | 19-6 |

## 20 DBMS\_APP\_CONT\_REPORT

---

|        |                                             |      |
|--------|---------------------------------------------|------|
| 20.1   | DBMS_APP_CONT_REPORT Security Model         | 20-1 |
| 20.2   | Summary of DBMS_APP_CONT_REPORT Subprograms | 20-1 |
| 20.2.1 | ACCHK_REPORT Procedure                      | 20-1 |

## 21 DBMS\_APPLICATION\_INFO

---

|        |                                              |      |
|--------|----------------------------------------------|------|
| 21.1   | DBMS_APPLICATION_INFO Overview               | 21-1 |
| 21.2   | DBMS_APPLICATION_INFO Security Model         | 21-1 |
| 21.3   | DBMS_APPLICATION_INFO Operational Notes      | 21-1 |
| 21.4   | Summary of DBMS_APPLICATION_INFO Subprograms | 21-2 |
| 21.4.1 | READ_CLIENT_INFO Procedure                   | 21-2 |
| 21.4.2 | READ_MODULE Procedure                        | 21-2 |
| 21.4.3 | SET_ACTION Procedure                         | 21-3 |
| 21.4.4 | SET_CLIENT_INFO Procedure                    | 21-4 |
| 21.4.5 | SET_MODULE Procedure                         | 21-5 |
| 21.4.6 | SET_SESSION_LONGOPS Procedure                | 21-5 |

## 22 DBMS\_APPLY\_ADM

---

|         |                                        |       |
|---------|----------------------------------------|-------|
| 22.1    | DBMS_APPLY_ADM Overview                | 22-1  |
| 22.2    | DBMS_APPLY_ADM Security Model          | 22-2  |
| 22.3    | DBMS_APPLY_ADM Deprecated Subprograms  | 22-2  |
| 22.4    | Summary of DBMS_APPLY_ADM Subprograms  | 22-3  |
| 22.4.1  | ALTER_APPLY Procedure                  | 22-4  |
| 22.4.2  | CLEAR_KEY_COLUMNS Procedure            | 22-9  |
| 22.4.3  | COMPARE_OLD_VALUES Procedure           | 22-10 |
| 22.4.4  | CREATE_APPLY Procedure                 | 22-12 |
| 22.4.5  | CREATE_OBJECT_DEPENDENCY Procedure     | 22-18 |
| 22.4.6  | DELETE_ALL_ERRORS Procedure            | 22-19 |
| 22.4.7  | DELETE_ERROR Procedure                 | 22-19 |
| 22.4.8  | DROP_APPLY Procedure                   | 22-20 |
| 22.4.9  | DROP_OBJECT_DEPENDENCY Procedure       | 22-21 |
| 22.4.10 | EXECUTE_ALL_ERRORS Procedure           | 22-22 |
| 22.4.11 | EXECUTE_ERROR Procedure                | 22-23 |
| 22.4.12 | GET_ERROR_MESSAGE Function             | 22-25 |
| 22.4.13 | HANDLE_COLLISIONS                      | 22-27 |
| 22.4.14 | SET_DML_CONFLICT_HANDLER Procedure     | 22-27 |
| 22.4.15 | SET_DML_HANDLER Procedure              | 22-33 |
| 22.4.16 | SET_ENQUEUE_DESTINATION Procedure      | 22-37 |
| 22.4.17 | SET_EXECUTE Procedure                  | 22-39 |
| 22.4.18 | SET_GLOBAL_INSTANTIATION_SCN Procedure | 22-40 |
| 22.4.19 | SET_KEY_COLUMNS Procedures             | 22-43 |
| 22.4.20 | SET_PARAMETER Procedure                | 22-46 |
| 22.4.21 | SET_REPERROR_HANDLER Procedure         | 22-67 |
| 22.4.22 | SET_SCHEMA_INSTANTIATION_SCN Procedure | 22-68 |
| 22.4.23 | SET_TABLE_INSTANTIATION_SCN Procedure  | 22-71 |
| 22.4.24 | SET_UPDATE_CONFLICT_HANDLER Procedure  | 22-73 |
| 22.4.25 | SET_VALUE_DEPENDENCY Procedure         | 22-76 |
| 22.4.26 | START_APPLY Procedure                  | 22-78 |
| 22.4.27 | STOP_APPLY Procedure                   | 22-78 |

## 23 DBMS\_AQ

---

|        |                                |      |
|--------|--------------------------------|------|
| 23.1   | DBMS_AQ Security Model         | 23-1 |
| 23.2   | DBMS_AQ Constants              | 23-2 |
| 23.3   | DBMS_AQ Data Types             | 23-3 |
| 23.4   | DBMS_AQ Operational Notes      | 23-5 |
| 23.5   | Summary of DBMS_AQ Subprograms | 23-5 |
| 23.5.1 | BIND_AGENT Procedure           | 23-6 |

|         |                        |       |
|---------|------------------------|-------|
| 23.5.2  | DEQUEUE Procedure      | 23-7  |
| 23.5.3  | DEQUEUE_ARRAY Function | 23-9  |
| 23.5.4  | ENQUEUE Procedure      | 23-10 |
| 23.5.5  | ENQUEUE_ARRAY Function | 23-11 |
| 23.5.6  | LISTEN Procedures      | 23-12 |
| 23.5.7  | POST Procedure         | 23-13 |
| 23.5.8  | REGISTER Procedure     | 23-14 |
| 23.5.9  | UNBIND_AGENT Procedure | 23-15 |
| 23.5.10 | UNREGISTER Procedure   | 23-15 |

## 24 DBMS\_AQADM

---

|         |                                        |       |
|---------|----------------------------------------|-------|
| 24.1    | DBMS_AQADM Security Model              | 24-1  |
| 24.2    | DBMS_AQADM Constants                   | 24-2  |
| 24.3    | DBMS_AQADM Subprogram Groups           | 24-3  |
| 24.3.1  | DBMS_AQADM Queue Table Subprograms     | 24-3  |
| 24.3.2  | DBMS_AQADM Privilege Subprograms       | 24-4  |
| 24.3.3  | DBMS_AQADM Queue Subprograms           | 24-4  |
| 24.3.4  | DBMS_AQADM Subscriber Subprograms      | 24-5  |
| 24.3.5  | DBMS_AQADM Propagation Subprograms     | 24-5  |
| 24.3.6  | DBMS_AQADM Miscellaneous Subprograms   | 24-5  |
| 24.3.7  | DBMS_AQADM Agent Subprograms           | 24-6  |
| 24.3.8  | DBMS_AQADM Alias Subprograms           | 24-6  |
| 24.4    | Summary of DBMS_AQADM Subprograms      | 24-7  |
| 24.4.1  | ADD_ALIAS_TO_LDAP Procedure            | 24-9  |
| 24.4.2  | ADD_SUBSCRIBER Procedure               | 24-9  |
| 24.4.3  | ALTER_AQ_AGENT Procedure               | 24-10 |
| 24.4.4  | ALTER_PROPAGATION_SCHEDULE Procedure   | 24-11 |
| 24.4.5  | ALTER_QUEUE Procedure                  | 24-12 |
| 24.4.6  | ALTER_QUEUE_TABLE Procedure            | 24-13 |
| 24.4.7  | ALTER_SHARDED_QUEUE Procedure          | 24-14 |
| 24.4.8  | ALTER_SUBSCRIBER Procedure             | 24-15 |
| 24.4.9  | CREATE_AQ_AGENT Procedure              | 24-15 |
| 24.4.10 | CREATE_NP_QUEUE Procedure              | 24-16 |
| 24.4.11 | CREATE_QUEUE Procedure                 | 24-17 |
| 24.4.12 | CREATE_QUEUE_TABLE Procedure           | 24-19 |
| 24.4.13 | CREATE_SHARDED_QUEUE Procedure         | 24-22 |
| 24.4.14 | CREATE_EXCEPTION_QUEUE Procedure       | 24-23 |
| 24.4.15 | DEL_ALIAS_FROM_LDAP Procedure          | 24-23 |
| 24.4.16 | DISABLE_DB_ACCESS Procedure            | 24-24 |
| 24.4.17 | DISABLE_PROPAGATION_SCHEDULE Procedure | 24-24 |
| 24.4.18 | DROP_AQ_AGENT Procedure                | 24-25 |

|         |                                       |       |
|---------|---------------------------------------|-------|
| 24.4.19 | DROP_QUEUE Procedure                  | 24-25 |
| 24.4.20 | DROP_QUEUE_TABLE Procedure            | 24-25 |
| 24.4.21 | DROP_SHARDED_QUEUE Procedure          | 24-26 |
| 24.4.22 | ENABLE_DB_ACCESS Procedure            | 24-27 |
| 24.4.23 | ENABLE_JMS_TYPES Procedure            | 24-27 |
| 24.4.24 | ENABLE_PROPAGATION_SCHEDULE Procedure | 24-28 |
| 24.4.25 | GET_MAX_STREAMS_POOL Procedure        | 24-28 |
| 24.4.26 | GET_MIN_STREAMS_POOL Procedure        | 24-28 |
| 24.4.27 | GET_QUEUE_PARAMETER Procedure         | 24-29 |
| 24.4.28 | GET_WATERMARK Procedure               | 24-31 |
| 24.4.29 | GRANT_QUEUE_PRIVILEGE Procedure       | 24-32 |
| 24.4.30 | GRANT_SYSTEM_PRIVILEGE Procedure      | 24-32 |
| 24.4.31 | MIGRATE_QUEUE_TABLE Procedure         | 24-33 |
| 24.4.32 | PURGE_QUEUE_TABLE Procedure           | 24-34 |
| 24.4.33 | QUEUE_SUBSCRIBERS Function            | 24-35 |
| 24.4.34 | REMOVE_SUBSCRIBER Procedure           | 24-35 |
| 24.4.35 | REVOKE_QUEUE_PRIVILEGE Procedure      | 24-36 |
| 24.4.36 | REVOKE_SYSTEM_PRIVILEGE Procedure     | 24-36 |
| 24.4.37 | SCHEDULE_PROPAGATION Procedure        | 24-37 |
| 24.4.38 | SET_QUEUE_PARAMETER Procedure         | 24-39 |
| 24.4.39 | SET_MAX_STREAMS_POOL Procedure        | 24-42 |
| 24.4.40 | SET_MIN_STREAMS_POOL Procedure        | 24-42 |
| 24.4.41 | SET_WATERMARK Procedure               | 24-43 |
| 24.4.42 | START_QUEUE Procedure                 | 24-43 |
| 24.4.43 | STOP_QUEUE Procedure                  | 24-44 |
| 24.4.44 | UNSCHEDULE_PROPAGATION Procedure      | 24-44 |
| 24.4.45 | UNSET_QUEUE_PARAMETER Procedure       | 24-45 |
| 24.4.46 | VERIFY_QUEUE_TYPES Procedure          | 24-47 |

## 25 DBMS\_AQELM

---

|        |                                   |      |
|--------|-----------------------------------|------|
| 25.1   | DBMS_AQELM Security Model         | 25-1 |
| 25.2   | Summary of DBMS_AQELM Subprograms | 25-1 |
| 25.2.1 | SET_MAILHOST Procedure            | 25-1 |
| 25.2.2 | SET_MAILPORT Procedure            | 25-2 |
| 25.2.3 | SET_SENDFROM Procedure            | 25-2 |

## 26 DBMS\_AQIN

---

|      |                          |      |
|------|--------------------------|------|
| 26.1 | DBMS_AQIN Security Model | 26-1 |
|------|--------------------------|------|

## 27 DBMS\_ASSERT

---

|        |                                    |      |
|--------|------------------------------------|------|
| 27.1   | DBMS_ASSERT Operational Notes      | 27-1 |
| 27.2   | Summary of DBMS_ASSERT Subprograms | 27-1 |
| 27.2.1 | ENQUOTE_LITERAL Function           | 27-2 |
| 27.2.2 | ENQUOTE_NAME Function              | 27-2 |
| 27.2.3 | NOOP Functions                     | 27-4 |
| 27.2.4 | QUALIFIED_SQL_NAME Function        | 27-4 |
| 27.2.5 | SCHEMA_NAME Function               | 27-5 |
| 27.2.6 | SIMPLE_SQL_NAME Function           | 27-5 |
| 27.2.7 | SQL_OBJECT_NAME Function           | 27-6 |

## 28 DBMS\_AUDIT\_MGMT

---

|         |                                                    |       |
|---------|----------------------------------------------------|-------|
| 28.1    | DBMS_AUDIT_MGMT Overview                           | 28-1  |
| 28.2    | DBMS_AUDIT_MGMT Deprecated Subprograms             | 28-2  |
| 28.3    | DBMS_AUDIT_MGMT Security Model                     | 28-2  |
| 28.4    | DBMS_AUDIT_MGMT Constants                          | 28-3  |
| 28.5    | DBMS_AUDIT_MGMT Views                              | 28-4  |
| 28.6    | DBMS_AUDIT_MGMT Subprogram Groups                  | 28-5  |
| 28.6.1  | DBMS_AUDIT_MGMT Audit Trail Management Subprograms | 28-5  |
| 28.6.2  | DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms    | 28-6  |
| 28.7    | Summary of DBMS_AUDIT_MGMT Subprograms             | 28-6  |
| 28.7.1  | ALTER_PARTITION_INTERVAL Procedure                 | 28-8  |
| 28.7.2  | CLEAN_AUDIT_TRAIL Procedure                        | 28-8  |
| 28.7.3  | CLEAR_AUDIT_TRAIL_PROPERTY Procedure               | 28-11 |
| 28.7.4  | CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure             | 28-12 |
| 28.7.5  | CREATE_PURGE_JOB Procedure                         | 28-13 |
| 28.7.6  | DEINIT_CLEANUP Procedure                           | 28-15 |
| 28.7.7  | DROP_OLD_UNIFIED_AUDIT_TABLES Procedure            | 28-16 |
| 28.7.8  | DROP_PURGE_JOB Procedure                           | 28-17 |
| 28.7.9  | FLUSH_UNIFIED_AUDIT_TRAIL Procedure                | 28-17 |
| 28.7.10 | GET_AUDIT_COMMIT_DELAY Function                    | 28-18 |
| 28.7.11 | GET_AUDIT_TRAIL_PROPERTY_VALUE Function            | 28-18 |
| 28.7.12 | GET_LAST_ARCHIVE_TIMESTAMP Function                | 28-19 |
| 28.7.13 | INIT_CLEANUP Procedure                             | 28-20 |
| 28.7.14 | IS_CLEANUP_INITIALIZED Function                    | 28-22 |
| 28.7.15 | LOAD_UNIFIED_AUDIT_FILES Procedure                 | 28-23 |
| 28.7.16 | SET_AUDIT_TRAIL_LOCATION Procedure                 | 28-24 |
| 28.7.17 | SET_AUDIT_TRAIL_PROPERTY Procedure                 | 28-26 |
| 28.7.18 | SET_LAST_ARCHIVE_TIMESTAMP Procedure               | 28-28 |
| 28.7.19 | SET_PURGE_JOB_INTERVAL Procedure                   | 28-30 |

|         |                                          |       |
|---------|------------------------------------------|-------|
| 28.7.20 | SET_PURGE_JOB_STATUS Procedure           | 28-31 |
| 28.7.21 | TRANSFER_UNIFIED_AUDIT_RECORDS Procedure | 28-31 |

## 29 DBMS\_AUDIT\_UTIL

---

|        |                                        |      |
|--------|----------------------------------------|------|
| 29.1   | DBMS_AUDIT_UTIL Overview               | 29-1 |
| 29.2   | DBMS_AUDIT_UTIL Security Model         | 29-1 |
| 29.3   | DBMS_AUDIT_UTIL Views                  | 29-1 |
| 29.4   | Summary of DBMS_AUDIT_UTIL Subprograms | 29-2 |
| 29.4.1 | DECODE_RLS_INFO_ATRAIL_FGA Function    | 29-2 |
| 29.4.2 | DECODE_RLS_INFO_ATRAIL_STD Function    | 29-3 |
| 29.4.3 | DECODE_RLS_INFO_ATRAIL_UNI Function    | 29-4 |
| 29.4.4 | DECODE_RLS_INFO_ATRAIL_XML Function    | 29-5 |

## 30 DBMS\_AUTO\_SQLTUNE

---

|        |                                                 |      |
|--------|-------------------------------------------------|------|
| 30.1   | DBMS_AUTO_SQLTUNE Overview                      | 30-1 |
| 30.2   | DBMS_AUTO_SQLTUNE Security Model                | 30-1 |
| 30.3   | Summary of DBMS_AUTO_SQLTUNE Subprograms        | 30-1 |
| 30.3.1 | EXECUTE_AUTO_TUNING_TASK Function and Procedure | 30-2 |
| 30.3.2 | REPORT_AUTO_TUNING_TASK Function                | 30-3 |
| 30.3.3 | SET_AUTO_TUNING_TASK_PARAMETER Procedures       | 30-4 |

## 31 DBMS\_AUTO\_INDEX

---

|        |                                        |      |
|--------|----------------------------------------|------|
| 31.1   | DBMS_AUTO_INDEX Overview               | 31-1 |
| 31.2   | Summary of DBMS_AUTO_INDEX Subprograms | 31-1 |
| 31.2.1 | CONFIGURE Procedure                    | 31-1 |
| 31.2.2 | DROP_AUTO_INDEXES Procedure            | 31-5 |
| 31.2.3 | DROP_SECONDARY_INDEXES Procedure       | 31-6 |
| 31.2.4 | REPORT_ACTIVITY Function               | 31-7 |
| 31.2.5 | REPORT_LAST_ACTIVITY Function          | 31-9 |

## 32 DBMS\_AUTO\_REPORT

---

|        |                                         |      |
|--------|-----------------------------------------|------|
| 32.1   | DBMS_AUTO_REPORT Overview               | 32-1 |
| 32.2   | DBMS_AUTO_REPORT Security Model         | 32-1 |
| 32.3   | Summary of DBMS_AUTO_REPORT Subprograms | 32-1 |
| 32.3.1 | FINISH_REPORT_CAPTURE Procedure         | 32-2 |
| 32.3.2 | REPORT_REPOSITORY_DETAIL Function       | 32-2 |
| 32.3.3 | REPORT_REPOSITORY_DETAIL_XML Function   | 32-3 |
| 32.3.4 | REPORT_REPOSITORY_LIST_XML Function     | 32-3 |

## 33 DBMS\_AUTO\_TASK\_ADMIN

---

|        |                                             |      |
|--------|---------------------------------------------|------|
| 33.1   | DBMS_AUTO_TASK_ADMIN Deprecated Subprograms | 33-1 |
| 33.2   | DBMS_AUTO_TASK_ADMIN Security Model         | 33-1 |
| 33.3   | DBMS_AUTO_TASK_ADMIN Constants              | 33-1 |
| 33.4   | Summary of DBMS_AUTO_TASK_ADMIN Subprograms | 33-2 |
| 33.4.1 | DISABLE Procedures                          | 33-2 |
| 33.4.2 | ENABLE Procedures                           | 33-3 |
| 33.4.3 | GET_CLIENT_ATTRIBUTES Procedure             | 33-4 |
| 33.4.4 | GET_P1_RESOURCES Procedure                  | 33-4 |
| 33.4.5 | OVERRIDE_PRIORITY Procedures                | 33-5 |
| 33.4.6 | SET_CLIENT_SERVICE Procedure                | 33-6 |
| 33.4.7 | SET_P1_RESOURCES Procedure                  | 33-6 |

## 34 DBMS\_AW\_STATS

---

|        |                                      |      |
|--------|--------------------------------------|------|
| 34.1   | Using DBMS_AW_STATS                  | 34-1 |
| 34.2   | Summary of DBMS_AW_STATS Subprograms | 34-1 |
| 34.2.1 | ANALYZE Procedure                    | 34-1 |
| 34.2.2 | CLEAR Procedure                      | 34-4 |

## 35 DBMS\_BLOCKCHAIN\_TABLE

---

|        |                                              |      |
|--------|----------------------------------------------|------|
| 35.1   | DBMS_BLOCKCHAIN_TABLE Overview               | 35-1 |
| 35.2   | DBMS_BLOCKCHAIN_TABLE Security Model         | 35-2 |
| 35.3   | Summary of DBMS_BLOCKCHAIN_TABLE Subprograms | 35-2 |
| 35.3.1 | DELETE_EXPIRED_ROWS Procedure                | 35-3 |
| 35.3.2 | GET_BYTES_FOR_ROW_HASH Procedure             | 35-3 |
| 35.3.3 | GET_BYTES_FOR_ROW_SIGNATURE Procedure        | 35-4 |
| 35.3.4 | GET_SIGNED_BLOCKCHAIN_DIGEST Function        | 35-5 |
| 35.3.5 | SIGN_ROW Procedure                           | 35-6 |
| 35.3.6 | VERIFY_ROWS Procedure                        | 35-7 |
| 35.3.7 | VERIFY_TABLE_BLOCKCHAIN Procedure            | 35-9 |

## 36 DBMS\_CAPTURE\_ADM

---

|        |                                         |      |
|--------|-----------------------------------------|------|
| 36.1   | DBMS_CAPTURE_ADM Overview               | 36-1 |
| 36.2   | DBMS_CAPTURE_ADM Security Model         | 36-1 |
| 36.3   | Summary of DBMS_CAPTURE_ADM Subprograms | 36-2 |
| 36.3.1 | ABORT_GLOBAL_INSTANTIATION Procedure    | 36-3 |

|         |                                        |       |
|---------|----------------------------------------|-------|
| 36.3.2  | ABORT_SCHEMA_INSTANTIATION Procedure   | 36-4  |
| 36.3.3  | ABORT_SYNC_INSTANTIATION Procedure     | 36-5  |
| 36.3.4  | ABORT_TABLE_INSTANTIATION Procedure    | 36-5  |
| 36.3.5  | ALTER_CAPTURE Procedure                | 36-6  |
| 36.3.6  | ALTER_SYNC_CAPTURE Procedure           | 36-11 |
| 36.3.7  | BUILD Procedure                        | 36-12 |
| 36.3.8  | CREATE_CAPTURE Procedure               | 36-13 |
| 36.3.9  | CREATE_SYNC_CAPTURE Procedure          | 36-22 |
| 36.3.10 | DROP_CAPTURE Procedure                 | 36-24 |
| 36.3.11 | INCLUDE_EXTRA_ATTRIBUTE Procedure      | 36-25 |

## 57 DBMS\_DDL

---

|        |                                         |      |
|--------|-----------------------------------------|------|
| 57.1   | DBMS_DDL Deprecated Subprograms         | 57-1 |
| 57.2   | DBMS_DDL Security Model                 | 57-1 |
| 57.3   | DBMS_DDL Operational Notes              | 57-1 |
| 57.4   | Summary of DBMS_DDL Subprograms         | 57-1 |
| 57.4.1 | ALTER_COMPILE Procedure                 | 57-2 |
| 57.4.2 | ALTER_TABLE_NOT_REFERENCEABLE Procedure | 57-3 |
| 57.4.3 | ALTER_TABLE_REFERENCEABLE Procedure     | 57-4 |
| 57.4.4 | CREATE_WRAPPED Procedures               | 57-4 |
| 57.4.5 | IS_TRIGGER_FIRE_ONCE Function           | 57-6 |

|        |                                        |      |
|--------|----------------------------------------|------|
| 57.4.6 | SET_TRIGGER_FIRING_PROPERTY Procedures | 57-7 |
| 57.4.7 | WRAP Functions                         | 57-8 |

## 58 DBMS\_DEBUG

---

|         |                                   |       |
|---------|-----------------------------------|-------|
| 58.1    | DBMS_DEBUG Overview               | 58-1  |
| 58.2    | DBMS_DEBUG Constants              | 58-2  |
| 58.3    | DBMS_DEBUG Variables              | 58-2  |
| 58.4    | DBMS_DEBUG Exceptions             | 58-2  |
| 58.5    | DBMS_DEBUG Operational Notes      | 58-4  |
| 58.6    | DBMS_DEBUG Data Structures        | 58-11 |
| 58.6.1  | BREAKPOINT_INFO Record Type       | 58-11 |
| 58.6.2  | PROGRAM_INFO Record Type          | 58-12 |
| 58.6.3  | RUNTIME_INFO Record Type          | 58-13 |
| 58.6.4  | BACKTRACE_TABLE Table Type        | 58-13 |
| 58.6.5  | BREAKPOINT_TABLE Table Type       | 58-13 |
| 58.6.6  | INDEX_TABLE Table Type            | 58-14 |
| 58.6.7  | VC2_TABLE Table Type              | 58-14 |
| 58.7    | Summary of DBMS_DEBUG Subprograms | 58-14 |
| 58.7.1  | ATTACH_SESSION Procedure          | 58-15 |
| 58.7.2  | CONTINUE Function                 | 58-16 |
| 58.7.3  | DEBUG_OFF Procedure               | 58-16 |
| 58.7.4  | DEBUG_ON Procedure                | 58-17 |
| 58.7.5  | DELETE_BREAKPOINT Function        | 58-17 |
| 58.7.6  | DELETE_OER_BREAKPOINT Function    | 58-18 |
| 58.7.7  | DETACH_SESSION Procedure          | 58-18 |
| 58.7.8  | DISABLE_BREAKPOINT Function       | 58-18 |
| 58.7.9  | ENABLE_BREAKPOINT Function        | 58-19 |
| 58.7.10 | EXECUTE Procedure                 | 58-20 |
| 58.7.11 | GET_INDEXES Function              | 58-21 |
| 58.7.12 | GET_MORE_SOURCE Procedure         | 58-22 |
| 58.7.13 | GET_LINE_MAP Function             | 58-23 |
| 58.7.14 | GET_RUNTIME_INFO Function         | 58-24 |
| 58.7.15 | GET_TIMEOUT_BEHAVIOUR Function    | 58-24 |
| 58.7.16 | GET_VALUE Function                | 58-25 |
| 58.7.17 | INITIALIZE Function               | 58-27 |
| 58.7.18 | PING Procedure                    | 58-28 |
| 58.7.19 | PRINT_BACKTRACE Procedure         | 58-28 |
| 58.7.20 | PRINT_INSTANTIATIONS Procedure    | 58-29 |
| 58.7.21 | PROBE_VERSION Procedure           | 58-30 |
| 58.7.22 | SELF_CHECK Procedure              | 58-30 |
| 58.7.23 | SET_BREAKPOINT Function           | 58-31 |

|         |                                  |       |
|---------|----------------------------------|-------|
| 58.7.24 | SET_OER_BREAKPOINT Function      | 58-32 |
| 58.7.25 | SET_TIMEOUT Function             | 58-32 |
| 58.7.26 | SET_TIMEOUT_BEHAVIOUR Procedure  | 58-33 |
| 58.7.27 | SET_VALUE Function               | 58-33 |
| 58.7.28 | SHOW_BREAKPOINTS Procedures      | 58-35 |
| 58.7.29 | SHOW_FRAME_SOURCE Procedure      | 58-35 |
| 58.7.30 | SHOW_SOURCE Procedures           | 58-36 |
| 58.7.31 | SYNCHRONIZE Function             | 58-37 |
| 58.7.32 | TARGET_PROGRAM_RUNNING Procedure | 58-38 |

## 59 DBMS\_DEBUG\_JDWP

---

|        |                                     |      |
|--------|-------------------------------------|------|
| 59.1   | DBMS_DEBUG_JDWP Overview            | 59-1 |
| 59.2   | DBMS_DEBUG_JDWP Security Model      | 59-1 |
| 59.3   | Summary DBMS_DEBUG_JDWP Subprograms | 59-2 |
| 59.3.1 | CONNECT_TCP Procedure               | 59-2 |
| 59.3.2 | CURRENT_SESSION_ID Function         | 59-4 |
| 59.3.3 | CURRENT_SESSION_SERIAL Function     | 59-4 |
| 59.3.4 | DISCONNECT Procedure                | 59-4 |
| 59.3.5 | GET-NLS_PARAMETER Function          | 59-5 |
| 59.3.6 | PROCESS_CONNECT_STRING Procedure    | 59-5 |
| 59.3.7 | SET-NLS_PARAMETER Procedure         | 59-6 |

## 60 DBMS\_DEBUG\_JDWP\_CUSTOM

---

|        |                                            |      |
|--------|--------------------------------------------|------|
| 60.1   | DBMS_DEBUG_JDWP_CUSTOM Overview            | 60-1 |
| 60.2   | DBMS_DEBUG_JDWP_CUSTOM Security Model      | 60-1 |
| 60.3   | Summary DBMS_DEBUG_JDWP_CUSTOM Subprograms | 60-1 |
| 60.3.1 | CONNECT_DEBUGGER Procedure                 | 60-2 |

## 61 DBMS\_DESCRIBE

---

|        |                                      |      |
|--------|--------------------------------------|------|
| 61.1   | DBMS_DESCRIBE Overview               | 61-1 |
| 61.2   | DBMS_DESCRIBE Security Model         | 61-1 |
| 61.3   | DBMS_DESCRIBE Types                  | 61-1 |
| 61.4   | DBMS_DESCRIBE Exceptions             | 61-1 |
| 61.5   | DBMS_DESCRIBE Examples               | 61-2 |
| 61.6   | Summary of DBMS_DESCRIBE Subprograms | 61-5 |
| 61.6.1 | DESCRIBE_PROCEDURE Procedure         | 61-5 |

## 62 DBMS\_DEVELOPER

---

|          |                                                       |       |
|----------|-------------------------------------------------------|-------|
| 62.1     | DBMS_DEVELOPER Overview                               | 62-1  |
| 62.2     | DBMS_DEVELOPER Security                               | 62-1  |
| 62.3     | Summary of DBMS_DEVELOPER Subprograms                 | 62-1  |
| 62.3.1   | GET_METADATA Function                                 | 62-2  |
| 62.3.1.1 | JSON Schema for Different Object and Sub-Object Types | 62-22 |

## 63 DBMS\_DG

---

|        |                                   |      |
|--------|-----------------------------------|------|
| 63.1   | Using DBMS_DG                     | 63-1 |
| 63.2   | DBMS_DG Security Model            | 63-1 |
| 63.3   | Summary of the DBMS_DG Subprogram | 63-2 |
| 63.3.1 | INITIATE_FS_FAILOVER Procedure    | 63-2 |

## 64 DBMS\_DICTIONARY\_CHECK

---

|      |                                              |      |
|------|----------------------------------------------|------|
| 64.1 | Overview of Oracle Database Dictionary Check | 64-1 |
| 64.2 | Using DBMS_DICTIONARY_CHECK                  | 64-1 |
| 64.3 | Summary of DBMS_DICTIONARY_CHECK Subprograms | 64-6 |

## 65 DBMS\_DIMENSION

---

|        |                                       |      |
|--------|---------------------------------------|------|
| 65.1   | DBMS_DIMENSION Security Model         | 65-1 |
| 65.2   | Summary of DBMS_DIMENSION Subprograms | 65-1 |
| 65.2.1 | DESCRIBE_DIMENSION Procedure          | 65-1 |
| 65.2.2 | VALIDATE_DIMENSION Procedure          | 65-2 |

## 66 DBMS\_DISTRIBUTED\_TRUST\_ADMIN

---

|        |                                                     |      |
|--------|-----------------------------------------------------|------|
| 66.1   | DBMS_DISTRIBUTED_TRUST_ADMIN Overview               | 66-1 |
| 66.2   | DBMS_DISTRIBUTED_TRUST_ADMIN Security Model         | 66-1 |
| 66.3   | DBMS_DISTRIBUTED_TRUST_ADMIN Examples               | 66-2 |
| 66.4   | Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms | 66-2 |
| 66.4.1 | ALLOW_ALL Procedure                                 | 66-3 |
| 66.4.2 | ALLOW_SERVER Procedure                              | 66-3 |
| 66.4.3 | DENY_ALL Procedure                                  | 66-4 |
| 66.4.4 | DENY_SERVER Procedure                               | 66-4 |

## 67 DBMS\_DNFS

---

|      |                                  |      |
|------|----------------------------------|------|
| 67.1 | DBMS_DNFS Security Model         | 67-1 |
| 67.2 | Summary of DBMS_DNFS Subprograms | 67-1 |

|        |                                        |      |
|--------|----------------------------------------|------|
| 67.2.1 | CLONEDB_RENAMEFILE Procedure           | 67-1 |
| 67.2.2 | RESTORE_DATAFILE_PERMISSIONS Procedure | 67-2 |
| 67.2.3 | UNMOUNTVOLUME Procedure                | 67-2 |

## 68 DBMS\_DST

---

|         |                                 |       |
|---------|---------------------------------|-------|
| 68.1    | DBMS_DST Overview               | 68-1  |
| 68.2    | DBMS_DST Security Model         | 68-1  |
| 68.3    | DBMS_DST Views                  | 68-2  |
| 68.4    | Summary of DBMS_DST Subprograms | 68-2  |
| 68.4.1  | BEGIN_PREPARE Procedure         | 68-3  |
| 68.4.2  | BEGIN_UPGRADE Procedure         | 68-3  |
| 68.4.3  | CREATE_AFFECTED_TABLE Procedure | 68-4  |
| 68.4.4  | CREATE_ERROR_TABLE Procedure    | 68-5  |
| 68.4.5  | CREATE_TRIGGER_TABLE Procedure  | 68-5  |
| 68.4.6  | END_PREPARE Procedure           | 68-6  |
| 68.4.7  | END_UPGRADE Procedure           | 68-6  |
| 68.4.8  | FIND_AFFECTED_TABLES Procedure  | 68-6  |
| 68.4.9  | UPGRADE_DATABASE Procedure      | 68-7  |
| 68.4.10 | UPGRADE_SCHEMA Procedure        | 68-9  |
| 68.4.11 | UPGRADE_TABLE Procedure         | 68-10 |

## 69 DBMS\_EDITIONS\_UTILITIES

---

|        |                                                |      |
|--------|------------------------------------------------|------|
| 69.1   | DBMS_EDITIONS_UTILITIES Overview               | 69-1 |
| 69.2   | DBMS_EDITIONS_UTILITIES Security Model         | 69-1 |
| 69.3   | DBMS_EDITIONS_UTILITIES Exceptions             | 69-1 |
| 69.4   | Summary of DBMS_EDITIONS_UTILITIES Subprograms | 69-1 |
| 69.4.1 | CLEAN_UNUSABLE_EDITIONS Procedure              | 69-2 |
| 69.4.2 | SET_EDITIONING_VIEWS_READ_ONLY Procedure       | 69-2 |
| 69.4.3 | SET_NULL_COLUMN_VALUES_TO_EXPR Procedure       | 69-3 |

## 70 DBMS\_EPG

---

|        |                                    |      |
|--------|------------------------------------|------|
| 70.1   | DBMS_EPG Overview                  | 70-1 |
| 70.2   | DBMS_EPG Security Model            | 70-1 |
| 70.3   | DBMS_EPG Exceptions                | 70-1 |
| 70.4   | DBMS_EPG Data Structures           | 70-2 |
| 70.5   | DBMS_EPG Subprogram Groups         | 70-2 |
| 70.5.1 | DBMS_EPG Configuration Subprograms | 70-2 |
| 70.5.2 | DBMS_EPG Authorization Subprograms | 70-3 |
| 70.6   | Summary of DBMS_EPG Subprograms    | 70-3 |

|         |                                     |       |
|---------|-------------------------------------|-------|
| 70.6.1  | AUTHORIZE_DAD Procedure             | 70-4  |
| 70.6.2  | CREATE_DAD Procedure                | 70-5  |
| 70.6.3  | DEAUTHORIZE_DAD Procedure           | 70-5  |
| 70.6.4  | DELETE_DAD_ATTRIBUTE Procedure      | 70-6  |
| 70.6.5  | DELETE_GLOBAL_ATTRIBUTE Procedure   | 70-6  |
| 70.6.6  | DROP_DAD Procedure                  | 70-7  |
| 70.6.7  | GET_ALL_DAD_ATTRIBUTES Procedure    | 70-7  |
| 70.6.8  | GET_ALL_DAD_MAPPINGS Procedure      | 70-8  |
| 70.6.9  | GET_ALL_GLOBAL_ATTRIBUTES Procedure | 70-9  |
| 70.6.10 | GET_DAD_ATTRIBUTE Function          | 70-9  |
| 70.6.11 | GET_DAD_LIST Procedure              | 70-10 |
| 70.6.12 | GET_GLOBAL_ATTRIBUTE Function       | 70-10 |
| 70.6.13 | MAP_DAD Procedure                   | 70-11 |
| 70.6.14 | SET_DAD_ATTRIBUTE Procedure         | 70-12 |
| 70.6.15 | SET_GLOBAL_ATTRIBUTE Procedure      | 70-14 |
| 70.6.16 | UNMAP_DAD Procedure                 | 70-15 |

## 71 DBMS\_ERRLOG

---

|        |                                    |      |
|--------|------------------------------------|------|
| 71.1   | DBMS_ERRLOG Security Model         | 71-1 |
| 71.2   | Summary of DBMS_ERRLOG Subprograms | 71-1 |
| 71.2.1 | CREATE_ERROR_LOG Procedure         | 71-1 |

## 72 DBMS\_FGA

---

|        |                                 |      |
|--------|---------------------------------|------|
| 72.1   | DBMS_FGA Security Model         | 72-1 |
| 72.2   | DBMS_FGA Operational Notes      | 72-1 |
| 72.3   | Summary of DBMS_FGA Subprograms | 72-1 |
| 72.3.1 | ADD_POLICY Procedure            | 72-2 |
| 72.3.2 | DISABLE_POLICY Procedure        | 72-6 |
| 72.3.3 | DROP_POLICY Procedure           | 72-7 |
| 72.3.4 | ENABLE_POLICY Procedure         | 72-8 |

## 73 DBMS\_FILE\_GROUP

---

|        |                                        |      |
|--------|----------------------------------------|------|
| 73.1   | DBMS_FILE_GROUP Overview               | 73-1 |
| 73.2   | DBMS_FILE_GROUP Security Model         | 73-2 |
| 73.3   | DBMS_FILE_GROUP Constants              | 73-2 |
| 73.4   | Summary of DBMS_FILE_GROUP Subprograms | 73-3 |
| 73.4.1 | ADD_FILE Procedure                     | 73-3 |
| 73.4.2 | ALTER_FILE Procedure                   | 73-5 |
| 73.4.3 | ALTER_FILE_GROUP Procedure             | 73-7 |

|         |                                   |       |
|---------|-----------------------------------|-------|
| 73.4.4  | ALTER_VERSION Procedure           | 73-8  |
| 73.4.5  | CREATE_FILE_GROUP Procedure       | 73-10 |
| 73.4.6  | CREATE_VERSION Procedure          | 73-11 |
| 73.4.7  | DROP_FILE_GROUP Procedure         | 73-12 |
| 73.4.8  | DROP_VERSION Procedure            | 73-12 |
| 73.4.9  | GRANT_OBJECT_PRIVILEGE Procedure  | 73-13 |
| 73.4.10 | GRANT_SYSTEM_PRIVILEGE Procedure  | 73-14 |
| 73.4.11 | PURGE_FILE_GROUP Procedure        | 73-14 |
| 73.4.12 | REMOVE_FILE Procedure             | 73-15 |
| 73.4.13 | REVOKE_OBJECT_PRIVILEGE Procedure | 73-16 |
| 73.4.14 | REVOKE_SYSTEM_PRIVILEGE Procedure | 73-17 |

## 74 DBMS\_FILE\_TRANSFER

---

|        |                                           |      |
|--------|-------------------------------------------|------|
| 74.1   | DBMS_FILE_TRANSFER Overview               | 74-1 |
| 74.2   | DBMS_FILE_TRANSFER Security Model         | 74-1 |
| 74.3   | DBMS_FILE_TRANSFER Operational Notes      | 74-1 |
| 74.4   | Summary of DBMS_FILE_TRANSFER Subprograms | 74-2 |
| 74.4.1 | COPY_FILE Procedure                       | 74-2 |
| 74.4.2 | GET_FILE Procedure                        | 74-4 |

| 79.1.1 | DBMS_GOLDENGATE_ADM Overview               | 79-1 |
| 79.1.2 | DBMS_GOLDENGATE_ADM Security Model         | 79-2 |
| 79.2   | Summary of DBMS_GOLDENGATE_ADM Subprograms | 79-2 |
| 79.2.1 | ADD_AUTO_CDR Procedure                     | 79-3 |

|         |                                        |       |
|---------|----------------------------------------|-------|
| 79.2.2  | ADD_AUTO_CDR_COLUMN_GROUP Procedure    | 79-4  |
| 79.2.3  | ADD_AUTO_CDR_DELTA_RES Procedure       | 79-5  |
| 79.2.4  | ALTER_AUTO_CDR Procedure               | 79-6  |
| 79.2.5  | ALTER_AUTO_CDR_COLUMN_GROUP Procedure  | 79-7  |
| 79.2.6  | DELETE_PROCREP_EXCLUSION_OBJ Procedure | 79-7  |
| 79.2.7  | GG_PROCEDURE_REPLICATION_ON Function   | 79-8  |
| 79.2.8  | INSERT_PROCREP_EXCLUSION_OBJ Procedure | 79-8  |
| 79.2.9  | PURGE_TOMBSTONES Procedure             | 79-9  |
| 79.2.10 | REMOVE_AUTO_CDR Procedure              | 79-9  |
| 79.2.11 | REMOVE_AUTO_CDR_COLUMN_GROUP Procedure | 79-10 |
| 79.2.12 | REMOVE_AUTO_CDR_DELTA_RES Procedure    | 79-10 |

## 80 DBMS\_GOLDENGATE\_AUTH

---

|        |                                             |      |
|--------|---------------------------------------------|------|
| 80.1   | DBMS_GOLDENGATE_AUTH Overview               | 80-1 |
| 80.2   | DBMS_GOLDENGATE_AUTH Security Model         | 80-1 |
| 80.3   | Summary of DBMS_GOLDENGATE_AUTH Subprograms | 80-2 |
| 80.3.1 | GRANT_ADMIN_PRIVILEGE Procedure             | 80-2 |
| 80.3.2 | REVOKE_ADMIN_PRIVILEGE Procedure            | 80-5 |

## 81 DBMS\_HADOOP

---

|        |                                           |      |
|--------|-------------------------------------------|------|
| 81.1   | DBMS_HADOOP Overview                      | 81-1 |
| 81.2   | DBMS_HADOOP Security Model                | 81-1 |
| 81.3   | Summary of DBMS_HADOOP Subprograms        | 81-1 |
| 81.3.1 | CREATE_EXTDDL_FOR_HIVE Procedure          | 81-2 |
| 81.3.2 | CREATE_HYBRID_PARTNED_TABLE Procedure     | 81-3 |
| 81.3.3 | SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure | 81-3 |

## 82 DBMS\_HANG\_MANAGER

---

|        |                                          |      |
|--------|------------------------------------------|------|
| 82.1   | DBMS_HANG_MANAGER Overview               | 82-1 |
| 82.2   | DBMS_HANG_MANAGER Security Model         | 82-1 |
| 82.3   | DBMS_HANG_MANAGER Constants              | 82-1 |
| 82.4   | DBMS_HANG_MANAGER Exceptions             | 82-2 |
| 82.5   | Summary of DBMS_HANG_MANAGER Subprograms | 82-3 |
| 82.5.1 | SET Procedure                            | 82-3 |

## 83 DBMS\_HEAT\_MAP

---

|      |                              |      |
|------|------------------------------|------|
| 83.1 | DBMS_HEAT_MAP Overview       | 83-1 |
| 83.2 | DBMS_HEAT_MAP Security Model | 83-1 |

|        |                                      |      |
|--------|--------------------------------------|------|
| 83.3   | Summary of DBMS_HEAT_MAP Subprograms | 83-1 |
| 83.3.1 | BLOCK_HEAT_MAP Function              | 83-2 |
| 83.3.2 | EXTENT_HEAT_MAP Function             | 83-3 |
| 83.3.3 | OBJECT_HEAT_MAP Function             | 83-4 |
| 83.3.4 | SEGMENT_HEAT_MAP Procedure           | 83-5 |
| 83.3.5 | TABLESPACE_HEAT_MAP Function         | 83-6 |

## 84 DBMS\_HIERARCHY

---

|        |                                       |      |
|--------|---------------------------------------|------|
| 84.1   | DBMS_HIERARCHY Overview               | 84-1 |
| 84.2   | DBMS_HIERARCHY Security Model         | 84-1 |
| 84.3   | Summary of DBMS_HIERARCHY Subprograms | 84-2 |
| 84.3.1 | CREATE_VALIDATE_LOG_TABLE Procedure   | 84-2 |
| 84.3.2 | UPGRADE_VALIDATE_LOG_TABLE Procedure  | 84-3 |
| 84.3.3 | VALIDATE_ANALYTIC_VIEW Function       | 84-4 |
| 84.3.4 | VALIDATE_CHECK_SUCCESS Function       | 84-5 |
| 84.3.5 | VALIDATE_HIERARCHY Function           | 84-6 |

## 85 DBMS\_HM

---

|        |                                |      |
|--------|--------------------------------|------|
| 85.1   | DBMS_HM Security Model         | 85-1 |
| 85.2   | Summary of DBMS_HM Subprograms | 85-1 |
| 85.2.1 | GET_RUN_REPORT Function        | 85-1 |
| 85.2.2 | RUN_CHECK Procedure            | 85-2 |

## 86 DBMS\_HPROF

---

|        |                                   |      |
|--------|-----------------------------------|------|
| 86.1   | DBMS_HPROF Security Model         | 86-1 |
| 86.2   | Summary of DBMS_HPROF Subprograms | 86-1 |
| 86.2.1 | ANALYZE Function                  | 86-2 |
| 86.2.2 | CREATE_TABLES Procedure           | 86-4 |
| 86.2.3 | START_PROFILING Procedure         | 86-4 |
| 86.2.4 | STOP_PROFILING Procedure          | 86-5 |

## 87 DBMS\_HS\_PARALLEL

---

|        |                                         |      |
|--------|-----------------------------------------|------|
| 87.1   | Using the DBMS_HS_PARALLEL Subprogram   | 87-1 |
| 87.2   | Summary of DBMS_HS_PARALLEL Subprograms | 87-1 |
| 87.2.1 | CREATE_OR_REPLACE_VIEW Procedure        | 87-1 |
| 87.2.2 | CREATE_TABLE_TEMPLATE Procedure         | 87-3 |
| 87.2.3 | DROP_VIEW Procedure                     | 87-3 |

## 88 DBMS\_HS\_PASSTHROUGH

---

|         |                                            |       |
|---------|--------------------------------------------|-------|
| 88.1    | DBMS_HS_PASSTHROUGH Overview               | 88-1  |
| 88.2    | DBMS_HS_PASSTHROUGH Operational Notes      | 88-1  |
| 88.3    | Summary of DBMS_HS_PASSTHROUGH Subprograms | 88-1  |
| 88.3.1  | BIND_INOUT_VARIABLE Procedure              | 88-2  |
| 88.3.2  | BIND_INOUT_VARIABLE_RAW Procedure          | 88-3  |
| 88.3.3  | BIND_OUT_VARIABLE Procedure                | 88-4  |
| 88.3.4  | BIND_OUT_VARIABLE_RAW Procedure            | 88-5  |
| 88.3.5  | BIND_VARIABLE Procedure                    | 88-6  |
| 88.3.6  | BIND_VARIABLE_RAW Procedure                | 88-7  |
| 88.3.7  | CLOSE_CURSOR Procedure                     | 88-8  |
| 88.3.8  | EXECUTE_IMMEDIATE Procedure                | 88-9  |
| 88.3.9  | EXECUTE_NON_QUERY Function                 | 88-10 |
| 88.3.10 | FETCH_ROW Function                         | 88-10 |
| 88.3.11 | GET_VALUE Procedure                        | 88-11 |
| 88.3.12 | GET_VALUE_RAW Procedure                    | 88-12 |
| 88.3.13 | OPEN_CURSOR Function                       | 88-13 |
| 88.3.14 | PARSE Procedure                            | 88-14 |

## 89 DBMS\_ILM

---

|        |                                 |      |
|--------|---------------------------------|------|

## 119 DBMS\_NETWORK\_ACL\_UTILITY

---

|         |                                                 |       |
|---------|-------------------------------------------------|-------|
| 119.1   | DBMS_NETWORK_ACL_UTILITY Security Model         | 119-1 |
| 119.2   | DBMS_NETWORK_ACL_UTILITY Examples               | 119-1 |
| 119.3   | Summary of DBMS_NETWORK_ACL_UTILITY Subprograms | 119-2 |
| 119.3.1 | CONTAINS_HOST Function                          | 119-3 |
| 119.3.2 | DOMAIN_LEVEL Function                           | 119-4 |
| 119.3.3 | DOMAINS Function                                | 119-5 |
| 119.3.4 | EQUALS_HOST Function                            | 119-5 |

## 120 DBMS\_ODCI

---

|         |                                  |       |
|---------|----------------------------------|-------|
| 120.1   | Summary of DBMS_ODCI Subprograms | 120-1 |
| 120.1.1 | ESTIMATE_CPU_UNITS Function      | 120-1 |

## 121 DBMS\_OPTIM\_BUNDLE

---

|         |                                          |       |
|---------|------------------------------------------|-------|
| 121.1   | DBMS_OPTIM_BUNDLE Security Model         | 121-1 |
| 121.2   | Summary of DBMS_OPTIM_BUNDLE Subprograms | 121-1 |
| 121.2.1 | ENABLE_OPTIM_FIXES Procedure             | 121-1 |
| 121.2.2 | GETBUGSFORBUNDLE Procedure               | 121-3 |
| 121.2.3 | LISTBUNDLESWITHFCFIXES Procedure         | 121-3 |
| 121.2.4 | SET_FIX_CONTROLS Procedure               | 121-4 |

## 122 DBMS\_OUTLN

---

|         |                                   |       |
|---------|-----------------------------------|-------|
| 122.1   | DBMS_OUTLN Overview               | 122-1 |
| 122.2   | DBMS_OUTLN Security Model         | 122-2 |
| 122.3   | Summary of DBMS_OUTLN Subprograms | 122-2 |
| 122.3.1 | CLEAR_USED Procedure              | 122-2 |
| 122.3.2 | CREATE_OUTLINE Procedure          | 122-3 |
| 122.3.3 | DROP_BY_CAT Procedure             | 122-3 |
| 122.3.4 | DROP_UNUSED Procedure             | 122-4 |
| 122.3.5 | EXACT_TEXT_SIGNATURES Procedure   | 122-4 |
| 122.3.6 | UPDATE_BY_CAT Procedure           | 122-4 |
| 122.3.7 | UPDATE_SIGNATURES Procedure       | 122-4 |

## 123 DBMS\_OUTPUT

---

|         |                                               |        |
|---------|-----------------------------------------------|--------|
| 123.1   | DBMS_OUTPUT Overview                          | 123-1  |
| 123.2   | DBMS_OUTPUT Security Model                    | 123-1  |
| 123.3   | DBMS_OUTPUT Operational Notes                 | 123-1  |
| 123.4   | DBMS_OUTPUT Exceptions                        | 123-2  |
| 123.5   | DBMS_OUTPUT Rules and Limits                  | 123-2  |
| 123.6   | DBMS_OUTPUT Examples                          | 123-2  |
| 123.7   | DBMS_OUTPUT Data Structures                   | 123-5  |
| 123.7.1 | CHARARR Table Type                            | 123-5  |
| 123.7.2 | DBMS_OUTPUT DBMSOUTPUT_LINESARRAY Object Type | 123-5  |
| 123.8   | Summary of DBMS_OUTPUT Subprograms            | 123-6  |
| 123.8.1 | DISABLE Procedure                             | 123-6  |
| 123.8.2 | ENABLE Procedure                              | 123-6  |
| 123.8.3 | GET_LINE Procedure                            | 123-7  |
| 123.8.4 | GET_LINES Procedure                           | 123-8  |
| 123.8.5 | NEW_LINE Procedure                            | 123-8  |
| 123.8.6 | PUT Procedure                                 | 123-9  |
| 123.8.7 | PUT_LINE Procedure                            | 123-10 |

## 124 DBMS\_PARALLEL\_EXECUTE

---

|          |                                              |        |
|----------|----------------------------------------------|--------|
| 124.1    | DBMS_PARALLEL_EXECUTE Overview               | 124-1  |
| 124.2    | DBMS_PARALLEL_EXECUTE Security Model         | 124-1  |
| 124.3    | DBMS_PARALLEL_EXECUTE Constants              | 124-2  |
| 124.4    | DBMS_PARALLEL_EXECUTE Views                  | 124-3  |
| 124.5    | DBMS_PARALLEL_EXECUTE Exceptions             | 124-3  |
| 124.6    | DBMS_PARALLEL_EXECUTE Examples               | 124-3  |
| 124.7    | Summary of DBMS_PARALLEL_EXECUTE Subprograms | 124-6  |
| 124.7.1  | ADM_DROP_CHUNKS Procedure                    | 124-7  |
| 124.7.2  | ADM_DROP_TASK Procedure                      | 124-7  |
| 124.7.3  | ADM_TASK_STATUS Function                     | 124-8  |
| 124.7.4  | ADM_STOP_TASK Procedure                      | 124-8  |
| 124.7.5  | CREATE_TASK Procedure                        | 124-8  |
| 124.7.6  | CREATE_CHUNKS_BY_NUMBER_COL Procedure        | 124-9  |
| 124.7.7  | CREATE_CHUNKS_BY_ROWID Procedure             | 124-9  |
| 124.7.8  | CREATE_CHUNKS_BY_SQL Procedure               | 124-10 |
| 124.7.9  | DROP_TASK Procedure                          | 124-11 |
| 124.7.10 | DROP_CHUNKS Procedure                        | 124-11 |
| 124.7.11 | GENERATE_TASK_NAME Function                  | 124-11 |
| 124.7.12 | GET_NUMBER_COL_CHUNK Procedure               | 124-12 |
| 124.7.13 | GET_ROWID_CHUNK Procedure                    | 124-12 |

|          |                                  |        |
|----------|----------------------------------|--------|
| 124.7.14 | PURGE_PROCESSED_CHUNKS Procedure | 124-13 |
| 124.7.15 | RESUME_TASK Procedures           | 124-14 |
| 124.7.16 | RUN_TASK Procedure               | 124-16 |
| 124.7.17 | SET_CHUNK_STATUS Procedure       | 124-17 |
| 124.7.18 | STOP_TASK Procedure              | 124-18 |
| 124.7.19 | TASK_STATUS Procedure            | 124-18 |

## 125 DBMS\_PART

---

|         |                                  |       |
|---------|----------------------------------|-------|
| 125.1   | DBMS_PART Security Model         | 125-1 |
| 125.2   | DBMS_PART Operational Notes      | 125-1 |
| 125.3   | Summary of DBMS_PART Subprograms | 125-1 |
| 125.3.1 | CLEANUP_GIDX Procedure           | 125-2 |
| 125.3.2 | CLEANUP_GIDX_JOB Procedure       | 125-2 |
| 125.3.3 | CLEANUP_ONLINE_OP Procedure      | 125-3 |

## 126 DBMS\_PCLXUTIL

---

|         |                                      |       |
|---------|--------------------------------------|-------|
| 126.1   | DBMS_PCLXUTIL Overview               | 126-1 |
| 126.2   | DBMS_PCLXUTIL Security Model         | 126-2 |
| 126.3   | DBMS_PCLXUTIL Operational Notes      | 126-2 |
| 126.4   | DBMS_PCLXUTIL Rules and Limits       | 126-2 |
| 126.5   | Summary of DBMS_PCLXUTIL Subprograms | 126-3 |
| 126.5.1 | BUILD_PART_INDEX Procedure           | 126-3 |

## 127 DBMS\_PDB

---

|          |                                   |       |
|----------|-----------------------------------|-------|
| 127.1    | DBMS_PDB Overview                 | 127-1 |
| 127.2    | DBMS_PDB Security Model           | 127-2 |
| 127.3    | Summary of DBMS_PDB Subprograms   | 127-2 |
| 127.3.1  | CHECK_PLUG_COMPATIBILITY Function | 127-3 |
| 127.3.2  | DESCRIBE Procedure                | 127-3 |
| 127.3.3  | EXPORTMANBACKUP Procedure         | 127-4 |
| 127.3.4  | RECOVER Procedure                 | 127-5 |
| 127.3.5  | SET_DATA_LINKED Procedure         | 127-5 |
| 127.3.6  | SET_EXT_DATA_LINKED Procedure     | 127-6 |
| 127.3.7  | SET_METADATA_LINKED Procedure     | 127-7 |
| 127.3.8  | SET_PROFILE_EXPLICIT Procedure    | 127-8 |
| 127.3.9  | SET_ROLE_EXPLICIT Procedure       | 127-8 |
| 127.3.10 | SET_USER_EXPLICIT Procedure       | 127-9 |

## 128 DBMS\_PDB\_ALTER\_SHARING

---

|         |                                               |       |
|---------|-----------------------------------------------|-------|
| 128.1   | DBMS_PDB_ALTER_SHARING Overview               | 128-1 |
| 128.2   | DBMS_PDB_ALTER_SHARING Security Model         | 128-2 |
| 128.3   | Summary of DBMS_PDB_ALTER_SHARING Subprograms | 128-2 |
| 128.3.1 | SET_DATA_LINKED Procedure                     | 128-3 |
| 128.3.2 | SET_EXT_DATA_LINKED Procedure                 | 128-4 |
| 128.3.3 | SET_METADATA_LINKED Procedure                 | 128-4 |
| 128.3.4 | SET_PROFILE_EXPLICIT Procedure                | 128-5 |
| 128.3.5 | SET_ROLE_EXPLICIT Procedure                   | 128-6 |
| 128.3.6 | SET_USER_EXPLICIT Procedure                   | 128-6 |

## 129 DBMS\_PERF

---

|         |                                  |       |
|---------|----------------------------------|-------|
| 129.1   | DBMS_PERF Overview               | 129-1 |
| 129.2   | DBMS_PERF Security Model         | 129-1 |
| 129.3   | Summary of DBMS_PERF Subprograms | 129-1 |
| 129.3.1 | REPORT_PERFHUB Function          | 129-2 |
| 129.3.2 | REPORT_SESSION Function          | 129-3 |
| 129.3.3 | REPORT_SQL Function              | 129-5 |

## 130 DBMS\_PIPE

---

|          |                                  |        |
|----------|----------------------------------|--------|
| 130.1    | DBMS_PIPE Overview               | 130-1  |
| 130.2    | DBMS_PIPE Security Model         | 130-2  |
| 130.3    | DBMS_PIPE Constants              | 130-2  |
| 130.4    | DBMS_PIPE Operational Notes      | 130-2  |
| 130.5    | DBMS_PIPE Exceptions             | 130-3  |
| 130.6    | DBMS_PIPE Examples               | 130-3  |
| 130.7    | Summary of DBMS_PIPE Subprograms | 130-12 |
| 130.7.1  | CREATE_PIPE Function             | 130-13 |
| 130.7.2  | NEXT_ITEM_TYPE Function          | 130-14 |
| 130.7.3  | PACK_MESSAGE Procedures          | 130-15 |
| 130.7.4  | PURGE Procedure                  | 130-16 |
| 130.7.5  | RECEIVE_MESSAGE Function         | 130-16 |
| 130.7.6  | RESET_BUFFER Procedure           | 130-18 |
| 130.7.7  | REMOVE_PIPE Function             | 130-18 |
| 130.7.8  | SEND_MESSAGE Function            | 130-19 |
| 130.7.9  | UNIQUE_SESSION_NAME Function     | 130-21 |
| 130.7.10 | UNPACK_MESSAGE Procedures        | 130-21 |

## 131 DBMS\_PLSQL\_CODE\_COVERAGE

---

|         |                                                 |       |

| 185.5.8  | ENABLE_PROTECTION_COLUMN Procedure       | 185-9  |
| 185.5.9  | ENABLE_PROTECTION_SOURCE Procedure       | 185-9  |
| 185.5.10 | ENABLE_PROTECTION_TYPE Procedure         | 185-10 |

## 186 DBMS\_TTS

---

|         |                                 |       |
|---------|---------------------------------|-------|
| 186.1   | DBMS_TTS Security Model         | 186-1 |
| 186.2   | DBMS_TTS Exceptions             | 186-1 |
| 186.3   | DBMS_TTS Operational Notes      | 186-1 |
| 186.4   | Summary of DBMS_TTS Subprograms | 186-2 |
| 186.4.1 | DOWNGRADE Procedure             | 186-2 |
| 186.4.2 | TRANSPORT_SET_CHECK Procedure   | 186-2 |

## 187 DBMS\_TYPES

---

|       |                       |       |
|-------|-----------------------|-------|
| 187.1 | DBMS_TYPES Constants  | 187-1 |
| 187.2 | DBMS_TYPES Exceptions | 187-2 |

## 188 DBMS\_UNDO\_ADV

---

|         |                                      |       |
|---------|--------------------------------------|-------|
| 188.1   | Summary of DBMS_UNDO_ADV Subprograms | 188-1 |
| 188.1.1 | BEST_POSSIBLE_RETENTION Function     | 188-2 |
| 188.1.2 | RBU_MIGRATION Function               | 188-3 |
| 188.1.3 | LONGEST_QUERY Function               | 188-3 |

|         |                             |       |
|---------|-----------------------------|-------|
| 188.1.4 | REQUIRED_RETENTION Function | 188-4 |
| 188.1.5 | REQUIRED_UNDO_SIZE Function | 188-5 |
| 188.1.6 | UNDO_ADVISOR Function       | 188-6 |
| 188.1.7 | UNDO_AUTOTUNE Function      | 188-7 |
| 188.1.8 | UNDO_HEALTH Function        | 188-7 |
| 188.1.9 | UNDO_INFO Function          | 188-9 |

## 189 DBMS\_UMF

---

|          |                                      |        |
|----------|--------------------------------------|--------|
| 189.1    | Summary of DBMS_UMF Subprograms      | 189-1  |
| 189.1.1  | CONFIGURE_NODE Procedure             | 189-2  |
| 189.1.2  | CREATE_LINK Procedure                | 189-2  |
| 189.1.3  | CREATE_TOPOLOGY Procedure            | 189-3  |
| 189.1.4  | DROP_LINK Procedure                  | 189-3  |
| 189.1.5  | DROP_TOPOLOGY Procedure              | 189-4  |
| 189.1.6  | ENABLE_SERVICE Procedure             | 189-4  |
| 189.1.7  | GET_NODE_ID_LOCAL Function           | 189-5  |
| 189.1.8  | GET_NODE_NAME_LOCAL Function         | 189-6  |
| 189.1.9  | GET_TARGET_ID Function               | 189-6  |
| 189.1.10 | GET_TOPOLOGY_NAME_LOCAL Function     | 189-6  |
| 189.1.11 | QUERY_LINK_INFO Procedure            | 189-7  |
| 189.1.12 | QUERY_NODE_INFO Procedures           | 189-7  |
| 189.1.13 | REGISTER_NODE Function and Procedure | 189-8  |
| 189.1.14 | SWITCH_DESTINATION Procedure         | 189-9  |
| 189.1.15 | UNCONFIGURE_NODE Procedure           | 189-10 |
| 189.1.16 | UNREGISTER_NODE Procedure            | 189-10 |

## 190 DBMS\_USER\_CERTS

---

|         |                                        |       |
|---------|----------------------------------------|-------|
| 190.1   | DBMS_USER_CERTS Overview               | 190-1 |
| 190.2   | DBMS_USER_CERTS Security Model         | 190-1 |
| 190.3   | Summary of DBMS_USER_CERTS Subprograms | 190-2 |
| 190.3.1 | ADD_CERTIFICATE Procedure              | 190-2 |
| 190.3.2 | DROP_CERTIFICATE Procedure             | 190-2 |

## 191 DBMS\_UTILITY

---

|       |                                     |       |
|-------|-------------------------------------|-------|
| 191.1 | DBMS_UTILITY Deprecated Subprograms | 191-1 |
| 191.2 | DBMS_UTILITY Security Model         | 191-1 |
| 191.3 | DBMS_UTILITY Constants              | 191-2 |
| 191.4 | DBMS_UTILITY Exceptions             | 191-2 |
| 191.5 | DBMS_UTILITY Data Structures        | 191-2 |

|          |                                          |        |
|----------|------------------------------------------|--------|
| 191.5.1  | DBMS_UTILITY INSTANCE_RECORD Record Type | 191-3  |

## 290 JMS Types

---

|         |                                                                 |        |
|---------|-----------------------------------------------------------------|--------|
| 290.1   | JMS Types Overview                                              | 290-1  |
| 290.2   | JMS Types Security Model                                        | 290-2  |
| 290.3   | Java Versus PL/SQL Datatypes                                    | 290-2  |
| 290.4   | More on Bytes, Stream and Map Messages                          | 290-3  |
| 290.5   | Upcasting and Downcasting Between General and Specific Messages | 290-6  |
| 290.6   | JMS Types Error Reporting                                       | 290-6  |
| 290.7   | Oracle JMS Type Constants                                       | 290-7  |
| 290.8   | CONVERT_JMS_SELECTOR                                            | 290-8  |
| 290.9   | Summary of JMS Types                                            | 290-10 |
| 290.9.1 | SYS.AQ\$_JMS_MESSAGE Type                                       | 290-10 |
| 290.9.2 | SYS.AQ\$_JMS_TEXT_MESSAGE Type                                  | 290-16 |
| 290.9.3 | SYS.AQ\$_JMS_BYTES_MESSAGE Type                                 | 290-19 |
| 290.9.4 | SYS.AQ\$_JMS_MAP_MESSAGE Type                                   | 290-28 |
| 290.9.5 | SYS.AQ\$_JMS_STREAM_MESSAGE Type                                | 290-37 |
| 290.9.6 | SYS.AQ\$_JMS_OBJECT_MESSAGE Type                                | 290-46 |
| 290.9.7 | SYS.AQ\$_JMS_NAMEARRAY Type                                     | 290-46 |
| 290.9.8 | SYS.AQ\$_JMS_VALUE Type                                         | 290-46 |
| 290.9.9 | SYS.AQ\$_JMS_EXCEPTION Type                                     | 290-47 |

## 291 JSON Data Structures

---

|       |                            |       |
|-------|----------------------------|-------|
| 291.1 | JSON_ELEMENT_T Object Type | 291-1 |
| 291.2 | JSON_OBJECT_T Object Type  | 291-3 |
| 291.3 | JSON_ARRAY_T Object Type   | 291-7 |
| 291.4 | JSON_SCALAR_T Object Type  | 291-9 |
| 291.5 | JSON_KEY_LIST Type         | 291-9 |

## 292 Logical Change Record TYPES

---

|       |                                            |       |
|-------|--------------------------------------------|-------|
| 292.1 | Logical Change Record TYPES Overview       | 292-1 |
| 292.2 | Logical Change Record Types Security Model | 292-1 |
| 292.3 | Summary of Logical Change Record Types     | 292-1 |

|         |                                                                 |        |
|---------|-----------------------------------------------------------------|--------|
| 292.3.1 | LCR\$_DDL_RECORD Type                                           | 292-2  |
| 292.3.2 | LCR\$_ROW_RECORD Type                                           | 292-10 |
| 292.3.3 | Common Subprograms for LCR\$_DDL_RECORD and<br>LCR\$_ROW_RECORD | 292-32 |
| 292.3.4 | LCR\$_ROW_LIST Type                                             | 292-43 |
| 292.3.5 | LCR\$_ROW_UNIT Type                                             | 292-44 |

## 293 MGD\_ID Package Types

---

|         |                                     |        |
|---------|-------------------------------------|--------|
| 293.1   | MGD_ID Package Types Security Model | 293-1  |
| 293.2   | Summary of Types                    | 293-2  |
| 293.2.1 | MGD_ID_COMPONENT Object Type        | 293-2  |
| 293.2.2 | MGD_ID_COMPONENT_VARRAY Object Type | 293-2  |
| 293.2.3 | MGD_ID Object Type                  | 293-3  |
| 293.3   | Summary of MGD_ID Subprograms       | 293-3  |
| 293.3.1 | MGD_ID Constructor Function         | 293-4  |
| 293.3.2 | FORMAT Function                     | 293-7  |
| 293.3.3 | GET_COMPONENT Function              | 293-8  |
| 293.3.4 | TO_STRING Function                  | 293-9  |
| 293.3.5 | TRANSLATE Function                  | 293-10 |

## 294 Rule TYPES

---

|          |                               |        |
|----------|-------------------------------|--------|
| 294.1    | Rule TYPES Overview           | 294-1  |
| 294.2    | Rule TYPES Security Model     | 294-1  |
| 294.3    | Summary of Rule Types         | 294-1  |
| 294.3.1  | RE\$ATTRIBUTE_VALUE Type      | 294-3  |
| 294.3.2  | RE\$ATTRIBUTE_VALUE_LIST Type | 294-3  |
| 294.3.3  | RE\$COLUMN_VALUE Type         | 294-3  |
| 294.3.4  | RE\$COLUMN_VALUE_LIST Type    | 294-4  |
| 294.3.5  | RE\$NAME_ARRAY Type           | 294-4  |
| 294.3.6  | RE\$NV_ARRAY Type             | 294-4  |
| 294.3.7  | RE\$NV_LIST Type              | 294-4  |
| 294.3.8  | RE\$NV_NODE Type              | 294-7  |
| 294.3.9  | RE\$RULE_HIT Type             | 294-7  |
| 294.3.10 | RE\$RULE_HIT_LIST Type        | 294-8  |
| 294.3.11 | RE\$RULE_NAME Type            | 294-8  |
| 294.3.12 | RE\$RULE_NAME_LIST Type       | 294-8  |
| 294.3.13 | RE\$TABLE_ALIAS Type          | 294-8  |
| 294.3.14 | RE\$TABLE_ALIAS_LIST Type     | 294-9  |
| 294.3.15 | RE\$TABLE_VALUE Type          | 294-10 |
| 294.3.16 | RE\$TABLE_VALUE_LIST Type     | 294-10 |

|          |                              |        |
|----------|------------------------------|--------|
| 294.3.17 | RE\$VALUE Type               | 294-10 |
| 294.3.18 | RE\$VALUE_LIST Type          | 294-11 |
| 294.3.19 | RE\$VARIABLE_TYPE Type       | 294-11 |
| 294.3.20 | RE\$VARIABLE_TYPE_LIST Type  | 294-13 |
| 294.3.21 | RE\$VARIABLE_VALUE Type      | 294-13 |
| 294.3.22 | RE\$VARIABLE_VALUE_LIST Type | 294-13 |

## 295 SODA Types

---

|            |                              |        |
|------------|------------------------------|--------|
| 295.1      | SODA Types Overview          | 295-1  |
| 295.2      | SODA Types Security Model    | 295-1  |
| 295.3      | Summary of SODA Types        | 295-2  |
| 295.3.1    | SODA_COLLECTION_T Type       | 295-2  |
| 295.3.1.1  | CREATE_INDEX Function        | 295-3  |
| 295.3.1.2  | CREATE_VIEW_FROM_DG Function | 295-4  |
| 295.3.1.3  | DROP_INDEX Function          | 295-5  |
| 295.3.1.4  | FIND Function                | 295-5  |
| 295.3.1.5  | FIND_ONE Function            | 295-6  |
| 295.3.1.6  | GET_DATA_GUIDE Function      | 295-6  |
| 295.3.1.7  | GET_METADATA Function        | 295-7  |
| 295.3.1.8  | GET_NAME Function            | 295-7  |
| 295.3.1.9  | INSERT_ONE Function          | 295-7  |
| 295.3.1.10 | INSERT_ONE_AND_GET Function  | 295-7  |
| 295.3.1.11 | REMOVE_ONE Function          | 295-8  |
| 295.3.1.12 | REPLACE_ONE Function         | 295-9  |
| 295.3.1.13 | REPLACE_ONE_AND_GET Function | 295-9  |
| 295.3.1.14 | SAVE Function                | 295-10 |
| 295.3.1.15 | SAVE_AND_GET Function        | 295-10 |
| 295.3.1.16 | TRUNCATE Function            | 295-11 |
| 295.3.2    | SODA_DOCUMENT_T Type         | 295-11 |
| 295.3.2.1  | GET_BLOB Function            | 295-12 |
| 295.3.2.2  | GET_CLOB Function            | 295-12 |
| 295.3.2.3  | GET_CREATED_ON Function      | 295-13 |
| 295.3.2.4  | GET_DATA_TYPE Function       | 295-13 |
| 295.3.2.5  | GET_KEY Function             | 295-13 |
| 295.3.2.6  | GET_LAST_MODIFIED Function   | 295-14 |
| 295.3.2.7  | GET_MEDIA_TYPE Function      | 295-14 |
| 295.3.2.8  | GET_VARCHAR2 Function        | 295-14 |
| 295.3.2.9  | GET_VERSION Function         | 295-14 |
| 295.3.3    | SODA_OPERATION_T Type        | 295-15 |
| 295.3.3.1  | ACQUIRE_LOCK Function        | 295-17 |
| 295.3.3.2  | AS_OF_SCN Function           | 295-17 |

|            |                              |        |
|------------|------------------------------|--------|
| 295.3.3.3  | AS_OF_TIMESTAMP Function     | 295-18 |
| 295.3.3.4  | COUNT Function               | 295-18 |
| 295.3.3.5  | FILTER Function              | 295-19 |
| 295.3.3.6  | GET_CURSOR Function          | 295-19 |
| 295.3.3.7  | GET_DATA_GUIDE Function      | 295-19 |
| 295.3.3.8  | GET_ONE Function             | 295-20 |
| 295.3.3.9  | HINT Function                | 295-20 |
| 295.3.3.10 | KEY Function                 | 295-21 |
| 295.3.3.11 | KEYS Function                | 295-21 |
| 295.3.3.12 | LIMIT Function               | 295-22 |
| 295.3.3.13 | REMOVE Function              | 295-22 |
| 295.3.3.14 | REPLACE_ONE Function         | 295-23 |
| 295.3.3.15 | REPLACE_ONE_AND_GET Function | 295-23 |
| 295.3.3.16 | SAMPLE Function              | 295-24 |
| 295.3.3.17 | SKIP Function                | 295-25 |
| 295.3.3.18 | VERSION Function             | 295-25 |
| 295.3.4    | SODA_CURSOR_T Type           | 295-26 |
| 295.3.4.1  | CLOSE Function               | 295-26 |
| 295.3.4.2  | HAS_NEXT Function            | 295-26 |
| 295.3.4.3  | NEXT Function                | 295-27 |

## 296 UTL Streams Types

---

|         |                                     |       |
|---------|-------------------------------------|-------|
| 296.1   | UTL Streams Types Security Model    | 296-1 |
| 296.2   | Summary of UTL Binary Streams Types | 296-1 |
| 296.2.1 | UTL_BINARYINPUTSTREAM Type          | 296-1 |
| 296.2.2 | UTL_BINARYOUTPUTSTREAM Type         | 296-2 |
| 296.2.3 | UTL_CHARACTERINPUTSTREAM Type       | 296-3 |
| 296.2.4 | UTL_CHARACTEROUTPUTSTREAM Type      | 296-4 |

## 297 XMLTYPE

---

## Index

---

# Preface

This Preface contains these topics:

- [Audience](#)
- [Related Documents](#)
- [Conventions](#)

## Audience

*Oracle Database PL/SQL Packages and Types Reference* is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Related Documents

For more information, see the following documents:

# Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- [Conventions in Text](#)
- [Conventions in Code Examples](#)

## Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

| Convention                                                       | Meaning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Example                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bold</b>                                                      | Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.                                                                                                                                                                                                                                                                                                                                                                                   | When you specify this clause, you create an <b>index-organized table</b> .                                                                                                                                                                                                                                                                                                          |
| <i>Italics</i>                                                   | Italic typeface indicates book titles or emphasis.                                                                                                                                                                                                                                                                                                                                                                                                                                        | <i>Oracle Database Concepts</i><br>Ensure that the recovery catalog and target database do <i>not</i> reside on the same disk.                                                                                                                                                                                                                                                      |
| UPPERCASE<br>monospace<br>(fixed-width)<br>font                  | Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.                                                                                                                                                                         | You can specify this clause only for a NUMBER column.<br>You can back up the database by using the BACKUP command.<br>Query the TABLE_NAME column in the USER_TABLES data dictionary view.<br>Use the DBMS_STATS.GENERATE_STATS procedure.                                                                                                                                          |
| lowercase<br>monospace<br>(fixed-width)<br>font                  | Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values.<br><i>Note:</i> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown. | Enter sqlplus to start SQL*Plus.<br>The password is specified in the orapwd file.<br>Back up the datafiles and control files in the /disk1/oracle/dbs directory.<br>The department_id, department_name, and location_id columns are in the hr.departments table.<br>Set the QUERY_REWRITE_ENABLED initialization parameter to true.<br>The JRepUtil class implements these methods. |
| lowercase<br><i>italic</i><br>monospace<br>(fixed-width)<br>font | Lowercase italic monospace font represents placeholders or variables.                                                                                                                                                                                                                                                                                                                                                                                                                     | You can specify the <i>parallel_clause</i> .<br>Run <i>old_release</i> .SQL where <i>old_release</i> refers to the release you installed prior to upgrading.                                                                                                                                                                                                                        |

## Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL\*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

| Convention     | Meaning                                                                                                                                                                                                                                                                                                                                 | Example                                                                                                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| [ ]            | Anything enclosed in brackets is optional.                                                                                                                                                                                                                                                                                              | DECIMAL ( <i>digits</i> [ , <i>precision</i> ])                                                                              |
| { }            | Braces are used for grouping items.                                                                                                                                                                                                                                                                                                     | {ENABLE   DISABLE}                                                                                                           |
|                | A vertical bar represents a choice of two options.                                                                                                                                                                                                                                                                                      | {ENABLE   DISABLE}<br>[COMPRESS   NOCOMPRESS]                                                                                |
| ...            | Ellipsis points mean repetition in syntax descriptions.<br>In addition, ellipsis points can mean an omission in code examples or text.                                                                                                                                                                                                  | CREATE TABLE ... AS <i>subquery</i> ;<br><br>SELECT <i>col1</i> , <i>col2</i> , ... , <i>coln</i> FROM employees;            |
| Other symbols  | You must use symbols other than brackets ([ ]), braces ({ }), vertical bars ( ), and ellipsis points (...) exactly as shown.                                                                                                                                                                                                            | <i>acctbal</i> NUMBER(11,2);<br><i>acct</i> CONSTANT NUMBER(4) := 3;                                                         |
| <i>Italics</i> | Italicized text indicates placeholders or variables for which you must supply particular values.                                                                                                                                                                                                                                        | <i>enter password</i><br><br>DB_NAME = <i>database_name</i>                                                                  |
| UPPERCASE      | Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase. | SELECT last_name, employee_id FROM employees;<br>SELECT * FROM USER_TABLES;<br>DROP TABLE hr.employees;                      |
| lowercase      | Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.<br><br><b>Note:</b> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.                                                                                                    | SELECT last_name, employee_id FROM employees;<br>sqlplus <i>user_id/password</i><br>CREATE USER mjones IDENTIFIED BY ty3MU9; |

# Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

This preface contains:

- [Changes in Oracle Database Release 19c, Version 19.1](#)

## Changes in Oracle Database Release 19c, Version 19.1

The following are changes in *Oracle Database PL/SQL Packages and Types Reference* for Oracle Database release 19c, version 19.1.

- [New Features](#)
- [Deprecated Features](#)
- [Desupported Features](#)

See *Oracle Database New Features Guide* for a complete list of new features in this release.

## New Features

This section lists the major new features in Oracle Database release 19c *PL/SQL Packages and Types Reference*.

The following features are new in Oracle Database release 19c, version 19.1:

- `ANYTYPE TYPE`

The `GETANYTYPEFROMPERSISTENT` function replaces `GETPERISTENT` static function.

See [GETANYTYPEFROMPERSISTENT Function](#)

- `DBMS_ADDM`

Automatic Database Diagnostic Monitor (ADDM) support for pluggable databases (PDBs). You can now use ADDM to analyze AWR data in PDBs for identifying and resolving performance related issues. Two new parameters, `CDB_TYPE_OVERRIDE` and `READ_ONLY_TYPE_OVERRIDE` added to the following subprograms to the `DBMS_ADDM` package:

- `ANALYZE_DB Procedure`
- `ANALYZE_INST Procedure`
- `ANALYZE_PARTIAL Procedure`
- `COMPARE_CAPTURE_REPLAY_REPORT Function`
- `COMPARE_DATABASES Function`
- `COMPARE_INSTANCES Function`
- `COMPARE_REPLAY_REPLAY_REPORT Function`

- `REAL_TIME_ADDM_REPORT` Function

- `DBMS_AUTO_INDEX`

The new package `DBMS_AUTO_INDEX` provides an interface for configuring auto indexes and generating reports containing the details of the executed automatic indexing operations in a database.

See "[DBMS\\_AUTO\\_INDEX](#)"

- `DBMS_CREDENTIAL`

You can also use the `DBMS_CREDENTIAL.CREATE_CREDENTIAL` procedure to manage the credentials for cloud object storage. The credential parameter of `impdb` specifies the name of a credential object that contains the user name and password required to access an object store bucket. You can also specify a default credential using the database property `DEFAULT_CREDENTIAL`.

- `DBMS_HADOOP`

Oracle Database now supports hybrid partitioned tables. A hybrid partitioned table is a partitioned table in which some partitions reside in the database and some partitions reside outside the database in external files, such as operating system files or Hadoop Distributed File System (HDFS) files.

A new procedure `CREATE_HYBRID_PARTNED_TABLE` is added to the `DBMS_HADOOP` package.

- `DBMS_INMEMORY_ADMIN`

A new function `POPULATE_WAIT` is added to `DBMS_INMEMORY_ADMIN` package. This function ensures that the specified In-Memory objects have been populated before allowing application access.

- `DBMS_MEMOPTIMIZE`

The following new subprograms are added to the `DBMS_MEMOPTIMIZE` package as part of the Memoptimized Rowstore fast ingest feature:

- `GET_APPLY_HWM_SEQID`
- `GET_WRITE_HWM_SEQID`
- `WRITE_END`

See "[DBMS\\_MEMOPTIMIZE](#)"

- `DBMS_MEMOPTIMIZE_ADMIN`

The new package `DBMS_MEMOPTIMIZE_ADMIN` provides an interface for flushing the Memoptimized Rowstore data buffered in the large pool to disk.

See "[DBMS\\_MEMOPTIMIZE\\_ADMIN](#)"

- `DBMS_METADATA`

The following new transform parameters which are used by the metadata layer of datapump are added to the `DBMS_METADATA.SET_TRANSFORM_PARAM` procedure:

- `OMIT_ENCRYPTION_CLAUSE`
- `DWCS_CVT_IOTS`
- `DWCS_CVT_CONSTRAINTS`
- `CONSTRAINT_USE_DEFAULT_INDEXES`
- `CONSTRAINT_NAME_FROM_INDEXES`

- `DBMS_MVIEW`

Oracle Database now supports hybrid partitioned tables. A hybrid partitioned table is a partitioned table in which some partitions reside in the database and some partitions reside outside the database in external files, such as operating system files or Hadoop Distributed File System (HDFS) files.

A new parameter, `SKIP_EXT_DATA`, is added to the `DBMS_MVIEW.REFRESH` procedure.

- `DBMS_SQLQ`

The new package `DBMS_SQLQ` provides an interface for configuring quarantine thresholds for SQL statements and their execution plans. The SQL statements that cross the quarantine thresholds are quarantined and are not allowed to run again in a database.

See "[DBMS\\_SQLQ](#)"

- `DBMS_SQLDIAG` New SQL Repair Advisor function `DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR`

The new SQL Repair Advisor function `DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR` creates a diagnostic task, executes it, and accepts SQL patch recommendation for a SQL statement that is generating a critical error. This function helps users to diagnose and fix problems.

- `DBMS_SODA`

`DBMS_SODA` is a PL/SQL package implementing Simple Oracle Document Access (SODA) which allows you to use the Oracle Database as a NoSQL document store. Additional functions and features are added in this release.

- `DBMS_STATS`

A new boolean parameter `REALTIME_STATS` is added to `GET_TABLE_STATS` and `GET_COLUMN_STATS` procedures.

- `DBMS_XPLAN`

New `COMPARE_PLANS` function added to the `DBMS_XPLAN` package. This function compares each plan in a list with a reference plan and returns the report.

- Key-based Messaging

The following new parameters are added to the `GET_QUEUE_PARAMETER`, `SET_QUEUE_PARAMETER`, and `UNSET_QUEUE_PARAMETER` procedures of the `DBMS_AQADM` package as part of the Key-based messaging feature:

- Sharded queue parameters

- \* `SHARD_NUM`
    - \* `KEY_BASED_ENQUEUE`
    - \* `STICKY_DEQUEUE`

- Key-based parameters

- \* `AQ$KEY_TO_SHARD_MAP`
    - \* `AQ$GET_KEY_SHARD_INST`

See "[DBMS\\_AQADM](#)"

## Changes in Oracle Database Release 19c, Version 19.9

The following features are new in Oracle Database release 19c, version 19.9:

- Support for `DBMS_CRYPTO` Asymmetric Key Operations

Starting with this release, the `DBMS_CRYPTO` PL/SQL package supports asymmetric key operations, in addition to the existing support for symmetric key operations. To implement the support for asymmetric key operations, the following procedures have been added to the `DBMS_CRYPTO` package:

- `PKENCRYPT`
- `PKDECRYPT`
- `SIGN`
- `VERIFY`

See [DBMS\\_CRYPTO](#).

### Changes in Oracle Database Release 19c, Version 19.10

The following features are new in Oracle Database release 19c, version 19.10:

- `DBMS_CLOUD`  
The `DBMS_CLOUD` package provides a comprehensive support for working with data in Object Storage.
- Blockchain tables are append-only tables in which only insert operations are allowed. Deleting rows is either prohibited or restricted based on time. Rows in a blockchain table are made tamper-resistant by special sequencing & chaining algorithms. Users can verify that rows have not been tampered. A hash value that is part of the row metadata is used to chain and validate rows. Blockchain tables enable you to implement a centralized ledger model where all participants in the blockchain network have access to the same tamper-resistant ledger. The following new packages are available in this release:
  - `DBMS_BLOCKCHAIN_TABLE`
  - `DBMS_USER_CERTS`
- `DBMS_LOGMNR` subprograms `ADD_LOGFILE` Procedure and `START_LOGMNR` Procedure modified to support per-PDB Capture for Oracle Autonomous Database.

### Changes in Oracle Database Release 19c, Version 19.11

The following features are new in Oracle Database release 19c, version 19.11:

- `DBMS_IMMUTABLE_TABLE`  
Immutable tables are read-only tables that protect data against unauthorized modification. They also prevent against accidental data modifications that may be caused by human errors. The `DBMS_IMMUTABLE_TABLE` package allows you to delete the expired rows in an immutable table.
- New subprograms are added to `DBMS_SODA` and `SODA` Types.
- A new procedure, `ACCHK_VIEWS`, is added to the `DBMS_APP_CONT_ADMIN` package. This procedure is available for the 19c release only.

## Deprecated Features

List of deprecated features in Oracle Database release 19c version 19.1 *PL/SQL Packages and Types Reference*.

- `DBMS_SESSION.IS_ROLE_ENABLED` function is deprecated.  
Use `DBMS_SESSION.CURRENT_IS_ROLE_ENABLED` or `DBMS_SESSION.SESSION_IS_ROLE_ENABLED` function instead.

- Starting with Oracle Database 19c, customer use of the `SERVICE_NAMES` parameter is deprecated. It can be desupported in a future release.

The use of the `SERVICE_NAMES` parameter is no longer actively supported. It must not be used for high availability (HA) deployments. It is not supported to use service names parameter for any HA operations. This restriction includes FAN, load balancing, `FAILOVER_TYPE`, `FAILOVER_RESTORE`, `SESSION_STATE_CONSISTENCY`, and any other uses.

To manage your services, Oracle recommends that you use the `SRVCTL` or `GDSCTL` command line utilities, or the `DBMS_SERVICE` package.

## Desupported Features

This section lists the desupported features in Oracle Database release 19c version 19.1 *PL/SQL Packages and Types Reference*.

The following features are desupported in this release:

- The ability to create flat file dictionary dumps of pluggable databases (PDBs) is desupported in Oracle Database 19c.

In previous releases, using a flat file dictionary was one means of mining the redo logs for the changes associated with a specific PDB whose data dictionary was contained within the flat file. This feature is now desupported. With Oracle Database 19c and later releases, Oracle recommends that you call `DBMS_LOGMNR.START_LOGMNR`, and supply the system change number (SCN) or time range that you want to mine. The SCN or time range options of `START_LOGMNR` are enhanced to support mining of individual PDBs.

- Desupport of `CONTINUOUS_MINE` option

The `continuous_mine` option for the `DBMS_LOGMNR.START_LOGMNR` package is desupported in Oracle Database 19c, and is no longer available. The `CONTINUOUS_MINE` functionality of the `LogMiner` package is obsolete. It was deprecated in Oracle Database 12c Release 2 (12.2). There is no replacement functionality.

Desupport of Oracle Streams

Starting in Oracle Database 19c, the Oracle Streams feature is desupported. Use Oracle GoldenGate to replace all replication features of Oracle Streams.

- Oracle Multimedia

Starting in Oracle Database 19c, the Oracle Multimedia feature is desupported. Use Oracle SecureFiles with open source or third-party products for metadata extraction and for image processing and conversion instead of Oracle Multimedia.

### See Also:

For more information, see *Oracle Database Upgrade Guide*

- `MAX_CONNECTIONS` attribute of `LOG_ARCHIVE_DEST_n` Desupported

The `MAX_CONNECTIONS` attribute of the `LOG_ARCHIVE_DEST_n` parameters for Oracle Data Guard Redo Transport is obsolete. It is desupported in Oracle Database 19c.

The `MAX_CONNECTIONS` attribute can interfere with the new Redo Transport Streaming mechanism introduced in Oracle Database 11g, and increase the time necessary to resolve gaps. To prevent these types of errors, Oracle has desupported and removed this attribute.

- Desupport of Extended Datatype Support (EDS)

The Extended Datatype Support (EDS) feature is desupported in Oracle Database 19c. All Data types that the EDS feature supported are now supported natively by both Logical Standby and Oracle GoldenGate.

The Extended Datatype Support (EDS) feature provides a mechanism for logical standbys to support certain Oracle data types that lack native redo-based support. For example, EDS was used to replicate tables with a SDO\_GEOMETRY column. However, starting with Oracle Database 12c Release 2 (12.2), there are no EDS-supported Oracle data types that are not supported natively, either by Logical standby, or by Oracle GoldenGate. This feature is desupported with Oracle Database 19c (19.1).

- The initialization parameter `07_DICTIONARY_ACCESSIBILITY` is desupported in Oracle Database 19c.

The `07_DICTIONARY_ACCESSIBILITY` parameter controlled restrictions on System Privileges from accessing SYS owned objects. It was retained to enable certain backward compatibility for earlier release applications. Desupporting obsolete features enables Oracle to focus on security across all features and functionality. Oracle recommends that you manage system privileges in accordance with standard security best practices.

# 1

## Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN (
  'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
  'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
  'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
  'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
  'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
  'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- [Package Overview](#)
- [Summary of Oracle Supplied PL/SQL Packages and Types](#)

### See Also:

*Oracle Database Development Guide* for information on how to create your own packages

## 1.1 Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

## 1.1.1 Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
[BEGIN
    -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

## 1.1.2 Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

## 1.1.3 Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL\*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

 **Note:**

It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

## 2. Create the package body with the `CREATE PACKAGE BODY` statement.

You can declare and define program objects in the package body.

- You must define public objects declared in the package specification.
- You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

 **See Also:**

- *Oracle Database PL/SQL Language Reference*
- *Oracle Database Development Guide* for more information on creating new packages
- *Oracle Database Concepts*  
for more information on storing and executing packages

### 1.1.3.1 Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

#### 1.1.3.1.1 Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
    mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
    deptno NUMBER) RETURN NUMBER;
  PROCEDURE fire_emp (emp_id NUMBER);
  PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
        new_empno    NUMBER(10);

    BEGIN
        SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
        INSERT INTO emp VALUES (new_empno, name, job, mgr,
            hiredate, sal, comm, deptno);
        RETURN (new_empno);
    END hire_emp;

    PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
    BEGIN
        DELETE FROM emp WHERE empno = emp_id;
        IF SQL%NOTFOUND THEN
            raise_application_error(-20011, 'Invalid Employee
                Number: ' || TO_CHAR(emp_id));
        END IF;
    END fire_emp;

    PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
    BEGIN

        -- If employee exists, then update salary with increase.

        UPDATE emp
            SET sal = sal + sal_incr
            WHERE empno = emp_id;
        IF SQL%NOTFOUND THEN
            raise_application_error(-20011, 'Invalid Employee
                Number: ' || TO_CHAR(emp_id));
        END IF;
    END sal_raise;
END employee_management;
```

**Note:**

If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL\*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
      > START WITH 8000 INCREMENT BY 10;
```

## 1.1.4 Referencing Package Contents

When you want to reference the types, items, and subprograms declared in a package specification, use the dot notation.

For example:

```
package_name.type_name  
package_name.item_name  
package_name.subprogram_name
```

## 1.2 Summary of Oracle Supplied PL/SQL Packages and Types

PL/SQL packages are supplied with the Oracle server that extend database functionality and provide PL/SQL access to SQL features.

These packages, listed in the following table, run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

### Note:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

**Table 1-1 Summary of Oracle Supplied PL/SQL Packages**

| Package Name                         | Description                                                                                                                                   |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| APEX_APPLICATION through<br>APEX_ZIP | For a complete description of all the packages that ship with Oracle Application Express, see <i>Oracle Application Express API Reference</i> |
| CTX_ADM                              | Lets you administer servers and the data dictionary                                                                                           |
| CTX_ANL                              | The CTX_ANL package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.               |
| CTX_CLS                              | Lets you generate CTXRULE rules for a set of documents                                                                                        |
| CTX_DDL                              | Lets you create and manage the preferences, section lists and stopgroups required for Text indexes                                            |
| CTX_DOC                              | Lets you request document services                                                                                                            |
| CTX_ENTITY                           | The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text.                   |
| CTX_OUTPUT                           | Lets you manage the index log                                                                                                                 |
| CTX_QUERY                            | Lets you generate query feedback, count hits, and create stored query expressions                                                             |
| CTX_REPORT                           | Lets you create various index reports                                                                                                         |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name          | Description                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CTX_THES              | Lets you to manage and browse thesauri                                                                                                                                                                                                                                                                 |
| CTX_ULEXER            | For use with the user-lexer                                                                                                                                                                                                                                                                            |
| DBMS_ADDM             | Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor                                                                                                                                                                                                       |
| DBMS_ADVANCED_REWRITE | Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite                                                                                                                                                               |
| DBMS_ADVISOR          | Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements                                                                                                                                                     |
| DBMS_ALERT            | Provides support for the asynchronous notification of database events                                                                                                                                                                                                                                  |
| DBMS_APP_CONT         | The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.                                                                                                        |
| DBMS_APPLICATION_INFO | Lets you register an application name with the database for auditing or performance tracking purposes                                                                                                                                                                                                  |
| DBMS_APPLY_ADM        | Provides administrative procedures to start, stop, and configure an apply process                                                                                                                                                                                                                      |
| DBMS_AQ               | Lets you add a message (of a predefined object type) onto a queue or to dequeue a message                                                                                                                                                                                                              |
| DBMS_AQADM            | Lets you perform administrative functions on a queue or queue table for messages of a predefined object type                                                                                                                                                                                           |
| DBMS_AQELM            | Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP                                                                                                                                                                                       |
| DBMS_AQIN             | Plays a part in providing secure access to the Oracle JMS interfaces                                                                                                                                                                                                                                   |
| DBMS_ASSERT           | Provides an interface to validate properties of the input value                                                                                                                                                                                                                                        |
| DBMS_AUDIT_UTIL       | The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V\$XML_AUDIT_TRAIL views.                                                                                                         |
| DBMS_AUDIT_MGMT       | The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail.                                                                                                                                               |
| DBMS_AUTO_REPORT      | The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR. |
| DBMS_AUTO_SQLTUNE     | The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task.                                                                                                                                                                                                             |
| DBMS_AUTO_TASK_ADMIN  | Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls                                                                                                                                                                                                                          |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name               | Description                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_AW_STATS              | Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions                                                                                                                                              |
| DBMS_BLOCKCHAIN_TABLE      | A blockchain table is an append-only table designed for centralized blockchain applications.                                                                                                                                               |
| DBMS_CAPTURE_ADM           | Describes administrative procedures to start, stop, and configure a capture process; used in Replication                                                                                                                                   |
| DBMS_CLOUD                 | This package provides comprehensive support for working with data in Object Storage.                                                                                                                                                       |
| DBMS_COMPARISON            | Provides interfaces to compare and converge database objects at different databases                                                                                                                                                        |
| DBMS_COMPRESSION           | Provides an interface to facilitate choosing the correct compression level for an application                                                                                                                                              |
| DBMS_CONNECTION_POOL       | Provides an interface to manage the Database Resident Connection Pool                                                                                                                                                                      |
| DBMS_CQ_NOTIFICATION       | Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms. |
| DBMS_CREDENTIAL            | The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.                                              |
| DBMS_CRYPTO                | Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms                                                                   |
| DBMS_CSX_ADMIN             | Provides an interface to customize the setup when transporting a tablespace containing binary XML data                                                                                                                                     |
| DBMS_CUBE                  | Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying                                                                                                                                |
| DBMS_CUBE_ADVISE           | Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite                                                                                                                            |
| DBMS_CUBE_LOG              | DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.                                                                                                                                           |
| DBMS_DATA_MINING           | Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models                                                                                                                                           |
| DBMS_DATA_MINING_TRANSFORM | Provides subroutines that can be used to prepare data for Oracle Data Mining                                                                                                                                                               |
| DBMS_DATAPUMP              | Lets you move all, or part of, a database between databases, including both data and metadata                                                                                                                                              |
| DBMS_DB_VERSION            | The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.                                                                      |
| DBMS_DBCOMP                | The DBMS_DBCOMP package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases.                                                                 |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name                 | Description                                                                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_DBFS_CONTENT            | Provides an interface comprising a file system-like abstraction backed by one or more Store Providers                                                                                                                               |
| DBMS_DBFS_CONTENT_SPI        | Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers                                                                                                                          |
| DBMS_DBFS_HS                 | Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables                                                                             |
| DBMS_DBFS_SFS                | Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package                                                                                                |
| DBMS_DDL                     | Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs                                                                                             |
| DBMS_DEBUG                   | Implements server-side debuggers and provides a way to debug server-side PL/SQL program units                                                                                                                                       |
| DBMS_DEBUG_JDWP              | The DBMS_DEBUG_JDWP provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).                                                       |
| DBMS_DEBUG_JDWP_CUSTOM       | The DBMS_DEBUG_JDWP_CUSTOM package is a PL/SQL package that provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP). |
| DBMS_DESCRIBE                | Describes the arguments of a stored procedure with full name translation and security checking                                                                                                                                      |
| DBMS_DG                      | Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover                                |
| DBMS_DIMENSION               | Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition                                                                          |
| DBMS_DISTRIBUTED_TRUST_ADMIN | Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted                                                                                              |
| DBMS_DNFS                    | The DBMS_DNFS package provides an interface to assists in creating a database using files in the backup set.                                                                                                                        |
| DBMS_DST                     | The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.                                                                                                  |
| DBMS_EDITIONS_UTILITIES      | The DBMS_EDITIONS_UTILITIES package provides helper functions for edition related operations.                                                                                                                                       |
| DBMS_EPG                     | Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener                                                                                                      |
| DBMS_ERRLOG                  | Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back                                                                |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name           | Description                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_FGA               | Provides fine-grained security functions                                                                                                                        |
| DBMS_FILE_GROUP        | One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories           |
| DBMS_FILE_TRANSFER     | Lets you copy a binary file within a database or to transfer a binary file between databases                                                                    |
| DBMS_FLASHBACK         | Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)                                       |
| DBMS_FLASHBACK_ARCHIVE | Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.            |
| DBMS_FREQUENT_ITEMSET  | Enables frequent itemset counting                                                                                                                               |
| DBMS_FS                | The DBMS_FS package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.                     |
| DBMS_GOLDENGATE_AUTH   | The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.                        |
| DBMS_HADOOP            | The DBMS_HADOOP package provides a PL/SQL procedure called CREATE_EXTDDL_FOR_HIVE(), that creates an Oracle external table for a given hive table.              |
| DBMS_HANG_MANAGER      | The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.                                                         |
| DBMS_HEAT_MAP          | The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace.   |
| DBMS_HIERARCHY         | Contains functions and procedures for validating the data in tables used by analytic views and hierarchies and for creating a log table.                        |
| DBMS_HM                | Contains constants and procedure declarations for health check management                                                                                       |
| DBMS_HPROF             | Provides an interface for profiling the execution of PL/SQL applications                                                                                        |
| DBMS_HS_PARALLEL       | Enables parallel processing for heterogeneous targets access                                                                                                    |
| DBMS_HS_PASSTHROUGH    | Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems                                                                   |
| DBMS_ILM               | The DBMS_ILM package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies. |
| DBMS_ILM_ADMIN         | The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution.                                               |
| DBMS_IMMUTABLE_TABLE   | The DBMS_IMMUTABLE_TABLE package allows you to delete the expired rows in an immutable table.                                                                   |
| DBMS_INMEMORY          | The DBMS_INMEMORY package provides an interface for In-Memory Column Store (IM column store) functionality.                                                     |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name          | Description                                                                                                                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_INMEMORY_ADVICE  | The DBMS_INMEMORY_ADVICE package provides the In-Memory Eligibility Tool, which you can use to determine whether or not a database would benefit from the Database In-Memory feature.                                                                   |
| DBMS_INMEMORY_ADMIN   | The DBMS_INMEMORY_ADMIN package provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).                                                                                                 |
| DBMS_IOT              | Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command                                                                                                                          |
| DBMS_JAVA             | Provides a PL/SQL interface for accessing database functionality from Java                                                                                                                                                                              |
| DBMS_JOB              | Schedules and manages jobs in the job queue (Deprecated)                                                                                                                                                                                                |
| DBMS_JSON             | Provides an interface for data-guide operations                                                                                                                                                                                                         |
| DBMS_LDAP             | Provides functions and procedures to access data from LDAP servers                                                                                                                                                                                      |
| DBMS_LDAP_UTL         | Provides the Oracle Extension utility functions for LDAP                                                                                                                                                                                                |
| DBMS_LIBCACHE         | Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution                                                                                                   |
| DBMS_LOB              | Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILES (read-only)                                                                                                              |
| DBMS_LOCK             | Lets you request, convert and release locks through Oracle Lock Management services                                                                                                                                                                     |
| DBMS_LOGMNR           | Provides functions to initialize and run the log reader                                                                                                                                                                                                 |
| DBMS_LOGMNR_D         | Queries the dictionary tables of the current database, and creates a text based file containing their contents                                                                                                                                          |
| DBMS_LOGSTDBY         | Describes procedures for configuring and managing the logical standby database environment                                                                                                                                                              |
| DBMS_LOGSTDBY_CONTEXT | You can use the procedures provided in the DBMS_LOGSTDBY_CONTEXT package to set and retrieve various parameters associated with LSBY_APPLY_CONTEXT.                                                                                                     |
| DBMS_METADATA         | Lets callers easily retrieve complete database object definitions (metadata) from the dictionary                                                                                                                                                        |
| DBMS_METADATA_DIFF    | Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API. |
| DBMS_MGD_ID_UTL       | Provides a set of utility subprograms                                                                                                                                                                                                                   |
| DBMS_MGWADM           | Describes the Messaging Gateway administrative interface; used in Advanced Queuing                                                                                                                                                                      |
| DBMS_MGWMSG           | Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.                                   |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name              | Description                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_MONITOR              | Let you use PL/SQL for controlling additional tracing and statistics gathering                                                                                                                                                                         |
| DBMS_MVIEW                | Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.                                                                                                                                     |
| DBMS_MVIEW_STATS          | The DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.                                                                                                      |
| DBMS_NETWORK_ACL_ADMIN    | Provides the interface to administer the network Access Control List (ACL)                                                                                                                                                                             |
| DBMS_NETWORK_ACL_UTILITY  | The DBMS_NETWORK_ACL_UTILITY package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.                                                                  |
| DBMS_ODCI                 | Returns the CPU cost of a user function based on the elapsed time of the function                                                                                                                                                                      |
| DBMS_OPTIM_BUNDLE         | The DBMS_OPTIM_BUNDLE package is used to manage the installed but disabled module bug fixes which cause an execution plan change.                                                                                                                      |
| DBMS_OUTLN                | Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG                                                                                                                            |
| DBMS_OUTPUT               | Accumulates information in a buffer so that it can be retrieved later                                                                                                                                                                                  |
| DBMS_PARALLEL_EXECUTE     | Enables the user to incrementally update table data in parallel                                                                                                                                                                                        |
| DBMS_PART                 | The DBMS_PART package provides an interface for maintenance and management operations on partitioned objects.                                                                                                                                          |
| DBMS_PCLXUTIL             | Provides intra-partition parallelism for creating partition-wise local indexes                                                                                                                                                                         |
| DBMS_PDB                  | The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface specify which database objects are application common objects.     |
| DBMS_PDB_ALTER_SHARING    | In an application container with a pre-installed application, the DBMS_PDB_ALTER_SHARING package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object. |
| DBMS_PERF                 | The DBMS_PERF package provides and interface to generate active reports for monitoring database performance.                                                                                                                                           |
| DBMS_PIPE                 | Provides a DBMS pipe service which enables messages to be sent between sessions                                                                                                                                                                        |
| DBMS_PLSQL_CODE_COVERAGE  | The DBMS_PLSQL_CODE_COVERAGE package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.                                                                                                   |
| DBMS_PREDICTIVE_ANALYTICS | Provides subroutines that implement automatic data mining operations for predict, explain, and profile                                                                                                                                                 |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name                | Description                                                                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_PREPROCESSOR           | Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form                                                                                                                            |
| DBMS_PRIVILEGE_CAPTURE      | The DBMS_PRIVILEGE_CAPTURE package provides an interface to database privilege analysis.                                                                                                                                          |
| DBMS_PROCESS                | The DBMS_PROCESS package provides an interface to manage the prespawmed servers.                                                                                                                                                  |
| DBMS_PROFILER               | Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks                                                                                                                        |
| DBMS_PROPAGATION_ADM        | Provides administrative procedures for configuring propagation from a source queue to a destination queue                                                                                                                         |
| DBMS_QOPATCH                | The DBMS_QOPATCH package provides an interface to view the installed database patches.                                                                                                                                            |
| DBMS_RANDOM                 | Provides a built-in random number generator                                                                                                                                                                                       |
| DBMS_REDACT                 | The DBMS_REDACT package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by lowprivileged users or an application.                                    |
| DBMS_REDEFINITION           | Lets you perform an online reorganization of tables                                                                                                                                                                               |
| DBMS_REFRESH                | Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option                                                                                  |
| DBMS_REPAIR                 | Provides data corruption repair procedures                                                                                                                                                                                        |
| DBMS_RESCONFIG              | Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource                                                                                                          |
| DBMS_RESOURCE_MANAGER       | Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema                                                                                       |
| DBMS_RESOURCE_MANAGER_PRIVS | Maintains privileges associated with resource consumer groups                                                                                                                                                                     |
| DBMS_RESULT_CACHE           | Provides an interface to operate on the Result Cache                                                                                                                                                                              |
| DBMS_RESUMABLE              | Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution                                                           |
| DBMS_RLS                    | Provides row level security administrative interface                                                                                                                                                                              |
| DBMS_ROLLING                | The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. |
| DBMS_ROWID                  | Provides procedures to create rowids and to interpret their contents                                                                                                                                                              |
| DBMS_RULE                   | Describes the subprograms that enable the evaluation of a rule set for a specified event.                                                                                                                                         |
| DBMS_RULE_ADM               | Provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.                                                                                                                                |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name        | Description                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_SCHEDULER      | Provides a collection of scheduling functions that are callable from any PL/SQL program                                                                                                                                                                                                                            |
| DBMS_SERVER_ALERT   | Lets you issue alerts when some threshold has been violated                                                                                                                                                                                                                                                        |
| DBMS_SERVICE        | Lets you create, delete, activate and deactivate services for a single instance                                                                                                                                                                                                                                    |
| DBMS_SESSION        | Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures                                                                                                                                                                                                             |
| DBMS_SHARED_POOL    | Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism                                                                                                                                                                                                            |
| DBMS_SODA           | Implements Simple Oracle Document Access (SODA) which allows you to use the Oracle Database as a NoSQL document store.                                                                                                                                                                                             |
| DBMS_SPACE          | Provides segment space information not available through standard SQL                                                                                                                                                                                                                                              |
| DBMS_SPACE_ADMIN    | Provides tablespace and segment space administration not available through the standard SQL                                                                                                                                                                                                                        |
| DBMS_SPD            | The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).                                                                                                                                                                                                                                  |
| DBMS_SPM            | Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements                                                                                                       |
| DBMS_SQL            | Lets you use dynamic SQL to access the database                                                                                                                                                                                                                                                                    |
| DBMS_SQL_MONITOR    | The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring.                                                                                                                                                                                      |
| DBMS_SQL_TRANSLATOR | The DBMS_SQL_TRANSLATOR package provides an interface for creating, configuring, and using SQL translation profiles.                                                                                                                                                                                               |
| DBMS_SQLDIAG        | Provides an interface to the SQL Diagnosability functionality                                                                                                                                                                                                                                                      |
| DBMS_SQLPA          | Provides an interface to implement the SQL Performance Analyzer.                                                                                                                                                                                                                                                   |
| DBMS_SQLTUNE        | Provides the interface to tune SQL statements                                                                                                                                                                                                                                                                      |
| DBMS_STAT_FUNCS     | Provides statistical functions                                                                                                                                                                                                                                                                                     |
| DBMS_STATS          | Provides a mechanism for users to view and modify optimizer statistics gathered for database objects                                                                                                                                                                                                               |
| DBMS_STORAGE_MAP    | Communicates with FMON to invoke mapping operations                                                                                                                                                                                                                                                                |
| DBMS_SYNC_REFRESH   | The DBMS_SYNC_REFRESH package provides an interface to perform a synchronous refresh of materialized views.                                                                                                                                                                                                        |
| DBMS_TDB            | Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database. |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name             | Description                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DBMS_TF                  | The DBMS_TF package contains utilities for POLYMORPHIC TABLE functions (PTFs) implementation. You can use DBMS_TF subprograms to consume and produce data, and get information about its execution environment..                                      |
| DBMS_TNS                 | The DBMS_TNS package provides the RESOLVE_TNSNAME function to resolve a TNS name and return the corresponding Oracle Net8 connection string.                                                                                                          |
| DBMS_TRACE               | Provides routines to start and stop PL/SQL tracing                                                                                                                                                                                                    |
| DBMS_TRANSACTION         | Provides access to SQL transaction statements from stored procedures and monitors transaction activities                                                                                                                                              |
| DBMS_TRANSFORM           | Provides an interface to the message format transformation features of Oracle Advanced Queuing                                                                                                                                                        |
| DBMS_TSDP_MANAGE         | The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database.                                                                                                                 |
| DBMS_TSDP_PROTECT        | The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. The DBMS_TSDP_PROTECT package is available with the Enterprise Edition only. |
| DBMS_TTS                 | Checks if the transportable set is self-contained                                                                                                                                                                                                     |
| DBMS_TYPES               | Consists of constants, which represent the built-in and user-defined types                                                                                                                                                                            |
| DBMS_UMF                 | The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.                                                  |
| DBMS_USER_CERTS          | The DBMS_USER_CERTS package allows you add and delete certificates.                                                                                                                                                                                   |
| DBMS_UTILITY             | Provides various utility routines                                                                                                                                                                                                                     |
| DBMS_WARNING             | Provides the interface to query, modify and delete current system or session settings                                                                                                                                                                 |
| DBMS_WM                  | Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions                                                                                                                                    |
| DBMS_WORKLOAD_CAPTURE    | Configures the Workload Capture system and produce the workload capture data.                                                                                                                                                                         |
| DBMS_WORKLOAD_REPLAY     | Provides an interface to replay and report on a record of a workload on a production or test system                                                                                                                                                   |
| DBMS_WORKLOAD_REPOSITORY | Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines                                                                                                                                               |
| DBMS_XA                  | Contains the XA/Open interface for applications to call XA interface in PL/SQL                                                                                                                                                                        |
| DBMS_XDB                 | Describes Resource Management and Access Control interface for PL/SQL                                                                                                                                                                                 |
| DBMS_XDB_ADMIN           | Provides an interface to implement XMLIndex administration operation                                                                                                                                                                                  |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name         | Description                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------|
| DBMS_XDB_CONFIG      | The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.                          |
| DBMS_XDB_CONSTANTS   | The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants.                                             |
| DBMS_XDB_REPOS       | The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.                           |
| DBMS_XDBRESOURCE     | Provides an interface to operate on the XDB resource's metadata and contents                                                 |
| DBMS_XDB_VERSION     | Describes the versioning interface                                                                                           |
| DBMS_XDBT            | Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance |
| DBMS_XDBZ            | Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)                                |
| DBMS_XEVENT          | Provides event-related types and supporting subprograms                                                                      |
| DBMS_XMLDOM          | Explains access to XMLType objects                                                                                           |
| DBMS_XMLGEN          | Converts the results of a SQL query to a canonical XML format                                                                |
| DBMS_XMLINDEX        | Provides an interface to implement asynchronous indexing and apply node referencing                                          |
| DBMS_XMLPARSER       | Explains access to the contents and structure of XML documents                                                               |
| DBMS_XMLQUERY        | Provides database-to-XMLType functionality                                                                                   |
| DBMS_XMLSAVE         | Provides XML-to-database-type functionality                                                                                  |
| DBMS_XMLSCHEMA       | Explains procedures to register and delete XML schemas                                                                       |
| DBMS_XMLSTORE        | Provides the ability to store XML data in relational tables                                                                  |
| DBMS_XMLTRANSLATIONS | Provides an interface to perform translations so that strings can be searched or displayed in various languages              |
| DBMS_XPLAN           | Describes how to format the output of the EXPLAIN PLAN command                                                               |
| DBMS_XSLPROCESSOR    | Explains access to the contents and structure of XML documents                                                               |
| DEBUG_EXTPROC        | Lets you debug external procedures on platforms with debuggers that attach to a running process                              |
| HTF                  | Hypertext functions generate HTML tags                                                                                       |
| HTP                  | Hypertext procedures generate HTML tags                                                                                      |
| OWA_CACHE            | Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications            |
| OWA_COOKIE           | Provides an interface for sending and retrieving HTTP cookies from the client's browser                                      |
| OWA_CUSTOM           | Provides a Global PLSQL Agent Authorization callback function                                                                |
| OWA_IMAGE            | Provides an interface to access the coordinates where a user clicked on an image                                             |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name    | Description                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWA_OPT_LOCK    | Contains subprograms that impose optimistic locking strategies so as to prevent lost updates                                                                                                                          |
| OWA_PATTERN     | Provides an interface to locate text patterns within strings and replace the matched string with another string                                                                                                       |
| OWA_SEC         | Provides an interface for custom authentication                                                                                                                                                                       |
| OWA_TEXT        | Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.                                                                                                |
| OWA_UTIL        | Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table |
| SDO_CS          | Provides functions for coordinate system transformation                                                                                                                                                               |
| SDO_CSW_PROCESS | Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)                                                                                                      |
| SDO_GCDR        | Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses                                                                                                                 |
| SDO_GEOM        | Provides functions implementing geometric operations on spatial objects                                                                                                                                               |
| SDO_GEOR        | Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata          |
| SDO_GEOR_ADMIN  | Contains subprograms for administrative operations related to GeoRaster.                                                                                                                                              |
| SDO_GEOR_UTL    | Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data                                                                            |
| SDO_LRS         | Provides functions for linear referencing system support                                                                                                                                                              |
| SDO_MIGRATE     | Provides functions for migrating spatial data from previous releases                                                                                                                                                  |
| SDO_NET         | Provides functions and procedures for working with data modeled as nodes and links in a network                                                                                                                       |
| SDO_NET_MEM     | Contains functions and procedures for performing editing and analysis operations on network data using a network memory object                                                                                        |
| SDO_OLS         | Contains functions and procedures for performing editing and analysis operations on network data using a network memory object                                                                                        |
| SDO_PC_PKG      | Contains subprograms to support the use of point clouds in Spatial                                                                                                                                                    |
| SDO_SAM         | Contains functions and procedures for spatial analysis and data mining                                                                                                                                                |
| SDO_TIN_PKG     | Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial                                                                                                                          |
| SDO_TOPO        | Provides procedures for creating and managing Spatial topologies                                                                                                                                                      |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name | Description                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SDO_TOPO_MAP | Contains subprograms for editing Spatial topologies using a cache (TopoMap object)                                                                                         |
| SDO_TUNE     | Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial                                              |
| SDO_UTIL     | Provides utility functions and procedures for Oracle Spatial                                                                                                               |
| SDO_WFS_LOCK | Contains subprograms for WFS support for registering and unregistering feature tables                                                                                      |
| SDO_WFS_PROC | Provides utility functions and procedures for Oracle Spatial                                                                                                               |
| SEM_APIS     | Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.                                      |
| SEM_PERF     | Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database |
| SEM_RDFCTX   | Contains subprograms for managing extractor policies and semantic indexes created for documents                                                                            |
| SEM_RDFSFA   | Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)                   |
| UTL_COLL     | Enables PL/SQL programs to use collection locators to query and update                                                                                                     |
| UTL_COMPRESS | Provides a set of data compression utilities                                                                                                                               |
| UTL_DBWS     | Provides database Web services                                                                                                                                             |
| UTL_ENCODE   | Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts                                                   |
| UTL_FILE     | Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O                  |
| UTL_HTTP     | Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges                                                           |
| UTL_I18N     | Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications                                                             |
| UTL_INADDR   | Provides a procedure to support internet addressing                                                                                                                        |
| UTL_IDENT    | Specifies which database or client PL/SQL is running                                                                                                                       |
| UTL_LMS      | Retrieves and formats error messages in different languages                                                                                                                |
| UTL_MAIL     | A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt                                                 |
| UTL_NLA      | Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs                                                            |
| UTL_RAW      | Provides SQL functions for manipulating RAW datatypes                                                                                                                      |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name                                   | Description                                                                                                                                                                            |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UTL_RECOMP                                     | Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels                                            |
| UTL_REF                                        | Enables a PL/SQL program to access an object by providing a reference to the object                                                                                                    |
| UTL_SMTP                                       | Provides PL/SQL functionality to send emails                                                                                                                                           |
| UTL_RPADV                                      | Provides subprograms to collect and analyze statistics for the Oracle Replication components in a distributed database environment                                                     |
| UTL_TCP                                        | Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world                                                                      |
| UTL_URL                                        | Provides escape and unescape mechanisms for URL characters                                                                                                                             |
| WPG_DOCLOAD                                    | Provides an interface to download files, both BLOBs and BFILEs                                                                                                                         |
| ANYDATA TYPE                                   | A self-describing data instance type containing an instance of the type plus a description                                                                                             |
| ANYDATASET TYPE                                | Contains a description of a given type plus a set of data instances of that type                                                                                                       |
| ANYTYPE TYPE                                   | Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions |
| Oracle Database Advanced Queuing Types         | Describes the types used in Advanced Queuing                                                                                                                                           |
| DBFS Content Interface Types                   | Describes public types defined to support the DBMS_DBFS_CONTENT interface.                                                                                                             |
| Database URI Type                              | Contains URI Support, UriType Super Type, UriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package                                                                   |
| Expression Filter Types                        | Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.                                                                              |
| JMS TYPES                                      | Describes JMS types so that a PL/SQL application can use JMS queues of JMS types                                                                                                       |
| LOGICAL CHANGE RECORD TYPES                    | Describes LCR types, which are message payloads that contain information about changes to a database.                                                                                  |
| MG_ID Package Types                            | Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types                                        |
| POLYMORPHIC TABLE FUNCTION (PTF) Package Types | Describes types defined in the DBMS_TF package to support PTF                                                                                                                          |
| RULES TYPES                                    | Describes the types used with rules, rule sets, and evaluation contexts                                                                                                                |
| RULES Manager Types                            | Rules Manager is supplied with one predefined type and a public synonym                                                                                                                |
| SODA Types                                     | Describes the SODA Types.                                                                                                                                                              |

**Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages**

| Package Name      | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| UTL Streams Types | Describes abstract streams types used with Oracle XML functionality         |
| XMLType           | Describes the types and functions used for native XML support in the server |

## 2

# Oracle Application Express Packages APEX\_APPLICATION Through APEX\_ZIP

The Oracle Application Express supplies PL/SQL packages for application developers who are building database-centric web applications using Oracle Application Express.

For a complete description of all the packages that ship with Oracle Application Express, see the *Oracle Application Express API Reference*.

# 3

## CTX\_ADM

The CTX\_ADM package lets you administer the Oracle Text data dictionary.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX\_ADM in the Oracle Text Reference.

# 4

## CTX\_ANL

The `CTX_ANL` package is used with `AUTO_LEXER` and provides procedures for adding and dropping a custom dictionary from the lexer.

A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

For a complete description of this package within the context of Oracle Text, see `CTX_ANL` in the Oracle Text Reference.

# 5

## CTX\_CLS

The `CTX_CLS` package enables generation of CTXRULE rules for a set of documents.

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the Oracle Text Reference.

# 6

## CTX\_DDL

The `CTX_DDL` package lets you create and manage the preferences, section groups, and stoplists required for Text indexes.

Note that you must install this package in order to use it.

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the Oracle Text Reference.

# 7

## CTX\_DOC

The CTX\_DOC package lets you request document services.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX\_DOC in the Oracle Text Reference.

# 8

## CTX\_ENTITY

The `CTX_ENTITY` package enables you to search for terms that are unknown to you without specifying a particular search text.

It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

For the complete description of this package within the context of Oracle Text, see `CTX_ENTITY` in the *Oracle Text Reference*.

# 9

## CTX\_OUTPUT

This Oracle Text package lets you manage the index log.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the Oracle Text Reference.

# 10

## CTX\_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_QUERY` in the Oracle Text Reference.

# 11

## CTX\_REPORT

This Oracle Text package lets you create various index reports.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the Oracle Text Reference.

# 12

## CTX\_THES

This Oracle Text package lets you to manage and browse thesauri.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the Oracle Text Reference.

# 13

## CTX\_ULEXER

This Oracle Text package is for use with the user-lexer.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the Oracle Text Reference.

# DBMS\_ADDM

The `DBMS_ADDM` package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_ADDM Subprograms](#)

## See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

## 14.1 DBMS\_ADDM Security Model

The `DBMS_ADDM` package runs with the caller's permission, not the definer's, and then applies the security constraints required by the `DBMS_ADVISOR` package.

## See Also:

The `DBMS_ADVISOR` package for more information about "[Security Model](#)".

## 14.2 Summary of DBMS\_ADDM Subprograms

The table in this topic lists and describes the `DBMS_ADDM` subprograms.

**Table 14-1 DBMS\_ADDM Package Subprograms**

| Subprogram                                | Description                                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">ANALYZE_DB Procedure</a>      | Creates an ADDM task for analyzing in database analysis mode and executes it                      |
| <a href="#">ANALYZE_INST Procedure</a>    | Creates an ADDM task for analyzing in instance analysis mode and executes it.                     |
| <a href="#">ANALYZE_PARTIAL Procedure</a> | Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it |

**Table 14-1 (Cont.) DBMS\_ADDM Package Subprograms**

| Subprogram                                             | Description                                                                                                      |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <a href="#">COMPARE_CAPTURE_REPLAY_REPORT Function</a> | Produces a Compare Period ADDM report comparing the performance of a capture to a replay                         |
| <a href="#">COMPARE_DATABASES Function</a>             | Produces a Compare Period ADDM report for a database-wide performance comparison                                 |
| <a href="#">COMPARE_INSTANCES Function</a>             | Produces a Compare Period ADDM report for an instance-level performance comparison                               |
| <a href="#">COMPARE_REPLAY_REPLAY_REPORT Function</a>  | Produces a Compare Period ADDM report comparing the performance of a replay to another replay                    |
| <a href="#">DELETE Procedure</a>                       | Deletes an already created ADDM task (of any kind)                                                               |
| <a href="#">DELETE_FINDING_DIRECTIVE Procedure</a>     | Deletes a finding directive                                                                                      |
| <a href="#">DELETE_PARAMETER_DIRECTIVE Procedure</a>   | Deletes a parameter directive                                                                                    |
| <a href="#">DELETE_SEGMENT_DIRECTIVE Procedure</a>     | Deletes a segment directive                                                                                      |
| <a href="#">DELETE_SQL_DIRECTIVE Procedure</a>         | Deletes a SQL directive                                                                                          |
| <a href="#">GET_ASH_QUERY Function</a>                 | Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding |
| <a href="#">GET_REPORT Function</a>                    | Retrieves the default text report of an executed ADDM task                                                       |
| <a href="#">INSERT_FINDING_DIRECTIVE Procedure</a>     | Creates a directive to limit reporting of a specific finding type.                                               |
| <a href="#">INSERT_PARAMETER_DIRECTIVE Procedure</a>   | Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter      |
| <a href="#">INSERT_SEGMENT_DIRECTIVE Procedure</a>     | Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments         |
| <a href="#">INSERT_SQL_DIRECTIVE Procedure</a>         | Creates a directive to limit reporting of actions on specific SQL                                                |
| <a href="#">REAL_TIME_ADDM_REPORT Function</a>         | Produces a real-time report of ADDM activity                                                                     |

## 14.2.1 ANALYZE\_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_DB (
    task_name          IN OUT VARCHAR2,
    begin_snapshot     IN      NUMBER,
    end_snapshot       IN      NUMBER,
    db_id              IN      NUMBER := NULL);
```

## Parameters

**Table 14-2 ANALYZE\_DB Procedure Parameters**

| Parameter      | Description                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------|
| task_name      | Name of the task to be created                                                                    |
| begin_snapshot | Number of the snapshot that starts the analysis period                                            |
| end_snapshot   | Number of the snapshot that ends the analysis period                                              |
| db_id          | Database ID for the database you to analyze. By default, this is the database currently connected |

## Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

## Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
    :tname := 'my_database_analysis_mode_task';
    DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## 14.2.2 ANALYZE\_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_INST (
    task_name          IN OUT VARCHAR2,
    begin_snapshot     IN      NUMBER,
    end_snapshot       IN      NUMBER,
    cdb_type_override  IN      VARCHAR2,
    read_only_type_override IN  VARCHAR2,
    instance_number    IN      NUMBER := NULL,
    db_id              IN      NUMBER := NULL);
```

## Parameters

**Table 14-3 ANALYZE\_INST Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>               | Name of the task to be created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>begin_snapshot</code>          | Number of the snapshot that starts the analysis period                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>end_snapshot</code>            | Number of the snapshot that ends the analysis period                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>cdb_type_override</code>       | Overrides the type of CDB that ADDM determines for doing analysis. The possible values are: <ul style="list-style-type: none"> <li><code>AUTONOMOUS OLTP</code>—autonomous OLTP inside a PDB</li> <li><code>AUTONOMOUS DATA WAREHOUSE</code>—autonomous data warehouse (ADWH) inside a PDB</li> <li><code>PDB</code> <ul style="list-style-type: none"> <li>—a regular PDB</li> </ul> </li> <li><code>CDB ROOT</code> <ul style="list-style-type: none"> <li>—the root of a CDB</li> </ul> </li> <li><code>NON-CDB</code> <ul style="list-style-type: none"> <li>—a system that is not CDB or PDB</li> </ul> </li> <li><code>AUTO</code> <ul style="list-style-type: none"> <li>—allows ADDM to decide the type of CDB to override based on the data</li> </ul> </li> </ul> |
| <code>read_only_type_override</code> | Overrides the type of CDB ADDM determines for analysis. The possible values are: <ul style="list-style-type: none"> <li><code>READ-WRITE</code>—a regular database or the primary database in a data guard configuration</li> <li><code>READ-ONLY</code>—a database open in read-only mode, such as an active data guard standby</li> <li><code>AUTO</code>—allows ADDM to decide the type of CDB to override based on the data</li> </ul>                                                                                                                                                                                                                                                                                                                                  |
| <code>instance_number</code>         | Number of the instance to analyze. By default it is the instance currently connected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>db_id</code>                   | Database ID for the database you to analyze. By default, this is the database currently connected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

## Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

## Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
    :tname := 'my_instance_analysis_mode_task';
```

```
DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);  
END
```

To see a report:

```
SET LONG 100000  
SET PAGESIZE 50000  
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## 14.2.3 ANALYZE\_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

### Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (  
    task_name          IN OUT VARCHAR2,  
    instance_numbers   IN    VARCHAR2,  
    begin_snapshot     IN    NUMBER,  
    end_snapshot       IN    NUMBER,  
    db_id              IN    NUMBER := NULL);
```

### Parameters

**Table 14-4 ANALYZE\_PARTIAL Procedure Parameters**

| Parameter        | Description                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------|
| task_name        | Name of the task to be created                                                                    |
| instance_numbers | Comma separated list of instance numbers to analyze                                               |
| begin_snapshot   | Number of the snapshot that starts the analysis period                                            |
| end_snapshot     | Number of the snapshot that ends the analysis period                                              |
| db_id            | Database ID for the database you to analyze. By default, this is the database currently connected |

### Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

### Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);  
BEGIN  
    :tname := 'my_partial_analysis_modetask';  
    DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);  
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

## 14.2.4 COMPARE\_CAPTURE\_REPLAY\_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

### Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
    replay_id          IN NUMBER,
    report_type        IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

### Parameters

**Table 14-5 COMPARE\_CAPTURE\_REPLAY\_REPORT Function Parameters**

| Parameter   | Description                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| replay_id   | Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression. |
| report_type | 'HTML' (the default) for an HTML active report, 'XML' for an XML report                                                                 |

### Return Values

A CLOB containing a compare period ADDM report

## 14.2.5 COMPARE\_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

### Syntax

```
DBMS_ADDM.COMPARE_DATABASES (
    base_dbid          IN NUMBER := NULL,
    base_begin_snap_id IN NUMBER,
    base_end_snap_id   IN NUMBER,
    comp_dbid          IN NUMBER := NULL,
    comp_begin_snap_id IN NUMBER,
    comp_end_snap_id   IN NUMBER,
    report_type        IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

## Parameters

**Table 14-6 COMPARE\_DATABASES Function Parameters**

| Parameter           | Description                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| base_dbid           | Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression. |
| base_begin_snap_ids | Begin AWR snapshot ID of the base period.                                                                                                         |
| base_end_snap_id    | End AWR snapshot ID of the base period.                                                                                                           |
| comp_dbid           | Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.                                   |
| comp_begin_snap_id  | Begin AWR snapshot ID of the comparison period                                                                                                    |
| comp_end_snap_id    | End AWR snapshot ID of the comparison period                                                                                                      |
| report_type         | 'HTML' (the default) for an HTML active report, 'XML' for an XML report                                                                           |

## Return Values

A CLOB containing a compare period ADDM report

## 14.2.6 COMPARE\_INSTANCES Function

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

## Syntax

```
DBMS_ADDM.COMPARE_INSTANCES (
    base_dbid           IN NUMBER := NULL,
    base_instance_id    IN NUMBER
    base_begin_snap_id  IN NUMBER,
    base_end_snap_id    IN NUMBER,
    comp_dbid           IN NUMBER := NULL,
    comp_instance_id    IN NUMBER,
    comp_begin_snap_id  IN NUMBER,
    comp_end_snap_id    IN NUMBER,
    report_type         IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

## Parameters

**Table 14-7 COMPARE\_INSTANCES Function Parameters**

| Parameter | Description                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| base_dbid | Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression. |

**Table 14-7 (Cont.) COMPARE\_INSTANCES Function Parameters**

| Parameter          | Description                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| base_instance_id   | Instance number of the database instance to include from the base period                                        |
| base_begin_snap_id | Begin AWR snapshot ID of the base period.                                                                       |
| base_end_snap_id   | End AWR snapshot ID of the base period.                                                                         |
| comp_dbid          | Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period. |
| comp_instance_id   | Instance number of the database instance to include from the comparison period                                  |
| comp_begin_snap_id | Begin AWR snapshot ID of the comparison period                                                                  |
| comp_end_snap_id   | End AWR snapshot ID of the comparison period                                                                    |
| report_type        | 'HTML' (the default) for an HTML active report, 'XML' for an XML report                                         |

#### Return Values

A CLOB containing a compare period ADDM report

## 14.2.7 COMPARE\_REPLAY\_REPLAY\_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

#### Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (
    replay_id1      IN NUMBER,
    replay_id2      IN NUMBER,
    report_type     IN VARCHAR2 := 'HTML')
RETURN CLOB;
```

#### Parameters

**Table 14-8 COMPARE\_REPLAY\_REPLAY\_REPORT Function Parameters**

| Parameter   | Description                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id1  | Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.                       |
| replay_id2  | Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression. |
| report_type | 'HTML' (the default) for an HTML active report, 'XML' for an XML report                                                                                       |

**Return Values**

A CLOB containing a compare period ADDM report

## 14.2.8 DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

**Syntax**

```
DBMS_ADDM.DELETE (
    task_name          IN VARCHAR2);
```

**Parameters**

**Table 14-9** DELETE Procedure Parameters

| Parameter | Description                    |
|-----------|--------------------------------|
| task_name | Name of the task to be deleted |

**Examples**

```
BEGIN
    DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

## 14.2.9 DELETE\_FINDING\_DIRECTIVE Procedure

This procedure deletes a finding directive.

**Syntax**

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
    task_name          IN VARCHAR2,
    dir_name           IN VARCHAR2);
```

**Parameters**

**Table 14-10** DELETE\_FINDING\_DIRECTIVE Procedure Parameters

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| task_name | Name of the task this directive applies to. If the value is NULL, it is a system directive. |
| dir_name  | Name of the directive. All directives must be given unique names.                           |

## 14.2.10 DELETE\_PARAMETER\_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

### Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 14-11** DELETE\_PARAMETER\_DIRECTIVE Procedure Parameters

| Parameter | Description                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------|
| task_name | Name of the task this directive applies to. If the value is <code>NULL</code> , it is a system directive. |
| dir_name  | Name of the directive. All directives must be given unique names.                                         |

### Examples

```
BEGIN  
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');  
END;
```

## 14.2.11 DELETE\_SEGMENT\_DIRECTIVE Procedure

This procedure deletes a segment directive.

### Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

### Parameters

**Table 14-12** DELETE\_SEGMENT\_DIRECTIVE Procedure Parameters

| Parameter | Description                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------|
| task_name | Name of the task this directive applies to. If the value is <code>NULL</code> , it is a system directive. |
| dir_name  | Name of the directive. All directives must be given unique names.                                         |

## 14.2.12 DELETE\_SQL\_DIRECTIVE Procedure

This procedure deletes a SQL directive.

### Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
    task_name      IN VARCHAR2,
    dir_name       IN VARCHAR2);
```

### Parameters

**Table 14-13** DELETE\_SQL\_DIRECTIVE Procedure Parameters

| Parameter | Description                                                                                 |
|-----------|---------------------------------------------------------------------------------------------|
| task_name | Name of the task this directive applies to. If the value is NULL, it is a system directive. |
| dir_name  | Name of the directive. All directives must be given unique names.                           |

## 14.2.13 GET\_ASH\_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding.

For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

### Syntax

```
DBMS_ADDM.GET_ASH_QUERY (
    task_name      IN  VARCHAR2,
    finding_id     IN  NUMBER)
RETURN VARCHAR2;
```

### Parameters

**Table 14-14** GET\_ASH\_QUERY Function Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| task_name | Name of the task                  |
| finding   | ID of the finding within the task |

### Return Values

A VARCHAR containing an ASH query identifying the rows in ASH with impact for the finding

## 14.2.14 GET\_REPORT Function

This function retrieves the default text report of an executed ADDM task.

### Syntax

```
DBMS_ADDM.GET_REPORT (
    task_name          IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 14-15 GET\_REPORT Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| task_name | Name of the task |

### Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

## 14.2.15 INSERT\_FINDING\_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
    task_name          IN VARCHAR2,
    dir_name           IN VARCHAR2,
    finding_name       IN VARCHAR2,
    min_active_sessions IN NUMBER := 0,
    min_perc_impact    IN NUMBER := 0);
```

### Parameters

**Table 14-16 INSERT\_FINDING\_DIRECTIVE Procedure Parameters**

| Parameter           | Description                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name           | Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.                                        |
| dir_name            | Name of the directive. All directives must be given unique names.                                                                                                         |
| finding_name        | Name of an ADDM finding to which this directive applies. All valid findings names appear in the <code>NAME</code> column of view <code>DBA_ADVISOR_FINDING_NAMES</code> . |
| min_active_sessions | Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.                                           |

**Table 14-16 (Cont.) INSERT\_FINDING\_DIRECTIVE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| min_perc_impact | Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result. |

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of `GET_REPORT` shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
    NULL,
    'Undersized SGA directive',
    'Undersized SGA',
    2,
    10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## 14.2.16 INSERT\_PARAMETER\_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

### Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  parameter_name     IN VARCHAR2);
```

### Parameters

**Table 14-17 INSERT\_PARAMETER\_DIRECTIVE Procedure Parameters**

| Parameter      | Description                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks. |
| dir_name       | Name of the directive. All directives must be given unique names.                                                                  |
| parameter_name | Specifies the parameter to use. Valid parameter names appear in <code>V\$PARAMETER</code> .                                        |

**Table 14-18 (Cont.) INSERT\_SEGMENT\_DIRECTIVE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sub_object_name | Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.<br><br> |
| object_number   | Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS                                                                                                                         |

**Examples**

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET\_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
    DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                        'my Segment directive',
                                        'SCOTT');
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## 14.2.18 INSERT\_SQL\_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
    task_name          IN VARCHAR2,
    dir_name           IN VARCHAR2,
    sql_id             IN VARCHAR2,
    min_active_sessions IN NUMBER := 0,
    min_response_time  IN NUMBER := 0);
```

**Parameters****Table 14-19 INSERT\_SQL\_DIRECTIVE Procedure Parameters**

| Parameter | Description                                                                                                            |
|-----------|------------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.   |
| dir_name  | Name of the directive. All directives must be given unique names.                                                      |
| sql_id    | Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'. |

**Table 14-19 (Cont.) INSERT\_SQL\_DIRECTIVE Procedure Parameters**

| Parameter           | Description                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| min_active_sessions | Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.         |
| min_response_time   | Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result. |

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of `GET_REPORT` shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
    NULL,
    'my SQL directive',
    'abcd123456789',
    2,
    1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

## 14.2.19 REAL\_TIME\_ADDM\_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over `GV$` is possible.

### Syntax

```
DBMS_ADDM.REAL_TIME_ADDM_REPORT ()
RETURN CLOB;
```

### Return Values

CLOB containing a real-time ADDM report

# DBMS\_ADVANCED\_REWRITE

DBMS\_ADVANCED\_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

## See Also:

*Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- [DBMS\\_ADVANCED\\_REWRITE Security Model](#)
- [Summary of DBMS\\_ADVANCED\\_REWRITE Subprograms](#)

## 15.1 DBMS\_ADVANCED\_REWRITE Security Model

Default privileges are not granted to anyone for access to DBMS\_ADVANCED\_REWRITE Security Model procedures. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user `er` can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS\_ADVANCED\_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user `er` can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

## 15.2 Summary of DBMS\_ADVANCED\_REWRITE Subprograms

This table lists the DBMS\_ADVANCED\_REWRITE subprograms and briefly describes them.

**Table 15-1 DBMS\_ADVANCED\_REWRITE Package Subprograms**

| Subprogram                                          | Description                                                                     |
|-----------------------------------------------------|---------------------------------------------------------------------------------|
| <a href="#">ALTER_REWRITE_EQUIVALENCE Procedure</a> | Changes the mode of the rewrite equivalence declaration to the mode you specify |

**Table 15-1 (Cont.) DBMS\_ADVANCED\_REWRITE Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BUILD_SAFE_REWRITE_EQUIVALENCE Procedure</a> | Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure                                                                                                                  |
| <a href="#">DECLARE_REWRITE_EQUIVALENCE Procedures</a>   | Creates a declaration indicating that <code>source_stmt</code> is functionally equivalent to <code>destination_stmt</code> for as long as the equivalence declaration remains enabled, and that <code>destination_stmt</code> is more favorable in terms of performance |
| <a href="#">DROP_REWRITE_EQUIVALENCE Procedure</a>       | Drops the specified rewrite equivalence declaration                                                                                                                                                                                                                     |
| <a href="#">VALIDATE_REWRITE_EQUIVALENCE Procedure</a>   | Validates the specified rewrite equivalence declaration using the same validation method as described with the <code>validate</code> parameter                                                                                                                          |

## 15.2.1 ALTER\_REWRITE\_EQUIVALENCE Procedure

This table list the all the package subprograms in alphabetical order.

### Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name          VARCHAR2,
    rewrite_mode   VARCHAR2);
```

### Parameters

**Table 15-2 ALTER\_REWRITE\_EQUIVALENCE Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code> | A name for the equivalence declaration to alter. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema. |

**Table 15-2 (Cont.) ALTER\_REWRITE\_EQUIVALENCE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rewrite_mode | <p>The following modes are supported, in increasing order of power:</p> <p><b>disabled:</b> Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</p> <p><b>text_match:</b> Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</p> <p><b>general:</b> Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>.</p> <p><b>recursive:</b> Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration.</p> <p>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</p> |

## 15.2.2 BUILD\_SAFE\_REWRITE\_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure.

It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

## 15.2.3 DECLARE\_REWRITE\_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance.

The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted` and `stale_tolerated` modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in `trusted` and `stale_tolerated` integrity modes.

### Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name          VARCHAR2,
    source_stmt    VARCHAR2,
    destination_stmt VARCHAR2,
    validate       BOOLEAN    := TRUE,
```

```

rewrite_mode          VARCHAR2      := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name                VARCHAR2,
    source_stmt          CLOB,
    destination_stmt     CLOB,
    validate             BOOLEAN      := TRUE,
    rewrite_mode         VARCHAR2     := 'TEXT_MATCH');

```

## Parameters

**Table 15-3 DECLARE\_REWRITE\_EQUIVALENCE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | <p>A name for the equivalence declaration. The name can be of the form <code>owner.name</code>, where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name.</p> <p>Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate <code>CREATE MATERIALIZED VIEW</code> privileges to alter an equivalence declaration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| source_stmt      | A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format. This is the query statement that is the target of optimization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| destination_stmt | A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| validate         | <p>A Boolean indicating whether to validate that the specified <code>source_stmt</code> is functionally equivalent to the specified <code>destination_stmt</code>. If <code>validate</code> is specified as <code>TRUE</code>, <code>DECLARE_REWRITE_EQUIVALENCE</code> evaluates the two sub-<code>SELECT</code>s and compares their results. If the results are not the same, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not create the rewrite equivalence and returns an error condition. If <code>FALSE</code>, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not validate the equivalence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| rewrite_mode     | <p>The following modes are supported, in increasing order of power:</p> <ul style="list-style-type: none"> <li>disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</li> <li>text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</li> <li>general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>.</li> <li>recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration.</li> </ul> <p>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</p> |

## Exceptions

**Table 15-4 DECLARE\_REWRITE\_EQUIVALENCE Procedure Exceptions**

| Exception | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| ORA-30388 | Name of the rewrite equivalence is not specified                                             |
| ORA-30391 | The specified rewrite equivalence does not exist                                             |
| ORA-30392 | The checksum analysis for the rewrite equivalence failed                                     |
| ORA-30393 | A query block in the statement did not write                                                 |
| ORA-30396 | Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater |

## Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's `source_stmt` or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's `destination_stmt` or the materialized view's container table, respectively.

## 15.2.4 DROP\_REWRITE\_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

### Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
    name          VARCHAR2);
```

### Parameters

**Table 15-5 DROP\_REWRITE\_EQUIVALENCE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | A name for the equivalence declaration to drop. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema. |

## 15.2.5 VALIDATE\_REWRITE\_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration.

It uses the same validation method as described with the `VALIDATE` parameter in "[VALIDATE\\_REWRITE\\_EQUIVALENCE Procedure](#)".

### Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
    name          VARCHAR2);
```

### Parameters

**Table 15-6 VALIDATE\_REWRITE\_EQUIVALENCE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | A name for the equivalence declaration to validate. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the <code>source_stmt</code> and <code>destination_stmt</code> of the specified equivalence declaration. |

# DBMS\_ADVISOR

DBMS\_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS\_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS\_ADDM)
- SQL Performance Analyzer (DBMS\_SQLPA)
- SQL Repair Advisor (DBMS\_SQLDIAG)
- SQL Tuning Advisor (DBMS\_SQLTUNE)
- Compression Advisor (DBMS\_COMPRESSION.GET\_COMPRESSION\_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS\_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS\_ADVISOR subprograms.

This chapter contains the following topics:

- [DBMS\\_ADVISOR Deprecated Subprograms](#)
- [DBMS\\_ADVISOR Security Model](#)
- [Summary of DBMS\\_ADVISOR Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide* to learn about Segment Advisor
- *Oracle Database 2 Day + Performance Tuning Guide* to learn how to use SQL Access Advisor in Enterprise Manager
- *Oracle Database SQL Tuning Guide* to learn more about SQL Access Advisor

## 16.1 DBMS\_ADVISOR Deprecated Subprograms

The section lists programs that are deprecated with Oracle Database 11g.

## Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated:

- [ADD\\_SQLWKLD\\_REF Procedure](#)
- [CREATE\\_SQLWKLD Procedure](#)
- [DELETE\\_SQLWKLD Procedure](#)
- [DELETE\\_SQLWKLD\\_REF Procedure](#)
- [DELETE\\_SQLWKLD\\_STATEMENT Procedure](#)
- [IMPORT\\_SQLWKLD\\_SCHEMA Procedure](#)
- [IMPORT\\_SQLWKLD\\_SQLCACHE Procedure](#)
- [IMPORT\\_SQLWKLD\\_STS Procedure](#)
- [IMPORT\\_SQLWKLD\\_SUMADV Procedure](#)
- [IMPORT\\_SQLWKLD\\_USER Procedure](#)
- [RESET\\_SQLWKLD Procedure](#)
- [SET\\_SQLWKLD\\_PARAMETER Procedure](#)
- [UPDATE\\_SQLWKLD\\_ATTRIBUTES Procedure](#)
- [UPDATE\\_SQLWKLD\\_STATEMENT Procedure](#)

## 16.2 DBMS\_ADVISOR Security Model

The `ADVISOR` privilege is required to use the `DBMS_ADVISOR` package.

## 16.3 Summary of DBMS\_ADVISOR Subprograms

This topic lists and describes the subprograms in the `DBMS_ADVISOR` package.

In the following table, the `Used in` column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.

**Table 16-1 DBMS\_ADVISOR Package Subprograms**

| Subprogram                                      | Description                                                                                            | Used in                             |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------|-------------------------------------|
| <a href="#">ADD_SQLWKLD_REF Procedure</a>       | Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)                          | SQL Access Advisor                  |
| <a href="#">ADD_SQLWKLD_STATEMENT Procedure</a> | Adds a single statement to a workload                                                                  | SQL Access Advisor                  |
| <a href="#">ADD_STS_REF Procedure</a>           | Establishes a link between the current SQL Access Advisor task and a SQL tuning set                    | SQL Access Advisor                  |
| <a href="#">CANCEL_TASK Procedure</a>           | Cancels a currently executing task operation                                                           | Segment Advisor, SQL Access Advisor |
| <a href="#">COPY_SQLWKLD_TO_STS Procedure</a>   | Copies the contents of a SQL workload object to a SQL tuning set                                       | SQL Access Advisor                  |
| <a href="#">CREATE_FILE Procedure</a>           | Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports | SQL Access Advisor                  |

**Table 16-1 (Cont.) DBMS\_ADVISOR Package Subprograms**

| Subprogram                                          | Description                                                                                                                   | Used in                             |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <a href="#">CREATE_OBJECT Procedure</a>             | Creates a new task object                                                                                                     | Segment Advisor                     |
| <a href="#">CREATE_SQLWKL D Procedure</a>           | Creates a new workload object (Caution: Deprecated Subprogram)                                                                | SQL Access Advisor                  |
| <a href="#">CREATE_TASK Procedures</a>              | Creates a new Advisor task in the repository                                                                                  | Segment Advisor, SQL Access Advisor |
| <a href="#">DELETE_SQLWKL D Procedure</a>           | Deletes an entire workload object (Caution: Deprecated Subprogram)                                                            | SQL Access Advisor                  |
| <a href="#">DELETE_SQLWKL D_REF Procedure</a>       | Deletes an entire workload object (Caution: Deprecated Subprogram)                                                            | SQL Access Advisor                  |
| <a href="#">DELETE_SQLWKL D_STATEMENT Procedure</a> | Deletes one or more statements from a workload (Caution: Deprecated Subprogram)                                               | SQL Access Advisor                  |
| <a href="#">DELETE_STS_REF Procedure</a>            | Removes a link between the current SQL Access Advisor task and a SQL tuning set object                                        | SQL Access Advisor                  |
| <a href="#">DELETE_TASK Procedure</a>               | Deletes the specified task from the repository                                                                                | SQL Access Advisor                  |
| <a href="#">EXECUTE_TASK Procedure</a>              | Executes the specified task                                                                                                   | Segment Advisor, SQL Access Advisor |
| <a href="#">GET_REC_ATTRIBUTES Procedure</a>        | Retrieves specific recommendation attributes from a task                                                                      | SQL Access Advisor                  |
| <a href="#">GET_TASK_REPORT Function</a>            | Creates and returns a report for the specified task                                                                           |                                     |
| <a href="#">GET_TASK_SCRIPT Function</a>            | Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer                                | SQL Access Advisor                  |
| <a href="#">IMPLEMENT_TASK Procedure</a>            | Implements the recommendations for a task                                                                                     | SQL Access Advisor                  |
| <a href="#">IMPORT_SQLWKL D_SCHEMA Procedure</a>    | Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)                                      | SQL Access Advisor                  |
| <a href="#">IMPORT_SQLWKL D_SQLCACHE Procedure</a>  | Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)                                      | SQL Access Advisor                  |
| <a href="#">IMPORT_SQLWKL D_STS Procedure</a>       | Imports data from a SQL tuning set into a SQL workload data object (Caution: Deprecated Subprogram)                           | SQL Access Advisor                  |
| <a href="#">IMPORT_SQLWKL D_SUMADV Procedure</a>    | Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)                                      | SQL Access Advisor                  |
| <a href="#">IMPORT_SQLWKL D_USER Procedure</a>      | Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)                                      | SQL Access Advisor                  |
| <a href="#">INTERRUPT_TASK Procedure</a>            | Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible | Segment Advisor, SQL Access Advisor |

**Table 16-1 (Cont.) DBMS\_ADVISOR Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                                              | Used in                             |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <a href="#">MARK_RECOMMENDATION Procedure</a>           | Sets the <code>annotation_status</code> for a particular recommendation                                                                                                                  | Segment Advisor, SQL Access Advisor |
| <a href="#">QUICK_TUNE Procedure</a>                    | Performs an analysis on a single SQL statement                                                                                                                                           | SQL Access Advisor                  |
| <a href="#">RESET_SQLWKLD Procedure</a>                 | Resets a workload to its initial starting point (Caution: Deprecated Subprogram)                                                                                                         | SQL Access Advisor                  |
| <a href="#">RESET_TASK Procedure</a>                    | Resets a task to its initial state                                                                                                                                                       | Segment Advisor, SQL Access Advisor |

## 16.3.1 ADD\_SQLWKLD\_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use `ADD_STS_REF` instead of `ADD_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

### Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
    task_name          IN VARCHAR2,
    workload_name      IN VARCHAR2,
    is_sts             IN NUMBER :=0);
```

### Parameters

**Table 16-2 ADD\_SQLWKLD\_REF Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name     | The SQL Access Advisor task name that uniquely identifies an existing task.                                                                                                                                                                                                                   |
| workload_name | The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure <code>DELETE_REFERENCE</code> . |
| is_sts        | Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"><li>0 - SQL workload object</li><li>1 - SQL tuning set</li></ul>                                                                                                                                |

### Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
```

```
END;  
/
```

## 16.3.2 ADD\_SQLWKLD\_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (  
    workload_name      IN VARCHAR2,  
    module              IN VARCHAR2,  
    action              IN VARCHAR2,  
    cpu_time            IN NUMBER := 0,  
    elapsed_time        IN NUMBER := 0,  
    disk_reads          IN NUMBER := 0,  
    buffer_gets         IN NUMBER := 0,  
    rows_processed      IN NUMBER := 0,  
    optimizer_cost      IN NUMBER := 0,  
    executions          IN NUMBER := 1,  
    priority            IN NUMBER := 2,  
    last_execution_date IN DATE := 'SYSDATE',  
    stat_period         IN NUMBER := 0,  
    username            IN VARCHAR2,  
    sql_text            IN CLOB);
```

### Parameters

**Table 16-3 ADD\_SQLWKLD\_STATEMENT Procedure Parameters**

| Parameter      | Description                                                                             |
|----------------|-----------------------------------------------------------------------------------------|
| workload_name  | The workload name that uniquely identifies an existing workload.                        |
| module         | An optional business application module that will be associated with the SQL statement. |
| action         | An optional application action that will be associated with the SQL statement.          |
| cpu_time       | The total CPU time in seconds that is consumed by the SQL statement.                    |
| elapsed_time   | The total elapsed time in seconds that is consumed by the SQL statement.                |
| disk_reads     | The total disk-read operations that are consumed by the SQL statement.                  |
| buffer_gets    | The total buffer-get operations that are consumed by the SQL statement.                 |
| rows_processed | The average number of rows processed by the SQL statement.                              |
| optimizer_cost | The cost value calculated by the optimizer.                                             |
| executions     | The total execution count of the SQL statement. This value should be greater than zero. |

**Table 16-3 (Cont.) ADD\_SQLWKLD\_STATEMENT Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>priority</code>            | The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.                                                                                                                                                                                                                                                                                                      |
| <code>last_execution_date</code> | The date and time at which the SQL statement last executed. If the value is NULL, then the database uses the current date and time.                                                                                                                                                                                                                                                                                  |
| <code>stat_period</code>         | Time interval in seconds from which statement statistics were calculated.                                                                                                                                                                                                                                                                                                                                            |
| <code>username</code>            | The database user that executed the SQL statement. Because a user name is an Oracle identifier, the <code>username</code> value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user <code>scott</code> or <code>Scott</code> as a match for SCOTT. |
| <code>sql_text</code>            | The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.                                                                                                                                                                                                                                                                                        |

### Usage Notes

You cannot modify or delete a workload when it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) for directions on setting a task to its initial state.

The `ADD_SQLWKLD_STATEMENT` procedure accepts several parameters that may be ignored by the caller. The database only uses the `disk_reads`, `buffer_gets`, and `optimizer_cost` parameters to sort workload data when actual analysis occurs. Therefore, actual values are only necessary when the `order_list` task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys:

- `cpu_time`
- `elapsed_time`
- `buffer_gets`
- `optimizer_cost`
- `disk_reads`
- `executions`
- `priority`

The `optimizer_cost` key, which is a typical setting of `priority`, indicates that SQL Access Advisor sorts the workload data by `priority` and `optimizer_cost`, and processes the highest cost statements first. Any statements that you add to the workload must include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, then choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

## Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT
AVG(amount_sold) FROM sh.sales');
END;
/
```

### 16.3.3 ADD\_STS\_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set.

The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use `ADD_STS_REF` for any STS-based advisor runs. The older method of using `ADD_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `ADD_STS_REF` function accepts a SQL tuning set owner name, whereas `ADD_SQLWKLD_REF` does not.

#### Syntax

```
DBMS_ADVISOR.ADD_STS_REF(
  task_name      IN VARCHAR2 NOT NULL,
  sts_owner      IN VARCHAR2,
  workload_name  IN VARCHAR2 NOT NULL);
```

#### Parameters

**Table 16-4 ADD\_STS\_REF Procedure Parameters**

| Parameter              | Description                                                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code> | The SQL Access Advisor task name that uniquely identifies an existing task.                                                                                                               |
| <code>sts_owner</code> | The owner of the SQL tuning set. The value of this parameter may be <code>NULL</code> , in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user. |

**Table 16-4 (Cont.) ADD\_STS\_REF Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set.<br>After a workload has been linked to a task, it becomes read-only and cannot be deleted.<br>There is no limit to the number of links to workloads.<br>To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF. |

### Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```

## 16.3.4 CANCEL\_TASK Procedure

This procedure causes a currently executing operation to terminate.

This call performs a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

### Syntax

```
DBMS_ADVISOR.CANCEL_TASK (  
    task_name      IN  VARCHAR2);
```

### Parameters

**Table 16-5 CANCEL\_TASK Procedure Parameter**

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| task_name | A valid Advisor task name that uniquely identifies an existing task. |

### Usage Notes

A cancel command restores the task to its condition prior to the start of the canceled operation. Therefore, a canceled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN
```

```
task_name := 'My Task';
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

## 16.3.5 COPY\_SQLWKLD\_TO\_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

### Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

```
DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (
    workload_name      IN VARCHAR2,
    sts_name           IN VARCHAR2,
    import_mode        IN VARCHAR2 := 'NEW');
```

### Parameters

**Table 16-6 COPY\_SQLWKLD\_TO\_STS Procedure Parameter**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The SQL Workload object name to copy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| sts_name      | The SQL tuning set name into which the SQL Workload object will be copied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| import_mode   | Specifies the handling of the target SQL tuning set. Possible values are: <ul style="list-style-type: none"> <li>APPEND <p>Causes SQL Workload data to be appended to the target SQL tuning set.</p> </li> <li>NEW <p>Indicates the SQL tuning set can only contain the copied contents. If the SQL tuning set exists and has data, an error will be reported.</p> </li> <li>REPLACE <p>Causes any existing data in the target SQL tuning set to be purged prior to the workload copy.</p> </li> </ul> <p>In all cases, if the specified SQL tuning set does not exist, it will be created.</p> |

### Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

### Examples

```
BEGIN
    DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

## 16.3.6 CREATE\_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports.

### Syntax

```
DBMS_ADVISOR.CREATE_FILE (  
    buffer          IN  CLOB,  
    location        IN  VARCHAR2,  
    filename        IN  VARCHAR2);
```

### Parameters

**Table 16-7 CREATE\_FILE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| buffer    | A CLOB buffer containing report or script information.                                                                                                                                                    |
| location  | The name of the directory that will contain the output file.<br>You must use the alias as defined by the CREATE DIRECTORY statement. The Advisor translates the alias into the actual directory location. |
| filename  | The name of the output file.<br>The file name can only contain the name and an optional file type of the form filename.filetype.                                                                          |

### Usage Notes

You must embed all formatting within the CLOB.

The database restricts file access within stored procedures. This means that file locations and names must adhere to the known file permissions in the server.

### Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';  
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;
```

```
DECLARE  
    v_task_id NUMBER;  
    v_task_name VARCHAR2(30);  
    v_workload_name VARCHAR2(30);  
BEGIN  
    v_task_name := 'My Task';  
    v_workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(  
        advisor_name => DBMS_ADVISOR.SQLACCESS_ADVISOR  
    ,    task_id      => v_task_id  
    ,    task_name    => v_task_name );  
    DBMS_ADVISOR.CREATE_SQLWKLD(  
        workload_name => v_workload_name  
    ,    description  => 'My Workload' );
```

```

DBMS_ADVISOR.ADD_SQLWKLD_REF(
    task_name      => v_task_name
,   workload_name => v_workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(
    workload_name      => v_workload_name
,   module             => 'MONTHLY'
,   action             => 'ROLLUP'
,   cpu_time          => 100
,   elapsed_time      => 400
,   disk_reads        => 5041
,   buffer_gets       => 103
,   rows_processed    => 640445
,   optimizer_cost    => 680000
,   executions        => 2
,   priority          => 1
,   last_execution_date => SYSDATE
,   stat_period       => 1
,   username          => 'SH'
,   sql_text          => 'SELECT AVG(amount_sold) FROM sh.sales' );
DBMS_ADVISOR.EXECUTE_TASK(v_task_name);
DBMS_ADVISOR.CREATE_FILE(
    buffer  => DBMS_ADVISOR.GET_TASK_SCRIPT(v_task_name)
,   location => 'MY_DIR'
,   filename => 'script.sql' );
END;
/

```

## 16.3.7 CREATE\_OBJECT Procedure

This procedure creates a new task object.

### Syntax

```

DBMS_ADVISOR.CREATE_OBJECT (
    task_name      IN VARCHAR2,
    object_type    IN VARCHAR2,
    attr1          IN VARCHAR2 := NULL,
    attr2          IN VARCHAR2 := NULL,
    attr3          IN VARCHAR2 := NULL,
    attr4          IN CLOB      := NULL,
    attr5          IN VARCHAR2 := NULL,
    object_id      OUT NUMBER,
    attr6          IN VARCHAR2 := NULL,
    attr7          IN VARCHAR2 := NULL,
    attr8          IN VARCHAR2 := NULL,
    attr9          IN VARCHAR2 := NULL,
    attr10         IN VARCHAR2 := NULL);

```

## Parameters

**Table 16-8 CREATE\_OBJECT Procedure Parameters**

| Parameter   | Description                                                          |
|-------------|----------------------------------------------------------------------|
| task_name   | A valid Advisor task name that uniquely identifies an existing task. |
| object_type | Specifies the external object type.                                  |
| attr1       | Advisor-specific data.                                               |
| attr2       | Advisor-specific data.                                               |
| attr3       | Advisor-specific data.                                               |
| attr4       | Advisor-specific data.                                               |
| attr5       | Advisor-specific data.                                               |
| object_id   | The advisor-assigned object identifier.                              |
| attr6       | Advisor-specific data.                                               |
| attr7       | Advisor-specific data.                                               |
| attr8       | Advisor-specific data.                                               |
| attr9       | Advisor-specific data.                                               |
| attr10      | Advisor-specific data.                                               |

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

## Return Values

Returns the new object identifier.

## Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

## Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL, 'SELECT * FROM
```

```
TEST_TAB', NULL, obj_id, NULL, NULL, NULL, NULL, NULL);  
END;  
/
```

## 16.3.8 CREATE\_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user.

A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (  
    workload_name          IN OUT VARCHAR2,  
    description            IN VARCHAR2 := NULL,  
    template              IN VARCHAR2 := NULL,  
    is_template            IN VARCHAR2 := 'FALSE');
```

### Parameters

**Table 16-9 CREATE\_SQLWKLD Procedure Parameters**

| Parameter     | Description                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long. |
| description   | Specifies an optional workload description. Descriptions can be up to 256 characters.                                                                  |
| template      | An optional SQL Workload name of an existing workload data object or data object template.                                                             |
| is_template   | An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.                                   |

### Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

### Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD\_SQLWKLD\_REF procedure.

## Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

## 16.3.9 CREATE\_TASK Procedures

This procedure creates a new Advisor task in the repository.

### Syntax

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_name         IN VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
  parent_task_name  IN VARCHAR2,
  rec_id            IN NUMBER,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2,
  template          IN VARCHAR2);
```

### Parameters

**Table 16-10 CREATE\_TASK Procedure Parameters**

| Parameter    | Description                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------|
| advisor_name | Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.                                      |
| task_id      | A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user. |

**Table 16-10 (Cont.) CREATE\_TASK Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name   | Specifies a new task name. Names must be unique among all tasks for the user.<br><br>When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long. |
| task_desc   | Specifies an optional task description. Descriptions can be up to 256 characters in length.                                                                                                                                               |
| template    | An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.                                                                                 |
| is_template | An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.                                                                                                                       |
| how_created | An optional value that identifies how the source was created.                                                                                                                                                                             |

### Return Values

Returns a unique task ID number and a unique task name if one is not specified.

### Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier DBMS\_ADVISOR.SQLACCESS\_ADVISOR as the advisor\_name.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- DBMS\_ADVISOR.SQLACCESS\_OLTP  
Parameters are preset to favor an OLTP application environment.
- DBMS\_ADVISOR.SQLACCESS\_WAREHOUSE  
Parameters are preset to favor a data warehouse application environment.
- DBMS\_ADVISOR.SQLACCESS\_GENERAL  
Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

### Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
    task_name);
```

```
END;  
/
```

## 16.3.10 DELETE\_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (  
    workload_name          IN VARCHAR2);
```

### Parameters

**Table 16-11 DELETE\_SQLWKLD Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE. |

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the [RESET\\_TASK Procedure](#) to set a task to its initial state.

### Examples

```
DECLARE  
    workload_name VARCHAR2(30);  
BEGIN  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);  
END;  
/
```

## 16.3.11 DELETE\_SQLWKLD\_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

Use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
    task_name          IN VARCHAR2,
    workload_name      IN VARCHAR2,
    is_sts             IN NUMBER :=0);
```

### Parameters

**Table 16-12** DELETE\_SQLWKLD\_REF Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name     | The SQL Access task name that uniquely identifies an existing task.                                                                                                                                                                                 |
| workload_name | The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name. |
| is_sts        | Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"> <li>0 - SQL workload object</li> <li>1 - SQL tuning set</li> </ul>                                                                                   |

### Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

## 16.3.12 DELETE\_SQLWKLD\_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

### Note:

This procedure has been deprecated.

### Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name      IN VARCHAR2,
    sql_id              IN NUMBER);
```

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name      IN VARCHAR2,
    search              IN VARCHAR2,
    deleted             OUT NUMBER);
```

### Parameters

**Table 16-13 DELETE\_SQLWKLD\_STATEMENT Procedure Parameters**

| Parameter     | Description                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                    |
| sql_id        | The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>ADVISOR_ALL</code> . |
| search        | Disabled.                                                                                                                                                  |
| deleted       | Returns the number of statements deleted by the searched deleted operation.                                                                                |

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the [RESET\\_TASK Procedure](#) to set a task to its initial state.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
    deleted NUMBER;
    id NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                         100,400,5041,103,640445,680000,2,
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
```

```

FROM sh.sales');

SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
WHERE workload_name = 'My Workload';

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

```

### 16.3.13 DELETE\_STS\_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL tuning set.

Use `DELETE_STS_REF` for any STS-based advisor runs. The older method of using `DELETE_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `DELETE_STS_REF` function accepts an STS owner name, whereas `DELETE_SQLWKLD_REF` does not.

#### Syntax

```

DBMS_ADVISOR.DELETE_STS_REF (
  task_name      IN VARCHAR2 NOT NULL,
  sts_owner      IN VARCHAR2,
  workload_name  IN VARCHAR2 NOT NULL);

```

#### Parameters

**Table 16-14** DELETE\_STS\_REF Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name     | The SQL Access Advisor task name that uniquely identifies an existing task.                                                                                                                                                                                                                                                                                                                                                                                                             |
| sts_owner     | The owner of the SQL tuning set. The value of this parameter may be <code>NULL</code> , in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.                                                                                                                                                                                                                                                                                               |
| workload_name | The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set.<br><br>The wildcard <code>%</code> is supported as a workload name. The rules of use are identical to the SQL <code>LIKE</code> operator. For example, to remove all links to SQL tuning set objects, use the wildcard <code>%</code> as the <code>STS_NAME</code> . |

#### Examples

```

DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');

```

## 16.3.14 DELETE\_TASK Procedure

This procedure deletes an existing task from the repository.

### Syntax

```
DBMS_ADVISOR.DELETE_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 16-15** DELETE\_TASK Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | <p>A single Advisor task name that will be deleted from the repository.</p> <p>The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME.</p> <p>If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</p> |

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,  
task_name);  
    DBMS_ADVISOR.DELETE_TASK(task_name);  
END;  
/
```

## 16.3.15 EXECUTE\_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

### Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (  
    task_name          IN VARCHAR2);  
  
DBMS_ADVISOR.EXECUTE_TASK (  
    task_name          IN VARCHAR2);
```

```

task_name      IN VARCHAR2,
execution_type IN VARCHAR2          := NULL,
execution_name IN VARCHAR2          := NULL,
execution_params IN dbms_advisor.argList := NULL,
execution_desc IN VARCHAR2          := NULL,
RETURN VARCHAR2;

```

## Parameters

**Table 16-16 EXECUTE\_TASK Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | The task name that uniquely identifies an existing task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| execution_type   | <p>The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter.</p> <p>As an example, the SQL Performance Analyzer accepts the following possible values:</p> <ul style="list-style-type: none"> <li>EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.</li> <li>TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.</li> <li>ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.</li> </ul> |
| execution_name   | A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| execution_params | <p>A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for.</p> <p>As an example, consider the following:</p> <pre>DBMS_ADVISOR.ARGUMENT('time_limit', 12, 'username', 'hr')</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| execution_desc   | A 256-length string describing the execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA\_ADVISOR\_LOG table for the execution status.

## Examples

```

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

```

```
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

## 16.3.16 GET\_REC\_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

### Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name      IN VARCHAR2,
  value              OUT VARCHAR2,
  owner_name         IN VARCHAR2 := NULL);
```

### Parameters

**Table 16-17 GET\_REC\_ATTRIBUTES Procedure Parameters**

| Parameter      | Description                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------|
| task_name      | The task name that uniquely identifies an existing task.                                                |
| rec_id         | The Advisor-generated identifier number that is assigned to the recommendation.                         |
| action_id      | The Advisor-generated action identifier that is assigned to the particular command.                     |
| attribute_name | Specifies the attribute to change.                                                                      |
| value          | The buffer to receive the requested attribute value.                                                    |
| owner_name     | Optional owner name of the target task. This permits access to task data not owned by the current user. |

### Return Values

The requested attribute value is returned in the `VALUE` argument.

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
```

```

workload_name := 'My Workload';
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
DBMS_ADVISOR.EXECUTE_TASK(task_name);
DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/

```

## 16.3.17 GET\_TASK\_REPORT Function

This function creates and returns a report for the specified task.

### Syntax

```

DBMS_ADVISOR.GET_TASK_REPORT (
  task_name      IN VARCHAR2,
  type           IN VARCHAR2 := 'TEXT',
  level          IN VARCHAR2 := 'TYPICAL',
  section        IN VARCHAR2 := 'ALL',
  owner_name     IN VARCHAR2 := NULL,
  execution_name IN VARCHAR2 := NULL,
  object_id      IN NUMBER   := NULL)
RETURN CLOB;

```

### Parameters

**Table 16-18 GET\_TASK\_REPORT Function Parameters**

| Parameter      | Description                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The name of the task from which the script will be created.                                                                             |
| type           | The only valid value is TEXT.                                                                                                           |
| level          | The possible values are BASIC, TYPICAL, and ALL.                                                                                        |
| section        | Advisor-specific report sections.                                                                                                       |
| owner_name     | Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.                 |
| execution_name | An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times. |
| object_id      | An identifier of an advisor object that can be targeted by the script.                                                                  |

### Return Values

Returns the buffer receiving the script.

## 16.3.18 GET\_TASK\_SCRIPT Function

This function creates a SQL\*Plus-compatible SQL script and sends the output to a file.

The output script contains all of the accepted recommendations from the specified task.

### Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (  
    task_name          IN VARCHAR2  
    type               IN VARCHAR2 := 'IMPLEMENTATION',  
    rec_id             IN NUMBER   := NULL,  
    act_id             IN NUMBER   := NULL,  
    owner_name         IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    object_id          IN NUMBER   := NULL)  
RETURN CLOB;
```

### Parameters

**Table 16-19** GET\_TASK\_SCRIPT Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The task name that uniquely identifies an existing task.                                                                                                                                                                                                                                       |
| type           | Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.                                                                                                                                                                                                     |
| rec_id         | An optional recommendation identifier number that can be used to extract a subset of the implementation script.<br>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task. |
| act_id         | Optional action identifier number that can be used to extract a single action as a DDL command.<br>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.                    |
| owner_name     | An optional task owner name.                                                                                                                                                                                                                                                                   |
| execution_name | An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.                                                                                                                                                        |
| object_id      | An identifier of an advisor object that can be targeted by the script.                                                                                                                                                                                                                         |

### Return Values

Returns the script as a CLOB buffer.

### Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

## Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    buf CLOB;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100,400,5041,103,640445,680000,2,
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                         FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

## 16.3.19 IMPLEMENT\_TASK Procedure

This procedure implements the recommendations of the specified Advisor task.

### Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
    task_name          IN VARCHAR2,
    rec_id             IN NUMBER := NULL,
    exit_on_error      IN BOOLEAN := NULL);
```

### Parameters

**Table 16-20** IMPLEMENT\_TASK Procedure Parameters

| Parameter     | Description                                     |
|---------------|-------------------------------------------------|
| task_name     | The name of the task.                           |
| rec_id        | An optional recommendation ID.                  |
| exit_on_error | An optional Boolean to exit on the first error. |

## 16.3.20 IMPORT\_SQLWKLD\_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (  
    workload_name      IN VARCHAR2,  
    import_mode         IN VARCHAR2 := 'NEW',  
    priority            IN NUMBER := 2,  
    saved_rows          OUT NUMBER,  
    failed_rows         OUT NUMBER);
```

### Parameters

**Table 16-21** IMPORT\_SQLWKLD\_SCHEMA Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| import_mode   | <p>Specifies the action to be taken when storing the workload. Possible values are:</p> <ul style="list-style-type: none"><li>• <b>APPEND</b> Indicates that the collected workload will be added to any existing workload in the task.</li><li>• <b>NEW</b> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li><li>• <b>REPLACE</b> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li></ul> <p>The default value is <b>NEW</b>.</p> |
| priority      | Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| failed_rows   | Returns the number of rows that were not saved due to syntax or validation errors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| saved_rows    | Returns the number of rows actually saved in the repository.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the `VALID_TABLE_LIST` parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
    failed);
END;
/
```

## 16.3.21 IMPORT\_SQLWKLD\_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority            IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

### Parameters

**Table 16-22** IMPORT\_SQLWKLD\_SQLCACHE Procedure Parameters

| Parameter                  | Description                                                             |
|----------------------------|-------------------------------------------------------------------------|
| <code>workload_name</code> | The workload object name that uniquely identifies an existing workload. |

**Table 16-22 (Cont.) IMPORT\_SQLWKLD\_SQLCACHE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| import_mode | <p>Specifies the action to be taken when storing the workload. Possible values are:</p> <ul style="list-style-type: none"><li>• <b>APPEND</b> Indicates that the collected workload will be added to any existing workload in the task.</li><li>• <b>NEW</b> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li><li>• <b>REPLACE</b> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li></ul> <p>The default value is <b>NEW</b>.</p> |
| priority    | <p>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| saved_rows  | <p>Returns the number of rows saved as output parameters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| failed_rows | <p>Returns the number of rows that were not saved due to syntax or validation errors.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state.

### Examples

```
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
        failed);
END;
/
```

## 16.3.22 IMPORT\_SQLWKLD\_STS Procedure

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
    workload_name      IN VARCHAR2,  
    sts_name           IN VARCHAR2,

### Parameters

**Table 16-23** IMPORT\_SQLWKLD\_STS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| sts_owner     | The optional owner of the SQL tuning set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| sts_name      | The name of an existing SQL tuning set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| import_mode   | <p>Specifies the action to be taken when storing the workload. Possible values are:</p> <ul style="list-style-type: none"><li>• <b>APPEND</b> Indicates that the collected workload will be added to any existing workload in the task.</li><li>• <b>NEW</b> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li><li>• <b>REPLACE</b> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li></ul> <p>The default value is <b>NEW</b>.</p> |

**Table 16-23 (Cont.) IMPORT\_SQLWKLD\_STS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| priority    | Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2. |
| saved_rows  | Returns the number of rows actually saved in the repository.                                                                                                                            |
| failed_rows | Returns the number of rows that were not saved due to syntax or validation errors.                                                                                                      |

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state.

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
    saved, failed);
END;
/
```

## 16.3.23 IMPORT\_SQLWKLD\_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload.

This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

## Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
    workload_name      IN VARCHAR2,
    import_mode        IN VARCHAR2 := 'NEW',
    priority            IN NUMBER := 2,
    sumadv_id          IN NUMBER,
    saved_rows         OUT NUMBER,
    failed_rows        OUT NUMBER);
```

## Parameters

**Table 16-24** IMPORT\_SQLWKLD\_SUMADV Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| import_mode   | Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> <li>APPEND Indicates that the collected workload will be added to any existing workload in the task.</li> <li>NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> The default value is NEW. |
| priority      | Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following:<br>1-HIGH, 2-MEDIUM, or 3-LOW.                                                                                                                                                                        |
| sumadv_id     | Specifies the Summary Advisor workload identifier number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| saved_rows    | Returns the number of rows actually saved in the repository.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| failed_rows   | Returns the number of rows that were not saved due to syntax or validation errors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Return Values

This call returns the number of rows saved and failed as output parameters.

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state.

## Examples

```
DECLARE
    workload_name VARCHAR2(30);
```

```

saved NUMBER;
failed NUMBER;
sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/

```

## 16.3.24 IMPORT\_SQLWKLD\_USER Procedure

This procedure collects a SQL workload from a specified user table.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```

DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  owner_name         IN VARCHAR2,
  table_name         IN VARCHAR2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);

```

### Parameters

**Table 16-25** IMPORT\_SQLWKLD\_USER Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| import_mode   | <p>Specifies the action to be taken when storing the workload. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>APPEND</b> Indicates that the collected workload will be added to any existing workload in the task.</li> <li>• <b>NEW</b> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</li> <li>• <b>REPLACE</b> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</li> </ul> <p>The default value is <b>NEW</b>.</p> |
| owner_name    | Specifies the owner name of the table or view from which workload data will be collected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 16-25 (Cont.) IMPORT\_SQLWKLD\_USER Procedure Parameters**

| Parameter   | Description                                                                         |
|-------------|-------------------------------------------------------------------------------------|
| table_name  | Specifies the name of the table or view from which workload data will be collected. |
| saved_rows  | Returns the number of rows actually saved in the workload object.                   |
| failed_rows | Returns the number of rows that were not saved due to syntax or validation errors.  |

### Return Values

This call returns the number of rows saved and failed as output parameters.

### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state.

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

## 16.3.25 INTERRUPT\_TASK Procedure

This procedure stops a currently executing task.

The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

### Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
  task_name          IN VARCHAR2);
```

## Parameters

**Table 16-26 INTERRUPT\_TASK Procedure Parameters**

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| task_name | A single Advisor task name that will be interrupted. |

## Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

## 16.3.26 MARK\_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

### Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
    task_name          IN VARCHAR2
    id                  IN NUMBER,
    action              IN VARCHAR2);
```

## Parameters

**Table 16-27 MARK\_RECOMMENDATION Procedure Parameters**

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| task_name | Name of the task.                                             |
| id        | The recommendation identifier number assigned by the Advisor. |

**Table 16-27 (Cont.) MARK\_RECOMMENDATION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action    | <p>The recommendation action setting. The possible actions are:</p> <ul style="list-style-type: none"> <li>• <b>ACCEPT</b> Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</li> <li>• <b>IGNORE</b> Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</li> <li>• <b>REJECT</b> Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</li> </ul> |

### Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

### Examples

```

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
    rec_id NUMBER;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100,400,5041,103,640445,680000,2,
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                         FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    rec_id := 1;
    DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/

```

## 16.3.27 QUICK\_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

## Syntax

```
DBMS_ADVISOR.QUICK_TUNE (  
    advisor_name      IN VARCHAR2,  
    task_name         IN VARCHAR2,  
    attr1             IN CLOB,  
    attr2             IN VARCHAR2 := NULL,  
    attr3             IN NUMBER  := NULL,  
    template          IN VARCHAR2 := NULL,  
    implement         IN BOOLEAN := FALSE,  
    description       IN VARCHAR2 := NULL);
```

## Parameters

**Table 16-28 QUICK\_TUNE Procedure Parameters**

| Parameter    | Description                                                                             |
|--------------|-----------------------------------------------------------------------------------------|
| advisor_name | Name of the Advisor that will perform the analysis.                                     |
| task_name    | Name of the task.                                                                       |
| attr1        | Advisor-specific attribute in the form of a CLOB variable.                              |
| attr2        | Advisor-specific attribute in the form of a VARCHAR2 variable.                          |
| attr3        | Advisor-specific attribute in the form of a NUMBER.                                     |
| template     | Name of an existing task or template from which the initial settings need to be copied. |
| implement    | Flag specifying whether to implement the task.                                          |
| description  | Description of the task.                                                                |

## Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of `SQLACCESS_GENERAL`. The workload will only contain the specified statement, and all task parameters will be defaulted.

`attr1` must be the single SQL statement to tune. For the SQL Access Advisor, `attr2` is the user who would execute the single statement. If omitted, the current user will be used.

## Examples

```
DECLARE  
    task_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
  
    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,  
                            'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');  
END;  
/
```

## 16.3.28 RESET\_SQLWKLD Procedure

This procedure resets a workload to its initial starting point.

Resetting the workload has the effect of removing all journal and log messages, and recalculating necessary volatility and usage statistics.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (  
    workload_name          IN VARCHAR2);
```

### Parameters

**Table 16-29** RESET\_SQLWKLD Procedure Parameters

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| workload_name | The SQL Workload object name that uniquely identifies an existing workload. |

### Usage Notes

RESET\_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

### Examples

```
DECLARE  
    workload_name VARCHAR2(30);  
BEGIN  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
                                         100,400,5041,103,640445,680000,2,  
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)  
                                         FROM sh.sales WHERE promo_id = 10');  
  
    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);  
END;  
/
```

## 16.3.29 RESET\_TASK Procedure

This procedure re-initializes the metadata for the specified task. The task status will be set to INITIAL.

### Syntax

```
DBMS_ADVISOR.RESET_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 16-30 RESET\_TASK Procedure Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| task_name | The task name that uniquely identifies an existing task. |

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,  
task_name);  
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
    DBMS_ADVISOR.RESET_TASK(task_name);  
END;  
/
```

## 16.3.30 SET\_DEFAULT\_SQLWKLD\_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

## Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
    parameter      IN VARCHAR2,
    value          IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
    parameter      IN VARCHAR2,
    value          IN NUMBER);
```

## Parameters

**Table 16-31 SET\_DEFAULT\_SQLWKLD\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter | The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes. |
| value     | The value of the specified parameter. The value can be specified as a string or a number. If the value is <code>DBMS_ADVISOR.DEFAULT</code> , the value will be reset to the default value.                                                                                          |

## Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

## Examples

```
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

## 16.3.31 SET\_DEFAULT\_TASK\_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a task or a template.

A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with `SET_TASK_PARAMETER` sets the local value only. Thus, `SET_DEFAULT_TASK_PARAMETER` has no effect on an existing task.

## Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
  advisor_name      IN VARCHAR2
  parameter         IN VARCHAR2,
  value             IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
  advisor_name      IN VARCHAR2
  parameter         IN VARCHAR2,
  value             IN NUMBER);
```

## Parameters

**Table 16-32 SET\_DEFAULT\_TASK\_PARAMETER Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                  |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| advisor_name | Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.                                                                                                                                                                            |
| parameter    | The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes. |
| value        | The value of the specified task parameter. The value can be specified as a string or a number.                                                                                                                                                               |

## Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
    'VALID_TABLE_LIST', 'SH.%');
END;
/
```

## 16.3.32 SET\_SQLWKLD\_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

## Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
    workload_name      IN VARCHAR2,
    parameter           IN VARCHAR2,
    value               IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
    workload_name      IN VARCHAR2,
    parameter           IN VARCHAR2,
    value               IN NUMBER);
```

## Parameters

**Table 16-33 SET\_SQLWKLD\_PARAMETER Procedure Parameters**

| Parameter     | Description                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The SQL Workload object name that uniquely identifies an existing workload.                                                                                                   |
| parameter     | The name of the data parameter to be modified. Parameter names are not case sensitive.                                                                                        |
| value         | The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value. |

## Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

## Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,
    'VALID_TABLE_LIST', 'SH.%');
END;
/
```

## 16.3.33 SET\_TASK\_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

### Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (  
    task_name          IN VARCHAR2  
    parameter          IN VARCHAR2,  
    value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_TASK_PARAMETER (  
    task_name          IN VARCHAR2  
    parameter          IN VARCHAR2,  
    value              IN NUMBER);
```

### Parameters

**Table 16-34 SET\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | The Advisor task name that uniquely identifies an existing task.                                                                                                                                                                                             |
| parameter | The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes. |
| value     | The value of the specified task parameter. The value can be specified as a string or a number. If the value is <code>DEFAULT</code> , the value will be reset to the default value.                                                                          |

### Usage Notes

A task cannot be modified unless it is in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

### SQL Access Advisor Task Parameters

[Table 16-35](#) lists SQL Access Advisor task parameters.

**Table 16-35 SQL Access Advisor Task Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ANALYSIS_SCOPE  | <p>A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>ALL</b> Short name for specifying <b>INDEX</b>, <b>MVIEW</b>, <b>TABLE</b>, and <b>PARTITION</b>.</li> <li>• <b>EVALUATION</b> Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone.</li> <li>• <b>INDEX</b> Allows the SQL Access Advisor to recommend index structure changes.</li> <li>• <b>MVIEW</b> Allows the SQL Access Advisor to recommend materialized view and log changes.</li> <li>• <b>PARTITION</b> Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the <b>INDEX</b>, <b>MVIEW</b>, and <b>TABLE</b> options.</li> <li>• <b>TABLE</b> Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning.</li> </ul> <p>Using the new keywords, the following combinations are valid:</p> <ul style="list-style-type: none"> <li>• <b>INDEX</b></li> <li>• <b>MVIEW</b></li> <li>• <b>INDEX, PARTITION</b></li> <li>• <b>INDEX, MVIEW, PARTITION</b></li> <li>• <b>INDEX, TABLE, PARTITION</b></li> <li>• <b>MVIEW, PARTITION</b></li> <li>• <b>MVIEW, TABLE, PARTITION</b></li> <li>• <b>INDEX, MVIEW, TABLE, PARTITION</b></li> <li>• <b>TABLE, PARTITION</b></li> <li>• <b>EVALUATION</b></li> </ul> <p>The default value is <b>INDEX</b>. The data type is <b>STRINGLIST</b>.</p> |
| CREATION_COST   | <p>When set to <b>true</b> (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to <b>false</b>, the cost of creation is ignored. The data type is <b>STRING</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DAYS_TO_EXPIRE  | <p>Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation.</p> <p>Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The data type is <b>NUMBER</b>.</p> <p>Once the task expires, it becomes a candidate for removal by an automatic purge operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• an integer in the range of 0 to 2147483647</li> <li>• <b>ADVISOR_UNLIMITED</b></li> <li>• <b>ADVISOR_UNUSED</b></li> </ul> <p>The default value is 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DEF_EM_TEMPLATE | <p>Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values.</p> <p>The default value is <b>SQLACCESS_EMTASK</b>. The data type is <b>STRING</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEF_INDEX_OWNER          | <p>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing schema name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>Existing tablespace name. Quoted identifiers are supported.</li> <li>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views.</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRING.</p>              |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DML_VOLATILITY  | <p>When set to <b>TRUE</b>, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The data type is <b>STRING</b>.</p> <p>See the related parameter <code>refresh_mode</code>.</p>                                                                                                                                                                                                                                                                                                                                                                             |
| END_TIME        | <p>Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> <li>• DD is the numeric date</li> <li>• MM is the numeric month</li> <li>• YYYY is the numeric year</li> <li>• HH is the hour in 24 hour format</li> <li>• MI is the minute</li> <li>• SS is the second</li> </ul> <p>The data type is <b>STRING</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| EVALUATION_ONLY | <p>This parameter is maintained for backward compatibility. All values will be translated and placed into the <code>ANALYSIS_SCOPE</code> task parameter.</p> <p>If set to <b>TRUE</b>, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>FALSE</b></li> <li>• <b>TRUE</b></li> </ul> <p>The default value is <b>FALSE</b>. The data type is <b>STRING</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| EXECUTION_TYPE  | <p>This parameter is maintained for backward compatibility. All values will be translated and placed into the <code>ANALYSIS_SCOPE</code> task parameter.</p> <p>The translated values are:</p> <ul style="list-style-type: none"> <li>• <b>FULL =&gt; FULL</b></li> <li>• <b>INDEX_ONLY =&gt; INDEX</b></li> <li>• <b>MVIEW_ONLY =&gt; MVIEW</b></li> <li>• <b>MVIEW_LOG_ONLY =&gt; MVIEW_LOG_ONLY</b></li> </ul> <p>The type of recommendations that is desired. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>FULL</b> All supported recommendation types will be considered.</li> <li>• <b>INDEX_ONLY</b> The SQL Access Advisor will only consider index solutions as recommendations.</li> <li>• <b>MVIEW_ONLY</b> The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations.</li> <li>• <b>MVIEW_LOG_ONLY</b> The SQL Access Advisor will only consider materialized view log solutions as recommendations.</li> </ul> <p>The default value is <b>FULL</b>. **Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMPLEMENT_EXIT_ON_ERROR | <p>When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul> <p>The default value is TRUE. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| INDEX_NAME_TEMPLATE     | <p>Specifies the method by which new index names are formed.</p> <p>If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters.</p> <p>Valid keywords are:</p> <ul style="list-style-type: none"> <li>Any literal value up to 22 characters.</li> <li>TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.</li> <li>TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.</li> <li>SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is <i>table_IDX\$\$_task_idsequence</i>. The data type is STRING.</p> |
| INVALID_ACTION_LIST     | <p>Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>single action</li> <li>comma-delimited action list</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                                                                                                                                           |
| INVALID_MODULE_LIST     | <p>Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>single application</li> <li>comma-delimited module list</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                                                                                                                                                 |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INVALID_SQLSTRING_LIST | <p>Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single string</li> <li>• comma-delimited string list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                                                                                                                                                                                                                                                                            |
| INVALID_USERNAME_LIST  | <p>Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single user name</li> <li>• comma-delimited user name list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| JOURNALING             | <p>Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• UNUSED: no journal messages</li> <li>• FATAL: explanation of fatal conditions</li> <li>• ERROR: explanation of errors</li> <li>• WARNING: explanation of warnings</li> <li>• INFORMATION: information message</li> <li>• INFORMATION2: common information</li> <li>• INFORMATION3: common information</li> <li>• INFORMATION4: common information</li> <li>• INFORMATION5: common information</li> <li>• INFORMATION6: common information</li> </ul> <p>Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository.</p> <p>INFORMATION6 represents the most thorough message recording and UNUSED is the least.</p> <p>The default value is INFORMATION. The data type is NUMBER.</p> |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LIMITED_PARTITION_SCHEMES | <p>User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>An integer in the range of 1 to 10</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is <code>ADVISOR_UNUSED</code>. The data type is <code>NUMBER</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MAX_NUMBER_PARTITIONS     | <p>Limits the number of partitions the advisor will recommend for any base table, index, or materialized view.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>An integer in the range of 1 to 4294967295</li> <li>ADVISOR_UNLIMITED</li> <li>ADVISOR_UNUSED</li> </ul> <p>The default value is <code>ADVISOR_UNLIMITED</code>. The data type is <code>NUMBER</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MODE                      | <p>Specifies the mode by which Access Advisor will operate during an analysis.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li><code>LIMITED</code> Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.</li> <li><code>COMPREHENSIVE</code> Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.</li> </ul> <p>The default value is <code>COMPREHENSIVE</code>. The data type is <code>STRING</code>.</p>                                                                                                                                                                                                                                                                                                                                                    |
| MVIEW_NAME_TEMPLATE       | <p>Specifies the method by which new materialized view names are formed.</p> <p>If the <code>TASK_ID</code> is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the <code>TASK_ID</code> in the template.</p> <p>The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> <li>Any literal value up to 22 characters.</li> <li><code>TASK_ID</code> Causes the current task identifier number to be inserted in hexadecimal form.</li> <li><code>SEQ</code> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is: <code>MV\$\$_task_idsequence</code>. The data type is <code>STRING</code>.</p> |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORDER_LIST              | <p>This parameter has been deprecated.</p> <p>Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.</li> <li>CPU_TIME Sets the order using the SQL statement's CPU time value.</li> <li>DISK_READS Sets the order using the SQL statement's disk-read count value.</li> <li>ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.</li> <li>EXECUTIONS Sets the order using the SQL statement's execution frequency value.</li> <li>OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.</li> <li>I/O Sets the order using the SQL statement's I/O count value.</li> <li>PRIORITY Sets the order using the user-supplied business priority value.</li> </ul> <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST.</p> |
| PARTITION_NAME_TEMPLATE | <p>Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> <li>Any literal value up to 22 characters.</li> <li><i>table</i> - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.</li> <li><i>task_id</i> - Causes the current task identifier number to be inserted in hexadecimal form.</li> <li><i>sequence</i> - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.</li> </ul> <p>The default template is PTN\$\$<i>table_task_id</i>sequence. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PARTITIONING_GOAL       | <p>Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| PARTITIONING_TYPES      | <p>Specifies the type of partitioning used. Possible values are RANGE and HASH. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RANKING_MEASURE               | <p>Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.</li> <li>CPU_TIME Sets the order using the SQL statement's CPU time value.</li> <li>DISK_READS Sets the order using the SQL statement's disk-read count value.</li> <li>ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.</li> <li>EXECUTIONS Sets the order using the SQL statement's elapsed time value.</li> <li>OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.</li> <li>PRIORITY Sets the order using the user-supplied business priority value.</li> </ul> <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST.</p> |
| RECOMMEND_MV_EXACT_TEXT_MATCH | <p>When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul> <p>The default value is TRUE. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RECOMMENDED_TABLESPACES       | <p>Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE (the default)</li> </ul> <p>The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| REFRESH_MODE                  | <p>Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>ON_DEMAND</li> <li>ON_COMMIT</li> </ul> <p>The default value is ON_DEMAND. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| REPORT_DATE_FORMAT            | <p>This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SHOW_RETAINS                  | <p>Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul> <p>The default value is TRUE. The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_LIMIT      | <p>Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table hr.employees are to be accepted, the SQL_LIMIT value will be only apply to those statements.</p> <p>When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• An integer in the range of 1 to 2147483647</li> <li>• ADVISOR_UNLIMITED</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is NUMBER.</p>                                                                                   |
| START_TIME     | <p>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> <li>• DD is the numeric date</li> <li>• MM is the numeric month</li> <li>• YYYY is the numeric year</li> <li>• HH is the hour in 24 hour format</li> <li>• MI is the minute</li> <li>• SS is the second</li> </ul> <p>The data type is STRING.</p>                                                                                                                                                                                                                                                                                                          |
| STORAGE_CHANGE | <p>Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL.</p> <p>When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• Any valid integer including negative values, zero and positive values.</li> </ul> <p>The default value is ADVISOR_UNLIMITED. The data type is NUMBER.</p> |
| TIME_LIMIT     | <p>Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• An integer in the range of 1 to 10,000</li> <li>• ADVISOR_UNLIMITED</li> </ul> <p>The default value is 720 (12 hours). The data type is NUMBER.</p> <p>Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.</p>                                                                                                                              |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALID_ACTION_LIST    | <p>Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single action</li> <li>• comma-delimited action list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>              |
| VALID_MODULE_LIST    | <p>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single application</li> <li>• comma-delimited module list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p> |
| VALID_SQLSTRING_LIST | <p>Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single string</li> <li>• comma-delimited string list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                |

**Table 16-35 (Cont.) SQL Access Advisor Task Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VALID_TABLE_LIST    | <p>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> <li>• schema.table</li> <li>• schema</li> <li>• schema.% (equivalent to schema)</li> <li>• comma-delimited action list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single table reference</li> <li>• comma-delimited reference list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is TABLELIST.</p> |
| VALID_USERNAME_LIST | <p>Contains a fully qualified list of user names that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's user name does not match a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• single user name</li> <li>• comma-delimited user name list</li> <li>• ADVISOR_UNUSED</li> </ul> <p>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WORKLOAD_SCOPE      | <p>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.</p> <p>FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.</p> <p>PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.</p> <p>The data type is STRING.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Segment Advisor Parameters

Table 16-36 lists the input task parameters that can be set in the Segment Advisor using the SET\_TASK\_PARAMETER procedure.

**Table 16-36 Segment Advisor Task Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MODE          | The data to use for analysis. The default value is <code>COMPREHENSIVE</code> , and the possible values are: <ul style="list-style-type: none"> <li><code>LIMITED</code>: Analysis restricted to statistics available in the Automatic Workload Repository</li> <li><code>COMPREHENSIVE</code>: Analysis based on sampling and Automatic Workload Repository statistics</li> </ul> |
| TIME_LIST     | The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are <code>UNLIMITED</code> .                                                                                                                                                                                                                                      |
| RECOMMEND_ALL | Whether to generate recommendations for all segments. The default value is <code>TRUE</code> . If set to <code>TRUE</code> , it generates recommendations all segments specified by the user. If set to <code>FALSE</code> , it generates recommendations for only those objects that are eligible for shrink.                                                                     |

**Examples**

```

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
'SH.%, SCOTT.EMP');
END;
/

```

**Undo Advisor Task Parameters**

[Table 16-37](#) lists the input task parameters that can be set in the Undo Advisor using the `SET_TASK_PARAMETER` procedure.

**Table 16-37 Undo Advisor Task Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TARGET_OBJECTS | The undo tablespace of the system. There is no default value, and the possible value is <code>UNDO_TBS</code> .                                                                                                                                                                                   |
| START_SNAPSHOT | The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.                                                                                    |
| END_SNAPSHOT   | The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.                                                                                      |
| BEGIN_TIME_SEC | The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. <code>BEGIN_TIME_SEC</code> should be greater than <code>END_TIME_SEC</code> . There is no default value and the possible values are any positive integer. |

**Table 16-37 (Cont.) Undo Advisor Task Parameters**

| Parameter    | Description                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| END_TIME_SEC | The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer. |

### Examples

```
DECLARE
    tname  VARCHAR2(30);
    oid    NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor
Task');
    DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null',
oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'INSTANCE', 1);
    DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

### Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 16-38 lists the input task parameters that can be set in ADDM using the SET\_TASK\_PARAMETER procedure.

**Table 16-38 ADDM Task Parameters**

| Parameter      | Description                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| START_SNAPSHOT | The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.                   |
| END_SNAPSHOT   | The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.                     |
| DB_ID          | The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.                                                                                                                                   |
| INSTANCE       | The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.                                                    |
| INSTANCES      | If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed. |
| DBIO_EXPECTED  | The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.                                                                                  |

## Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```
DECLARE
    tid      NUMBER;
    tname    VARCHAR2(30) := 'ADDM_TEST';
BEGIN
    DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
    DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

## SQL Tuning Advisor Task Parameters

See the [DBMS\\_SQLTUNE](#) package and *Oracle Database SQL Tuning Guide* for more information.

## 16.3.34 TUNE\_MVIEW Procedure

This procedure shows how to decompose a materialized view into multiple views and to restate the materialized view to be optimized for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

### Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
    task_name      IN OUT VARCHAR2,
    mv_create_stmt IN      [CLOB | VARCHAR2]);
```

### Parameters

**Table 16-39** TUNE\_MVIEW Procedure Parameters

| Parameter      | Description                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The task name for querying the results in a catalog view. If not specified, the database generates a task name, and then returns. |
| mv_create_stmt | The original materialized view creation statement.                                                                                |

## Usage Notes

Executing `TUNE_MVIEW` generates two sets of output results: one for the implementation, and the other for undoing the implementation. The output is accessible through `USER_TUNE_MVIEW` and `DBA_TUNE_MVIEW` views. You can also use `DBMS_ADVISOR.GET_TASK_SCRIPT` and `DBMS_ADVISOR.CREATE_FILE` to print the `TUNE_MVIEW` results into a script file for later execution.

**Table 16-40** `USER_TUNE_MVIEW` and `DBA_TUNE_MVIEW` Views

| Column Name | Column Description                                                                                                                                                                                                                                                                                                                                         |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER       | The name of the materialized view owner.                                                                                                                                                                                                                                                                                                                   |
| TASK_NAME   | The name of the task. This name serves as a key to access the set of recommendations.                                                                                                                                                                                                                                                                      |
| SCRIPT_TYPE | Recommendation ID that indicates whether the row is for the IMPLEMENTATION or UNDO script.                                                                                                                                                                                                                                                                 |
| ACTION_ID   | Action ID used as the command order number.                                                                                                                                                                                                                                                                                                                |
| STATEMENT   | For <code>TUNE_MVIEW</code> output, this column represents the following statements, and includes statement properties such as <code>REFRESH</code> and <code>REWRITE</code> options: <ul style="list-style-type: none"> <li>CREATE MATERIALIZED VIEW LOG</li> <li>ALTER MATERIALIZED VIEW LOG FORCE</li> <li>[CREATE   DROP] MATERIALIZED VIEW</li> </ul> |

## Examples

The following example shows how to use `TUNE_MVIEW` to optimize a `CREATE MATERIALIZED VIEW` statement:

```
DECLARE
  v_tname VARCHAR2(30);
BEGIN
  v_tname := 'mview_task';
  DBMS_ADVISOR.TUNE_MVIEW(
    task_name => v_tname
  , mv_create_stmt =>
    'CREATE MATERIALIZED VIEW omv REFRESH WITH ROWID AS SELECT * FROM
orders');
END;
```

You can view the results by querying `USER_TUNE_MVIEW` or `DBA_TUNE_MVIEW` as the following example (sample output included):

```
SET LINESIZE 120
COL TASK_NAME FORMAT a20
COL STATEMENT FORMAT a40

SELECT *
FROM   USER_TUNE_MVIEW
WHERE  TASK_NAME='mview_task'
AND    SCRIPT_TYPE='IMPLEMENTATION';

TASK_NAME          ACTION_ID SCRIPT_TYPE  STATEMENT
-----
```

```

-----
mview_task          1 IMPLEMENTATION CREATE MATERIALIZED VIEW LOG
ON "OE"."ORDERS" WITH ROWID

mview_task          2 IMPLEMENTATION ALTER MATERIALIZED VIEW LOG
FORCE ON "OE"."ORDERS" ADD ROWID

mview_task          3 IMPLEMENTATION CREATE MATERIALIZED VIEW
OE.OMV REFRESH
FAST WITH ROWID DISABLE QUERY
REWRITE

```

Alternatively, you can save the output results in an external script file as in the following example:

```

CREATE DIRECTORY TUNE_RESULTS_DIR AS '/tmp';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS_DIR TO PUBLIC;
BEGIN
  DBMS_ADVISOR.CREATE_FILE(
    buffer      => DBMS_ADVISOR.GET_TASK_SCRIPT( task_name => 'mview_task')
  , location   => 'TUNE_RESULTS_DIR'
  , filename   => 'mview_create.sql' );
END;

```

The preceding statement will save the results in /tmp/mview\_create.sql.

#### See Also:

*Oracle Database SQL Tuning Guide* for more information about using the TUNE\_MVIEW procedure

## 16.3.35 UPDATE\_OBJECT Procedure

This procedure updates an existing task object.

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

### Syntax

```

DBMS_ADVISOR.UPDATE_OBJECT (
  task_name      IN VARCHAR2
  object_id      IN NUMBER,
  attr1          IN VARCHAR2 := NULL,
  attr2          IN VARCHAR2 := NULL,
  attr3          IN VARCHAR2 := NULL,
  attr4          IN CLOB := NULL,
  attr5          IN VARCHAR2 := NULL);

```

## Parameters

**Table 16-41 UPDATE\_OBJECT Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| task_name | A valid advisor task name that uniquely identifies an existing task.                 |
| object_id | The advisor-assigned object identifier.                                              |
| attr1     | Advisor-specific data. If set to NULL, there will be no effect on the target object. |
| attr2     | Advisor-specific data. If set to NULL, there will be no effect on the target object. |
| attr3     | Advisor-specific data. If set to NULL, there will be no effect on the target object. |
| attr4     | Advisor-specific data. If set to NULL, there will be no effect on the target object. |
| attr5     | Advisor-specific data. If set to null, there will be no effect on the target object. |

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

## Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

## Examples

```

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                                'SELECT * FROM SH.SALES', obj_id);
    DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id, NULL, NULL, NULL,
                                'SELECT count(*) FROM SH.SALES');

END;
/

```

**See Also:**

*Oracle Database Administrator's Guide* for further information regarding the Segment Advisor

## 16.3.36 UPDATE\_REC\_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

### Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (  
    task_name          IN VARCHAR2  
    rec_id             IN NUMBER,  
    action_id          IN NUMBER,  
    attribute_name     IN VARCHAR2,  
    value              IN VARCHAR2);
```

### Parameters

**Table 16-42** UPDATE\_REC\_ATTRIBUTES Procedure Parameters

| Parameter      | Description                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The task name that uniquely identifies an existing task.                                                                                                                                                                                     |
| rec_id         | The Advisor-generated identifier number that is assigned to the recommendation.                                                                                                                                                              |
| action_id      | The Advisor-generated action identifier that is assigned to the particular command.                                                                                                                                                          |
| attribute_name | Name of the attribute to be changed. The valid values are: <ul style="list-style-type: none"><li>owner The new owner of the object.</li><li>name The new name of the object.</li><li>tablespace The new tablespace for the object.</li></ul> |
| value          | Specifies the new value for the recommendation attribute.                                                                                                                                                                                    |

### Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

### Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
    attribute VARCHAR2(100);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
```

```

task_name);
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';

DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/

```

### 16.3.37 UPDATE\_SQLWKLD\_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

#### Note:

This procedure is deprecated starting in Oracle Database 11g.

#### Syntax

```

DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
    workload_name      IN VARCHAR2,
    new_name            IN VARCHAR2 := NULL,
    description         IN VARCHAR2 := NULL,
    read_only          IN VARCHAR2 := NULL,
    is_template         IN VARCHAR2 := NULL,
    how_created         IN VARCHAR2 := NULL);

```

#### Parameters

**Table 16-43 UPDATE\_SQLWKLD\_ATTRIBUTES Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The workload object name that uniquely identifies an existing workload.                                                                                                                            |
| new_name      | The new workload object name. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , the workload will not be renamed. A task name can be up to 30 characters long. |
| description   | A new workload description. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , the description will not be changed. Names can be up to 256 characters long.     |
| read_only     | Set to <code>TRUE</code> so it cannot be changed.                                                                                                                                                  |
| is_template   | <code>TRUE</code> if workload is to be used as a template.                                                                                                                                         |

**Table 16-43 (Cont.) UPDATE\_SQLWKLD\_ATTRIBUTES Procedure Parameters**

| Parameter   | Description                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| how_created | Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed. |

### Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

## 16.3.38 UPDATE\_SQLWKLD\_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

### Note:

This procedure is deprecated starting in Oracle Database 11g.

### Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  sql_id             IN NUMBER,
  application         IN VARCHAR2 := NULL,
  action             IN VARCHAR2 := NULL,
  priority           IN NUMBER := NULL,
  username           IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  search             IN VARCHAR2,
  updated            OUT NUMBER,
  application         IN VARCHAR2 := NULL,
  action             IN VARCHAR2 := NULL,
  priority           IN NUMBER := NULL,
  username           IN VARCHAR2 := NULL);
```

## Parameters

**Table 16-44 UPDATE\_SQLWKLD\_STATEMENT Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| workload_name | The SQL Workload object name that uniquely identifies an existing workload.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| sql_id        | The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.                                                                                                                                                                                                                                                                                                                                                      |
| updated       | Returns the number of statements changed by a searched update.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| application   | Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.                                                                                                                                                                                                                                                                                                        |
| action        | Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.                                                                                                                                                                                                                                                                                                                                          |
| priority      | The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW.<br><br>If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.                                                                                                                                                                                                                                                                 |
| username      | The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.<br><br>Because a user name is an Oracle identifier, the username value must be entered exactly like it is stored in the database. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. The database does not recognize the user scott as a match for SCOTT. |
| search        | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET\\_TASK Procedure](#) to set a task to its initial state.

## Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
```

```
WHERE workload_name = 'My Workload';

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

## 16.3.39 UPDATE\_TASK\_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

### Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
  task_name          IN VARCHAR2
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only          IN VARCHAR2 := NULL,
  is_template        IN VARCHAR2 := NULL,
  how_created        IN VARCHAR2 := NULL);
```

### Parameters

**Table 16-45 UPDATE\_TASK\_ATTRIBUTES Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name   | The Advisor task name that uniquely identifies an existing task.                                                                                                                                                                                                         |
| new_name    | The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.                                                                                                         |
| description | A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.                                                                                                          |
| read_only   | Sets the task to read-only. Possible values are: TRUE and FALSE.<br>If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.                                                                                                          |
| is_template | Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed. |
| how_created | Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.                                                                                                         |

### Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id,
```

```
task_name);  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');  
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');  
END;  
/
```

# DBMS\_ALERT

DBMS\_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Summary of DBMS\\_ALERT Subprograms](#)

## 17.1 DBMS\_ALERT Overview

This scenario describes a possible use of the DBMS\_ALERT package.

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (WAITONE) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (SIGNAL) whenever the trigger is fired.

## 17.2 DBMS\_ALERT Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package.

## 17.3 DBMS\_ALERT Constants

The DBMS\_ALERT package uses the constants listed and described in this topic.

**Table 17-1 DBMS\_ALERT Constants**

| Name    | Type    | Value    | Description                                                                     |
|---------|---------|----------|---------------------------------------------------------------------------------|
| MAXWAIT | INTEGER | 86400000 | The maximum time to wait for an alert (1000 days which is essentially forever). |

## 17.4 DBMS\_ALERT Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

## 17.5 DBMS\_ALERT Exceptions

DBMS\_ALERT raises the application error -20000 on error conditions.

Table 17-2 shows the messages and the procedures that can raise them.

## 17.6 DBMS\_ALERT Operational Notes

This topic lists notes related to general and specific applications. Also, a list of DBMS\_ALERT error messages is provided.

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

 **See Also:**  
[DBMS\\_PIPE](#)

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to five seconds and can be set by the `SET_DEFAULTS` procedure.

- **WAITANY** procedure. If you use the **WAITANY** procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

**Table 17-2 DBMS\_ALERT Error Messages**

| Error Message                                                        | Procedure |
|----------------------------------------------------------------------|-----------|
| ORU-10001 lock request error, status: N                              | SIGNAL    |
| ORU-10015 error: N waiting for pipe status                           | WAITANY   |
| ORU-10016 error: N sending on pipe 'X'                               | SIGNAL    |
| ORU-10017 error: N receiving on pipe 'X'                             | SIGNAL    |
| ORU-10019 error: N on lock request                                   | WAIT      |
| ORU-10020 error: N on lock request                                   | WAITANY   |
| ORU-10021 lock request error; status: N                              | REGISTER  |
| ORU-10022 lock request error, status: N                              | SIGNAL    |
| ORU-10023 lock request error; status N                               | WAITONE   |
| ORU-10024 there are no alerts registered                             | WAITANY   |
| ORU-10025 lock request error; status N                               | REGISTER  |
| ORU-10037 attempting to wait on uncommitted signal from same session | WAITONE   |

## 17.7 DBMS\_ALERT Examples

In this example, suppose that you want to graph average salaries by department, for all employees. Your application needs to know whenever **EMP** is changed.

Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
/* ... read the emp table and graph it */
  DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
  if status = 0 then goto <<readagain>>; else
  /* ... error condition */
```

The **EMP** table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
  DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

## 17.8 Summary of DBMS\_ALERT Subprograms

This table lists the DBMS\_ALERT subprograms and briefly describes them.

**Table 17-3 DBMS\_ALERT Package Subprograms**

| Subprogram                             | Description                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------|
| <a href="#">REGISTER Procedure</a>     | Receives messages from an alert                                                                  |
| <a href="#">REMOVE Procedure</a>       | Disables notification from an alert                                                              |
| <a href="#">REMOVEALL Procedure</a>    | Removes all alerts for this session from the registration list                                   |
| <a href="#">SET_DEFAULTS Procedure</a> | Sets the polling interval                                                                        |
| <a href="#">SIGNAL Procedure</a>       | Signals an alert (send message to registered sessions)                                           |
| <a href="#">WAITANY Procedure</a>      | Waits <code>timeout</code> seconds to receive alert message from an alert registered for session |
| <a href="#">WAITONE Procedure</a>      | Waits <code>timeout</code> seconds to receive message from named alert                           |

### 17.8.1 REGISTER Procedure

This procedure lets a session register interest in an alert.

#### Syntax

```
DBMS_ALERT.REGISTER (  
    name      IN  VARCHAR2,  
    cleanup   IN  BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 17-4 REGISTER Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>name</code>    | Name of the alert in which this session is interested                                                                                                                                                                                 |
| <code>cleanup</code> | Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE. |

#### **WARNING:**

Alert names beginning with 'ORA\$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

#### Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling `REMOVE`.

## 17.8.2 REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

### Syntax

```
DBMS_ALERT.REMOVE (  
    name IN VARCHAR2);
```

### Parameters

**Table 17-5 REMOVE Procedure Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| name      | Name of the alert (case-insensitive) to be removed from registration list. |

### Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

## 17.8.3 REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

### Syntax

```
DBMS_ALERT.REMOVEALL;
```

## 17.8.4 SET\_DEFAULTS Procedure

In case a polling loop is required, use the SET\_DEFAULTS procedure to set the polling interval.

### Syntax

```
DBMS_ALERT.SET_DEFAULTS (  
    sensitivity IN NUMBER);
```

## Parameters

**Table 17-6 SET\_DEFAULTS Procedure Parameters**

| Parameter   | Description                                                                                 |
|-------------|---------------------------------------------------------------------------------------------|
| sensitivity | Polling interval, in seconds, to sleep between polls. The default interval is five seconds. |

## 17.8.5 SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

### Syntax

```
DBMS_ALERT.SIGNAL (  
    name      IN  VARCHAR2,  
    message   IN  VARCHAR2);
```

## Parameters

**Table 17-7 SIGNAL Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the alert to signal.                                                                                                                                                                                                                        |
| message   | Message, of 1800 bytes or less, to associate with this alert.<br><br>This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message. |

## 17.8.6 WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

### Syntax

```
DBMS_ALERT.WAITANY (  
    name      OUT  VARCHAR2,  
    message   OUT  VARCHAR2,  
    status    OUT  INTEGER,  
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

## Parameters

**Table 17-8 WAITANY Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Returns the name of the alert that occurred.                                                                                                                                                                                                                                                                               |
| message   | Returns the message associated with the alert.<br>This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITANY</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded. |
| status    | Values returned:<br>0 - alert occurred<br>1 - timeout occurred                                                                                                                                                                                                                                                             |
| timeout   | Maximum time to wait for an alert.<br>If no alert occurs before <code>timeout</code> seconds, this returns a status of 1.                                                                                                                                                                                                  |

## Usage Notes

An implicit `COMMIT` is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

## Exceptions

-20000, ORU-10024: there are no alerts registered.

## 17.8.7 WAITONE Procedure

This procedure waits for a specific alert to occur.

An implicit `COMMIT` is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

## Syntax

```
DBMS_ALERT.WAITONE (  
    name      IN   VARCHAR2,  
    message   OUT  VARCHAR2,  
    status     OUT  INTEGER,  
    timeout    IN   NUMBER DEFAULT MAXWAIT);
```

## Parameters

**Table 17-9 WAITONE Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| name      | Name of the alert to wait for. |

**Table 17-9 (Cont.) WAITONE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message   | Returns the message associated with the alert.<br>This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITONE</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded. |
| status    | Values returned:<br>0 - alert occurred<br>1 - timeout occurred                                                                                                                                                                                                                                                             |
| timeout   | Maximum time to wait for an alert.<br>If the named alert does not occurs before <code>timeout</code> seconds, this returns a status of 1.                                                                                                                                                                                  |

# DBMS\_APP\_CONT

The `DBMS_APP_CONT` package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

## See Also:

*Oracle Database Development Guide* for explanations of application continuity and Transaction Guard, and the relationship between these two features:

- "Using Transaction Guard"

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_APP\\_CONT Subprograms](#)

## 18.1 DBMS\_APP\_CONT Overview

The `DBMS_APP_CONT` package can be used to solve this example issue.

### Problem Description

One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

### GET\_LTXID\_OUTCOME

The purpose of the [GET\\_LTXID\\_OUTCOME Procedure](#) is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.

## See Also:

*Oracle Database Concepts* for explanation of Logical Transaction ID

## 18.2 DBMS\_APP\_CONT Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT` package.

To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user ;
```

## 18.3 Summary of DBMS\_APP\_CONT Subprograms

This topic lists the `DBMS_APP_CONT` subprograms in alphabetical order and briefly describes them.

**Table 18-1 DBMS\_APP\_CONT Package Subprograms**

| Subprogram                                   | Description                                                                                                                                                                                                                                                                          |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">APPLY_REPLAY_RULE Procedure</a>  | This procedure activates a new replay rule that is inherited by any sub-routine unless it is overwritten by a new rule applied to that sub-routine.                                                                                                                                  |
| <a href="#">GET_LTXID_OUTCOME Procedure</a>  | Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.                                                                                                                         |
| <a href="#">GET_REPLAY_RULES Function</a>    | This function returns a list of the replay rules. From the results, you can test if any rule target is replayable with bit and function.                                                                                                                                             |
| <a href="#">RESET_REPLAY_RULES Procedure</a> | This procedure resets all existing replay rules. When you call this procedure, it clears all locally defined rules in the specified scope and restores them to the original state when they were inherited from their parent scope, or the service if parent scope is not specified. |

### 18.3.1 APPLY\_REPLAY\_RULE Procedure

This procedure activates a new replay rule that is inherited by any sub-routine unless it is overwritten by a new rule applied to that sub-routine.

A replay rule activated in a PL/SQL block loses its effect when `reset_replay_rules` is called or the block returns.

#### Note:

Calling this procedure in a sub-block of a procedure, function, or anonymous block applies the rule to its parent scope. When the sub-block returns, the rule will not lose its effect. Thus, you are not recommended to call this procedure in a sub-block.

#### Syntax

```
DBMS_APP_CONT.APPLY_REPLAY_RULE (  
    replayable IN   BOOLEAN,  
    targets     IN   BINARY_INTEGER,  
    scope       IN   BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT);
```

## Parameters

**Table 18-2** *APPLY\_REPLAY\_RULE Procedure Parameters*

| Parameter  | Description                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replayable | TRUE or FALSE, depending on whether the rule is replayable or not.                                                                                                                                          |
| targets    | Target effects on which this rule is applied. If multiple effects are desired, pass them as bit or as individual effects, such as:<br>dbms_app_cont.side_effects +<br>dbms_app_cont.autonomous_transactions |
| scope      | Scope of the rule, either dbms_app_cont.scope_current (default) or dbms_app_cont.scope_parent.                                                                                                              |

## 18.3.2 GET\_LTXID\_OUTCOME Procedure

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

### Syntax

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (
  client_ltxid      IN   RAW,
  committed         OUT  BOOLEAN,
  user_call_completed OUT  BOOLEAN)
```

## Parameters

**Table 18-3** *GET\_LTXID\_OUTCOME Procedure Parameters*

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_ltxid        | Client-side logical transaction ID. Obtain the LTXID from the previous failed session using the client driver provided APIs - getLTXID for JDBC, and LogicalTransactionId for ODP.net., and OCI_ATTR_GET with LTXID for OCI.                                                                                                                                                                          |
| committed           | Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.                                                                                                             |
| user_call_completed | Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter. |

## Exceptions

**Table 18-4 GET\_LTXID\_OUTCOME Procedure Exceptions**

| Exception                  | Description                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ORA-14950 - SERVER_AHEAD   | The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage. |
| ORA-14951 - CLIENT_AHEAD   | The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.                                                                                                                                                               |
| ORA-14906 - SAME_SESSION   | Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.                                                                                                                                                                                        |
| ORA-14909 - COMMIT_BLOCKED | Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.                                                                                                                       |
| ORA-14952 - ERROR          | The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.                                                                                                                                                                                                                                  |

## 18.3.3 GET\_REPLAY\_RULES Function

This function returns a list of the replay rules. From the results, you can test if any rule target is replayable with BITAND function.

### Syntax

```
DBMS_APP_CONT.GET_REPLAY_RULES (
  replayable IN BOOLEAN,
  scope      IN BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT)
RETURN      BINARY_INTEGER;
```

### Parameters

**Table 18-5 GET\_REPLAY\_RULES Procedure Parameters**

| Parameter  | Description                                                                                     |
|------------|-------------------------------------------------------------------------------------------------|
| replayable | TRUE or FALSE, depending on weather the rule is replayable or not.                              |
| scope      | Scope of the rules, either dbms_app_cont.scope_current (default) or dbms_app_cont.scope_parent. |

## 18.3.4 RESET\_REPLAY\_RULES Procedure

This procedure resets all existing replay rules. When you call this procedure, it clears all locally defined rules in the specified scope and restores them to the original state when they were inherited from their parent scope, or the service if parent scope is not specified.

### Syntax

```
DBMS_APP_CONT.RESET_REPLAY_RULES (  
  targets IN BINARY_INTEGER DEFAULT NULL,  
  scope   IN BINARY_INTEGER DEFAULT DBMS_APP_CONT.SCOPE_CURRENT);
```

### Parameters

**Table 18-6** *RESET\_REPLAY\_RULES Procedure Parameters*

| Parameter | Description                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------|
| targets   | Target effects on which you want to reset the rules.                                                                      |
| scope     | Scope of the rule, either <code>dbms_app_cont.scope_current</code> (default) or <code>dbms_app_cont.scope_parent</code> . |

# DBMS\_APP\_CONT\_ADMIN

This package provides a collection dba level admin operations in relation to Application Continuity.

This chapter contains the following topics:

- [DBMS\\_APP\\_CONT\\_ADMIN Security Model](#)
- [Summary of DBMS\\_APP\\_CONT\\_ADMIN Subprograms](#)

## 19.1 DBMS\_APP\_CONT\_ADMIN Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT_ADMIN` package.

## 19.2 Summary of DBMS\_APP\_CONT\_ADMIN Subprograms

This topic lists the `DBMS_APP_CONT_ADMIN` subprograms in alphabetical order and briefly describes them.

**Table 19-1** *DBMS\_APP\_CONT\_ADMIN Package Subprograms*

| Subprogram                                           | Description                                                                                                                                                                                                                                                         |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACCHK_PURGE Procedure</a>                | This procedure purges all previously collected ACCHK information.                                                                                                                                                                                                   |
| <a href="#">ACCHK_SET Procedure</a>                  | This procedure enables or disables data collection for acchk protection for your application when using Application Continuity or Transparent Application Continuity. The <code>DISABLE_TIME</code> parameter is used to extend the runtime. Default is 10 minutes. |
| <a href="#">ADD_SQL_CONNECTION_TEST Procedure</a>    | This procedure adds a new connection test that is used during draining sessions before planned maintenance begins.                                                                                                                                                  |
| <a href="#">DELETE_SQL_CONNECTION_TEST Procedure</a> | This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.                                                                                             |
| <a href="#">DISABLE_CONNECTION_TEST Procedure</a>    | This procedure disables usage of a connection test during draining of sessions.                                                                                                                                                                                     |
| <a href="#">ENABLE_CONNECTION_TEST Procedure</a>     | This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.                                                                        |

### 19.2.1 ACCHK\_PURGE Procedure

This procedure purges all previously collected ACCHK information.

- You should call `ACCHK_PURGE` before `ACCHK_SET`, which loads the filters.
- `ACCHK_PURGE` is set at the PDB level.

## Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_PURGE (
    start_time IN DATE      DEFAULT NULL,
    end_time   IN DATE      DEFAULT NULL,
    purge_all  IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 19-2 ACCHK\_PURGE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | The start time from which you want to purge the ACCHK information.                                                                                                                                                                                                                                                    |
| end_time   | The end time till when you want to purge the ACCHK information.                                                                                                                                                                                                                                                       |
| purge_all  | This parameter is used to delete all ACCHK information. <ul style="list-style-type: none"> <li>• TRUE- enables deletion of all ACCHK information.</li> <li>• FALSE- disables deletion of all ACCHK information. When this parameter is set to FALSE, then only the specified ACCHK information is deleted.</li> </ul> |

## Examples

The following examples illustrate how to purge all ACCHK information:

```
SQL> execute dbms_app_cont_admin.acchk_purge(purge_all => TRUE);
```

## 19.2.2 ACCHK\_SET Procedure

This procedure enables or disables data collection for `acchk` protection reports for your application when using Application Continuity or Transparent Application Continuity. The `DISABLE_TIME` parameter is used to extend the runtime. Default value is 10 minutes.

Enabling or disabling data collection applies to the level connected, that is, a CDB or a PDB.

- `acchk` is enabled/disabled at your CDB if connected to the container.
- `acchk` is enabled/disabled at your PDB only when connected to the PDB.

Data collection applies to new sessions only.

Once enabled, data is collected for the workload run under this service. You can then view this data in the `ACCHK_REPORTS` and can also be mined in the `ACCHK` views.

## Syntax

```
DBMS_APP_CONT_ADMIN.ACCHK_SET (
    enabled          IN BOOLEAN,
    disable_time_in_seconds DEFAULT 600);
```

## Parameters

**Table 19-3 ACCHK\_SET Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enabled                 | This parameter is used to enable or disable data collection at a CDB or PDB level. <ul style="list-style-type: none"> <li>TRUE-enables data collection at this level.</li> <li>FALSE-explicitly disables data collection.</li> </ul> |
| disable_time_in_seconds | Optional parameter used to disable ACCHK tracing automatically in a given number of seconds.<br>The maximum value that you can specify is 3600 seconds.<br>The default value is 600 seconds.                                         |

## Usage Notes

- This procedure is owned by SYS at CDB\$ROOT or PDB level, or by SYS when not multitenant
- The acchk activation is enabled across all instances of RAC supporting that service.
- Enabling is persistent to allow for failover and restart tests, that is, implementation uses ALTER SESSION SET EVENTS .... SCOPE=BOTH. The enable is per database. For Data Guard, enable and disable must be at each database.

## Examples

Application Continuity Protection Check is not enabled by default. Follow this procedure to enable or disable ACCHK and generate reports to check protection level for the applications.

- Grant read access to the users, who will run the Application Continuity Protection Check report and views, using the ACCHK\_READ role:

```
GRANT ACCHK_READ TO USER;
```

- Enable Application Continuity tracing for your applications using the dbms\_app\_cont\_admin.acchk\_set(true) procedure:

```
SQL> execute dbms_app_cont_admin.acchk_set(true);
```

By default, ACCHK is disabled automatically after 600 seconds. You can specify a lower number to reduce the auto disable time. For example, to disable ACCHK after 300 seconds:

```
SQL> dbms_app_cont_admin.acchk_set(true,300);
```

The dbms\_app\_cont\_admin.acchk\_set(true) procedure enables Application Continuity tracing at the database level to which you are connected. If you are connected at the CDB level, then tracing is enabled for the CDB, and if you are connected at the PDB level, then tracing is enabled for the PDB.

 **Note:**

Set the `COMPATIBLE` parameter to 12.2.0 or greater.

3. To disable Application Continuity tracing for new sessions in your applications:

```
SQL> execute dbms_app_cont_admin.acchk_set(false);
```

 **Note:**

The tracing will not be disabled for the current sessions until the sessions are terminated.

## 19.2.3 ADD\_SQL\_CONNECTION\_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

### Syntax

```
DBMS_APP_CONT_ADMIN.ADD_SQL_CONNECTION_TEST (
    connection_test      IN VARCHAR2
    service_name          IN VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 19-4 ADD\_SQL\_CONNECTION\_TEST Procedure Parameters**

| Parameter       | Description                                      |
|-----------------|--------------------------------------------------|
| CONNECTION_TEST | The SQL text used to test and drain connections. |
| SERVICE_NAME    | Optional service name qualifier.                 |

### Usage Notes

The `ADD_SQL_CONNECTION_TEST` Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

## 19.2.4 DELETE\_SQL\_CONNECTION\_TEST Procedure

This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.

### Syntax

```
DBMS_APP_CONT_ADMIN.DELETE_SQL_CONNECTION_TEST (
    connection_test      IN VARCHAR2
    service_name         IN VARCHAR2   DEFAULT NULL);
```

### Parameters

**Table 19-5 DELETE\_SQL\_CONNECTION\_TEST Procedure Parameters**

| Parameter       | Description                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| CONNECTION_TEST | The SQL text used to test and drain connections.                                                                                        |
| SERVICE_NAME    | Optional service name qualifier.<br>If the optional SERVICE_NAME qualifier is provided, only the test for that service name is deleted. |

### Usage Notes

If you are not certain if a test should be deleted, you can disable the test using `DISABLE_CONNECTION_TEST` Procedure. Only custom SQL tests can be deleted. Predefined tests cannot be deleted. Check for latest updates on service qualifier availability.

This procedure is owned by SYS at CDB\$ROOT or PDB level, or SYS for when not multitenant.

Connection tests and their status can be checked by querying the view `DBA_CONNECTION_TESTS`.

## 19.2.5 DISABLE\_CONNECTION\_TEST Procedure

This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.

### Syntax

```
DBMS_APP_CONT_ADMIN.DISABLE_CONNECTION_TEST (
    connection_test_type IN VARCHAR2,
    connection_test      IN VARCHAR2,
    service_name         IN VARCHAR2   DEFAULT NULL);
```

### Parameters

**Table 19-6 DISABLE\_CONNECTION\_TEST Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONNECTION_TEST_TYPE | The permitted values are: <ul style="list-style-type: none"> <li>DBMS_APP_CONT_ADMIN.SQL_TEST</li> <li>DBMS_APP_CONT_ADMIN.PING_TEST</li> <li>DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST</li> </ul> |

**Table 19-6 (Cont.) DISABLE\_CONNECTION\_TEST Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONNECTION_TEST | The SQL text used to test and drain connections. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.                                                                                                                                            |
| SERVICE_NAME    | Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. A disable at service name level takes precedence over an enable at PDB level. That is the PDB can be enabled, and the service disabled. |

### Usage Notes

This procedure is owned by SYS and is granted to users for execution at CDB\$ROOT or PDB levels, or when not multitenant, at dictionary level.

Connection tests and their status can be checked by querying the view DBA\_CONNECTION\_TESTS.

## 19.2.6 ENABLE\_CONNECTION\_TEST Procedure

This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

### Syntax

```
DBMS_APP_CONT_ADMIN.ENABLE_CONNECTION_TEST (
    connection_test_type    IN VARCHAR2,
    connection_test         IN VARCHAR2,
    service_name            IN VARCHAR2    DEFAULT NULL);
```

### Parameters

**Table 19-7 ENABLE\_CONNECTION\_TEST Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONNECTION_TEST_TYPE | The connection type used when managing connection tests for draining before planned maintenance. See ADD, DELETE, ENABLE, DISABLE procedures for connection tests. The permitted values are: <ul style="list-style-type: none"> <li>DBMS_APP_CONT_ADMIN.SQL_TEST</li> <li>DBMS_APP_CONT_ADMIN.PING_TEST</li> <li>DBMS_APP_CONT_ADMIN.ENDREQUEST_TEST</li> </ul> |
| CONNECTION_TEST      | The SQL text used to test and drain connections at the RDBMS before planned maintenance starts. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.                                                                                                                                                                                |

**Table 19-7 (Cont.) ENABLE\_CONNECTION\_TEST Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME | Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled. |

#### Usage Notes

- This procedure is owned by SYS and is granted to users for execution at CDB\$ROOT or PDB levels, or when not multitenant, at dictionary level
- ENABLE\_CONNECTION\_TEST enables a connection test for draining sessions during planned maintenance. The enable operation applies to all RAC instances where the PDB is open. It persists across database restarts.
- This procedure is owned by SYS and is granted to users for execution at CDB\$ROOT or PDB levels, or when not multitenant, at dictionary level.

# DBMS\_APP\_CONT\_REPORT

This procedure generates a report of ACCHK trace collected while `ACCHK_SET(TRUE)`.

This chapter contains the following topics:

- [DBMS\\_APP\\_CONT\\_REPORT Security Model](#)
- [Summary of DBMS\\_APP\\_CONT\\_REPORT Subprograms](#)

## 20.1 DBMS\_APP\_CONT\_REPORT Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_APP_CONT_REPORT` package.

## 20.2 Summary of DBMS\_APP\_CONT\_REPORT Subprograms

This topic lists the `DBMS_APP_CONT_REPORT` subprograms in alphabetical order and briefly describes them.

**Table 20-1** *DBMS\_APP\_CONT\_REPORT Package Subprograms*

| Subprogram                             | Description                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">ACCHK_REPORT Procedure</a> | This procedure provides a report of your run. The data is derived from the <code>acchk</code> views. |

### 20.2.1 ACCHK\_REPORT Procedure

This procedure generates a report of your run. The data is derived from the `acchk` views.

**Syntax**

```
DBMS_APP_CONT_REPORT.ACCHK_REPORT (  
    level                IN VARCHAR2,  
    service_name         IN VARCHAR2);
```

**Parameters**

**Table 20-2** *ACCHK\_REPORT Procedure Parameters*

| Parameter                 | Description                                                                                                                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>level</code>        | These are constants. <ul style="list-style-type: none"><li>• <code>SUMMARY</code>-summary report only (default)</li><li>• <code>WARNING</code>-summary and warnings</li><li>• <code>FULL</code>-summary and all workload capture, including where there are no warnings</li></ul> |
| <code>service_name</code> | The service name qualifier (Optional).<br>The value <code>NULL</code> applies to all <code>service_names</code> .                                                                                                                                                                 |

### Procedure Exceptions

The exceptions of DBMS\_APP\_CONT\_REPORT.ACCHK\_REPORT procedure are as follows:

- 20000-Invalid report level parameter.

### Example

```
SET SERVEROUTPUT ON FORMAT WRAPPED
```

```
SET LINESIZE 180
```

```
DBMS_APP_CONT_REPORT.ACCHK_REPORT(DBMS_APP_CONT_REPORT.FULL);
```

```
SET SERVEROUTPUT ON FORMAT WRAPPED
```

```
SET LINESIZE 180
```

```
DBMS_APP_CONT_REPORT.ACCHK_REPORT(DBMS_APP_CONT_REPORT.WARNING);
```

```
SET SERVEROUTPUT ON FORMAT WRAPPED
```

```
SET LINESIZE 180
```

```
DBMS_APP_CONT_REPORT.ACCHK_REPORT(DBMS_APP_CONT_REPORT.SUMMARY);
```

# DBMS\_APPLICATION\_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_APPLICATION\\_INFO Subprograms](#)

## 21.1 DBMS\_APPLICATION\_INFO Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

## 21.2 DBMS\_APPLICATION\_INFO Security Model

No further privileges are required. The `DBMSAPIN.SQL` script is already run as a part of standard database creation.

### Note:

The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

## 21.3 DBMS\_APPLICATION\_INFO Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

## 21.4 Summary of DBMS\_APPLICATION\_INFO Subprograms

This table lists and describes the DBMS\_APPLICATION\_INFO package subprograms.

**Table 21-1 DBMS\_APPLICATION\_INFO Package Subprograms**

| Subprogram                                    | Description                                                                  |
|-----------------------------------------------|------------------------------------------------------------------------------|
| <a href="#">READ_CLIENT_INFO Procedure</a>    | Reads the value of the <code>client_info</code> field of the current session |
| <a href="#">READ_MODULE Procedure</a>         | Reads the values of the module and action fields of the current session      |
| <a href="#">SET_ACTION Procedure</a>          | Sets the name of the current action within the current module                |
| <a href="#">SET_CLIENT_INFO Procedure</a>     | Sets the <code>client_info</code> field of the session                       |
| <a href="#">SET_MODULE Procedure</a>          | Sets the name of the module that is currently running to a new module        |
| <a href="#">SET_SESSION_LONGOPS Procedure</a> | Sets a row in the V\$SESSION_LONGOPS table                                   |

### 21.4.1 READ\_CLIENT\_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

#### Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

#### Parameters

**Table 21-2 READ\_CLIENT\_INFO Procedure Parameters**

| Parameter                | Description                                                                           |
|--------------------------|---------------------------------------------------------------------------------------|
| <code>client_info</code> | Last client information value supplied to the <code>SET_CLIENT_INFO</code> procedure. |

### 21.4.2 READ\_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

#### Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (  
    module_name OUT VARCHAR2,  
    action_name OUT VARCHAR2);
```

#### Parameters

**Table 21-3 READ\_MODULE Procedure Parameters**

| Parameter                | Description                                                                     |
|--------------------------|---------------------------------------------------------------------------------|
| <code>module_name</code> | Last value that the module name was set to by calling <code>SET_MODULE</code> . |

**Table 21-3 (Cont.) READ\_MODULE Procedure Parameters**

| Parameter   | Description                                                                     |
|-------------|---------------------------------------------------------------------------------|
| action_name | Last value that the action name was set to by calling SET_ACTION or SET_MODULE. |

#### Usage Notes

Module and action names for a registered application can be retrieved by querying V\$SQLAREA or by calling the READ\_MODULE procedure. Client information can be retrieved by querying the V\$SESSION view, or by calling the [READ\\_CLIENT\\_INFO Procedure](#).

#### Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V\$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
-----
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

## 21.4.3 SET\_ACTION Procedure

This procedure sets the name of the current action within the current module.

#### Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

#### Parameters

**Table 21-4 SET\_ACTION Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action_name | The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated. |

#### Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to `NULL` after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to `NULL`, subsequent transactions may be logged with the previous transaction's name.

### Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
        WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
        WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

## 21.4.4 SET\_CLIENT\_INFO Procedure

This procedure supplies additional information about the client application.

### Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
    client_info IN VARCHAR2);
```

### Parameters

**Table 21-5 SET\_CLIENT\_INFO Procedure Parameters**

| Parameter   | Description                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client_info | Supplies any additional information about the client application. This information is stored in the <code>V\$SESSION</code> view. Information exceeding 64 bytes is truncated. |

#### Note:

`CLIENT_INFO` is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

## 21.4.5 SET\_MODULE Procedure

This procedure sets the name of the current application or module.

### Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
    module_name IN VARCHAR2,
    action_name IN VARCHAR2);
```

### Parameters

**Table 21-6 SET\_MODULE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| module_name | Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated. |
| action_name | Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.                                                       |

### Usage Notes

### Example

```
CREATE or replace PROCEDURE add_employee(
    name VARCHAR2,
    salary NUMBER,
    manager NUMBER,
    title VARCHAR2,
    commission NUMBER,
    department NUMBER) AS
BEGIN
    DBMS_APPLICATION_INFO.SET_MODULE(
        module_name => 'add_employee',
        action_name => 'insert into emp');
    INSERT INTO emp
        (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
        commission, department);
    DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

## 21.4.6 SET\_SESSION\_LONGOPS Procedure

This procedure sets a row in the V\$SESSION\_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET\_SESSION\_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V\$SESSION\_LONGOPS view.

## Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
    rindex      IN OUT BINARY_INTEGER,
    slno        IN OUT BINARY_INTEGER,
    op_name     IN      VARCHAR2        DEFAULT NULL,
    target      IN      BINARY_INTEGER DEFAULT 0,
    context     IN      BINARY_INTEGER DEFAULT 0,
    sofar       IN      NUMBER          DEFAULT 0,
    totalwork   IN      NUMBER          DEFAULT 0,
    target_desc IN      VARCHAR2        DEFAULT 'unknown target',
    units       IN      VARCHAR2        DEFAULT NULL)
```

```
set_session_longops_nohint constant BINARY_INTEGER := -1;
```

## Parameters

**Table 21-7 SET\_SESSION\_LONGOPS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rindex      | A token which represents the v\$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.                                                   |
| slno        | Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.                                                                                                                |
| op_name     | Specifies the name of the long running task. It appears as the OPNAME column of v\$session_longops. The maximum length is 64 bytes.                                                                                                    |
| target      | Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v\$session_longops.                                       |
| context     | Any number the client wants to store. It appears in the CONTEXT column of v\$session_longops.                                                                                                                                          |
| sofar       | Any number the client wants to store. It appears in the SOFAR column of v\$session_longops. This is typically the amount of work which has been done so far.                                                                           |
| totalwork   | Any number the client wants to store. It appears in the TOTALWORK column of v\$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.                            |
| target_desc | Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v\$session_longops. The maximum length is 32 bytes. |
| units       | Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v\$session_longops. The maximum length is 32 bytes.                                                                           |

## Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V\$SESSION\_LONGOPS on the procedure's progress.

```
DECLARE
    rindex      BINARY_INTEGER;
    slno        BINARY_INTEGER;
```

```
totalwork number;  
sofar      number;  
obj        BINARY_INTEGER;  
  
BEGIN  
  rindex := dbms_application_info.set_session_longops_nohint;  
  sofar := 0;  
  totalwork := 10;  
  
  WHILE sofar < 10 LOOP  
    -- update obj based on sofar  
    -- perform task on object target  
  
    sofar := sofar + 1;  
    dbms_application_info.set_session_longops(rindex, slno,  
      "Operation X", obj, 0, sofar, totalwork, "table", "tables");  
  END LOOP;  
END;
```

# DBMS\_APPLY\_ADM

The `DBMS_APPLY_ADM` package provides subprograms to configure and manage Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_APPLY\\_ADM Subprograms](#)

## 22.1 DBMS\_APPLY\_ADM Overview

The `DBMS_APPLY_ADM` package provides interfaces to start, stop, and configure Oracle Apply processes, XStream outbound servers, and XStream inbound servers.

This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

## Note:

- For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as **apply components**. This chapter identifies a specific type of apply component when necessary.
- Using XStream requires purchasing a license for the Oracle GoldenGate product.

 **See Also:**

## 22.2 DBMS\_APPLY\_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles..

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

 **Note:**

The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

 **See Also:**

*Oracle Database XStream Guide* for information about configuring an XStream administrator

## 22.3 DBMS\_APPLY\_ADM Deprecated Subprograms

The `NONE` value for the `commit_serialization` apply component parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

 **Note:**

Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

## 22.4 Summary of DBMS\_APPLY\_ADM Subprograms

This table topic lists and describes the DBMS\_APPLY\_ADM subprograms.

**Table 22-1 DBMS\_APPLY\_ADM Package Subprograms**

| Subprogram                                         | Description                                                                                                                                                                                         |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_APPLY Procedure</a>              | Alters an apply component                                                                                                                                                                           |
| <a href="#">CLEAR_KEY_COLUMNS Procedure</a>        | Removes the key columns that were used as the substitute primary key by the <a href="#">SET_KEY_COLUMNS</a> procedure                                                                               |
| <a href="#">COMPARE_OLD_VALUES Procedure</a>       | Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply |
| <a href="#">CREATE_APPLY Procedure</a>             | Creates an apply component                                                                                                                                                                          |
| <a href="#">CREATE_OBJECT_DEPENDENCY Procedure</a> | Creates an object dependency                                                                                                                                                                        |
| <a href="#">DELETE_ALL_ERRORS Procedure</a>        | Deletes all the error transactions for the specified apply component                                                                                                                                |
| <a href="#">DELETE_ERROR Procedure</a>             | Deletes the specified error transaction                                                                                                                                                             |
| <a href="#">DROP_APPLY Procedure</a>               | Drops an apply component                                                                                                                                                                            |
| <a href="#">DROP_OBJECT_DEPENDENCY Procedure</a>   | Drops an object dependency                                                                                                                                                                          |
| <a href="#">EXECUTE_ALL_ERRORS Procedure</a>       | Reexecutes the error transactions for the specified apply component                                                                                                                                 |
| <a href="#">EXECUTE_ERROR Procedure</a>            | Reexecutes the specified error transaction                                                                                                                                                          |
| <a href="#">GET_ERROR_MESSAGE Function</a>         | Returns the message payload from the error queue for the specified message number and transaction identifier                                                                                        |
| <a href="#">HANDLE_COLLISIONS</a>                  | Enables or disables basic conflict resolution for an apply process and a table                                                                                                                      |
| <a href="#">SET_DML_CONFLICT_HANDLER Procedure</a> | Adds, modifies, or removes a prebuilt DML conflict handler for <code>INSERT</code> , <code>UPDATE</code> , or <code>DELETE</code> conflicts on the specified object                                 |
| <a href="#">SET_DML_HANDLER Procedure</a>          | Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database                  |
| <a href="#">SET_ENQUEUE_DESTINATION Procedure</a>  | Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule                                                                                         |
| <a href="#">SET_EXECUTE Procedure</a>              | Specifies whether a message that satisfies the specified rule is executed by an apply component                                                                                                     |

**Table 22-1 (Cont.) DBMS\_APPLY\_ADM Package Subprograms**

| Subprogram                                             | Description                                                                                                                                                                             |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_GLOBAL_INSTANTIATION_SCN Procedure</a> | Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas                 |
| <a href="#">SET_KEY_COLUMNS Procedures</a>             | Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist |
| <a href="#">SET_PARAMETER Procedure</a>                | Sets an apply parameter to the specified value                                                                                                                                          |
| <a href="#">SET_REPERROR_HANDLER Procedure</a>         | Specifies how a particular error is handled based on its error number                                                                                                                   |
| <a href="#">SET_SCHEMA_INSTANTIATION_SCN Procedure</a> | Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database            |
| <a href="#">SET_TABLE_INSTANTIATION_SCN Procedure</a>  | Records the specified instantiation SCN for the specified table in the specified source database                                                                                        |
| <a href="#">SET_UPDATE_CONFLICT_HANDLER Procedure</a>  | Adds, updates, or drops an update conflict handler for the specified object                                                                                                             |
| <a href="#">SET_VALUE_DEPENDENCY Procedure</a>         | Sets or removes a value dependency                                                                                                                                                      |
| <a href="#">START_APPLY Procedure</a>                  | Directs the apply component to start applying messages                                                                                                                                  |
| <a href="#">STOP_APPLY Procedure</a>                   | Stops the apply component from applying any messages and rolls back any unfinished transactions being applied                                                                           |

**Note:**

All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

## 22.4.1 ALTER\_APPLY Procedure

This procedure alters an apply component.

### Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name          IN  VARCHAR2,
    rule_set_name       IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set     IN  BOOLEAN   DEFAULT FALSE,
    message_handler     IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler IN  BOOLEAN  DEFAULT FALSE,
    ddl_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler  IN  BOOLEAN   DEFAULT FALSE,
    apply_user          IN  VARCHAR2  DEFAULT NULL,
    apply_tag           IN  RAW        DEFAULT NULL,
    remove_apply_tag    IN  BOOLEAN   DEFAULT FALSE,
```

```
precommit_handler      IN  VARCHAR2  DEFAULT NULL,
remove_precommit_handler IN  BOOLEAN  DEFAULT FALSE,
negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 22-2 ALTER\_APPLY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name             | The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| rule_set_name          | <p>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</p> <p>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then this procedure retains any existing positive rule set for the specified apply component. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then this procedure removes any existing positive rule set from the specified apply component.</p> |
| remove_rule_set        | <p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue.</p> <p>If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified apply component.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                          |
| message_handler        | <p>A user-defined procedure that processes non-LCR messages in the queue for the apply component.</p> <p>See "Usage Notes" in the <a href="#">CREATE_APPLY Procedure</a> for more information about a message handler procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| ddl_handler        | <p>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the <code>EXECUTE</code> member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" in the <a href="#">CREATE_APPLY Procedure</a> for more information about a DDL handler procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| remove_ddl_handler | <p>If <code>TRUE</code>, then the procedure removes the DDL handler for the specified apply component.</p> <p>If <code>FALSE</code>, then the procedure retains any DDL handler for the specified apply component.</p> <p>If the <code>ddl_handler</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| apply_user         | <p>The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If <code>NULL</code>, then the apply user is not changed.</p> <p>If a non-<code>NULL</code> value is specified to change the apply user, then the user who invokes the <code>ALTER_APPLY</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>apply_user</code> to <code>SYS</code>.</p> <p>If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>• The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>• <code>EXECUTE</code> privilege on the rule sets used by the apply component</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> <li>• <code>EXECUTE</code> privilege on all apply handler procedures</li> </ul> <p>These privileges can be granted directly to the apply user, or they can be granted through roles.</p> <p>In addition, the apply user must be granted the <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>By default, this parameter is set to the user who created the apply component by running either the <code>CREATE_APPLY</code> procedure in this package.</p> <p><b>Note:</b> If the apply user for an apply component is dropped using <code>DROP USER . . . CASCADE</code>, then the apply component is also dropped automatically.</p> |

**Table 22-2 (Cont.) ALTER\_APPLY Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_tag</code>                | <p>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.</p> <p>If <code>NULL</code>, the default, then the apply tag for the apply component is not changed.</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW('17')</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>remove_apply_tag</code>         | <p>If <code>TRUE</code>, then the procedure sets the apply tag for the specified apply component to <code>NULL</code>, and the apply component generates redo entries with <code>NULL</code> tags.</p> <p>If <code>FALSE</code>, then the procedure retains any apply tag for the specified apply component.</p> <p>If the <code>apply_tag</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>precommit_handler</code>        | <p>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> <li>When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</li> <li>When a user or application enqueues messages and then issues a <code>COMMIT</code> statement, the commit directive is enqueued automatically.</li> </ul> <p>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> <li>Any work that commits must be an autonomous transaction.</li> <li>Any rollback must be to a named savepoint created in the procedure.</li> </ul> <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" in the <a href="#">CREATE_APPLY Procedure</a> for more information about a precommit handler procedure.</p> |
| <code>remove_precommit_handler</code> | <p>If <code>TRUE</code>, then the procedure removes the precommit handler for the specified apply component.</p> <p>If <code>FALSE</code>, then the procedure retains any precommit handler for the specified apply component.</p> <p>If the <code>precommit_handler</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 22-2 (Cont.) ALTER\_APPLY Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>negative_rule_set_name</code>   | <p>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.</p> <p>If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</p> |
| <code>remove_negative_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue.</p> <p>If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified apply component.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                                                    |

### Usage Notes

The following usage notes apply to this procedure:

- [Automatic Restart of Apply Components](#)
- [The ALTER\\_APPLY Procedure and XStream Outbound Servers](#)
- [The ALTER\\_APPLY Procedure and XStream Inbound Servers](#)

#### Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`

### The ALTER\_APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The `apply_user` parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: `message_handler`, `ddl_handler`, and `precommit_handler`.

The client application can perform custom processing of the LCRs instead if necessary.

- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the `apply_tag` parameter.

### The ALTER\_APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

## 22.4.2 CLEAR\_KEY\_COLUMNS Procedure

This procedure removes the key columns that were used as the substitute primary key by the `SET_KEY_COLUMNS` procedure.

### Syntax

```
DBMS_APPLY_ADM.CLEAR_KEY_COLUMNS(  
    apply_name IN VARCHAR2 DEFAULT NULL);
```

### Parameter

**Table 22-3** CLEAR\_KEY\_COLUMNS Procedure Parameter

| Parameter               | Description               |
|-------------------------|---------------------------|
| <code>apply_name</code> | The apply component name. |

### Usage Notes

The following usage notes apply to this procedure:

#### The CLEAR\_KEY\_COLUMNS Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

#### The CLEAR\_KEY\_COLUMNS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

#### The CLEAR\_KEY\_COLUMNS Procedure and CDBs

This procedure removes the columns that are used as a substitute primary key. You must perform the `CLEAR_KEY_COLUMNS` procedure in the appropriate PDB.

## 22.4.3 COMPARE\_OLD\_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply.

This procedure is relevant only for `UPDATE` and `DELETE` operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

### Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
  object_name      IN VARCHAR2,
  column_list      IN VARCHAR2,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
  object_name      IN VARCHAR2,
  column_table     IN DBMS_UTILITY.LNAME_ARRAY,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 22-4 COMPARE\_OLD\_VALUES Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_name</code>  | The name of the source table specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.                                                                                                                      |
| <code>column_list</code>  | A comma-delimited list of column names in the table. There must be no spaces between entries.<br>Specify <code>*</code> to include all nonkey columns.                                                                                                                                                                 |
| <code>column_table</code> | A PL/SQL associative array of type <code>DBMS_UTILITY.LNAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.                                                  |
| <code>operation</code>    | The name of the operation, which can be specified as: <ul style="list-style-type: none"> <li><code>UPDATE</code> for <code>UPDATE</code> operations</li> <li><code>DELETE</code> for <code>DELETE</code> operations</li> <li><code>*</code> for both <code>UPDATE</code> and <code>DELETE</code> operations</li> </ul> |
| <code>compare</code>      | If <code>compare</code> is <code>TRUE</code> , the old values of the specified columns are compared during apply.<br>If <code>compare</code> is <code>FALSE</code> , the old values of the specified columns are not compared during apply.                                                                            |

**Table 22-4 (Cont.) COMPARE\_OLD\_VALUES Procedure Parameters**

| Parameter                        | Description                                                                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_database_link</code> | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. |

### Usage Notes

The following usage notes apply to this procedure:

- [Conflict Detection](#)
- [The COMPARE\\_OLD\\_VALUES Procedure and XStream Outbound Servers](#)
- [The COMPARE\\_OLD\\_VALUES Procedure and XStream Inbound Servers](#)

#### Conflict Detection

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the `COMPARE_OLD_VALUES` procedure, specify the set of columns in the `column_list` or `column_table` parameter, and set the `compare` parameter to `FALSE`.

In addition, when the `compare_key_only` apply component parameter is set to `Y`, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the `compare_key_only` apply component parameter is set to `N`, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.

#### Note:

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
- This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

#### See Also:

[SET\\_PARAMETER Procedure](#) for more information about the `compare_key_only` apply component parameter

The `COMPARE_OLD_VALUES` Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The `COMPARE_OLD_VALUES` Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.4 CREATE\_APPLY Procedure

This procedure creates an apply component.

### Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY (
    queue_name          IN  VARCHAR2,
    apply_name          IN  VARCHAR2,
    rule_set_name       IN  VARCHAR2  DEFAULT NULL,
    message_handler     IN  VARCHAR2  DEFAULT NULL,
    ddl_handler         IN  VARCHAR2  DEFAULT NULL,
    apply_user          IN  VARCHAR2  DEFAULT NULL,
    apply_database_link IN  VARCHAR2  DEFAULT NULL,
    apply_tag           IN  RAW        DEFAULT '00',
    apply_captured      IN  BOOLEAN    DEFAULT FALSE,
    precommit_handler   IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
    source_database     IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 22-5 CREATE\_APPLY Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name    | <p>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form <code>[schema_name.]queue_name</code>. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> The <code>queue_name</code> setting cannot be altered after the apply component is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                        |
| apply_name    | <p>The name of the apply component being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p>The specified name must not match the name of an existing apply component or messaging client.</p> <p><b>Note:</b> The <code>apply_name</code> setting cannot be altered after the apply component is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| rule_set_name | <p>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages.</p> <p>If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_apply_rules</code>, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist.</p> |

**Table 22-5 (Cont.) CREATE\_APPLY Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message_handler | <p>A user-defined procedure that processes non-LCR messages in the queue for the apply component.</p> <p>See "<a href="#">Usage Notes</a>" for more information about a message handler procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ddl_handler     | <p>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the <code>EXECUTE</code> member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "<a href="#">Usage Notes</a>" for more information about a DDL handler procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| apply_user      | <p>The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If <code>NULL</code>, then the user who runs the <code>CREATE_APPLY</code> procedure is used.</p> <p>The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> <li>• The necessary privileges to perform DML and DDL changes on the apply objects</li> <li>• <code>EXECUTE</code> privilege on the rule sets used by the apply component</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> <li>• <code>EXECUTE</code> privilege on all apply handler procedures</li> </ul> <p>These privileges can be granted directly to the apply user, or they can be granted through roles.</p> <p>In addition, the apply user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>You can use the <code>DBMS_XSTREAM_AUTH</code> package to grant and revoke administrative privileges in XStream configuration. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects.</p> <p><b>Note:</b> If the apply user for an apply component is dropped using <code>DROP USER . . . CASCADE</code>, then the apply component is also dropped automatically.</p> <p>See "<a href="#">Usage Notes</a>" for more information about this parameter.</p> |

**Table 22-5 (Cont.) CREATE\_APPLY Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_database_link</code> | <p>The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to <code>NULL</code> to specify that the apply component applies messages at the local database.</p> <p><b>Note:</b> The <code>apply_database_link</code> setting cannot be altered after the apply component is created.</p>                                                                                                                                                                                                                                                                                         |
| <code>apply_tag</code>           | <p>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.</p> <p>By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero).</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW('17')</pre> <p>If <code>NULL</code>, then the apply component generates redo entries with <code>NULL</code> tags.</p>          |
| <code>apply_captured</code>      | <p>Either <code>TRUE</code> or <code>FALSE</code>.</p> <p>If <code>TRUE</code>, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Replication capture process.</p> <p>If <code>FALSE</code>, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Replication capture process, such as persistent LCRs or user messages.</p> <p>To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components.</p> <p><b>Note:</b> The <code>apply_captured</code> setting cannot be altered after the apply component is created.</p> |

**Table 22-5 (Cont.) CREATE\_APPLY Procedure Parameters**

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>precommit_handler</code>      | <p>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> <li>• When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</li> <li>• When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.</li> <li>• When a user or application enqueues messages and then issues a <code>COMMIT</code> statement, the commit directive is enqueued automatically.</li> </ul> <p>For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> <li>• Any work that commits must be an autonomous transaction.</li> <li>• Any rollback must be to a named savepoint created in the procedure.</li> </ul> <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "<a href="#">Usage Notes</a>" for more information about a precommit handler procedure.</p> |
| <code>negative_rule_set_name</code> | <p>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.</p> <p>If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist.</p> <p>If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 22-5 (Cont.) CREATE\_APPLY Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>source_database</code> | <p>The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database.</p> <p>If <code>NULL</code>, then the source database name of the first LCR received by the apply component is used for the source database.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the <code>DBA_APPLY_PROGRESS</code> data dictionary view.</p> |

### Usage Notes

The following sections describe usage notes for this procedure:

- [DBA Role Requirement](#)
- [Handler Procedure Names](#)
- [Message Handler and DDL Handler Procedure](#)
- [Precommit Handler Procedure](#)
- [The CREATE\\_APPLY Procedure and XStream Outbound Servers](#)
- [The CREATE\\_APPLY Procedure and XStream Inbound Servers](#)

#### DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `apply_user` to `SYS`.

#### Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

#### Message Handler and DDL Handler Procedure

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (  
    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

#### See Also:

[Logical Change Record TYPES](#) for information about DDL LCRs

#### Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (  
    parameter_name IN NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

#### The CREATE\_APPLY Procedure and XStream Outbound Servers

This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the `DBMS_XSTREAM_ADM` package.

#### The CREATE\_APPLY Procedure and XStream Inbound Servers

The following usage notes apply to this procedure and XStream inbound servers:

- The `CREATE_APPLY` procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.
- When creating an inbound server using the `CREATE_APPLY` procedure, set the `apply_captured` parameter to `TRUE`. Inbound servers only process LCRs captured by a capture process.
- Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the `message_handler` parameter.

## 22.4.5 CREATE\_OBJECT\_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

### Note:

An error is raised if `NULL` is specified for either of the procedure parameters.

### See Also:

[DROP\\_OBJECT\\_DEPENDENCY Procedure](#)

### Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(  
    object_name          IN  VARCHAR2,  
    parent_object_name  IN  VARCHAR2);
```

### Parameters

**Table 22-6 CREATE\_OBJECT\_DEPENDENCY Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                    |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_name</code>        | The name of the child database object, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.    |
| <code>parent_object_name</code> | The name of the parent database object, specified as <code>[schema_name.]object_name</code> . For example, <code>hr.departments</code> . If the schema is not specified, then the current user is the default. |

### Usage Notes

The following usage notes apply to this procedure:

- [The CREATE\\_OBJECT\\_DEPENDENCY Procedure and XStream Outbound Servers](#)
- [The CREATE\\_OBJECT\\_DEPENDENCY Procedure and XStream Inbound Servers](#)

The `CREATE_OBJECT_DEPENDENCY` Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The `CREATE_OBJECT_DEPENDENCY` Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.6 DELETE\_ALL\_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

### Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS (  
    apply_name IN VARCHAR2 DEFAULT NULL);
```

### Parameter

**Table 22-7 DELETE\_ALL\_ERRORS Procedure Parameter**

| Parameter  | Description                                                                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name | The name of the apply component that raised the errors while processing the transactions. Do not specify an owner.<br>If NULL, then all error transactions for all apply components are deleted. |

### Usage Notes

The following usage notes apply to this procedure:

- [The DELETE\\_ALL\\_ERRORS Procedure and XStream Outbound Servers](#)
- [The DELETE\\_ALL\\_ERRORS Procedure and XStream Inbound Servers](#)

#### The DELETE\_ALL\_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

#### The DELETE\_ALL\_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.7 DELETE\_ERROR Procedure

This procedure deletes the specified error transaction.

### Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR (  
    local_transaction_id IN VARCHAR2);
```

### Parameter

**Table 22-8 DELETE\_ERROR Procedure Parameter**

| Parameter            | Description                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| local_transaction_id | The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised. |

## Usage Notes

The following usage notes apply to this procedure:

### The DELETE\_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

### The DELETE\_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.8 DROP\_APPLY Procedure

This procedure drops an apply component.

## Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

## Parameters

**Table 22-9 DROP\_APPLY Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name            | The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| drop_unused_rule_sets | <p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Replication or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</p> |

## Usage Notes

The following usage notes apply to this procedure:

- [The DROP\\_APPLY Procedure and Rules](#)
- [The DROP\\_APPLY Procedure and XStream Outbound Servers](#)
- [The DROP\\_APPLY Procedure and XStream Inbound Servers](#)

### The DROP\_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- ALL\_STREAMS\_GLOBAL\_RULES

- DBA\_STREAMS\_GLOBAL\_RULES
- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES

#### The DROP\_APPLY Procedure and XStream Outbound Servers

When the `DROP_APPLY` procedure is executed on an outbound server, it runs the `DROP_OUTBOUND` procedure in the `DBMS_XSTREAM_ADM` package. Therefore, it might also drop the outbound server's capture process and queue.

#### The DROP\_APPLY Procedure and XStream Inbound Servers

When the `DROP_APPLY` procedure is executed on an inbound server, it runs the `DROP_INBOUND` procedure in the `DBMS_XSTREAM_ADM` package. Therefore, it might also drop the inbound server's queue.

## 22.4.9 DROP\_OBJECT\_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

### Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if `NULL` is specified for either of the procedure parameters.

### See Also:

[CREATE\\_OBJECT\\_DEPENDENCY Procedure](#)

### Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
    object_name          IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);
```

### Parameters

**Table 22-10 DROP\_OBJECT\_DEPENDENCY Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_name</code> | The name of the child database object, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |

**Table 22-10 (Cont.) DROP\_OBJECT\_DEPENDENCY Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parent_object_name | The name of the parent database object, specified as <i>[schema_name.] object_name</i> . For example, <i>hr.departments</i> . If the schema is not specified, then the current user is the default. |

### Usage Notes

The following usage notes apply to this procedure:

The DROP\_OBJECT\_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The DROP\_OBJECT\_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.10 EXECUTE\_ALL\_ERRORS Procedure

This procedure re-executes the error transactions in the error queue for the specified apply component.

The transactions are re-executed in commit SCN order. Error re-execution stops if an error is raised.

### Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(  
    apply_name      IN  VARCHAR2  DEFAULT NULL,  
    execute_as_user IN  BOOLEAN    DEFAULT FALSE);
```

### Parameters

**Table 22-11 EXECUTE\_ALL\_ERRORS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name      | The name of the apply component that raised the errors while processing the transactions. Do not specify an owner.<br>If NULL, then all error transactions for all apply components are re-executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| execute_as_user | If TRUE, then the procedure re-executes the transactions in the security context of the current user.<br>If FALSE, then the procedure re-executes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The <i>DBA_APPLY_ERROR</i> data dictionary view lists the original receiver for each error transaction.<br>The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component. |

## Usage Notes

The following usage notes apply to this procedure:

- [The EXECUTE\\_ALL\\_ERRORS Procedure and XStream Outbound Servers](#)
- [The EXECUTE\\_ALL\\_ERRORS Procedure and XStream Inbound Servers](#)

The EXECUTE\_ALL\_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE\_ALL\_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.11 EXECUTE\_ERROR Procedure

This procedure re-executes the specified error transaction in the error queue.

### Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id IN VARCHAR2,
    execute_as_user      IN BOOLEAN  DEFAULT FALSE,
    user_procedure       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 22-12 EXECUTE\_ERROR Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local_transaction_id | The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| execute_as_user      | <p>If TRUE, then the procedure re-executes the transaction in the security context of the current user.</p> <p>If FALSE, then the procedure re-executes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction.</p> <p>The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</p> |
| user_procedure       | <p>A user-defined procedure that modifies the error transaction so that it can be successfully executed.</p> <p>Specify NULL to execute the error transaction without running a user procedure.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information about the user procedure</p>                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

The following usage notes apply to this procedure:

- [The User Procedure](#)
- [The EXECUTE\\_ERROR Procedure and XStream Outbound Servers](#)
- [The EXECUTE\\_ERROR Procedure and XStream Inbound Servers](#)

### The User Procedure

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the `schema_name`.
- `fix_errors` is the `package_name`.
- `fix_hr_errors` is the `procedure_name`.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    in_anydata          IN      ANYDATA,
    error_record         IN      DBA_APPLY_ERROR%ROWTYPE,
    error_message_number IN      NUMBER,
    messaging_default_processing IN OUT BOOLEAN,
    out_anydata          OUT     ANYDATA);
```

The user procedure has the following parameters:

- `in_anydata`: The `ANYDATA` encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- `error_record`: The row in the `DBA_APPLY_ERROR` data dictionary view that identifies the transaction
- `error_message_number`: The message number of the `ANYDATA` object in the `in_anydata` parameter, starting at 1
- `messaging_default_processing`: If `TRUE`, then the apply component continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers.

If `FALSE`, then the apply component skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.

- `out_anydata`: The `ANYDATA` object processed by the user procedure and used by the apply component if `messaging_default_processing` is `TRUE`.

If an LCR is executed using the `EXECUTE` LCR member procedure in the user procedure, then the LCR is executed directly, and the `messaging_default_processing` parameter should be set to `FALSE`. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction.
- Do not modify `LONG`, `LONG RAW` or `LOB` column data in an LCR.
- If the `ANYDATA` object in the `in_anydata` parameter is a row LCR, then the `out_anydata` parameter must be row LCR if the `messaging_default_processing` parameter is set to `TRUE`.
- If the `ANYDATA` object in the `in_anydata` parameter is a DDL LCR, then the `out_anydata` parameter must be DDL LCR if the `messaging_default_processing` parameter is set to `TRUE`.
- The user who runs the user procedure must have the `SELECT` or `READ` privilege on the `DBA_APPLY_ERROR` data dictionary view.

**Note:**

LCRs containing transactional directives, such as `COMMIT` and `ROLLBACK`, are not passed to the user procedure.

**The EXECUTE\_ERROR Procedure and XStream Outbound Servers**

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

**The EXECUTE\_ERROR Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

## 22.4.12 GET\_ERROR\_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

### See Also:

- [SET\\_ENQUEUE\\_DESTINATION Procedure](#)
- [SET\\_EXECUTE Procedure](#)

## Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
    message_number      IN    NUMBER,
    local_transaction_id IN    VARCHAR2,
    destination_queue_name OUT VARCHAR2,
    execute              OUT    BOOLEAN)
RETURN ANYDATA;
```

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
    message_number      IN    NUMBER,
    local_transaction_id IN    VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 22-13 GET\_ERROR\_MESSAGE Function Parameters**

| Parameter              | Description                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message_number         | The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error. |
| local_transaction_id   | Identifier of the error transaction for which to return a message                                                                                                                                               |
| destination_queue_name | Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.                                                |
| execute                | Contains TRUE if the message should be executed<br>Contains FALSE if the message should not be executed                                                                                                         |

## Usage Notes

The following usage notes apply to this procedure:

- [The GET\\_ERROR\\_MESSAGE Procedure and XStream Outbound Servers](#)
- [The GET\\_ERROR\\_MESSAGE Procedure and XStream Inbound Servers](#)

The GET\_ERROR\_MESSAGE Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET\_ERROR\_MESSAGE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.13 HANDLE\_COLLISIONS

This procedure enables or disables basic conflict resolution for an apply process and a table.

### Syntax

```
DBMS_APPLY_ADM.HANDLE_COLLISIONS (
    apply_name      IN  VARCHAR2,
    enable          IN  BOOLEAN,
    object          IN  VARCHAR2,
    source_object   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 22-14** HANDLE\_COLLISIONS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name    | The name of the apply process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| enable        | <p>If TRUE, then the following conflict resolution methods are used:</p> <ul style="list-style-type: none"><li>When a conflict is detected for a row that exists in the table, the data in the row LCR overwrites the data in the table.</li><li>When a conflict is detected for a row that does not exist in the table, the data in the row LCR is ignored.</li></ul> <p>If FALSE then it disables conflict resolution set by this procedure for the specified apply process and object.</p> <p>If NULL, then removes any explicit table-level setting for collision handling for the specified apply process and object.</p> |
| object        | <p>The schema and name of the target table, specified as <i>[schema_name.]table_name</i> for the change of the setting.</p> <p>For example, if you are changing the setting for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                  |
| source_object | <p>The schema and object name of the source table, specified as <i>[schema_name.]table_name</i> for the table where the change originated.</p> <p>For example, if the change originated at the <code>employees</code> table owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                   |

## 22.4.14 SET\_DML\_CONFLICT\_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt DML conflict handler for `INSERT`, `UPDATE`, or `DELETE` conflicts on the specified object.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

### Syntax

```
DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER (
    apply_name          IN  VARCHAR2,
    conflict_handler_name IN  VARCHAR2,
    object              IN  VARCHAR2 DEFAULT NULL,
    operation_name       IN  VARCHAR2 DEFAULT NULL,
```

```

conflict_type      IN  VARCHAR2  DEFAULT NULL,
method_name        IN  VARCHAR2  DEFAULT NULL,
column_list        IN  VARCHAR2  DEFAULT NULL,
resolution_column  IN  VARCHAR2  DEFAULT NULL,
source_object      IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
  apply_name        IN  VARCHAR2,
  conflict_handler_name IN VARCHAR2,
  object            IN  VARCHAR2  DEFAULT NULL,
  operation_name    IN  VARCHAR2  DEFAULT NULL,
  conflict_type     IN  VARCHAR2  DEFAULT NULL,
  method_name       IN  VARCHAR2  DEFAULT NULL,
  column_table      IN  DBMS_UTILITY.LNAME_ARRAY,
  resolution_column IN  VARCHAR2  DEFAULT NULL,
  source_object     IN  VARCHAR2  DEFAULT NULL);

```

## Parameters

**Table 22-15 SET\_DML\_CONFLICT\_HANDLER Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| apply_name            | The name of the apply process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| conflict_handler_name | The name of the conflict handler.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| object                | <p>The schema and name of the target table, specified as <i>[schema name.] table name</i> for which a conflict handler is being added, modified, or removed.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                    |
| operation_name        | <p>The name of the operation, which can be specified as:</p> <ul style="list-style-type: none"> <li>• INSERT</li> <li>• UPDATE</li> <li>• DELETE</li> </ul> <p>In order to set up conflict handlers for different operations on the same table, you must make one call per operation.</p>                                                                                                                                                                                                                                          |
| conflict_type         | <p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> <li>• ROW_EXISTS: A row with the same primary key already exists in the database for an insert or update.</li> <li>• ROW_MISSING: A row with the same primary key cannot be found for an update or delete.</li> </ul> |

**Table 22-15 (Cont.) SET\_DML\_CONFLICT\_HANDLER Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method_name | <p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> <li>• <b>DELTA:</b> If the conflict type is <code>ROW_EXISTS</code> and the LCR is an update, then take the difference between the old and new values of the column in the LCR and add it to the current value of the column in the target database. The columns in the column group must be of type <code>NUMBER</code>.</li> <li>• <b>IGNORE:</b> Silently ignores the LCR and can be used for all conflict types.</li> <li>• <b>MAXIMUM:</b> Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for <code>ROW_EXISTS</code> and only applies to inserts and updates.</li> <li>• <b>MINIMUM:</b> Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. This resolution method is only supported for <code>ROW_EXISTS</code> and only applies to inserts and updates.</li> <li>• <b>OVERWRITE:</b> Applies the column list from the source database, overwriting the column values at the destination database.<br/>An <code>INSERT</code> with <code>ROW_EXISTS</code> is converted to an <code>UPDATE</code>.<br/>An <code>UPDATE</code> with <code>ROW_MISSING</code> is converted to an <code>INSERT</code>.<br/>A <code>DELETE</code> with <code>ROW_MISSING</code> is ignored.</li> <li>• <b>RECORD:</b> Enqueue the LCR into the error queue. Can be used for all conflict types and can only be specified for a column group that contains all the columns in the table.</li> <li>• <b>MAX_AND_EQUALS:</b> Applies the column list from the source database if the value of resolution column is greater than or equal to the value of the column in the database.</li> <li>• <b>MIN_AND_EQUALS:</b> Applies the column list from the source database if the value of resolution column is less than or equal to the value of the column in the database.</li> </ul> <p>If <code>NULL</code>, then the procedure removes any existing conflict handler with the same <code>object_name</code>, <code>resolution_group</code>, and <code>conflict_type</code>.</p> <p>If a conflict handler already exists with the same <code>object_name</code> and <code>resolution_column</code> and <code>conflict_type</code>, then the existing handler is replaced.</p> |

**Table 22-15 (Cont.) SET\_DML\_CONFLICT\_HANDLER Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>column_list</code>       | <p>A comma-separated list of the column names for which the conflict handler is called.</p> <p>The same column cannot be in more than one column list (for a given <code>apply_name</code>, <code>object_name</code>, <code>operation_name</code> and <code>conflict_type</code>).</p> <p>Specify <code>*</code> for the default column group, which includes all the columns in the table that are not already specified in another column list (for a given <code>apply_name</code>, <code>object_name</code>, <code>operation_name</code> and <code>conflict_type</code>).</p> <p>If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.</p> <p>You cannot use a <code>column_list</code> if you use a <code>*</code> in the <code>object_name</code>.</p> <p>The only time you can use multiple column groups is when you are specifying a conflict handler for insert or update for <code>ROW_EXISTS</code>.</p> <p><b>Note:</b> Prebuilt conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the <code>column_list</code> parameter.</p> <p>This parameter must be set to <code>'*'</code> in the following cases:</p> <ul style="list-style-type: none"> <li>• The <code>operation_name</code> is DELETE.</li> <li>• The <code>method_name</code> is RECORD.</li> <li>• The <code>operation_name</code> is UPDATE and the <code>conflict_type</code> is ROW_MISSING.</li> </ul> |
| <code>column_table</code>      | <p>An array of column names for which the conflict handler is called.</p> <p>This parameter is the same as the <code>column_list</code> parameter, but it uses an array instead of a list for the column names.</p> <p><b>Note:</b> The <code>column_list</code> and <code>column_table</code> parameters are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>resolution_column</code> | <p>For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is the one tested to determine whether the current row or the LCR has the smaller value. The resolution column must be one of the columns listed in the <code>column_list</code> or <code>column_table</code> parameter.</p> <p>You can specify NULL for other resolution methods.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>source_object</code>     | <p>The schema and object name of the source table, specified as <code>[schema_name.]table_name</code> for the table where the change originated.</p> <p>For example, if the change originated at the <code>employees</code> table owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Usage Notes

The following usage notes apply to this procedure:

- [Modifying an Existing Conflict Handler](#)
- [Removing an Existing Conflict Handler](#)
- [Series of Actions for Conflicts](#)

- [Procedure DML Handlers for Conflicts](#)
- [A Column Can Be in Only One Column List](#)
- [The SET\\_DML\\_CONFLICT\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_DML\\_CONFLICT\\_HANDLER Procedure and XStream Inbound Servers](#)
- [Table 22-16](#)
- [Example](#)

### Modifying an Existing Conflict Handler

If you want to modify an existing conflict handler, then you specify the `object`, `conflict_type`, and `resolution_column` of an the existing conflict handler. You can modify the `method_name` or the `column_list`.

### Removing an Existing Conflict Handler

If you want to remove an existing conflict handler, then specify `NULL` for the `method_name` and specify the `object`, `conflict_type`, and `resolution_column` of the existing conflict handler.

### Series of Actions for Conflicts

If an conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate conflict handler to resolve the conflict
2. If no conflict handler is specified or if the conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, object name, and operation name to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

#### See Also:

"[Signature of a DML Handler Procedure or Error Handler Procedure](#)" for information about setting an error handler

### Procedure DML Handlers for Conflicts

If you cannot use a prebuilt conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

#### See Also:

[SET\\_DML\\_HANDLER Procedure](#)

### A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY\$\_CONF\_HDLR\_COLUMNS\_UNQ1) VIOLATED

### The SET\_DML\_CONFLICT\_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

### The SET\_DML\_CONFLICT\_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

**Table 22-16 Valid Combinations of Parameters**

| Operation | Conflict Type | Method    |
|-----------|---------------|-----------|
| INSERT    | ROW_EXISTS    | OVERWRITE |
|           |               | RECORD    |
|           |               | IGNORE    |
|           |               | MAXIMUM   |
|           |               | MINIMUM   |
| UPDATE    | ROW_EXISTS    | OVERWRITE |
|           |               | RECORD    |
|           |               | IGNORE    |
|           |               | MAXIMUM   |
|           |               | MINIMUM   |
| UPDATE    | ROW_MISSING   | DELTA     |
|           |               | OVERWRITE |
|           |               | RECORD    |
| DELETE    | ROW_EXISTS    | IGNORE    |
|           |               | OVERWRITE |
|           |               | RECORD    |
| DELETE    | ROW_MISSING   | IGNORE    |
|           |               | RECORD    |

### Example

The following is an example for setting a conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name          => 'appl1',
    conflict_handler_name => 'emp_handler_update',
    object              => 'hr.employees',
    operation_name       => 'UPDATE',
    conflict_type        => 'ROW_EXISTS',
    method_name          => 'MAXIMUM',
    resolution_column    => 'salary',
    column_table         => cols);
```

```
END;
/
```

This example sets a conflict handler named `emp_handler_update` that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

## 22.4.15 SET\_DML\_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

### Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
  object_name      IN  VARCHAR2,
  object_type      IN  VARCHAR2,
  operation_name    IN  VARCHAR2,
  error_handler     IN  BOOLEAN   DEFAULT FALSE,
  user_procedure    IN  VARCHAR2,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  apply_name        IN  VARCHAR2 DEFAULT NULL,
  assemble_lob      IN  BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 22-17 SET\_DML\_HANDLER Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_name</code>    | The name of the source object specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>object_type</code>    | The type of the source object. Currently, <code>TABLE</code> is the only possible source object type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>operation_name</code> | <p>The name of the operation, which can be specified as:</p> <ul style="list-style-type: none"> <li>• <code>INSERT</code></li> <li>• <code>UPDATE</code></li> <li>• <code>DELETE</code></li> <li>• <code>LOB_UPDATE</code></li> <li>• <code>DEFAULT</code></li> </ul> <p>The procedure must be run for each operation individually.</p> <p>Specify <code>DEFAULT</code> to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any <code>INSERT</code>, <code>UPDATE</code>, <code>DELETE</code>, and <code>LOB_WRITE</code> on the database object, if another procedure DML handler is not specifically set for the operation on the database object.</p> |

**Table 22-17 (Cont.) SET\_DML\_HANDLER Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>error_handler</code>       | <p>If <code>TRUE</code>, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions.</p> <p>If <code>FALSE</code>, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</p>                            |
| <code>user_procedure</code>      | <p>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered.</p> <p>Specify <code>NULL</code> to unset a procedure DML handler that is set for the specified operation on the specified object.</p>                                                                    |
| <code>apply_database_link</code> | <p>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| <code>apply_name</code>          | <p>The name of the apply component that uses the procedure DML handler or error handler.</p> <p>If <code>NULL</code>, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database.</p> <p>If the <code>user_procedure</code> parameter is set to <code>NULL</code> to unset a handler, and the handler being unset is set for a specific apply component, then use the <code>apply_name</code> parameter to specify the apply component to unset the handler.</p> |
| <code>assemble_lob</code>        | <p>If <code>TRUE</code>, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly.</p> <p>If <code>FALSE</code>, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</p>                                                                                            |

### Usage Notes

The following usage notes apply to this procedure:

- [Run the SET\\_DML\\_HANDLER Procedure at the Destination Database](#)
- [Procedure DML Handlers and Error Handlers](#)
- [The apply\\_name Parameter](#)
- [Signature of a DML Handler Procedure or Error Handler Procedure](#)
- [LOB Assembly](#)
- [The SET\\_DML\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_DML\\_HANDLER Procedure and XStream Inbound Servers](#)

Run the SET\_DML\_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The `SET_DML_HANDLER` procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

#### Procedure DML Handlers and Error Handlers

If the `error_handler` parameter is set to `TRUE`, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the `error_handler` parameter is set to `FALSE`, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

#### Note:

Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

#### The `apply_name` Parameter

If the `apply_name` parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the `apply_name` parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named `handler_hr` is specified for an apply component named `apply_hr` for UPDATE operations on the `hr.employees` table.
- A general procedure DML handler named `handler_gen` also exists for UPDATE operations on the `hr.employees` table.

In this case, the `apply_hr` apply component uses the `handler_hr` procedure DML handler for UPDATE operations on the `hr.employees` table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

#### Signature of a DML Handler Procedure or Error Handler Procedure

You can use the `SET_DML_HANDLER` procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the *package\_name* must be specified. The user who invokes the `SET_DML_HANDLER` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the *schema\_name* is not specified, then the user who invokes the `SET_DML_HANDLER` procedure is the default.

For example, suppose the *procedure\_name* has the following properties:

- *hr* is the *schema\_name*.
- *apply\_pkg* is the *package\_name*.
- *employees\_default* is the *procedure\_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the `EXECUTE` member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is `UPDATE` or `DELETE`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all non `LOB`, non `LONG`, and non `LONG RAW` columns.
- If the command type is `INSERT`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: `LOB`, `LONG`, `LONG RAW`, user-defined types (including object types, `REFS`, `varrays`, nested tables), and Oracle-supplied types (including `Any` types, `XML` types, spatial types, and media types).

The procedure specified in the *user\_procedure* parameter must have the following signature:

```
PROCEDURE user_procedure (  
    parameter_name IN ANYDATA);
```

Here, *user\_procedure* stands for the name of the procedure and *parameter\_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a `ANYDATA` encapsulation of a row LCR.

#### See Also:

[Logical Change Record TYPES](#) for more information about LCRs

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    message          IN  ANYDATA,
    error_stack_depth IN  NUMBER,
    error_numbers    IN  DBMS_UTILITY.NUMBER_ARRAY,
    error_messages   IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the `EXECUTE` member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

#### Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

### LOB Assembly

Do not modify `LONG`, `LONG RAW`, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

### The SET\_DML\_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

### The SET\_DML\_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.16 SET\_ENQUEUE\_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is an `ANYDATA` instance containing the queue name specified as a `VARCHAR2`.

### Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name          IN  VARCHAR2,
    destination_queue_name IN  VARCHAR2);
```

### Parameters

**Table 22-18 SET\_ENQUEUE\_DESTINATION Procedure Parameters**

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code>              | The name of the rule, specified as <code>[schema_name.]rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>destination_queue_name</code> | The name of the queue into which the apply component enqueues the message. Specify the queue in the form <code>[schema_name.]queue_name</code> . Only local queues can be specified. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code> , enter <code>hr.streams_queue</code> . If the schema is not specified, then the current user is the default.<br>If <code>NULL</code> , then an existing name-value pair with the name <code>APPLY\$_ENQUEUE</code> is removed. If no name-value pair exists with the name <code>APPLY\$_ENQUEUE</code> for the rule, then no action is taken.<br>If non- <code>NULL</code> and a name-value pair exists for the rule with the name <code>APPLY\$_ENQUEUE</code> , then it is removed, and a new name-value pair with the value specified by this parameter is added. |

### Usage Notes

The following usage notes apply to this procedure:

- [The SET\\_ENQUEUE\\_DESTINATION Procedure and Apply Handlers](#)
- [Considerations for the SET\\_ENQUEUE\\_DESTINATION Procedure](#)
- [The SET\\_ENQUEUE\\_DESTINATION Procedure and XStream Outbound Servers](#)
- [The SET\\_ENQUEUE\\_DESTINATION Procedure and XStream Inbound Servers](#)

#### The SET\_ENQUEUE\_DESTINATION Procedure and Apply Handlers

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

#### Considerations for the SET\_ENQUEUE\_DESTINATION Procedure

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.

- The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET\_ENQUEUE\_DESTINATION Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET\_ENQUEUE\_DESTINATION Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.17 SET\_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is an `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, an apply component does not execute the message and does not send the message to any apply handler.

### Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE (
    rule_name  IN  VARCHAR2,
    execute    IN  BOOLEAN);
```

### Parameters

**Table 22-19 SET\_EXECUTE Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_name</code> | The name of the rule, specified as <code>[schema_name.]rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default. |

**Table 22-19 (Cont.) SET\_EXECUTE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| execute   | <p>If TRUE, then the procedure removes the name-value pair with the name <code>APPLY\$_EXECUTE</code> for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name <code>APPLY\$_EXECUTE</code> exists for the rule, then no action is taken.</p> <p>If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is <code>APPLY\$_EXECUTE</code> and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name <code>APPLY\$_EXECUTE</code>, then it is removed, and a new one with the value NO is added.</p> <p>If NULL, then the procedure raises an error.</p> |

### Usage Notes

The following usage notes apply to this procedure:

- [Considerations for the SET\\_EXECUTE Procedure](#)
- [The SET\\_EXECUTE Procedure and XStream Outbound Servers](#)
- [The SET\\_EXECUTE Procedure and XStream Inbound Servers](#)

#### Considerations for the SET\_EXECUTE Procedure

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Replication capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

#### The SET\_EXECUTE Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

#### The SET\_EXECUTE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.18 SET\_GLOBAL\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

## Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
    source_database_name IN VARCHAR2,
    instantiation_scn    IN NUMBER,
    apply_database_link  IN VARCHAR2 DEFAULT NULL,
    recursive            IN BOOLEAN  DEFAULT FALSE,
    source_root_name     IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 22-20 SET\_GLOBAL\_INSTANTIATION\_SCN Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_database_name | The global name of the source database. For example, DBS1.NET.<br><br>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| instantiation_scn    | The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| apply_database_link  | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| recursive            | If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user.<br><br>If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables.<br><br><b>Note:</b> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database. |
| source_root_name     | The global name of the source root database.<br><br>In a non-CDB, this parameter must be NULL.<br><br>In a CDB, if you want to do the instantiation for a specific container than you must specify both source_database and source_root_name. If you want to do the instantiation for all the containers in the CDB, specify the source_root_name for the database and leave the source_database name as NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage Notes

The following usage notes apply to this procedure:

- [Instantiation SCNs and DDL LCRs](#)

- [The recursive Parameter](#)
- [Considerations for the SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure](#)
- [The SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure and XStream Outbound Servers](#)
- [The SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure and XStream Inbound Servers](#)
- [The SET\\_GLOBAL\\_INSTANTIATION\\_SCN Procedure and CDBs](#)

#### See Also:

- [SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure](#)
- [SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure](#)
- [LCR\\$\\_DDL\\_RECORD Type](#) for more information about DDL LCRs

### Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

### The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

### Considerations for the SET\_GLOBAL\_INSTANTIATION\_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

### The SET\_GLOBAL\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

#### See Also:

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The `SET_GLOBAL_INSTANTIATION_SCN` Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The `SET_GLOBAL_INSTANTIATION_SCN` Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

## 22.4.19 SET\_KEY\_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

### Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS (
    object_name          IN  VARCHAR2,
    column_list          IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name           IN  VARCHAR2  DEFAULT NULL);
```

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS (
    object_name          IN  VARCHAR2,
    column_table         IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name           IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 22-21 SET\_KEY\_COLUMNS Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_name</code> | The name of the table specified as <code>[schema_name.]object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified. |

**Table 22-21 (Cont.) SET\_KEY\_COLUMNS Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>column_list</code>         | A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names.<br>If the <code>column_list</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed.                                                                                                                              |
| <code>column_table</code>        | A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a <code>NULL</code> .<br>If the <code>column_table</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed. |
| <code>apply_database_link</code> | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.                                                                                                                                                                                                                                           |
| <code>apply_name</code>          | The name of the apply component.                                                                                                                                                                                                                                                                                                                                                            |

### Usage Notes

The following usage notes apply to this procedure:

- [Considerations for the SET\\_KEY\\_COLUMNS Procedure](#)
- [Duplicate Rows and Substitute Primary Key Columns](#)
- [The SET\\_KEY\\_COLUMNS Procedure and XStream Outbound Servers](#)
- [The SET\\_KEY\\_COLUMNS Procedure and XStream Inbound Servers](#)
- [The SET\\_KEY\\_COLUMNS Procedure and CDBs](#)

#### Considerations for the SET\_KEY\_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain `NULLS`. However, Oracle recommends that each column you specify as a substitute key column be a `NOT NULL` column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one `NOT NULL` column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: `LOB`, `LONG`, `LONG RAW`, user-defined types (including object types, `REFS`, `varrays`, nested tables), and Oracle-supplied types (including `Any` types, XML types, spatial types, and media types).

## Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to Y, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the `allow_duplicate_rows` apply component parameter is set to Y, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply component parameter is set to Y, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than

one row because the `c1` values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

The `SET_KEY_COLUMNS` Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The `SET_KEY_COLUMNS` Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The `SET_KEY_COLUMNS` Procedure and CDBs

This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.

## 22.4.20 SET\_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

### Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
    apply_name IN VARCHAR2,
    parameter  IN VARCHAR2,
    value      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 22-22 SET\_PARAMETER Procedure Parameters**

| Parameter               | Description                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>apply_name</code> | The apply component name. Do not specify an owner.                                                                 |
| <code>parameter</code>  | The name of the parameter you are setting.                                                                         |
| <code>value</code>      | The value to which the parameter is set.<br>If <code>NULL</code> , then the parameter is set to its default value. |

### Apply Component Parameters

The following table lists the parameters for an apply component.

#### Note:

`OPTIMIZE_PROGRESS_TABLE` is desupported in the Oracle Database 19c Release and is no longer available.

**Table 22-23 Apply Component Parameters**

| Parameter Name                      | Possible Values | Default                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|-----------------|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>allow_duplicate_rows</code>   | Y or N          | N                                                                                              | <p>If Y and more than one row is changed by a single row logical change record (row LCR) with an <code>UPDATE</code> or <code>DELETE</code> command type, then the apply component only updates or deletes one of the rows.</p> <p>If N, then the apply component raises an error when it encounters a single row LCR with an <code>UPDATE</code> or <code>DELETE</code> command type that changes more than one row in a table.</p> <p><b>Note:</b> Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> and <a href="#">"Duplicate Rows and Substitute Primary Key Columns"</a></p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>apply_sequence_nextval</code> | Y or N          | <p>N for apply processes</p> <p>Y for XStream outbound servers and XStream inbound servers</p> | <p>Controls whether the apply component checks and adjusts sequence values.</p> <p>If Y, then the apply component checks and adjusts sequence values.</p> <p>For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values.</p> <p>For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values.</p> <p>If N, then the apply component does not check or adjust sequence values.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">SET_PARAMETER Procedure</a> for information about the <code>capture_sequence_nextval</code> capture process parameter</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name | Possible Values                                 | Default                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|-------------------------------------------------|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| batchsql_mode  | DEPENDENT,<br>DEPENDENT_EAGER, or<br>SEQUENTIAL | DEPENDENT                                                  | <p>Determines the batching method used to generate batch transactions for reordering. This parameter can be set to one of the following:</p> <ul style="list-style-type: none"> <li>DEPENDENT - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. An executing batch has no unresolved dependencies.</li> <li>DEPENDENT_EAGER - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. A batch can be executed when there are unresolved dependencies. The apply server waits for dependencies to be resolved before executing an LCR.</li> <li>SEQUENTIAL - Batch transactions in a sequential manner.</li> </ul> <p>COMMIT_SERIALIZATION = FULL runs in this mode regardless of the Oracle GoldenGate BATCHSQL mode.</p> <p><b>Note:</b> This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.</p> |
| cdgranularity  | ROW or<br>COLGROUP                              | COLGROUP for<br>XStream In<br>ROW for Oracle<br>GoldenGate | <p>Specifies the conflict detection granularity. This parameter can be set to one of the following:</p> <ul style="list-style-type: none"> <li>ROW - Conflict resolution is applied for all column groups if there is a conflict for any column group.</li> <li>COLGROUP - Conflict resolution is applied for column groups that have a conflict. Conflict resolution is not applied for column groups that do not have a conflict.</li> </ul> <p><b>Note:</b> This parameter is intended for XStream and Oracle GoldenGate. Do not set this parameter for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p>                                                                                                                                                                                                                                                                             |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name       | Possible Values                 | Default                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|---------------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| commit_serialization | DEPENDENT_TRANSACTIONAL or FULL | DEPENDENT_TRANSACTIONAL | <p>The order in which applied transactions are committed.</p> <p>Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database.</p> <p>You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the <code>commit_serialization</code> apply parameter. This parameter has the following settings:</p> <ul style="list-style-type: none"> <li><code>DEPENDENT_TRANSACTIONAL</code> - The apply component can commit nondependent transactions in any order. Performance is best if you specify <code>DEPENDENT_TRANSACTIONAL</code>.</li> <li><code>FULL</code> - The apply component commits applied transactions in the order in which they were committed at the source database.</li> </ul> <p>Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.</p> <p>If you specify <code>DEPENDENT_TRANSACTIONAL</code>, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:</p> <ol style="list-style-type: none"> <li>Transaction A</li> <li>Transaction B</li> </ol> <p>At the destination database, these transactions might be committed in the opposite order:</p> <ol style="list-style-type: none"> <li>Transaction B</li> <li>Transaction A</li> </ol> <p>If you specify <code>DEPENDENT_TRANSACTIONAL</code> and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add <code>RELY</code> constraints to account for the application constraints. See <i>Oracle Database Data Warehousing Guide</i> for information about <code>RELY</code> constraints.</p> <p><b>Note:</b> The <code>NONE</code> value is deprecated for this parameter. It is replaced by the <code>DEPENDENT_TRANSACTIONAL</code> value.</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name             | Possible Values | Default                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|-----------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| compare_key_only           | Y or N          | N for apply processes<br>Y for XStream inbound servers | <p><b>See Also:</b> <a href="#">"Usage Notes"</a></p> <p>If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR.</p> <p>If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR.</p> <p><b>Note:</b> The <code>COMPARE_OLD_VALUES</code> procedure in this package can disable comparison of old values for specified columns during apply. See <a href="#">COMPARE_OLD_VALUES Procedure</a>.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a></p>                                                                                                                                                                                                                                                                                                                                                                                           |
| compute_lcr_dep_on_arrival | Y or N          | N                                                      | <p>If Y, the dependencies are computed as the LCRs for the transaction are received.</p> <p>If N, the dependencies are computed only after all the LCRs for a transaction are received.</p> <p>If the target table has all of the same constraints as the source table, you can improve the performance by setting this parameter to Y.</p> <p>If the number of LCRs in transaction exceeds the value of the number of the <code>eager_size</code> parameter, then the dependencies for that transaction are calculated on arrival regardless of the setting of <code>compute_lcr_dep_on_arrival</code>.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> |
| disable_on_error           | Y or N          | Y                                                      | <p>If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable.</p> <p>If N, then the apply component continues regardless of unresolved errors.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name                | Possible Values    | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|--------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>disable_on_limit</code> | Y or N             | N       | <p>If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the <code>time_limit</code> parameter or <code>transaction_limit</code> parameter.</p> <p>If N, then the apply component is restarted immediately after stopping because it reached a limit.</p> <p>When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (<code>APnn</code>) remains the same.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>eager_size</code>       | A positive integer | 9500    | <p>The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than <code>eager_size</code> LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than <code>eager_size</code> LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes.</p> <p>Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter <code>max_parallelism</code> limits the maximum number of apply servers that can be used for an apply process.</p> <p>This apply parameter is relevant only if its value is less than the value of the <code>txn_lcr_spill_threshold</code> apply parameter. When the value of <code>txn_lcr_spill_threshold</code> is lower than the value of <code>eager_size</code>, transactions spill to disk before eager apply begins.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> |

Table 22-23 (Cont.) Apply Component Parameters

| Parameter Name             | Possible Values                                 | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable_xstream_table_stats | Y or N                                          | Y       | <p>When this parameter is set to Y, statistics about the operations of applied transactions are collected and made available in the <code>V\$XSTREAM_TABLE_STATS</code> view.</p> <p>When this parameter is set to N, no statistics are collected.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment.</p>                                                                                                                                                                                                                                                                                                                                                                                  |
| excludetag                 | Comma-delimited list of Oracle Replication tags | NULL    | <p>Controls whether the capture process for an outbound server captures DML changes that are tagged with one of the specified Oracle Replication tags.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment.</p> <p><b>See Also:</b> "Usage Notes" for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</p> |
| excludetrans               | Comma-delimited list of transaction names       | NULL    | <p>Controls whether the capture process for an outbound server captures DML changes in the specified transaction names.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment.</p> <p><b>See Also:</b> "Usage Notes" for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</p>                                |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name | Possible Values                        | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|----------------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| excludeuser    | Comma-delimited list of user names     | NULL    | <p>Controls whether the capture process for an outbound server captures DML changes made by the specified users.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify <code>HR</code> for the <code>hr</code> user.</p> <p>If <code>NULL</code>, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</p> |
| excludeuserid  | Comma-delimited list of user ID values | NULL    | <p>Controls whether the capture process for an outbound server captures data manipulation language (DML) changes made by the specified users.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>To view the user ID for a user, query the <code>USER_ID</code> column in the <code>ALL_USERS</code> data dictionary view.</p> <p>If <code>NULL</code>, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</p>     |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name | Possible Values                    | Default                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|------------------------------------|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| grouptransops  | A positive integer from 1 to 10000 | 250 for apply processes and XStream inbound servers<br>10000 for XStream outbound servers | <p>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction.</p> <p>This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions.</p> <p>If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions.</p> <p>This parameter only takes effect if the <code>parallelism</code> parameter setting is 1. The <code>grouptransops</code> parameter is ignored if the <code>parallelism</code> parameter setting is greater than 1.</p> <p><b>Note:</b> This parameter is intended for XStream outbound servers and inbound servers. An Oracle Apply process ignores this parameter unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a></p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name   | Possible Values | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|-----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| handlecollisions | Y or N          | N       | <p>This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading.</p> <p>This parameter should be set to <b>N</b> for normal replication activity. It should be set to <b>Y</b> only when data is being loaded (instantiated) and replication is enabled.</p> <p>If <b>Y</b>, then does the equivalent of <b>OVERWRITE</b> for <b>INSERT</b>, <b>UPDATE</b> and <b>DELETE</b> operations that get <b>ROW_EXISTS</b> errors, and ignores <b>UPDATE</b> and <b>DELETE</b> operations that get <b>ROW_MISSING</b> errors.</p> <p>Specifically, the apply component performs the following actions when this parameter is set to <b>Y</b>:</p> <ul style="list-style-type: none"> <li>• If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update.</li> <li>• If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored.</li> <li>• If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored.</li> <li>• If the operation is an update that modifies the primary key or unique key columns, and the a row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values.</li> <li>• If the operation is a delete and the row does not exist, then the change is ignored.</li> </ul> <p>If <b>N</b> then it disables the above settings.</p> <p><b>Note:</b> This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Replication environment.</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name     | Possible Values                       | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ignore_transaction | A valid source transaction ID or NULL | NULL     | <p>Instructs the apply component to ignore the specified transaction from the source database, effective immediately.</p> <p>Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.</p> <p>To ignore multiple transactions, specify each transaction in a separate call to the <code>SET_PARAMETER</code> procedure. The <code>DBA_APPLY_PARAMETERS</code> view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the <code>SET_PARAMETER</code> procedure and specify <code>NULL</code> for the <code>ignore_transaction</code> parameter.</p> <p>If <code>NULL</code>, then the apply component ignores this parameter.</p> <p><b>Note:</b> An apply component ignores this parameter for transactions that were not captured by a capture process.</p> <p><b>See Also:</b> "Usage Notes"</p> |
| maximum_scn        | A valid SCN or INFINITE               | INFINITE | <p>The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified.</p> <p>If <code>INFINITE</code>, then the apply component runs regardless of the SCN value.</p> <p><b>Note:</b> An apply component ignores this parameter for transactions that were not captured by a capture process.</p> <p><b>See Also:</b> "Usage Notes"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name  | Possible Values    | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_parallelism | A positive integer | 50       | <p>Limits the maximum number of apply servers that can be used for an apply component.</p> <p>When the apply parallelism parameter is set greater than one, the apply component adds apply servers when necessary to process transactions until it reaches the limit set by this parameter (<code>max_parallelism</code>). Transactions include both unassigned (eager) and assigned transactions.</p> <p>Apply servers that idle for more than 5 minutes are shut down until the configured <code>parallelism</code> is attained.</p> <p>Runtime statistics for servers that have been shut down are aggregated into apply server 0 so that accurate apply statistics for the entire apply process can be maintained.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> |
| max_sga_size    | A positive integer | INFINITE | <p>Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes.</p> <p>The memory is allocated for the duration of the apply component's session and is released when the apply component becomes disabled.</p> <p><b>Note:</b> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the <code>STREAMS_POOL_SIZE</code> initialization parameter.</p> <p>If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a></p>                                |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name             | Possible Values         | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|-------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message_tracking_frequency | 0 or a positive integer | 2000000 | <p>The frequency at which messages applied by the inbound server are tracked automatically.</p> <p>For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically.</p> <p>The tracking label used for automatic message tracking is <i>inbound_server_name</i>:AUTOTRACK, where <i>inbound_server_name</i> is the name of the inbound server. Only the first 20 bytes of the inbound server name are used; the rest is truncated if it exceeds 20 bytes.</p> <p>If 0 (zero), then no messages are tracked automatically.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| optimize_self_updates      | Y or N                  | Y       | <p>This parameter affects conflict resolution when an update in the source database sets a column to its existing value.</p> <p>When this parameter is set to Y, a conflict between the value in the LCR and the corresponding column in the target database is considered resolved.</p> <p>When this parameter is set to N, the conflict is processed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| parallelism                | A positive integer      | 4       | <p>The number of apply servers that can concurrently apply transactions.</p> <p>The reader server and the apply server process names are <i>ASnn</i>, where <i>nn</i> can include letters and numbers. The total number of <i>ASnn</i> processes is the value of the <i>parallelism</i> parameter plus one.</p> <p>For example, if <i>parallelism</i> is set to 4, then an apply component uses a total of five <i>ASnn</i> processes. In this case, there is one reader server and four apply servers.</p> <p>Setting the <i>parallelism</i> parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the <i>PROCESSES</i> initialization parameter is set appropriately when you set the <i>parallelism</i> parameter.</p> <p><b>Note:</b> When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart.</p> <p><b>See Also:</b> "Usage Notes"</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name                    | Possible Values         | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>parallelism_interval</code> | 0 or a positive integer | 0       | <p>The parallelism interval is the interval in seconds at which the current workload activity is computed.</p> <p>The apply component calculates the mean throughput every 5 X <code>parallelism_interval</code> seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers.</p> <p>The parallelism interval is used only if the <code>parallelism</code> parameter is set to a value greater than one and the <code>max_parallelism</code> parameter value is greater than the <code>parallelism</code> parameter value.</p> <p><b>Note:</b> This parameter is intended for an XStream In environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a></p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name                            | Possible Values                    | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>preserve_encryption</code>          | Y or N                             | Y       | <p>Whether to preserve encryption for columns encrypted using Transparent Data Encryption.</p> <p>If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply component tries to apply the row LCRs.</p> <p>If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply component applies the changes in the row LCRs.</p> <p><b>Note:</b> When the value of this parameter is changed for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p> |
| <code>rtrim_on_implicit_conversion</code> | Y or N                             | Y       | <p>Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply.</p> <p>If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table.</p> <p>If N, then blank padding is preserved in the column.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>startup_seconds</code>              | 0, a positive integer, or INFINITE | 0       | <p>The maximum number of seconds to wait for another instantiation of the same apply component to finish. If the other instantiation of the same apply component does not finish within this time, then the apply component does not start.</p> <p>If INFINITE, then an apply component does not start until another instantiation of the same apply component finishes.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name    | Possible Values                | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| suppresstriggers  | Y or N                         | Y        | <p>This parameter controls whether triggers fire when a change is made by the apply component. If Y, triggers do not fire for changes made by the apply component. If N, triggers fire for changes made by the apply component.</p> <p>If a trigger's firing property is set to always fire, then the trigger always fires for changes made by the apply component, regardless of the value of the suppresstriggers parameter. A trigger's firing property is set to always fire by running the <code>DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY</code> procedure with the <code>fire_once</code> parameter set to FALSE.</p> <p><b>Note:</b> This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Replication environment.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p> |
| time_limit        | A positive integer or INFINITE | INFINITE | <p>The apply component stops as soon as possible after the specified number of seconds since it started.</p> <p>If INFINITE, then the apply component continues to run until it is stopped explicitly.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| trace_level       | 0 or a positive integer        | 0        | <p>Set this parameter only under the guidance of Oracle Support Services.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| transaction_limit | A positive integer or INFINITE | INFINITE | <p>The apply component stops after applying the specified number of transactions.</p> <p>If INFINITE, then the apply component continues to run regardless of the number of transactions applied.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 22-23 (Cont.) Apply Component Parameters

| Parameter Name          | Possible Values                | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|--------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| txn_age_spill_threshold | A positive integer or INFINITE | 900     | <p>The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk.</p> <p>If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages.</p> <p>Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>"</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name          | Possible Values                | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|--------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| txn_lcr_spill_threshold | A positive integer or INFINITE | 10000   | <p>The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less.</p> <p>If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:</p> <ol style="list-style-type: none"> <li>1. Reads the first 10,000 messages in the transaction into memory</li> <li>2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000</li> <li>3. Reads the next 100 messages in the transaction into memory</li> <li>4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100</li> <li>5. Reads the next 100 messages in the transaction into memory</li> </ol> <p>The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.</p> <p>If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction.</p> <p>Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component.</p> <p><b>See Also:</b> "Usage Notes"</p> |

**Table 22-23 (Cont.) Apply Component Parameters**

| Parameter Name  | Possible Values | Default | Description                                                                                                                                                                                                                         |
|-----------------|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| write_alert_log | Y or N          | Y       | If Y, then the apply component writes a message to the alert log on exit.<br>If N, then the apply component does not write a message to the alert log on exit.<br>The message specifies the reason why the apply component stopped. |

### Usage Notes

The following usage notes apply to this procedure:

- [Delays Are Possible Before New Parameter Settings Take Effect](#)
- [Parameters Interpreted as Positive Integers](#)
- [Parameters with a System Change Number \(SCN\) Setting](#)
- [The SET\\_PARAMETER Procedure and Replication](#)
- [The SET\\_PARAMETER Procedure and XStream Outbound Servers](#)
- [The SET\\_PARAMETER Procedure and XStream Inbound Servers](#)

#### Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

#### Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `INFINITE` for larger values.

#### Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

#### The SET\_PARAMETER Procedure and Replication

You can use the following parameters in Replication if you enable XStream performance optimizations for Oracle Replication using the procedure

`DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS`:

- `apply_sequence_nextval`
- `compute_lcr_dep_on_arrival`
- `eager_size`
- `grouptransops`
- `max_parallelism`
- `max_sga_size`
- `parallelism_interval`

#### The SET\_PARAMETER Procedure and XStream Outbound Servers

Outbound servers ignore the settings for the following apply parameters:

- `allow_duplicate_rows`
- `commit_serialization`
- `compare_key_only`
- `compute_lcr_dep_on_arrival`
- `disable_on_error`
- `eager_size`
- `enable_xstream_table_stats`
- `grouptransops`
- `handlecollisions`
- `optimize_self_updates`
- `parallelism`
- `parallelism_interval`
- `preserve_encryption`
- `rtrim_on_implicit_conversion`
- `suppresstriggers`

The `commit_serialization` parameter is always set to `FULL` for an outbound server, and the `parallelism` parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

The `SET_PARAMETER` Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `ignore_transaction`
- `maximum_scn`

You can use all of the other apply component parameters with inbound servers.

The default setting for the `compare_key_only` parameter for an inbound server is `Y`.

The default setting for the `parallelism` parameter for an inbound server is 4.

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

## 22.4.21 SET\_REPERROR\_HANDLER Procedure

This procedure specifies how a particular error is handled based on its error number.

You can choose between several predefined actions for a given error.

### Syntax

```
DBMS_APPLY_ADM.SET_REPERROR_HANDLER(  
    apply_name      IN  VARCHAR2,  
    object          IN  VARCHAR2,  
    error_number    IN  NUMBER,  
    method          IN  VARCHAR2,  
    source_object   IN  VARCHAR2 DEFAULT NULL,  
    max_retries     IN  NUMBER   DEFAULT NULL,  
    delay_csecs     IN  NUMBER   DEFAULT 6000);
```

### Parameters

**Table 22-24** SET\_REPERROR\_HANDLER Procedure Parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_name</code>   | The name of the apply process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>object</code>       | <p>The schema and name of the target table, specified as <code>[schema name.]table name</code> for which an error handler is being added, modified, or removed. The table must exist.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| <code>error_number</code> | <p>The error handling number.</p> <p>If 0, then use the default for all error handling for <code>object</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>method</code>       | <p>Specifies the action to take when the given <code>error_number</code> occurs.</p> <p>If NULL, remove the error handler for <code>error_number</code></p> <p>The possible actions are:</p> <ul style="list-style-type: none"><li>• <b>ABEND</b>: Stop the apply process when the error occurs.</li><li>• <b>RECORD</b>: Move the LCR to the error queue when the error is encountered.</li><li>• <b>IGNORE</b>: Silently ignore the error and do not apply the LCR.</li><li>• <b>RETRY</b>: Retry the LCR <code>max_retries</code> times.</li><li>• <b>RETRY_TRANSACTION</b>: Retry the transaction <code>max_retries</code> times. Wait <code>delay_csecs</code> centiseconds before each retry.</li></ul> <p><b>RECORD_TRANSACTION</b> : Move the entire transaction to the error queue if this error occurs.</p> |

**Table 22-24 (Cont.) SET\_REPERROR\_HANDLER Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_object | The schema and object name of the source table, specified as <i>[schema_name.] table_name</i> for the table where the change originated.<br><br>For example, if the change originated at the <code>employees</code> table owned by user <code>hr</code> , then specify <code>hr.employees</code> . If the schema is not specified, then the current user is the default. |
| max_retries   | Maximum number of times to retry for <code>RETRY</code> and <code>RETRY_TRANSACTION</code> actions in method. Must be specified with either the <code>RETRY</code> or <code>RETRY_TRANSACTION</code>                                                                                                                                                                     |
| delay_csecs   | The number of centiseconds between retries for <code>RETRY</code> and <code>RETRY_TRANSACTION</code> action in method.                                                                                                                                                                                                                                                   |

### Usage Notes

The following usage notes apply to this procedure:

- [Priority of Error Handlers](#)

### Priority of Error Handlers

Any conflict handling specified by `SET_UPDATE_CONFLICT_HANDLER` or `SET_DML_CONFLICT_HANDLER` is tried before the actions specified by `SET_REPERROR_HANDLER`. The PL/SQL procedure specified by `SET_DML_HANDLER` is called to handle the error if none of the previously mentioned methods resolve it.

## 22.4.22 SET\_SCHEMA\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.

### Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
    source_schema_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT FALSE,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 22-25 SET\_SCHEMA\_INSTANTIATION\_SCN Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_schema_name   | The name of the source schema. For example, hr.<br><br>When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| source_database_name | The global name of the source database. For example, DBS1.NET.<br><br>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| instantiation_scn    | The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| apply_database_link  | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| recursive            | If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user.<br><br>If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables<br><br><b>Note:</b> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database. |
| source_root_name     | The global name of the source root database.<br><br>In a non-CDB, this parameter must be NULL.<br><br>In a CDB, both source_database and source_root_name must be specified to identify a specific container.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage Notes

The following usage notes apply to this procedure:

- [LCR\\$\\_DDL\\_RECORD Type](#) for more information about DDL LCRs

### The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

#### Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

#### The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

### The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:**

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET\_SCHEMA\_INSTANTIATION\_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

## 22.4.23 SET\_TABLE\_INSTANTIATION\_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

### Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 22-26 SET\_TABLE\_INSTANTIATION\_SCN Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source_object_name   | <p>The name of the source object specified as <i>[schema_name.]object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.</p> |
| source_database_name | <p>The global name of the source database. For example, <i>DBS1.NET</i>.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <i>DBS1</i> and the domain is <i>NET</i>, then the procedure specifies <i>DBS1.NET</i> automatically.</p>                                                                                                                                      |
| instantiation_scn    | <p>The instantiation SCN. Specify <i>NULL</i> to remove the instantiation SCN metadata for the source table from the data dictionary.</p>                                                                                                                                                                                                                                                                                                                           |

**Table 22-26 (Cont.) SET\_TABLE\_INSTANTIATION\_SCN Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                 |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_database_link</code> | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.<br><b>Note:</b> This parameter must be <code>NULL</code> when the procedure is invoked from the root of a CDB. |
| <code>source_root_name</code>    | The global name of the source root database.<br>In a non-CDB, this parameter must be <code>NULL</code> .<br>In a CDB, both <code>source_database</code> and <code>source_root_name</code> must be specified to identify a specific container.                                               |

### Usage Notes

The following usage notes apply to this procedure:

- [Instantiation SCNs and LCRs](#)
- [The SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure and XStream Outbound Servers](#)
- [The SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure and XStream Inbound Servers](#)
- [The SET\\_TABLE\\_INSTANTIATION\\_SCN Procedure and CDBs](#)

#### Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-`NULL` `base_table_owner` and `base_table_name` specified, except for DDL LCRs with a `command_type` of `CREATE TABLE`

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `ALTER TABLE` or `CREATE TRIGGER`.

#### Note:

The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

 **See Also:**

- [SET\\_SCHEMA\\_INSTANTIATION\\_SCN Procedure](#)
- [LCR\\$\\_ROW\\_RECORD Type](#) for more information about row LCRs
- [LCR\\$\\_DDL\\_RECORD Type](#) for more information about DDL LCRs

#### The SET\_TABLE\_INSTANTIATION\_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

 **See Also:**

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

#### The SET\_TABLE\_INSTANTIATION\_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

#### The SET\_TABLE\_INSTANTIATION\_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

## 22.4.24 SET\_UPDATE\_CONFLICT\_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

### Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name          IN  VARCHAR2,
    method_name          IN  VARCHAR2,
    resolution_column    IN  VARCHAR2,
    column_list          IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 22-27 SET\_UPDATE\_CONFLICT\_HANDLER Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_name         | <p>The schema and name of the table, specified as <code>[schema_name.]object_name</code>, for which an update conflict handler is being added, modified, or removed.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| method_name         | <p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> <li><b>MAXIMUM:</b> Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.</li> <li><b>MINIMUM:</b> Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.</li> <li><b>OVERWRITE:</b> Applies the column list from the source database, overwriting the column values at the destination database.</li> <li><b>DISCARD:</b> Retains the column list from the destination database, discarding the column list from the source database.</li> </ul> <p>If <code>NULL</code>, then the procedure removes any existing update conflict handler with the same <code>object_name</code>, <code>resolution_column</code>, and <code>column_list</code>. If non-<code>NULL</code>, then the procedure replaces any existing update conflict handler with the same <code>object_name</code> and <code>resolution_column</code>.</p> |
| resolution_column   | <p>Name of the column used to uniquely identify an update conflict handler. For the <b>MAXIMUM</b> and <b>MINIMUM</b> prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the <code>column_list</code> parameter.</p> <p><code>NULL</code> is not allowed for this parameter. For the <b>OVERWRITE</b> and <b>DISCARD</b> prebuilt methods, you can specify any column in the column list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| column_list         | <p>List of columns for which the conflict handler is called.</p> <p>The same column cannot be in more than one column list.</p> <p>If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.</p> <p><b>Note:</b> Prebuilt update conflict handlers do not support <code>LOB</code>, <code>LONG</code>, <code>LONG RAW</code>, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the <code>column_list</code> parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| apply_database_link | <p>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</p> <p><b>Note:</b> Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage Notes

The following usage notes apply to this procedure:

- [Modifying an Existing Update Conflict Handler](#)
- [Removing an Existing Update Conflict Handler](#)
- [Series of Actions for Conflicts](#)
- [Procedure DML Handlers for Conflicts](#)
- [A Column Can Be in Only One Column List](#)
- [Update Conflict Handlers and Non-Oracle Databases](#)
- [The SET\\_UPDATE\\_CONFLICT\\_HANDLER Procedure and XStream Outbound Servers](#)
- [The SET\\_UPDATE\\_CONFLICT\\_HANDLER Procedure and XStream Inbound Servers](#)

### Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

### Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

### Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

#### See Also:

["Signature of a DML Handler Procedure or Error Handler Procedure"](#) for information about setting an error handler

### Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

**See Also:**[SET\\_DML\\_HANDLER Procedure](#)**A Column Can Be in Only One Column List**

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

**Update Conflict Handlers and Non-Oracle Databases**

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

**The SET\_UPDATE\_CONFLICT\_HANDLER Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The SET\_UPDATE\_CONFLICT\_HANDLER Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

**Examples**

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name => 'hr.employees',
    method_name => 'MAXIMUM',
    resolution_column => 'salary',
    column_list => cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

## 22.4.25 SET\_VALUE\_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

### Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

### Parameters

**Table 22-28 SET\_VALUE\_DEPENDENCY Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dependency_name</code> | <p>The name of the value dependency.</p> <p>If a dependency with the specified name does not exist, then it is created.</p> <p>If a dependency with the specified name exists, then the specified object and attributes are added to the dependency.</p> <p>If NULL, an error is raised.</p>                                                                                                                                                                           |
| <code>object_name</code>     | <p>The name of the table, specified as <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised.</p> <p>If NULL, then <code>attribute_list</code> and <code>attribute_table</code> also must be NULL.</p> |
| <code>attribute_list</code>  | A comma-delimited list of column names in the table. There must be no spaces between entries.                                                                                                                                                                                                                                                                                                                                                                          |
| <code>attribute_table</code> | A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.                                                                                                                                                                                                                |

### Usage Notes

The following usage notes apply to this procedure:

- [The SET\\_VALUE\\_DEPENDENCY Procedure and XStream Outbound Servers](#)
- [The SET\\_VALUE\\_DEPENDENCY Procedure and XStream Inbound Servers](#)

The SET\_VALUE\_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET\_VALUE\_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.26 START\_APPLY Procedure

This procedure directs the apply component to start applying messages.

### Syntax

```
DBMS_APPLY_ADM.START_APPLY(  
    apply_name IN VARCHAR2);
```

### Parameter

**Table 22-29** START\_APPLY Procedure Parameter

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| apply_name | The apply component name. A NULL setting is not allowed. Do not specify an owner. |

### Usage Notes

The following usage notes apply to this procedure:

- [Apply Component Status](#)
- [The START\\_APPLY Procedure and XStream Outbound Servers](#)
- [The START\\_APPLY Procedure and XStream Inbound Servers](#)

#### Apply Component Status

The apply component status is persistently recorded. Hence, if the status is `ENABLED`, then the apply component is started upon database instance startup. An apply component (*an<sub>nn</sub>*) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

#### The START\_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

#### The START\_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

## 22.4.27 STOP\_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

### Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(  
    apply_name IN VARCHAR2,  
    force      IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 22-30 STOP\_APPLY Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_name</code> | The apply component name. A <code>NULL</code> setting is not allowed. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>force</code>      | <p>If <code>TRUE</code>, then the procedure stops the apply component as soon as possible.</p> <p>If <code>FALSE</code>, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions.</p> <p>The behavior of the apply component depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply component parameter. See <a href="#">"Usage Notes"</a> for more information.</p> |

## Usage Notes

The following usage notes apply to this procedure:

- [Apply Component Status](#)
- [Queue Subprograms Have No Effect on Apply Component Status](#)
- [The STOP\\_APPLY force Parameter and the commit\\_serialization Apply Parameter](#)
- [The STOP\\_APPLY Procedure and XStream Outbound Servers](#)
- [The STOP\\_APPLY Procedure and XStream Inbound Servers](#)

### Apply Component Status

The apply component status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the apply component is not started upon database instance startup.

### Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the `STOP` status of an apply component.

### The STOP\_APPLY force Parameter and the commit\_serialization Apply Parameter

The following table describes apply component behavior for each setting of the `force` parameter in the `STOP_APPLY` procedure and the `commit_serialization` apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

| <code>force</code> | <code>commit_serialization</code>  | Apply Component Behavior                                                                                                                                                                                         |
|--------------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TRUE</code>  | <code>FULL</code>                  | The apply component stops immediately and does not apply any unfinished transactions.                                                                                                                            |
| <code>TRUE</code>  | <code>DEPENDENT_TRANSACTION</code> | When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally. |
| <code>FALSE</code> | <code>FULL</code>                  | The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.                                                                           |

| <b>force</b> | <b>commit_serialization</b> | <b>Apply Component Behavior</b>                                                                                                                                             |
|--------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FALSE        | DEPENDENT_TRANSACTION       | Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time. |

For example, assume that the `commit_serialization` apply component parameter is set to `DEPENDENT_TRANSACTION` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply component stops.

A different scenario would result if the `commit_serialization` apply component parameter is set to `FULL`. For example, assume that the `commit_serialization` apply component parameter is set to `FULL` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply component stops, and transaction C is rolled back.

[SET\\_PARAMETER Procedure](#) for more information about the `commit_serialization` apply component parameter

#### The STOP\_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

#### The STOP\_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The `DBMS_AQ` package provides an interface to Oracle Advanced Queuing (AQ).

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Operational Notes](#)
- [Summary of DBMS\\_AQ Subprograms](#)

 **See Also:**

- *Oracle Database Advanced Queuing User's Guide*
- [Oracle Database Advanced Queuing \(AQ\) Types](#) for information about `TYPES` to use with `DBMS_AQ`.

## 23.1 DBMS\_AQ Security Model

Initially, only `SYS` and `SYSTEM` have execution privilege for the procedures in `DBMS_AQ` and `DBMS_AQADM`.

### Queue Security

To enqueue or dequeue, users need `EXECUTE` rights on `DBMS_AQ` and either `ENQUEUE` or `DEQUEUE` privileges on target queues, or `ENQUEUE_ANY/DEQUEUE_ANY` system privileges. Users who have been granted `EXECUTE` rights to `DBMS_AQ` and `DBMS_AQADM` are able to create, manage, and use queues in their own schemas. The `MANAGE_ANY` AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the `EXECUTE` right on `DBMS_AQ`.

 **See Also:**

*Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

### OCI Applications and Queue Access

For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the `ENQUEUE ANY QUEUE`

or `DEQUEUE ANY QUEUE` system privileges. The `EXECUTE` right of `DBMS_AQ` is not checked against the session user's rights.

### Security Required for Propagation

Propagation jobs are owned by `SYS`, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted `EXECUTE` privileges on the `DBMS_AQADM` package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier `SYS.DBMS_AQADM` not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have `EXECUTE` access on the `DBMS_AQ` and `DBMS_AQADM` packages on the remote database.

#### See Also:

- [DBMS\\_AQADM](#)
- *Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation

## 23.2 DBMS\_AQ Constants

This topic describes the constants used by `DBMS_AQ`.

The `DBMS_AQ` package uses the constants shown in the following table.

When using enumerated constants such as `BROWSE`, `LOCKED`, or `REMOVE`, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with `DBMS_AQ`. For example: `DBMS_AQ.BROWSE`.

#### Note:

The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

**Table 23-1 Enumerated Constants**

| Parameter    | Options   | Type | Description |
|--------------|-----------|------|-------------|
| VISIBILITY   | IMMEDIATE | -    | -           |
| -            | ON_COMMIT | -    | -           |
| DEQUEUE_MODE | BROWSE    | -    | -           |
| -            | LOCKED    | -    | -           |
| -            | REMOVE    | -    | -           |

**Table 23-1 (Cont.) Enumerated Constants**

| Parameter                  | Options                    | Type           | Description |
|----------------------------|----------------------------|----------------|-------------|
| -                          | REMOVE_NODATA              | -              | -           |
| NAVIGATION                 | FIRST_MESSAGE              | -              | -           |
| -                          | NEXT_MESSAGE               | -              | -           |
| STATE                      | WAITING                    | -              | -           |
| -                          | READY                      | -              | -           |
| -                          | PROCESSED                  | -              | -           |
| -                          | EXPIRED                    | -              | -           |
| SEQUENCE_DEVIATION         | BEFORE                     | -              | -           |
| -                          | TOP                        | -              | -           |
| WAIT                       | FOREVER                    | BINARY_INTEGER | -           |
| -                          | NO_WAIT                    | BINARY_INTEGER | -           |
| DELAY                      | NO_DELAY                   | -              | -           |
| EXPIRATION                 | NEVER                      | -              | -           |
| NAMESPACE                  | NAMESPACE_AQ               | -              | -           |
| -                          | NAMESPACE_ANONYMOUS        | -              | -           |
| NTFN_GROUPING_CLASS        | NTFN_GROUPING_CLASS_TIME   | NUMBER         | -           |
| NTFN_GROUPING_TYPE         | NTFN_GROUPING_TYPE_SUMMARY | NUMBER         | -           |
| -                          | NTFN_GROUPING_TYPE_LAST    | NUMBER         | -           |
| NTFN_GROUPING_REPEAT_COUNT | NTFN_GROUPING_FOREVER      | NUMBER         | -           |

## 23.3 DBMS\_AQ Data Types

This topic lists and describes DBMS\_AQ data types.

**Table 23-2 DBMS\_AQ Data Structures**

| Data Structures                                  | Description                                                                                                |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| OBJECT_NAME                                      | Names database objects                                                                                     |
| TYPE_NAME                                        | Defines queue types                                                                                        |
| Oracle Database Advanced Queuing PL/SQL Callback | Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification |

### OBJECT\_NAME

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

## Syntax

```
object_name := VARCHAR2;  
object_name := [schema_name.]name;
```

## Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 128 bytes long. Queue names and queue table names can be up to 122 bytes long. Maximum length of agent names and subscriber names can be 128 characters with datablock size greater than 2k. For 2k datablock size, maximum length for subscriber is 128 bytes.

## TYPE\_NAME

The `type_name` data structure defines queue types.

## Syntax

```
type_name := VARCHAR2;  
type_name := object_type | "RAW";
```

## Attributes

**Table 23-3 Type Name Attributes**

| Attribute                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>object_type</code> | Maximum number of attributes in the object type is limited to 900.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| "RAW"                    | <p>To store payload of type <code>RAW</code>, Oracle Database Advanced Queuing creates a queue table with a <code>LOB</code> column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a <code>LOB</code> column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Database Advanced Queuing. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept <code>RAW</code> buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your <code>RAW</code> data will be limited to the maximum amount of contiguous memory (as an <code>OCIRaw</code> is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases.</p> <p>Because <code>LOB</code> columns are used for storing <code>RAW</code> payload, the Oracle Database Advanced Queuing administrator can choose the <code>LOB</code> tablespace and configure the <code>LOB</code> storage by constructing a <code>LOB</code> storage string in the <code>storage_clause</code> parameter during queue table creation time.</p> |

## Oracle Database Advanced Queuing PL/SQL Callback

The `plsqcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

## Syntax

If a notification message is expected for a `RAW` payload enqueue, then the PL/SQL callback must have the following signature:

```

procedure plsqlcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
  payload IN RAW,
  payloadl IN NUMBER);

```

### Attributes

**Table 23-4 Oracle Database Advanced Queuing PL/SQL Callback Attributes**

| Attribute | Description                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| context   | Specifies the context for the callback function that was passed by <code>dbms_aq.register</code> . See <a href="#">AQ\$_REG_INFO</a> Type.                                                                                    |
| reginfo   | See <a href="#">AQ\$_REG_INFO</a> Type.                                                                                                                                                                                       |
| descr     | See <a href="#">AQ\$_DESCRIPTOR</a> Type                                                                                                                                                                                      |
| payload   | If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null. |
| payloadl  | Specifies the length of payload. If payload is null, <code>payloadl = 0</code> .                                                                                                                                              |

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```

procedure plsqlcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
  payload IN VARCHAR2,
  payloadl IN NUMBER);

```

## 23.4 DBMS\_AQ Operational Notes

This topic lists various DBMS\_AQ operational notes.

### DBMS\_AQ and DBMS\_AQADM Java Classes

Java interfaces are available for DBMS\_AQ and DBMS\_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the DBMS\_AQIN package to use these interfaces.

## 23.5 Summary of DBMS\_AQ Subprograms

The DBMS\_AQ package uses subprograms described in this table.

**Table 23-5 DBMS\_AQ Package Subprograms**

| Subprograms                            | Description                                                                          |
|----------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">BIND_AGENT Procedure</a>   | Creates an entry for an Oracle Database Advanced Queuing agent in the LDAP directory |
| <a href="#">DEQUEUE Procedure</a>      | Dequeues a message from the specified queue                                          |
| <a href="#">DEQUEUE_ARRAY Function</a> | Dequeues an array of messages from the specified queue                               |

**Table 23-5 (Cont.) DBMS\_AQ Package Subprograms**

| Subprograms                            | Description                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ENQUEUE Procedure</a>      | Adds a message to the specified queue                                                                                   |
| <a href="#">ENQUEUE_ARRAY Function</a> | Adds an array of messages to the specified queue                                                                        |
| <a href="#">LISTEN Procedures</a>      | Listen to one or more queues on behalf of a list of agents                                                              |
| <a href="#">POST Procedure</a>         | Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications |
| <a href="#">REGISTER Procedure</a>     | Registers for message notifications                                                                                     |
| <a href="#">UNBIND_AGENT Procedure</a> | Removes an entry for an Oracle Database Advanced Queuing agent from the LDAP directory                                  |
| <a href="#">UNREGISTER Procedure</a>   | Unregisters a subscription which turns off notification                                                                 |

**Note:**

DBMS\_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

## 23.5.1 BIND\_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

### Syntax

```
DBMS_AQ.BIND_AGENT (
    agent      IN SYS.AQ$_AGENT,
    certificate IN VARCHAR2 default NULL);
```

### Parameters

**Table 23-6 BIND\_AGENT Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agent       | Agent that is to be registered in LDAP server.                                                                                                                                                                                                                                                                                    |
| certificate | Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute <code>usercertificate</code> ) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent. |

### Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

## 23.5.2 DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

### Syntax

```
DBMS_AQ.DEQUEUE (
    queue_name          IN      VARCHAR2,
    dequeue_options     IN      dequeue_options_t,
    message_properties   OUT     message_properties_t,
    payload              OUT     "<ADT_1>"
    msgid               OUT     RAW);
```

### Parameters

**Table 23-7 DEQUEUE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name         | Specifies the name of the queue.                                                                                                                                                                                                                   |
| dequeue_options    | See <a href="#">DEQUEUE_OPTIONS_T</a> Type.                                                                                                                                                                                                        |
| message_properties | See <a href="#">MESSAGE_PROPERTIES_T</a> Type.                                                                                                                                                                                                     |
| payload            | Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of <i>type_name</i> refer to TYPE_NAME in <a href="#">DBMS_AQ Data Types</a> . |
| msgid              | System generated identification of the message.                                                                                                                                                                                                    |

### Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- consumer\_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

- deq\_condition

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

 **Note:**

It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

### Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See [DEQUEUE\\_OPTIONS\\_T Type](#) for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE\\_AQ\\_AGENT Procedure](#).
- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE\\_DB\\_ACCESS Procedure](#).

## 23.5.3 DEQUEUE\_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

### Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
    queue_name          IN    VARCHAR2,
    dequeue_options     IN    dequeue_options_t,
    array_size          IN    pls_integer,
    message_properties_array OUT message_properties_array_t,
    payload_array       OUT    "<COLLECTION_1>",
    msgid_array         OUT    msgid_array_t,
    error_array         OUT    error_array_t)
RETURN pls_integer;
```

### Parameters

**Table 23-8 DEQUEUE\_ARRAY Function Parameters**

| Parameter                | Description                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name               | The queue name from which messages are dequeued (same as single-row dequeue).                                                                                                                  |
| dequeue_options          | The set of options which will be applied to all messages in the array (same as single-row dequeue).                                                                                            |
| array_size               | The number of elements to dequeue. For buffered messages, array_size should be 1.                                                                                                              |
| message_properties_array | A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See <a href="#">MESSAGE_PROPERTIES_ARRAY_T Type</a> . |
| payload_array            | An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation. Users can dequeue RAW and ADT payloads.                  |
| msgid_array              | An array of message IDs of the dequeued messages. See <a href="#">MSGID_ARRAY_T Type</a> .                                                                                                     |
| error_array              | Currently not implemented                                                                                                                                                                      |

### Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeue by `message_id` is not supported. See [DEQUEUE Procedure](#) for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- `FIRST_MESSAGE_MULTI_GROUP`
- `NEXT_MESSAGE_MULTI_GROUP`

**See Also:**[ENQUEUE\\_OPTIONS\\_T Type](#)

For transaction grouped queues and `ONE_GROUP` navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In `MULTI_GROUP` navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. ORA-25235 is returned to indicate the end of a transaction group.

`DEQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

## 23.5.4 ENQUEUE Procedure

This procedure adds a message to the specified queue.

### Syntax

```
DBMS_AQ.ENQUEUE (
    queue_name          IN      VARCHAR2,
    enqueue_options     IN      enqueue_options_t,
    message_properties  IN      message_properties_t,
    payload             IN      "<ADT_1>",
    msgid              OUT     RAW);
```

### Parameters

**Table 23-9 ENQUEUE Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>queue_name</code>         | Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.                                                                                                                                                                                |
| <code>enqueue_options</code>    | See <a href="#">ENQUEUE_OPTIONS_T Type</a> .                                                                                                                                                                                                                                                     |
| <code>message_properties</code> | See <a href="#">MESSAGE_PROPERTIES_T Type</a> .                                                                                                                                                                                                                                                  |
| <code>payload</code>            | Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of <i>type_name</i> refer to <code>TYPE_NAME</code> in <a href="#">DBMS_AQ Data Types</a> . |
| <code>msgid</code>              | System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.                                                                                                                                                   |

### Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

#### Note:

The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

#### Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See [MESSAGE\\_PROPERTIES\\_T Type](#) for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE\\_AQ\\_AGENT Procedure](#).
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE\\_DB\\_ACCESS Procedure](#).

## 23.5.5 ENQUEUE\_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

#### Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
    queue_name           IN    VARCHAR2,
    enqueue_options      IN    enqueue_options_t,
    array_size           IN    pls_integer,
    message_properties_array IN message_properties_array_t,
    payload_array        IN    "<COLLECTION_1>",
    msgid_array          OUT   msgid_array_t,
    error_array          OUT   error_array_t)
RETURN pls_integer;
```

#### Parameters

**Table 23-10 ENQUEUE\_ARRAY Function Parameters**

| Parameter                    | Description                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------|
| <code>queue_name</code>      | The queue name in which messages are enqueued (same as single-row enqueue).                    |
| <code>enqueue_options</code> | See <a href="#">ENQUEUE_OPTIONS_T Type</a> .                                                   |
| <code>array_size</code>      | The number of elements to enqueue. For buffered messages, <code>array_size</code> should be 1. |

**Table 23-10 (Cont.) ENQUEUE\_ARRAY Function Parameters**

| Parameter                | Description                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message_properties_array | A record containing an array corresponding to each message property. For each property, the user must allocate <code>array_size</code> elements. See <a href="#">MESSAGE_PROPERTIES_ARRAY_T Type</a> . |
| payload_array            | An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation. Users can enqueue RAW and ADT payloads.                                  |
| msgid_array              | An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See <a href="#">MSGID_ARRAY_T Type</a> .                    |
| error_array              | Currently not implemented                                                                                                                                                                              |

### Usage Notes

ENQUEUE\_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

## 23.5.6 LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

### Syntax

```
DBMS_AQ.LISTEN (
    agent_list      IN      AQ$_AGENT_LIST_T,
    wait            IN      BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
    agent           OUT     SYS.AQ$_AGENT);
```

```
DBMS_AQ.LISTEN (
    agent_list      IN      AQ$_AGENT_LIST_T,
    wait            IN      BINARY_INTEGER DEFAULT FOREVER,
    listen_delivery_mode IN  PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
    agent           OUT     SYS.AQ$_AGENT,
    message_delivery_mode OUT PLS_INTEGER);
```

```
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

### Parameters

**Table 23-11 LISTEN Procedure Parameters**

| Parameter  | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| agent_list | List of agents to listen for                                                      |
| wait       | Time out for the listen call in seconds. By default, the call will block forever. |

**Table 23-11 (Cont.) LISTEN Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>listen_delivery_mode</code>  | The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of <code>DBMS_AQ.PERSISTENT</code> or <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT_OR_BUFFERED</code> |
| <code>agent</code>                 | Agent with a message available for consumption                                                                                                                                                                                                          |
| <code>message_delivery_mode</code> | Returns the message type along with the queue and consumer for which there is a message                                                                                                                                                                 |

### Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

#### Note:

You cannot call `LISTEN` on nonpersistent queues.

## 23.5.7 POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

### Syntax

```
DBMS_AQ.POST (
  post_list      IN SYS.AQ$_POST_INFO_LIST,
  post_count     IN NUMBER);
```

### Parameters

**Table 23-12 POST Procedure Parameters**

| Parameter              | Description                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>post_list</code> | Specifies the list of anonymous subscriptions to which you want to post. It is a list of <a href="#">AQ\$_POST_INFO_LIST</a> Type. |

**Table 23-12 (Cont.) POST Procedure Parameters**

| Parameter  | Description                                       |
|------------|---------------------------------------------------|
| post_count | Specifies the number of entries in the post_list. |

#### Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

## 23.5.8 REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

#### Syntax

```
DBMS_AQ.REGISTER (
    reg_list      IN  SYS.AQ$_REG_INFO_LIST,
    count         IN  NUMBER);
```

#### Parameters

**Table 23-13 REGISTER Procedure Parameters**

| Parameter | Description                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| reg_list  | Specifies the list of subscriptions to which you want to register for message notifications. It is a list of <a href="#">AQ\$_REG_INFO Type</a> . |
| count     | Specifies the number of entries in the reg_list.                                                                                                  |

#### Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only `TIME` criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion `TIME`)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for `DBCHANGE` namespace)
  - Repeat count – how many times to perform grouping (Default is `FOREVER`)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you

should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

**See Also:**

[DBMS\\_AQELM](#) for more information on e-mail and HTTP notifications

## 23.5.9 UNBIND\_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

**Syntax**

```
DBMS_AQ.UNBIND_AGENT (  
    agent      IN SYS.AQ$_AGENT);
```

**Parameters**

**Table 23-14** BIND\_AGENT Procedure Parameters

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| agent     | Agent that is to be removed from the LDAP server |

## 23.5.10 UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

**Syntax**

```
DBMS_AQ.UNREGISTER (  
    reg_list      IN SYS.AQ$_REG_INFO_LIST,  
    reg_count     IN NUMBER);
```

**Parameters**

**Table 23-15** UNREGISTER Procedure Parameters

| Parameter | Description                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| reg_list  | Specifies the list of subscriptions to which you want to register for message notifications. It is a list of <a href="#">AQ\$_REG_INFO Type</a> . |
| reg_count | Specifies the number of entries in the <code>reg_list</code> .                                                                                    |

**Usage Notes**

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

# DBMS\_AQADM

The `DBMS_AQADM` package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

## See Also:

- *Oracle Database Advanced Queuing User's Guide*
- [Oracle Database Advanced Queuing \(AQ\) Types](#) for information about the `TYPES` to use with `DBMS_AQADM`

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_AQADM Subprograms](#)

## 24.1 DBMS\_AQADM Security Model

Initially, only `SYS` and `SYSTEM` have execution privilege for the procedures in `DBMS_AQADM` and `DBMS_AQ`. Users who have been granted `EXECUTE` rights to `DBMS_AQ` and `DBMS_AQADM` are able to create, manage, and use queues in their own schemas. The `MANAGE_ANY` AQ system privilege is used to create and manage queues in other schemas and can be granted and revoked through `DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE` and `DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE` respectively. Starting from Oracle Database 12c Release 2, `MANAGE_ANY` privilege will not allow access to `SYS` owned queues by users other than `SYS`.

### User Roles

The database administrator has the option of granting the system privileges `ENQUEUE_ANY` and `DEQUEUE_ANY`, exercising `DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE` and `DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE` directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising `DBMS_AQADM.GRANT_QUEUE_PRIVILEGE` and `DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE`. Starting from Oracle Database 12c Release 2, `ENQUEUE_ANY` and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

 **See Also:**

- [DBMS\\_AQ](#).
- *Oracle Database Advanced Queuing User's Guide* for more information on queue privileges and access control.

**Security Required for Propagation**

Propagation jobs are owned by `SYS`, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted `EXECUTE` privileges on the `DBMS_AQADM` package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier `SYS.DBMS_AQADM` not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have `EXECUTE` access on the `DBMS_AQ` and `DBMS_AQADM` packages on the remote database.

 **See Also:**

*Oracle Database Advanced Queuing User's Guide* for more information on security required for propagation.

**Queue Table Migration**

The `MIGRATE_QUEUE_TABLE` procedure requires that the `EXECUTE` privilege on `DBMS_AQADM` be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the `EXECUTE` privilege as soon as the migration is done.

 **See Also:**

- ["MIGRATE\\_QUEUE\\_TABLE Procedure."](#)
- *Oracle Database Advanced Queuing User's Guide* for more information on granting Oracle Database Advanced Queuing system privileges.

## 24.2 DBMS\_AQADM Constants

When using enumerated constants, such as `INFINITE`, `TRANSACTIONAL`, or `NORMAL_QUEUE`, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with `DBMS_AQADM`. For example:

`DBMS_AQADM.NORMAL_QUEUE`.

**Table 24-1 Enumerated Types in the Administrative Interface**

| Parameter        | Options                                             |
|------------------|-----------------------------------------------------|
| retention        | 0, 1, 2...INFINITE                                  |
| message_grouping | TRANSACTIONAL, NONE                                 |
| queue_type       | NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE |

**See Also:**

For more information on the Java classes and data structures used in both `DBMS_AQ` and `DBMS_AQADM`, see the [DBMS\\_AQ](#) package.

## 24.3 DBMS\_AQADM Subprogram Groups

This section lists and describes the DBMS\_AQADM subprogram groups.

This DBMS\_AQADM package is made up of the following subprogram groups:

- [Queue Table Subprograms](#)
- [Privilege Subprograms](#)
- [Queue Subprograms](#)
- [Subscriber Subprograms](#)
- [Propagation Subprograms](#)
- [Miscellaneous Subprograms](#)
- [Oracle Database Advanced Queuing Agent Subprograms](#)
- [Alias Subprograms](#)

### 24.3.1 DBMS\_AQADM Queue Table Subprograms

This section lists and describes the DBMS\_AQADM Queue Table subprograms.

**Table 24-2 Queue Table Subprograms**

| Subprograms                                   | Description                                                                                                                                                               |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_QUEUE_TABLE Procedure</a>   | Alters the existing properties of a queue table                                                                                                                           |
| <a href="#">CREATE_QUEUE_TABLE Procedure</a>  | Creates a queue table for messages of a predefined type                                                                                                                   |
| <a href="#">DROP_QUEUE_TABLE Procedure</a>    | Drops an existing queue table                                                                                                                                             |
| <a href="#">ENABLE_JMS_TYPES Procedure</a>    | A precondition for the enqueue of JMS types and XML types                                                                                                                 |
| <a href="#">MIGRATE_QUEUE_TABLE Procedure</a> | Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table |

**Table 24-2 (Cont.) Queue Table Subprograms**

| Subprograms                                 | Description                       |
|---------------------------------------------|-----------------------------------|
| <a href="#">PURGE_QUEUE_TABLE Procedure</a> | Purges messages from queue tables |

## 24.3.2 DBMS\_AQADM Privilege Subprograms

This sections lists and describes the DBMS\_AQADM Privilege subprograms.

**Table 24-3 Privilege Subprograms**

| Subprograms                                       | Description                                                                     |
|---------------------------------------------------|---------------------------------------------------------------------------------|
| <a href="#">GRANT_QUEUE_PRIVILEGE Procedure</a>   | Grants privileges on a queue to users and roles                                 |
| <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>  | Grants Oracle Database Advanced Queuing system privileges to users and roles    |
| <a href="#">REVOKE_QUEUE_PRIVILEGE Procedure</a>  | Revokes privileges on a queue from users and roles                              |
| <a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a> | Revokes Oracle Database Advanced Queuing system privileges from users and roles |

## 24.3.3 DBMS\_AQADM Queue Subprograms

This sections lists and describes the DBMS\_AQADM Queue subprograms.

**Table 24-4 Queue Subprograms**

| Subprograms                                      | Description                                                                                                                                        |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_QUEUE Procedure</a>            | Alters existing properties of a queue                                                                                                              |
| <a href="#">CREATE_NP_QUEUE Procedure</a>        | Creates a nonpersistent RAW queue                                                                                                                  |
| <a href="#">CREATE_QUEUE Procedure</a>           | Creates a queue in the specified queue table                                                                                                       |
| <a href="#">CREATE_SHARDED_QUEUE Procedure</a>   | Creates a queue and its queue table for a sharded queue all together.                                                                              |
| <a href="#">DROP_SHARDED_QUEUE Procedure</a>     | Drops an existing sharded queue from the database queuing system                                                                                   |
| <a href="#">ALTER_SHARDED_QUEUE Procedure</a>    | Alters an sharded queue in the database queuing system                                                                                             |
| <a href="#">CREATE_EXCEPTION_QUEUE Procedure</a> | Creates an exception queue for a sharded queue                                                                                                     |
| <a href="#">DROP_QUEUE Procedure</a>             | Drops an existing queue                                                                                                                            |
| <a href="#">QUEUE_SUBSCRIBERS Function</a>       | Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type<br>DBMS_AQADM.AQ\$_subscriber_list_t |
| <a href="#">START_QUEUE Procedure</a>            | Enables the specified queue for enqueueing or dequeuing                                                                                            |
| <a href="#">STOP_QUEUE Procedure</a>             | Disables enqueueing or dequeuing on the specified queue                                                                                            |

## 24.3.4 DBMS\_AQADM Subscriber Subprograms

This section lists and describes the DBMS\_AQADM Subscriber subprograms.

**Table 24-5 Subscriber Subprograms**

| Subprograms                                 | Description                                                     |
|---------------------------------------------|-----------------------------------------------------------------|
| <a href="#">ADD_SUBSCRIBER Procedure</a>    | Adds a default subscriber to a queue                            |
| <a href="#">ALTER_SUBSCRIBER Procedure</a>  | Alters existing properties of a subscriber to a specified queue |
| <a href="#">REMOVE_SUBSCRIBER Procedure</a> | Removes a default subscriber from a queue                       |

## 24.3.5 DBMS\_AQADM Propagation Subprograms

This section lists and describes the DBMS\_AQADM propagation subprograms.

**Table 24-6 Propagation Subprograms**

| Subprograms                                            | Description                                                                                                                   |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a>   | Alters parameters for a propagation schedule                                                                                  |
| <a href="#">DISABLE_PROPAGATION_SCHEDULE Procedure</a> | Disables a propagation schedule                                                                                               |
| <a href="#">ENABLE_PROPAGATION_SCHEDULE Procedure</a>  | Enables a previously disabled propagation schedule                                                                            |
| <a href="#">SCHEDULE_PROPAGATION Procedure</a>         | Schedules propagation of messages from a queue to a destination identified by a specific database link                        |
| <a href="#">UNSCHEDULE_PROPAGATION Procedure</a>       | Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link |
| <a href="#">VERIFY_QUEUE_TYPES Procedure</a>           | Verifies that the source and destination queues have identical types                                                          |

## 24.3.6 DBMS\_AQADM Miscellaneous Subprograms

This section lists and describes the DBMS\_AQADM miscellaneous subprograms.

**Table 24-7 Miscellaneous Subprograms**

| Subprograms                                    | Description                                                                               |
|------------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">GET_QUEUE_PARAMETER Procedure</a>  | Used to get different parameters for sharded queues at queue or database level.           |
| <a href="#">GET_MAX_STREAMS_POOL Procedure</a> | Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit |
| <a href="#">GET_MIN_STREAMS_POOL Procedure</a> | Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit |
| <a href="#">GET_WATERMARK Procedure</a>        | Retrieves the value of watermark set by the <code>SET_WATERMARK</code> Procedure          |

**Table 24-7 (Cont.) Miscellaneous Subprograms**

| Subprograms                                     | Description                                                                                    |
|-------------------------------------------------|------------------------------------------------------------------------------------------------|
| <a href="#">SET_QUEUE_PARAMETER Procedure</a>   | Used to set different parameters for sharded queues at queue or database level.                |
| <a href="#">SET_MAX_STREAMS_POOL Procedure</a>  | Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use |
| <a href="#">SET_MIN_STREAMS_POOL Procedure</a>  | Used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use |
| <a href="#">SET_WATERMARK Procedure</a>         | Used for Oracle Database Advanced Queuing notification to specify and limit memory use         |
| <a href="#">UNSET_QUEUE_PARAMETER Procedure</a> | Used to unset different parameters for sharded queues at queue or database level.              |

## 24.3.7 DBMS\_AQADM Agent Subprograms

This section lists and describes the DBMS\_AQADM agent subprograms.

**Table 24-8 Oracle Streams AQ Agent Subprograms**

| Subprograms                                 | Description                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_AQ_AGENT Procedure</a>    | Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues                       |
| <a href="#">CREATE_AQ_AGENT Procedure</a>   | Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues |
| <a href="#">DISABLE_DB_ACCESS Procedure</a> | Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent                                                                       |
| <a href="#">DROP_AQ_AGENT Procedure</a>     | Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access                                                                               |
| <a href="#">ENABLE_DB_ACCESS Procedure</a>  | Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user                                                                             |

## 24.3.8 DBMS\_AQADM Alias Subprograms

This section lists and describes the DBMS\_AQADM alias subprograms.

**Table 24-9 Alias Subprograms**

| Subprograms                                   | Description                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------|
| <a href="#">ADD_ALIAS_TO_LDAP Procedure</a>   | Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP |
| <a href="#">DEL_ALIAS_FROM_LDAP Procedure</a> | Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP     |

## 24.4 Summary of DBMS\_AQADM Subprograms

This section lists and describes the DBMS\_AQADM package subprograms.

**Table 24-10 DBMS\_AQADM Package Subprograms**

| Subprograms                                            | Description                                                                                                                                                                      |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_ALIAS_TO_LDAP Procedure</a>            | Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP                                                                                                          |
| <a href="#">ADD_SUBSCRIBER Procedure</a>               | Adds a default subscriber to a queue                                                                                                                                             |
| <a href="#">ALTER_AQ_AGENT Procedure</a>               | Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues                       |
| <a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a>   | Alters parameters for a propagation schedule                                                                                                                                     |
| <a href="#">ALTER_QUEUE Procedure</a>                  | Alters existing properties of a queue                                                                                                                                            |
| <a href="#">ALTER_QUEUE_TABLE Procedure</a>            | Alters the existing properties of a queue table                                                                                                                                  |
| <a href="#">ALTER_SHARDED_QUEUE Procedure</a>          | Provides user the ability to alter the <code>cache_hint</code> and comment for the sharded queue                                                                                 |
| <a href="#">ALTER_SUBSCRIBER Procedure</a>             | Alters existing properties of a subscriber to a specified queue                                                                                                                  |
| <a href="#">CREATE_AQ_AGENT Procedure</a>              | Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues |
| <a href="#">CREATE_NP_QUEUE Procedure</a>              | Creates a nonpersistent RAW queue                                                                                                                                                |
| <a href="#">CREATE_QUEUE Procedure</a>                 | Creates a queue in the specified queue table                                                                                                                                     |
| <a href="#">CREATE_SHARDED_QUEUE Procedure</a>         | Creates a queue and its queue table for a sharded queue all together.                                                                                                            |
| <a href="#">CREATE_EXCEPTION_QUEUE Procedure</a>       | Creates an exception queue.                                                                                                                                                      |
| <a href="#">CREATE_QUEUE_TABLE Procedure</a>           | Creates a queue table for messages of a predefined type                                                                                                                          |
| <a href="#">DEL_ALIAS_FROM_LDAP Procedure</a>          | Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP                                                                                                              |
| <a href="#">DISABLE_DB_ACCESS Procedure</a>            | Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent                                                                       |
| <a href="#">DISABLE_PROPAGATION_SCHEDULE Procedure</a> | Disables a propagation schedule                                                                                                                                                  |
| <a href="#">DROP_AQ_AGENT Procedure</a>                | Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access                                                                               |
| <a href="#">DROP_QUEUE Procedure</a>                   | Drops an existing queue                                                                                                                                                          |
| <a href="#">DROP_SHARDED_QUEUE Procedure</a>           | Drops an existing sharded queue from the database queuing system                                                                                                                 |
| <a href="#">DROP_QUEUE_TABLE Procedure</a>             | Drops an existing queue table                                                                                                                                                    |

**Table 24-10 (Cont.) DBMS\_AQADM Package Subprograms**

| Subprograms                                           | Description                                                                                                                                                               |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ENABLE_DB_ACCESS Procedure</a>            | Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user                                                                      |
| <a href="#">ENABLE_JMS_TYPES Procedure</a>            | A precondition for the enqueue of JMS types and XML types                                                                                                                 |
| <a href="#">ENABLE_PROPAGATION_SCHEDULE Procedure</a> | Enables a previously disabled propagation schedule                                                                                                                        |
| <a href="#">GET_MAX_STREAMS_POOL Procedure</a>        | Retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit                                                                                 |
| <a href="#">GET_MIN_STREAMS_POOL Procedure</a>        | Retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit                                                                                 |
| <a href="#">GET_QUEUE_PARAMETER Procedure</a>         | Used to get different parameters for sharded queues at queue or database level.                                                                                           |
| <a href="#">GET_WATERMARK Procedure</a>               | Retrieves the value of watermark set by the <a href="#">SET_WATERMARK Procedure</a>                                                                                       |
| <a href="#">GRANT_QUEUE_PRIVILEGE Procedure</a>       | Grants privileges on a queue to users and roles                                                                                                                           |
| <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a>      | Grants Oracle Database Advanced Queuing system privileges to users and roles                                                                                              |
| <a href="#">MIGRATE_QUEUE_TABLE Procedure</a>         | Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table |
| <a href="#">PURGE_QUEUE_TABLE Procedure</a>           | Purges messages from queue tables                                                                                                                                         |
| <a href="#">QUEUE_SUBSCRIBERS Function</a>            | Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type<br><code>DBMS_AQADM.AQ\$_subscriber_list_t</code>           |
| <a href="#">REMOVE_SUBSCRIBER Procedure</a>           | Removes a default subscriber from a queue                                                                                                                                 |
| <a href="#">REVOKE_QUEUE_PRIVILEGE Procedure</a>      | Revokes privileges on a queue from users and roles                                                                                                                        |
| <a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a>     | Revokes Oracle Database Advanced Queuing system privileges from users and roles                                                                                           |
| <a href="#">SCHEDULE_PROPAGATION Procedure</a>        | Schedules propagation of messages from a queue to a destination identified by a specific database link                                                                    |
| <a href="#">SET_QUEUE_PARAMETER Procedure</a>         | Used to set different parameters for sharded queues at queue or database level.                                                                                           |
| <a href="#">SET_MAX_STREAMS_POOL Procedure</a>        | Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use                                                                            |
| <a href="#">SET_MIN_STREAMS_POOL Procedure</a>        | Used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use                                                                            |
| <a href="#">SET_WATERMARK Procedure</a>               | Used for Oracle Database Advanced Queuing notification to specify and limit memory use                                                                                    |
| <a href="#">START_QUEUE Procedure</a>                 | Enables the specified queue for enqueueing or dequeuing                                                                                                                   |

**Table 24-10 (Cont.) DBMS\_AQADM Package Subprograms**

| Subprograms                                      | Description                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">STOP_QUEUE Procedure</a>             | Disables enqueueing or dequeuing on the specified queue                                                                       |
| <a href="#">UNSCHEDULE_PROPAGATION Procedure</a> | Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link |
| <a href="#">UNSET_QUEUE_PARAMETER Procedure</a>  | Used to unset different parameters for sharded queues at queue or database level.                                             |
| <a href="#">VERIFY_QUEUE_TYPES Procedure</a>     | Verifies that the source and destination queues have identical types                                                          |

## 24.4.1 ADD\_ALIAS\_TO\_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

### Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(  
    alias           IN VARCHAR2,  
    obj_location    IN VARCHAR2);
```

### Parameters

**Table 24-11 ADD\_ALIAS\_TO\_LDAP Procedure Parameters**

| Parameter    | Description                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------|
| alias        | Name of the alias. Example: west_shipping.                                                       |
| obj_location | The distinguished name of the object (queue, agent or connection factory) to which alias refers. |

### Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.

## 24.4.2 ADD\_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

### Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (  
    queue_name      IN    VARCHAR2,  
    subscriber      IN    sys.aq$_agent,  
    rule            IN    VARCHAR2 DEFAULT NULL,  
    transformation  IN    VARCHAR2 DEFAULT NULL  
    queue_to_queue  IN    BOOLEAN DEFAULT FALSE,  
    delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

## Parameters

**Table 24-12 ADD\_SUBSCRIBER Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name     | Name of the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| subscriber     | Agent on whose behalf the subscription is being defined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| rule           | A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are <code>priority</code> and <code>corrid</code> .<br><br>To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters. |
| transformation | Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| queue_to_queue | If <code>TRUE</code> , propagation is from queue-to-queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| delivery_mode  | The administrator may specify one of <code>DBMS_AQADM.PERSISTENT</code> , <code>DBMS_AQADM.BUFFERED</code> , or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by <code>ALTER_SUBSCRIBER</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule    => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

## 24.4.3 ALTER\_AQ\_AGENT Procedure

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

### Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name          IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http         IN BOOLEAN DEFAULT FALSE,
```

```

enable_smtp          IN BOOLEAN DEFAULT FALSE,
enable_anyp          IN BOOLEAN DEFAULT FALSE )

```

## Parameters

**Table 24-13 ALTER\_AQ\_AGENT Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agent_name             | Specifies the username of the Oracle Database Advanced Queuing Internet agent.                                                                                                                                                                               |
| certification_location | Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required. |
| enable_http            | TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.                                                                                            |
| enable_smtp            | TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.                                                                                   |
| enable_anyp            | TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).                                                                                                                                                        |

## 24.4.4 ALTER\_PROPAGATION\_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

### Syntax

```

DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
    queue_name          IN    VARCHAR2,
    destination          IN    VARCHAR2 DEFAULT NULL,
    duration             IN    NUMBER  DEFAULT NULL,
    next_time            IN    VARCHAR2 DEFAULT NULL,
    latency              IN    NUMBER  DEFAULT 60,
    destination_queue    IN    VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 24-14 ALTER\_PROPAGATION\_SCHEDULE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.                                                                                                                                                                                                    |
| destination | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used. |
| duration    | Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.                                                                                                                                                                                                                                      |

**Table 24-14 (Cont.) ALTER\_PROPAGATION\_SCHEDULE Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next_time         | Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| latency           | <p>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value.</p> <p>For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</p> |
| destination_queue | Name of the target queue to which messages are to be propagated in the form of a dblink                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 24.4.5 ALTER\_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max\_retries, retention\_time, and retry\_delay are not supported for nonpersistent queues.

### Syntax

```
DBMS_AQADM.ALTER_QUEUE (
    queue_name      IN      VARCHAR2,
    max_retries     IN      NUMBER   DEFAULT NULL,
    retry_delay     IN      NUMBER   DEFAULT NULL,
    retention_time  IN      NUMBER   DEFAULT NULL,
    auto_commit     IN      BOOLEAN  DEFAULT TRUE,
    comment         IN      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 24-15 ALTER\_QUEUE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the queue that is to be altered                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| max_retries | <p>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1.</p> <p>A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</p> <p>Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</p> |

**Table 24-15 (Cont.) ALTER\_QUEUE Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>retry_delay</code>    | Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is <code>NULL</code> , which means that the value will not be altered.<br><br>Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.                                                |
| <code>retention_time</code> | Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is <code>NULL</code> , which means that the value will not be altered.                                                                                                                                                                                                                                             |
| <code>auto_commit</code>    | <code>TRUE</code> causes the current transaction, if any, to commit before the <code>ALTER_QUEUE</code> operation is carried out. The <code>ALTER_QUEUE</code> operation become persistent when the call returns. This is the default. <code>FALSE</code> means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.<br><br>Caution: This parameter has been deprecated. |
| <code>comment</code>        | User-specified description of the queue. This user comment is added to the queue catalog. The default value is <code>NULL</code> , which means that the value will not be changed.                                                                                                                                                                                                                                                |

## 24.4.6 ALTER\_QUEUE\_TABLE Procedure

This procedure alters the existing properties of a queue table.

### Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
    queue_table      IN    VARCHAR2,
    comment          IN    VARCHAR2          DEFAULT NULL,
    primary_instance IN    BINARY_INTEGER DEFAULT NULL,
    secondary_instance IN BINARY_INTEGER DEFAULT NULL,
    replication_mode IN    BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 24-16 ALTER\_QUEUE\_TABLE Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>queue_table</code>        | Name of a queue table to be created.                                                                                                                                                                                                                     |
| <code>comment</code>            | Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is <code>NULL</code> which means that the value will not be changed.                                                      |
| <code>primary_instance</code>   | This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is <code>NULL</code> , which means that the current value will not be changed. |
| <code>secondary_instance</code> | The queue table fails over to the secondary instance if the primary instance is not available. The default value is <code>NULL</code> , which means that the current value will not be changed.                                                          |

**Table 24-16 (Cont.) ALTER\_QUEUE\_TABLE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replication_mode | DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode. DBMS_AQADM.NONE if queue is being altered to not be replicated. The default value is NULL. |

## 24.4.7 ALTER\_SHARDED\_QUEUE Procedure

This procedure provides user the ability to alter a sharded queue.

### See Also:

*Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

### Syntax

```
PROCEDURE ALTER_SHARDED_QUEUE (
    queue_name      IN VARCHAR2,
    max_retries     IN NUMBER      DEFAULT NULL,
    comment         IN VARCHAR2    DEFAULT NULL,
    queue_properties IN QUEUE_PROPS_T DEFAULT NULL,
    replication_mode IN BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 24-17 ALTER\_SHARDED\_QUEUE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name       | This parameter specifies the name of the sharded queue. A maximum of 128 characters are allowed.                                                                                                 |
| max_retries      | The maximum number of retries allowed.                                                                                                                                                           |
| comment          | The comment of the queue.                                                                                                                                                                        |
| queue_properties | Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint.<br>Refer to <a href="#">QUEUE_PROPS_T Type</a> for more information about queue_properties. |
| replication_mode | Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode or else DBMS_AQADM.NONE. Default is NULL.                                           |

## 24.4.8 ALTER\_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

### Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (  
    queue_name      IN    VARCHAR2,  
    subscriber      IN    sys.aq$_agent,  
    rule            IN    VARCHAR2  
    transformation IN    VARCHAR2);
```

### Parameters

**Table 24-18 ALTER\_SUBSCRIBER Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name     | Name of the queue.                                                                                                                                                                                                                                                         |
| subscriber     | Agent on whose behalf the subscription is being altered. See " <a href="#">AQ__AGENT Type</a> ".                                                                                                                                                                           |
| rule           | A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.                                                       |
| transformation | Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue. |

### Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema.AQ\$queue\_table\_R* and *schema.AQ\$queue\_table\_S* views.

## 24.4.9 CREATE\_AQ\_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

### Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (  
    agent_name          IN VARCHAR2,  
    certificate_location IN VARCHAR2 DEFAULT NULL,  
    enable_http         IN BOOLEAN DEFAULT FALSE,  
    enable_smtp         IN BOOLEAN DEFAULT FALSE,  
    enable_anyp         IN BOOLEAN DEFAULT FALSE )
```

## Parameters

**Table 24-19 CREATE\_AQ\_AGENT Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agent_name             | Specifies the username of the Oracle Database Advanced Queuing Internet agent.                                                                                                                                                                               |
| certification_location | Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required. |
| enable_http            | TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.                                                                                            |
| enable_smtp            | TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.                                                                                   |
| enable_anyp            | TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).                                                                                                                                                        |

## Usage Notes

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Database Advanced Queuing Internet agents.

## 24.4.10 CREATE\_NP\_QUEUE Procedure

This procedure creates a nonpersistent RAW queue.

### Note:

Nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

## Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
    queue_name          IN          VARCHAR2,
    multiple_consumers  IN          BOOLEAN DEFAULT FALSE,
    comment             IN          VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 24-20 CREATE\_NP\_QUEUE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name | Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> . |

**Table 24-20 (Cont.) CREATE\_NP\_QUEUE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multiple_consumers | FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.<br><br>Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table. |
| comment            | User-specified description of the queue. This user comment is added to the queue catalog.                                                                                                                                                                                                                                                                                 |

**Usage Notes**

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ\$\_MEM\_SC or AQ\$\_MEM\_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

## 24.4.11 CREATE\_QUEUE Procedure

This procedure creates a queue in the specified queue table.

**Syntax**

```
DBMS_AQADM.CREATE_QUEUE (
    queue_name      IN      VARCHAR2,
    queue_table     IN      VARCHAR2,
    queue_type      IN      BINARY_INTEGER DEFAULT NORMAL_QUEUE,
    max_retries     IN      NUMBER          DEFAULT NULL,
    retry_delay     IN      NUMBER          DEFAULT 0,
    retention_time  IN      NUMBER          DEFAULT 0,
    dependency_tracking IN    BOOLEAN        DEFAULT FALSE,
    comment         IN      VARCHAR2        DEFAULT NULL,
    auto_commit     IN      BOOLEAN        DEFAULT TRUE);
```

**Parameters****Table 24-21 CREATE\_QUEUE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> with regard to reserved characters. |
| queue_table | Name of the queue table that will contain the queue.                                                                                                                                                         |

**Table 24-21 (Cont.) CREATE\_QUEUE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_type          | Specifies whether the queue being created is an exception queue or a normal queue. <code>NORMAL_QUEUE</code> means the queue is a normal queue. This is the default. <code>EXCEPTION_QUEUE</code> means it is an exception queue. Only the dequeue operation is allowed on the exception queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| max_retries         | <p>Limits the number of times a dequeue with the <code>REMOVE</code> mode can be attempted on a message. The maximum value of <code>max_retries</code> is <math>2^{31}-1</math>.</p> <p>A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code>. <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <p>Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</p> |
| retry_delay         | <p>Delay time, in seconds, before this message is scheduled for processing again after an application rollback.</p> <p>The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if <code>max_retries</code> is set to 0. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| retention_time      | Number of seconds for which a message is retained in the queue table after being dequeued from the queue. <code>INFINITE</code> means the message is retained forever. <code>NUMBER</code> is the number of seconds for which to retain the messages. The default is 0, no retention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dependency_tracking | Reserved for future use. <code>FALSE</code> is the default. <code>TRUE</code> is not permitted in this release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| comment             | User-specified description of the queue. This user comment is added to the queue catalog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| auto_commit         | <p><code>TRUE</code> causes the current transaction, if any, to commit before the <code>CREATE_QUEUE</code> operation is carried out. The <code>CREATE_QUEUE</code> operation becomes persistent when the call returns. This is the default. <code>FALSE</code> means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</p> <p>Caution: This parameter has been deprecated.</p>                                                                                                                                                                                                                                                                                                                                                                                         |

### Usage Notes

All queue names must be unique within a schema. After a queue is created with `CREATE_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

## 24.4.12 CREATE\_QUEUE\_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

### Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
    queue_table          IN      VARCHAR2,
    queue_payload_type   IN      VARCHAR2,
    storage_clause       IN      VARCHAR2          DEFAULT NULL,
    sort_list            IN      VARCHAR2          DEFAULT NULL,
    multiple_consumers   IN      BOOLEAN           DEFAULT FALSE,
    message_grouping     IN      BINARY_INTEGER    DEFAULT NONE,
    comment              IN      VARCHAR2          DEFAULT NULL,
    auto_commit          IN      BOOLEAN           DEFAULT TRUE,
    primary_instance     IN      BINARY_INTEGER    DEFAULT 0,
    secondary_instance   IN      BINARY_INTEGER    DEFAULT 0,
    compatible           IN      VARCHAR2          DEFAULT NULL,
    secure               IN      BOOLEAN           DEFAULT FALSE,
    replication_mode     IN      BINARY_INTEGER    DEFAULT NONE);
```

### Parameters

**Table 24-22 CREATE\_QUEUE\_TABLE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_table        | Name of a queue table to be created                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| queue_payload_type | Type of the user data stored. See Type Name in <a href="#">DBMS_AQ Data Types</a> for valid values for this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| storage_clause     | Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause.<br><br>If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <i>Oracle Database SQL Language Reference</i> for the usage of these parameters. |

**Table 24-22 (Cont.) CREATE\_QUEUE\_TABLE Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sort_list          | <p>The columns to be used as the sort key in ascending order. This parameter has the following format:</p> <pre>'sort_column_1,sort_column_2'</pre> <p>The allowed column names are <code>priority</code>, <code>enq_time</code>, and <code>commit_time</code>. If both columns are specified, then <code>sort_column_1</code> defines the most significant order.</p> <p>After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.</p> <p>If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.</p> <p>Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its <code>msgid</code> or <code>correlation</code>. <code>msgid</code>, <code>correlation</code>, and <code>sequence_deviation</code> take precedence over the default dequeuing order, if they are specified.</p> <p>When <code>commit_time</code> is specified for the <code>sort_list</code> parameter the resulting queue table uses commit-time ordering.</p> <p>See also "Priority and Ordering of Messages" in <i>Oracle Database Advanced Queuing User's Guide</i> for information about message ordering in Oracle Database Advanced Queuing.</p> |
| multiple_consumers | <p><code>FALSE</code> means queues created in the table can only have one consumer for each message. This is the default. <code>TRUE</code> means queues created in the table can have multiple consumers for each message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| message_grouping   | <p>Message grouping behavior for queues created in the table. <code>NONE</code> means each message is treated individually. <code>TRANSACTIONAL</code> means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The default value is 0, which means that the queue table will fail over to any available instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| compatible         | <p>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 24-22 (Cont.) CREATE\_QUEUE\_TABLE Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>secure</code>           | This parameter must be set to <code>TRUE</code> if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users. |
| <code>replication_mode</code> | <code>DBMS_AQADM.REPLICATION_MODE</code> if queue is being created in the Replication Mode or else <code>DBMS_AQADM.NONE</code> . Default is <code>DBMS_AQADM.NONE</code> .                                                                                                                                                                                                                                                                                                     |

### Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions

`aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

`CLOB`, `BLOB`, and `BFILE` are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only `CLOB` and `BLOB` can be propagated using Oracle Database Advanced Queuing propagation in Oracle8i release 8.1.5 or later. See the *Oracle Database Advanced Queuing User's Guide* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the `init.ora`. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

## 24.4.13 CREATE\_SHARDED\_QUEUE Procedure

The `CREATE_SHARDED_QUEUE` API creates a queue and its queue table as appropriate for a sharded queue. This API cannot be used to create unsharded queues. Sharded queues must be created using this single integrated API that will automatically set AQ properties as needed.

Sharded queues may be either a single consumer or a multi-consumer queue.

### Syntax

```
PROCEDURE CREATE_SHARDED_QUEUE (
    queue_name          IN VARCHAR2,
    storage_clause       IN VARCHAR2          DEFAULT NULL,
    multiple_consumers   IN BOOLEAN           DEFAULT FALSE,
    max_retries          IN NUMBER            DEFAULT NULL,
    comment              IN VARCHAR2          DEFAULT NULL,
    queue_payload_type    IN VARCHAR2          DEFAULT JMS_TYPE,
    queue_properties     IN QUEUE_PROPS_T     DEFAULT NULL,
    replication_mode     IN BINARY_INTEGER   DEFAULT NONE);
```

### Parameters

**Table 24-23 CREATE\_SHARDED\_QUEUE Procedure Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>queue_name</code>         | This required parameter specifies the name of the new queue. Maximum of 128 characters allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>storage_clause</code>     | <p>The storage parameter is included in the <code>CREATE TABLE</code> statement when the queue table is created. The <code>storage_clause</code> argument can take any text that can be used in a standard <code>CREATE TABLE storage_clause</code> argument. The storage parameter can be made up of any combinations of the following parameters: <code>PCTFREE</code>, <code>PCTUSED</code>, <code>INITRANS</code>, <code>MAXTRANS</code>, <code>TABLESPACE</code>, <code>LOB</code>, and a table storage clause.</p> <p>If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <i>Oracle Database SQL Language Reference</i> for the usage of these parameters.</p> |
| <code>multiple_consumers</code> | <p><code>FALSE</code> means queues can only have one consumer for each message. This is the default. <code>TRUE</code> means queues created in the table can have multiple consumers for each message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>max_retries</code>        | <p>This optional parameter limits the number of times that a dequeue can be attempted on a message after a failure. The maximum value of <code>max_retries</code> is <math>2^{31} - 1</math>. After the retry limit has been exceeded, the message will be purged from the queue. <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p>                                                                                                                                                                                                                                                                                       |
| <code>comment</code>            | This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>queue_payload_type</code> | Payload can be <code>RAW</code> , <code>DBMS_AQADM.JMS_TYPE</code> , or an object type. Default is <code>DBMS_AQADM.JMS_TYPE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 24-23 (Cont.) CREATE\_SHARDED\_QUEUE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_properties | Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint.<br>Refer to <a href="#">QUEUE_PROPS_T Type</a> for more information about queue_properties. |
| replication_mode | Reserved for future use. DBMS_AQADM.REPLICATION_MODE if Queue is being created in the Replication Mode or else DBMS_AQADM.NONE.<br>Default is DBMS_AQADM.NONE.                                   |

## 24.4.14 CREATE\_EXCEPTION\_QUEUE Procedure

The CREATE\_EXCEPTION\_QUEUE API creates an exception queue for a sharded queue.

### Syntax

```
PROCEDURE CREATE_EXCEPTION_QUEUE (
    sharded_queue_name    IN VARCHAR2,
    exception_queue_name  IN VARCHAR2 DEFAULT NULL
);
```

### Parameters

**Table 24-24 CREATE\_EXCEPTION\_QUEUE Procedure Parameters**

| Parameter            | Description                      |
|----------------------|----------------------------------|
| sharded_queue_name   | The name of the sharded queue.   |
| exception_queue_name | The name of the exception queue. |

## 24.4.15 DEL\_ALIAS\_FROM\_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

### Syntax

```
DBMS_AQADM.DEL_ALIAS_FROM_LDAP (
    alias IN VARCHAR2);
```

### Parameters

**Table 24-25 DEL\_ALIAS\_FROM\_LDAP Procedure Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| alias     | The alias to be removed. |

## 24.4.16 DISABLE\_DB\_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

### Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
    agent_name          IN VARCHAR2,
    db_username         IN VARCHAR2)
```

### Parameters

**Table 24-26** DISABLE\_DB\_ACCESS Procedure Parameters

| Parameter   | Description                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------|
| agent_name  | Specifies the username of the Oracle Database Advanced Queuing Internet agent.                                           |
| db_username | Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent. |

### Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the [ENABLE\\_DB\\_ACCESS Procedure](#).

## 24.4.17 DISABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure disables a propagation schedule.

### Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
    queue_name          IN VARCHAR2,
    destination         IN VARCHAR2 DEFAULT NULL,
    destination_queue   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 24-27** DISABLE\_PROPAGATION\_SCHEDULE Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name        | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.                                                                                                                                                                                                                  |
| destination       | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used. |
| destination_queue | Name of the target queue to which messages are to be propagated in the form of a dblink                                                                                                                                                                                                                                                                                                         |

## 24.4.18 DROP\_AQ\_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

### Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
    agent_name          IN VARCHAR2)
```

### Parameters

**Table 24-28 DROP\_AQ\_AGENT Procedure Parameters**

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| agent_name | Specifies the username of the Oracle Database Advanced Queuing Internet agent |

## 24.4.19 DROP\_QUEUE Procedure

This procedure drops an existing queue.

### Syntax

```
DBMS_AQADM.DROP_QUEUE (
    queue_name          IN   VARCHAR2,
    auto_commit         IN   BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 24-29 DROP\_QUEUE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the queue that is to be dropped.                                                                                                                                                                                                                                                                                                                                 |
| auto_commit | TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.<br>Caution: This parameter has been deprecated. |

### Usage Notes

DROP\_QUEUE is not allowed unless STOP\_QUEUE has been called to disable the queue for both enqueueing and dequeuing. All the queue data is deleted as part of the drop operation.

## 24.4.20 DROP\_QUEUE\_TABLE Procedure

This procedure drops an existing queue table.

### Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
    queue_table         IN   VARCHAR2,
```

```

force          IN    BOOLEAN DEFAULT FALSE,
auto_commit    IN    BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 24-30 DROP\_QUEUE\_TABLE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_table | Name of a queue table to be dropped.                                                                                                                                                                                                                                                                                                                                                 |
| force       | FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.                                                                                                                                                                                                      |
| auto_commit | TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.<br>Caution: This parameter has been deprecated. |

## Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

## 24.4.21 DROP\_SHARDED\_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system.

You must stop the queue before calling `DROP_SHARDED_QUEUE`. User must stop the queue explicitly if `force` is set to `FALSE` before calling `DROP_SHARDED_QUEUE`. If `force` is set to `TRUE` then queue will be stopped internally and then dropped.

## Syntax

```

DBMS_AQADM.DROP_SHARDED_QUEUE (
    queue_name IN VARCHAR2,
    force      IN BOOLEAN DEFAULT FALSE )

```

## Parameters

**Table 24-31 DROP\_SHARDED\_QUEUE Procedure Parameters**

| Parameter  | Description                                                      |
|------------|------------------------------------------------------------------|
| queue_name | This required parameter specifies the name of the sharded queue. |
| force      | The sharded queue is dropped even if the queue is not stopped.   |

## 24.4.22 ENABLE\_DB\_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

### Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
    agent_name          IN VARCHAR2,
    db_username         IN VARCHAR2)
```

### Parameters

**Table 24-32** ENABLE\_DB\_ACCESS Procedure Parameters

| Parameter   | Description                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------|
| agent_name  | Specifies the username of the Oracle Database Advanced Queuing Internet agent.                                         |
| db_username | Specified the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent. |

### Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the [CREATE\\_AQ\\_AGENT Procedure](#).

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

The SYS.AQ\$INTERNET\_USERS view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.

## 24.4.23 ENABLE\_JMS\_TYPES Procedure

Enqueue JMS types and XML types.

### Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
    queue_table IN VARCHAR2);
```

### Parameters

**Table 24-33** ENABLE\_JMS\_TYPES Procedure Parameters

| Parameter   | Description                                                            |
|-------------|------------------------------------------------------------------------|
| queue_table | Specifies name of the queue table to be enabled for JMS and XML types. |

## 24.4.24 ENABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

### Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name      IN   VARCHAR2,
    destination     IN   VARCHAR2 DEFAULT NULL,
    destination_queue IN   VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 24-34** ENABLE\_PROPAGATION\_SCHEDULE Procedure Parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name        | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.                                                                                                                                                                                                                  |
| destination       | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used. |
| destination_queue | Name of the target queue to which messages are to be propagated in the form of a dblink                                                                                                                                                                                                                                                                                                         |

## 24.4.25 GET\_MAX\_STREAMS\_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

### Syntax

```
DBMS_AQADM.GET_MAX_STREAMS_POOL (
    value OUT NUMBER);
```

### Parameters

**Table 24-35** GET\_MAX\_STREAMS\_POOL Procedure Parameter

| Parameter | Description         |
|-----------|---------------------|
| value     | Value in megabytes. |

## 24.4.26 GET\_MIN\_STREAMS\_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

### Syntax

```
DBMS_AQADM.GET_MIN_STREAMS_POOL (
    value OUT NUMBER);
```

## Parameters

**Table 24-36** GET\_MIN\_STREAMS\_POOL Procedure Parameter

| Parameter | Description         |
|-----------|---------------------|
| value     | Value in megabytes. |

## 24.4.27 GET\_QUEUE\_PARAMETER Procedure

This procedure allows user to get different parameters for sharded queues at queue or database level.

For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

### See Also:

*Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

## Syntax

```
PROCEDURE GET_QUEUE_PARAMETER(  
    queue_name      IN VARCHAR2,  
    param_name      IN VARCHAR2,  
    param_value     OUT NUMBER);
```

## Parameters

**Table 24-37** GET\_QUEUE\_PARAMETER Procedure Parameters

| Parameter   | Description                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------|
| queue_name  | The name of the sharded queue.                                                                                             |
| param_name  | The name of the parameter. <a href="#">Table 24-38</a> and <a href="#">Table 24-39</a> describe the valid parameter names. |
| param_value | The value of the parameter.                                                                                                |

**Table 24-38** Sharded queue parameters

| Parameter Name | Scope       | Allowed Values | Description                                     |
|----------------|-------------|----------------|-------------------------------------------------|
| SHARD_NUM      | Queue level | [1, UB4MAXVAL] | Maximum number of shards allowed for the queue. |

**Table 24-38 (Cont.) Sharded queue parameters**

| Parameter Name    | Scope       | Allowed Values | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY_BASED_ENQUEUE | Queue level | [0,1]          | <p>When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set.</p> <p>When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.</p> |
| STICKY_DEQUEUE    | Queue level | [0,1]          | <p>When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set.</p> <p>When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.</p>                                                         |

**Table 24-39 Key-based Parameters**

| Parameter Name       | Scope       | Description                                                                                                                                                                                                              |
|----------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AQ\$KEY_TO_SHARD_MAP | Queue level | Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped. |

**Table 24-39 (Cont.) Key-based Parameters**

| Parameter Name         | Scope       | Description                                                                                                                                          |
|------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| AQ\$GET_KEY_SHARD_INST | Queue level | Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter. |

**Example 24-1 Key to shard mapping**

Users can explicitly map a new key to an existing shard or to a new shard.

To map a key value 'RED' to a shard with id 0 for queue named MY\_SHQ1, submit the following:

```
execute
    dbms_aqadm.set_queue_paramter('MY_SHQ1', 'AQ$KEY_TO_SHARD_MAP=RED',
0);
```

If a key is being enqueued which has not been explicitly mapped to a shard, then one of the shards is chosen at random and mapped to that key permanently. Once a key is mapped to shard, the mapping cannot be changed.

To get the shard identifier for a key which is mapped already, submit the following:

```
declare
    pval number;
begin
    dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD=RED', pval);
    dbms_output.put_line('The key RED is mapped to shard id ' || pval);
END;
/
```

**Example 24-2 Key to instance mapping**

User sharding performs best when cross instance enqueues are not involved. To know the instance where a key can be enqueued without any cross instance enqueue, submit the following:

```
declare
    pval number;
begin
    dbms_aqadm.get_queue_parameter('MY_SHQ1', 'AQ$GET_KEY_SHARD_INST=RED', pval);
    dbms_output.put_line('The key RED is owned by instance id ' || pval);
END;
/
```

## 24.4.28 GET\_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET\_WATERMARK.

**Syntax**

```
DBMS_AQADM.GET_WATERMARK (
    wmvalue      IN      NUMBER);
```

## Parameters

**Table 24-40 GET\_WATERMARK Procedure Parameter**

| Parameter | Description                   |
|-----------|-------------------------------|
| wmvalue   | Watermark value in megabytes. |

## 24.4.29 GRANT\_QUEUE\_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are `ENQUEUE` or `DEQUEUE`. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

### Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (  
    privilege      IN    VARCHAR2,  
    queue_name     IN    VARCHAR2,  
    grantee        IN    VARCHAR2,  
    grant_option   IN    BOOLEAN := FALSE);
```

## Parameters

**Table 24-41 GRANT\_QUEUE\_PRIVILEGE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege    | The Oracle Database Advanced Queuing queue privilege to grant. The options are <code>ENQUEUE</code> , <code>DEQUEUE</code> , and <code>ALL</code> . <code>ALL</code> means both <code>ENQUEUE</code> and <code>DEQUEUE</code> .                                                                                                                      |
| queue_name   | Name of the queue.                                                                                                                                                                                                                                                                                                                                   |
| grantee      | Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.                                                                                                                                                                                                                                                                   |
| grant_option | Specifies if the access privilege is granted with the <code>GRANT</code> option or not. If the privilege is granted with the <code>GRANT</code> option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is <code>FALSE</code> . |

## 24.4.30 GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles.

The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. Initially, only `SYS` and `SYSTEM` can use this procedure successfully.

### Note:

Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

## Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (  
    privilege      IN    VARCHAR2,  
    grantee       IN    VARCHAR2,  
    admin_option  IN    BOOLEAN := FALSE);
```

## Parameters

**Table 24-42 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege    | The Oracle Database Advanced Queuing system privilege to grant. The options are <code>ENQUEUE_ANY</code> , <code>DEQUEUE_ANY</code> , and <code>MANAGE_ANY</code> . <code>ENQUEUE_ANY</code> means users granted this privilege are allowed to enqueue messages to any queues in the database. <code>DEQUEUE_ANY</code> means users granted this privilege are allowed to dequeue messages from any queues in the database. <code>MANAGE_ANY</code> means users granted this privilege are allowed to run <code>DBMS_AQADM</code> calls on any schemas in the database. |
| grantee      | Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| admin_option | Specifies if the system privilege is granted with the <code>ADMIN</code> option or not. If the privilege is granted with the <code>ADMIN</code> option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is <code>FALSE</code> .                                                                                                                                                                                                                                                                    |

### Note:

Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

## 24.4.31 MIGRATE\_QUEUE\_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

## Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table  IN    VARCHAR2,  
    compatible   IN    VARCHAR2);
```

## Parameters

**Table 24-43 MIGRATE\_QUEUE\_TABLE Procedure Parameters**

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| queue_table | Specifies name of the queue table to be migrated. |

**Table 24-43 (Cont.) MIGRATE\_QUEUE\_TABLE Procedure Parameters**

| Parameter  | Description                                                                                                              |
|------------|--------------------------------------------------------------------------------------------------------------------------|
| compatible | Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table. |

## 24.4.32 PURGE\_QUEUE\_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

### Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table      IN   VARCHAR2,
    purge_condition  IN   VARCHAR2,
    purge_options    IN   aq$_purge_options_t);
```

where type `aq$_purge_options_t` is described in [Oracle Database Advanced Queuing \(AQ\) Types](#).

### Parameters

**Table 24-44 PURGE\_QUEUE\_TABLE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_table     | Specifies the name of the queue table to be purged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| purge_condition | <p>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of <code>aq\$queue_table_name</code> view.</p> <p>When specifying the <code>purge_condition</code>, qualify the column names in <code>aq\$queue_table_name</code> view with <code>qtview</code>.</p> <p>To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or <code>' '</code> (two single quotes).</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| purge_options   | <p>Type <code>aq\$_purge_options_t</code> contains a <code>block</code> parameter and a <code>delivery_mode</code> parameter.</p> <ul style="list-style-type: none"> <li>If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>. The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> <li><code>delivery_mode</code> is used to specify whether <code>DBMS_AQADM.PERSISTENT</code>, <code>DBMS_AQADM.BUFFERED</code> or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.</li> </ul> |

### Usage Notes

- You can purge selected messages from the queue table by specifying a `purge_condition`. [Table 24-44](#) describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.
- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

## 24.4.33 QUEUE\_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`.

Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$queue_table_name_S` view.

### Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name          IN          VARCHAR2);
RETURN AQ$_subscriber_list_t IS
```

### Parameters

**Table 24-45** QUEUE\_SUBSCRIBERS Function Parameters

| Parameter               | Description                                              |
|-------------------------|----------------------------------------------------------|
| <code>queue_name</code> | Specifies the queue whose subscribers are to be printed. |

## 24.4.34 REMOVE\_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

### Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
    queue_name          IN          VARCHAR2,
    subscriber          IN          sys.aq$_agent);
```

### Parameters

**Table 24-46** REMOVE\_SUBSCRIBER Procedure Parameters

| Parameter               | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| <code>queue_name</code> | Name of the queue.                                                |
| <code>subscriber</code> | Agent who is being removed. See <a href="#">AQ\$_AGENT Type</a> . |

## 24.4.35 REVOKE\_QUEUE\_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are `ENQUEUE` or `DEQUEUE`.

### Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
    privilege      IN      VARCHAR2,
    queue_name     IN      VARCHAR2,
    grantee        IN      VARCHAR2);
```

### Parameters

**Table 24-47 REVOKE\_QUEUE\_PRIVILEGE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege  | The Oracle Database Advanced Queuing queue privilege to revoke. The options are <code>ENQUEUE</code> , <code>DEQUEUE</code> , and <code>ALL</code> . <code>ALL</code> means both <code>ENQUEUE</code> and <code>DEQUEUE</code> . |
| queue_name | Name of the queue.                                                                                                                                                                                                               |
| grantee    | Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role. If the privilege has been propagated by the grantee through the <code>GRANT</code> option, then the propagated privilege is also revoked.     |

### Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the `GRANT` option are revoked if the grantor's privileges are revoked.

## 24.4.36 REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY` and `MANAGE_ANY`. The `ADMIN` option for a system privilege cannot be selectively revoked. Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

### Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
    privilege      IN      VARCHAR2,
    grantee        IN      VARCHAR2);
```

## Parameters

**Table 24-48 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| privilege | The Oracle Database Advanced Queuing system privilege to revoke. The options are <code>ENQUEUE_ANY</code> , <code>DEQUEUE_ANY</code> , and <code>MANAGE_ANY</code> . The <code>ADMIN</code> option for a system privilege cannot be selectively revoked. |

### Note:

Starting from Oracle Database 12c Release 2, `MANAGE_ANY`, `ENQUEUE_ANY`, and `DEQUEUE_ANY` privileges will not allow access to `SYS` owned queues by users other than `SYS`.

grantee      Grantee(s). The grantee(s) can be a user, a role, or the `PUBLIC` role.

## 24.4.37 SCHEDULE\_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

### Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
    queue_name          IN    VARCHAR2,
    destination          IN    VARCHAR2 DEFAULT NULL,
    start_time           IN    DATE      DEFAULT SYSDATE,
    duration             IN    NUMBER    DEFAULT NULL,
    next_time            IN    VARCHAR2  DEFAULT NULL,
    latency              IN    NUMBER    DEFAULT 60,
    destination_queue    IN    VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 24-49 SCHEDULE\_PROPAGATION Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.                                                                                                                                                                                                                                                         |
| destination | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 390 bytes, and if the name is not fully qualified, then the default domain name is used. The pattern <code>schema.queue@dblink</code> is used. |

**Table 24-49 (Cont.) SCHEDULE\_PROPAGATION Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>start_time</code>        | Initial start time for the propagation window for messages from the source queue to the destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>duration</code>          | Duration of the propagation window in seconds. A <code>NULL</code> value means the propagation window is forever or until the propagation is unscheduled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>next_time</code>         | Date function to compute the start of the next propagation window from the end of the current window. If this value is <code>NULL</code> , then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, <code>next_time</code> should be specified as <code>SYSDATE + 1 - duration/86400</code> .                                                                                                                                                                                                                                                                                                                                                           |
| <code>latency</code>           | <p>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued.</p> <p>For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds.</p> <p>It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</p> |
| <code>destination_queue</code> | Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

Messages may also be propagated to other queues in the same database by specifying a `NULL` destination. If a message has multiple recipients at the same destination in either the same or different queues, the message is propagated to all of them at the same time.

Oracle extensions for JMS such as JMS propagation and remote subscribers are not currently supported for sharded queues. Propagation between sharded and non-sharded queues is not supported

## 24.4.38 SET\_QUEUE\_PARAMETER Procedure

This procedure allows user to set different parameters for sharded queues at queue or database level. For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

### See Also:

*Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

### Syntax

```
PROCEDURE SET_QUEUE_PARAMETER(  
    queue_name      IN VARCHAR2,  
    param_name      IN VARCHAR2,  
    param_value     IN NUMBER);
```

### Parameters

**Table 24-50 SET\_QUEUE\_PARAMETER Procedure Parameters**

| Parameter                | Description                                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>queue_name</code>  | The name of the sharded queue.                                                                                             |
| <code>param_name</code>  | The name of the parameter. <a href="#">Table 24-51</a> and <a href="#">Table 24-52</a> describe the valid parameter names. |
| <code>param_value</code> | The value of the parameter.                                                                                                |

**Table 24-51 Sharded queue parameters**

| Parameter Name             | Scope       | Allowed Values | Description                                                                                                                                                                                                                                              |
|----------------------------|-------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SHARD_NUM</code>     | Queue level | [1, UB4MAXVAL] | Maximum number of shards allowed for the queue.                                                                                                                                                                                                          |
| <code>SUBSHARD_SIZE</code> | Queue level | [1, UB2MAXVAL] | Default value is 20,000. This is the size of each partition for allocation of memory in a shard. Each shard consists of multiple subshards, which are allocated, used, and purged automatically based on message enqueue and dequeue rate for the shard. |

**Table 24-51 (Cont.) Sharded queue parameters**

| Parameter Name    | Scope       | Allowed Values | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY_BASED_ENQUEUE | Queue level | [0,1]          | <p>When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set.</p> <p>When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound.</p> |
| STICKY_DEQUEUE    | Queue level | [0,1]          | <p>When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set.</p> <p>When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.</p>                                                         |

**Table 24-52 Key-based Parameters**

| Parameter Name       | Scope       | Description                                                                                                                                                                                                              |
|----------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AQ\$KEY_TO_SHARD_MAP | Queue level | Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped. |

**Table 24-52 (Cont.) Key-based Parameters**

| Parameter Name         | Scope       | Description                                                                                                                                          |
|------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| AQ\$GET_KEY_SHARD_INST | Queue level | Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter. |

**Example 24-3 Create a sharded queue with key based enqueues**

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure DBMS\_AQADM.SET\_QUEUE\_PARAMETER is called after CREATE\_SHARDED\_QUEUE.

```
execute
    sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');

execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'KEY_BASED_ENQUEUE', 1);
```

**Example 24-4 Create a sharded queue with sticky dequeues**

To create a sharded queue with key based enqueues (user sharding), the PL/SQL procedure DBMS\_AQADM.SET\_QUEUE\_PARAMETER is called after CREATE\_SHARDED\_QUEUE.

```
execute
    sys.dbms_aqadm.create_sharded_queue(queue_name => 'MY_SHQ1');

execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'STICKY_DEQUEUE', 1);
```

**Example 24-5 Setting or changing the number of shards**

Once a queue is created, it can have a maximum of 5 shards by default in non-Oracle RAC databases. In Oracle RAC databases, each queue can have a maximum of 5 shards per database instance by default.

```
execute
    dbms_aqadm.set_queue_parameter('MY_SHQ1', 'SHARD_NUM', 200);
```

**Note:**

Odd numbered shard identifiers are reserved for internal use. In the above example, the 200 shard identifiers used will be 0, 2, 4, ..., 398.

#### Example 24-6 Enabling the scrambling and flow control feature using the queue level param/knob enhancement

Spread the concurrent dequeuers across different blocks/buffers to reduce "buffer busy waits" contention, enable scrambled dequeues by setting the following queue parameter.

```
dbms_aqadm.set_queue_parameter('<schema name>.<queue name>',
'CQ_SCRAMBLED_DEQ',
1);
```

Internally restrict the number of concurrent sessions which execute the dequeue select for update on a queue, eventually causing row lock contention and buffer busy waits contention, enable Dequeue Flow Control by setting the following queue parameter:

```
dbms_aqadm.set_queue_parameter('<schema name>.<queue name>',
'CQ_DEQ_FLOWCONTROL',
N);
```

where N is number of internal dequeue sessions allowed to do core work of contentions.

M is the number of actual external dequeue sessions.

And  $N \leq M$ .

### 24.4.39 SET\_MAX\_STREAMS\_POOL Procedure

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

#### Syntax

```
DBMS_AQADM.SET_MAX_STREAMS_POOL (
value IN NUMBER);
```

#### Parameters

**Table 24-53 SET\_MAX\_STREAMS\_POOL Procedure Parameter**

| Parameter | Description         |
|-----------|---------------------|
| value     | Value in megabytes. |

### 24.4.40 SET\_MIN\_STREAMS\_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

#### Syntax

```
DBMS_AQADM.SET_MIN_STREAMS_POOL (
value IN NUMBER);
```

## Parameters

**Table 24-54 SET\_MIN\_STREAMS\_POOL Procedure Parameter**

| Parameter | Description         |
|-----------|---------------------|
| value     | Value in megabytes. |

## 24.4.41 SET\_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

### Syntax

```
DBMS_AQADM.SET_WATERMARK (  
    wmvalue      IN      NUMBER);
```

## Parameters

**Table 24-55 SET\_WATERMARK Procedure Parameter**

| Parameter | Description                   |
|-----------|-------------------------------|
| wmvalue   | Watermark value in megabytes. |

## 24.4.42 START\_QUEUE Procedure

This procedure enables the specified queue for enqueueing or dequeuing.

### Syntax

```
DBMS_AQADM.START_QUEUE (  
    queue_name    IN      VARCHAR2,  
    enqueue       IN      BOOLEAN DEFAULT TRUE,  
    dequeue       IN      BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 24-56 START\_QUEUE Procedure Parameters**

| Parameter  | Description                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name | Name of the queue to be enabled                                                                                                                          |
| enqueue    | Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting. |
| dequeue    | Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting. |

### Usage Notes

After creating a queue, the administrator must use START\_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on

an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

## 24.4.43 STOP\_QUEUE Procedure

This procedure disables enqueueing or dequeuing on the specified queue.

### Syntax

```
DBMS_AQADM.STOP_QUEUE (
    queue_name      IN   VARCHAR2,
    enqueue         IN   BOOLEAN DEFAULT TRUE,
    dequeue         IN   BOOLEAN DEFAULT TRUE,
    wait            IN   BOOLEAN DEFAULT TRUE,
    free_memory     IN   BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 24-57 STOP\_QUEUE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name  | Name of the queue to be disabled                                                                                                                                                                                                                                                               |
| enqueue     | Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.                                                                                                                                     |
| dequeue     | Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.                                                                                                                                     |
| wait        | Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error. |
| free_memory | Specifies whether the queue should be stopped.                                                                                                                                                                                                                                                 |

### Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

## 24.4.44 UNSCHEDULE\_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

### Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
    queue_name      IN   VARCHAR2,
    destination     IN   VARCHAR2 DEFAULT NULL,
    destination_queue IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 24-58 UNSCHEDULE\_PROPAGATION Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name        | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.                                                                                                                                                                                                   |
| destination       | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used. |
| destination_queue | Name of the target queue to which messages are to be propagated in the form of a dblink                                                                                                                                                                                                                                                                                                         |

## 24.4.45 UNSET\_QUEUE\_PARAMETER Procedure

This procedure allows user to unset different parameters for sharded queues at queue or database level.

For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

### See Also:

*Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

## Syntax

```
PROCEDURE UNSET_QUEUE_PARAMETER(
    queue_name      IN VARCHAR2,
    param_name      IN VARCHAR2);
```

## Parameters

**Table 24-59 UNSET\_QUEUE\_PARAMETER Procedure Parameters**

| Parameter  | Description                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------|
| queue_name | The name of the sharded queue.                                                                                             |
| param_name | The name of the parameter. <a href="#">Table 24-60</a> and <a href="#">Table 24-61</a> describe the valid parameter names. |

**Table 24-60 Sharded queue parameters**

| Parameter Name    | Scope       | Allowed Values | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHARD_NUM         | Queue level | [1, UB4MAXVAL] | Maximum number of shards allowed for the queue.                                                                                                                                                                                                                                                                                                                                                                                     |
| SUBSHARD_SIZE     | Queue level | [1, UB2MAXVAL] | Default value is 20,000.<br>This is the size of each partition for allocation of memory in a shard. Each shard consists of multiple subshards, which are allocated, used, and purged automatically based on message enqueue and dequeue rate for the shard.                                                                                                                                                                         |
| KEY_BASED_ENQUEUE | Queue level | [0, 1]         | When set, the shard to which a message gets enqueued is determined by the key value specified in the message. Refer to key-based sharding (link) for more details. This parameter cannot be unset once set.<br><br>When this parameter is not set (default), a session is bound to a shard at the time of first enqueue to the queue. All messages enqueued by the session will go to the same shard to which the session is bound. |
| STICKY_DEQUEUE    | Queue level | [0, 1]         | When set, dequeue session sticks to a shard in the queue. A session is bound to a shard on first dequeue from the queue. All messages dequeued by the session come from the same shard to which it is bound. This parameter cannot be unset once set.<br><br>When this parameter is not set, messages dequeued by a session can spread across multiple shards of the queue.                                                         |

**Table 24-61 Key-based Parameters**

| Parameter Name         | Scope       | Description                                                                                                                                                                                                              |
|------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AQ\$KEY_TO_SHARD_MAP   | Queue level | Shard number to which a given key is mapped. When key-based sharding is enabled, this parameter is used to establish mapping between a key and a shard number or retrieve the shard number to which given key is mapped. |
| AQ\$GET_KEY_SHARD_INST | Queue level | Instance number that owns the shard to which a given key is mapped. Applicable only when key-based sharding is enabled. It is a read-only parameter.                                                                     |

**Example 24-7 Disabling the scrambling and flow control feature using the queue level param/knob enhancement**

Spread the concurrent dequeuers across different blocks/buffers to reduce "buffer busy waits" contention, disable scrambled dequeues by unsetting the following queue parameter.

```
dbms_aqadm.unset_queue_parameter('<schema name>.<queue name>',
'CQ_SCRAMBLED_DEQ');
```

Internally restrict the number of concurrent sessions which execute the dequeue select for update on a queue, eventually causing row lock contention and buffer busy waits contention, disable Dequeue Flow Control by unsetting the following queue parameter:

```
dbms_aqadm.unset_queue_parameter('MY_QUEUE', 'CQ_DEQ_FLOWCONTROL');
```

## 24.4.46 VERIFY\_QUEUE\_TYPES Procedure

This procedure verifies that the source and destination queues have identical types.

The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

### Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
  src_queue_name   IN   VARCHAR2,
  dest_queue_name  IN   VARCHAR2,
  destination      IN   VARCHAR2 DEFAULT NULL,
  rc               OUT  BINARY_INTEGER);
```

## Parameters

**Table 24-62** VERIFY\_QUEUE\_TYPES Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_queue_name  | Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.                                                                                                                                                                                                                  |
| dest_queue_name | Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.                                                                                                                                                                                                             |
| destination     | Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used. |
| rc              | Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in <code>rc</code> .                                                                                                                           |

### Note:

- `SYS.AQ$_MESSAGE_TYPES` can have multiple entries for the same source queue, destination queue, and database link, but with different transformations.
- `VERIFY_QUEUE_TYPES` check happens once per AQ propagation schedule and not for every propagated message send.
- In case the payload of the queue is modified then the existing propagation schedule between source and destination queue needs to be dropped and recreated.

# DBMS\_AQELM

The package provides subprograms to manage the configuration of Oracle Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

## See Also:

*Oracle Database Advanced Queuing User's Guide* for detailed information about DBMS\_AQELM

This chapter contains the following topics: DBMS\_AQELM

- [Security Model](#)
- [Summary of DBMS\\_AQELM Subprograms](#)

## 25.1 DBMS\_AQELM Security Model

You need the administrator role `AQ_ADMINISTRATOR_ROLE` to run all procedures in DBMS\_AQELM.

## 25.2 Summary of DBMS\_AQELM Subprograms

This section lists and briefly describes the DBMS\_AQELM subprograms.

**Table 25-1 DBMS\_AQELM Package Subprograms**

| Subprogram                             | Description                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">SET_MAILHOST Procedure</a> | Sets the host name for the SMTP server that the database will use to send out e-mail notifications |
| <a href="#">SET_MAILPORT Procedure</a> | Sets the port number for the SMTP server                                                           |
| <a href="#">SET_SENDFROM Procedure</a> | Sets the sent-from e-mail address                                                                  |

### 25.2.1 SET\_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

#### Syntax

```
DBMS_AQELM.SET_MAILHOST (
    mailhost IN VARCHAR2);
```

## Parameters

**Table 25-2 SET\_MAILHOST Procedure Parameters**

| Parameter | Description            |
|-----------|------------------------|
| mailhost  | SMTP server host name. |

## Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package needs to set the host name before registering for e-mail notifications.

## 25.2.2 SET\_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

### Syntax

```
DBMS_AQELM.SET_MAILPORT (  
    mailport IN NUMBER);
```

## Parameters

**Table 25-3 SET\_MAILPORT Procedure Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| mailport  | SMTP server port number. |

## Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on `DBMS_AQELM` package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

## 25.2.3 SET\_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

### Syntax

```
DBMS_AQELM.SET_SENDFROM (  
    sendfrom IN VARCHAR2);
```

## Parameters

**Table 25-4 SET\_SENDFROM Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| sendfrom  | The sent-from e-mail address. |

### Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package should set the sent-from address before registering for e-mail notifications

# 26

## DBMS\_AQIN

The `DBMS_AQIN` package plays a part in providing secure access to the Oracle JMS interfaces.

### See Also:

*Oracle Database Advanced Queuing User's Guide* for detailed information about `DBMS_AQIN`

This chapter contains the following topic:

- [Security Model](#)

## 26.1 DBMS\_AQIN Security Model

While you should not call any subprograms in the `DBMS_AQIN` package directly, you must have the `EXECUTE` privilege on the `DBMS_AQIN` and `DBMS_AQJMS` packages to use the Oracle JMS interfaces.

Use the following syntax to accomplish this with regard to the `DBMS_AQIN` package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

You must have `EXECUTE` privilege on the `DBMS_AQIN` and `DBMS_AQJMS` packages to use the Oracle JMS interfaces. You can also acquire these rights through the `AQ_USER_ROLE` or the `AQ_ADMINISTRATOR_ROLE`.

### See Also:

*Oracle Database Advanced Queuing User's Guide* for more information on accessing standard and Oracle JMS applications.

# DBMS\_ASSERT

The DBMS\_ASSERT package provides an interface to validate properties of the input value.

## See Also:

*Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Operational Notes](#)
- [Summary of DBMS\\_ASSERT Subprograms](#)

## 27.1 DBMS\_ASSERT Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

## 27.2 Summary of DBMS\_ASSERT Subprograms

This section describes the subprograms of the DBMS\_ASSERT package.

**Table 27-1 DBMS\_ASSERT Package Subprograms**

| Subprogram                                  | Description                                                                                                  |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <a href="#">ENQUOTE_LITERAL Function</a>    | Enquotes a string literal                                                                                    |
| <a href="#">ENQUOTE_NAME Function</a>       | Ensures that a string is enclosed by quotation marks, then checks that the result is a valid SQL identifier. |
| <a href="#">NOOP Functions</a>              | Returns the value without any checking                                                                       |
| <a href="#">QUALIFIED_SQL_NAME Function</a> | Verifies that the input string is a qualified SQL name                                                       |
| <a href="#">SCHEMA_NAME Function</a>        | Verifies that the input string is an existing schema name                                                    |
| <a href="#">SIMPLE_SQL_NAME Function</a>    | Verifies that the input string is a simple SQL name                                                          |
| <a href="#">SQL_OBJECT_NAME Function</a>    | Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object             |

## 27.2.1 ENQUOTE\_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

### Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (  
    str          VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 27-2** *ENQUOTE\_LITERAL Function Parameters*

| Parameter | Description       |
|-----------|-------------------|
| str       | String to enqueue |

### Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.

## 27.2.2 ENQUOTE\_NAME Function

This function encloses the provided string in double quotes (quotation marks). No additional quotes are added if the string was already in quotes (quotation marks). The quoted string is then checked to see if it is a valid (quoted) simple SQL name.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference.

### Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (  
    str          VARCHAR2,  
    capitalize   BOOLEAN DEFAULT TRUE)  
RETURN VARCHAR2;
```

### Parameters

**Table 27-3** *ENQUOTE\_NAME Function Parameters*

| Parameter  | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| str        | String to enqueue                                                                                       |
| capitalize | If TRUE or defaulted, alphabetic characters of str which was not in quotes are translated to upper case |

### Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.

## Examples

```
-- This procedure creates a single column table in the createOneColumnTable's schema.
create or replace procedure createOneColumnTable(proposedTableName varchar2) is
BEGIN
  IF
    (proposedTableName is NULL)
  THEN
    raise value_error;
  END IF;
  -- The use of ENQUOTE_NAME ensures that the table will be created in the
  -- definer's schema and not in some other schema even if the definer has
  -- privileges to create tables in other schemas.
  EXECUTE IMMEDIATE 'create table ' ||
    DBMS_ASSERT.ENQUOTE_NAME(proposedTableName) || ' (c1 number)';
  EXCEPTION
    WHEN
      others
    THEN
      dbms_output.put_line('Table creation failed due to: ' || SQLERRM);
END;
/

-- Examples of ENQUOTE_NAME showing input/output relationships
BEGIN
  -- 'eMp' becomes '"EMP"' since it is unquoted
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('eMp'));
END;
/

BEGIN
  -- For quoted strings, the case is preserved
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"EmP"'));
END;
/

-- Invalid identifier example
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('SCOTT."EMP"'));
END;
/

-- CHR(0) examples
-- The following examples illustrates that CHR(0), the NULL character, cannot appear
-- in the string; such a string poses a SQL injection risk.
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('BAD' || CHR(0) || 'IDENTIFIER'));
END;
/

BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT' || CHR(0) || '.EMP"'));
END;
/

-- Oracle allows a period (.) to be a part of a quoted string
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT.EMP"'));
END;
/
```

```
-- The single quotation mark ('), as opposed to a double quotation mark, can appear in
the string
-- Note: In Oracle, a single quotation mark is specified in a literal using two single
-- quotes. The first quotation mark escapes the second quotation mark in the same way
that
-- backslash (\) in POSIX is an escape character.
BEGIN
    dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('O''LEARY'));
END;
/
```

## 27.2.3 NOOP Functions

This function returns the value without any checking.

### Syntax

```
DBMS_ASSERT.NOOP (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT.NOOP (
    str      CLOB CHARACTER SET ANY_CS)
RETURN      CLOB CHARACTER SET str%CHARSET;
```

### Parameters

**Table 27-4** *NOOP Function Parameters*

| Parameter | Description |
|-----------|-------------|
| str       | Input value |

## 27.2.4 QUALIFIED\_SQL\_NAME Function

This function verifies that the input string is a qualified SQL name.

### Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (
    str      VARCHAR2 CHARACTER SET ANY_CS)
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 27-5** *QUALIFIED\_SQL\_NAME Function Parameters*

| Parameter | Description |
|-----------|-------------|
| str       | Input value |

### Exceptions

ORA44004: string is not a qualified SQL name

### Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> {'.' <simple name>}  
<database link name> ::= <local qualified name> ['@' <connection string>]  
<connection string> ::= <simple name>  
<qualified name> ::= <local qualified name> ['@' <database link name>]
```

## 27.2.5 SCHEMA\_NAME Function

This function verifies that the input string is an existing schema name.

### Syntax

```
DBMS_ASSERT.SCHEMA_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 27-6** SCHEMA\_NAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| str       | Input value |

### Exceptions

ORA44001: Invalid schema name

### Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

## 27.2.6 SIMPLE\_SQL\_NAME Function

This function verifies that the input string is a simple SQL name.

### Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 27-7** SIMPLE\_SQL\_NAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| str       | Input value |

### Exceptions

ORA44003: string is not a simple SQL name

### Usage Notes

- The input value must meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters `_`, `$`, and `#` in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

## 27.2.7 SQL\_OBJECT\_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

### Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 27-8** *SQL\_OBJECT\_NAME Function Parameters*

| Parameter | Description |
|-----------|-------------|
| str       | Input value |

### Exceptions

ORA44002: Invalid object name

### Usage Notes

The use of synonyms requires that the base object exists.

# DBMS\_AUDIT\_MGMT

The `DBMS_AUDIT_MGMT` package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

This chapter contains the following topics:

- [DBMS\\_AUDIT\\_MGMT Overview](#)
- [DBMS\\_AUDIT\\_MGMT Deprecated Subprograms](#)
- [DBMS\\_AUDIT\\_MGMT Security Model](#)
- [DBMS\\_AUDIT\\_MGMT Constants](#)
- [DBMS\\_AUDIT\\_MGMT Views](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#)

## See Also:

- *Oracle Database Security Guide* regarding verifying security access with auditing
- *Oracle Database Upgrade Guide* regarding migrating to unified auditing

## 28.1 DBMS\_AUDIT\_MGMT Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the `AUDIT_TRAIL` initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

In a mixed mode environment, when `AUDIT_TRAIL` is set to `DB`, database records are written to the `AUD$` table. In a unified auditing environment, audit records are written to a read-only table in the `AUDSYS` schema. The contents of this table are available from the `UNIFIED_AUDIT_TRAIL` data dictionary view. When `AUDIT_TRAIL` is set to `OS`, audit records are written to operating system files. When `AUDIT_TRAIL` is set to `XML`, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the `UNIFIED_AUDIT_TRAIL` views.

It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The `DBMS_AUDIT_MGMT` subprograms enable you to efficiently manage your audit trail records.

If you have not yet migrated to unified auditing, the `DBMS_AUDIT_MGMT` package provides a subprogram that allows you to move the database audit trail tables out of the `SYSTEM`

tablespace. This improves overall database performance by reducing the load on the `SYSTEM` tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the `DBMS_AUDIT_MGMT` subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The `DBMS_AUDIT_MGMT` subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The `DBMS_AUDIT_MGMT` package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The `DBMS_AUDIT_MGMT` subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

#### See Also:

*Oracle Database Security Guide* for a detailed description of unified auditing

## 28.2 DBMS\_AUDIT\_MGMT Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following have been deprecated from the `DBMS_AUDIT_MGMT` package starting in Oracle Database 12c release 12.2:

- `DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL` procedure
- `AUDIT_TRAIL_WRITE` mode of the `AUDIT_TRAIL_PROPERTY` parameter of the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY` procedure

These are no longer necessary because audit records now bypass the common logging infrastructure queues and are directly written to a new internal relational table.

## 28.3 DBMS\_AUDIT\_MGMT Security Model

All `DBMS_AUDIT_MGMT` subprograms require the user to have `EXECUTE` privilege over the `DBMS_AUDIT_MGMT` package. The `SYSDBA` and `AUDIT_ADMIN` roles have `EXECUTE` privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the `EXECUTE` privilege on the `DBMS_AUDIT_MGMT` package and be granted the `AUDIT_ADMIN` role.

Executions of the `DBMS_AUDIT_MGMT` subprograms are always audited.

## 28.4 DBMS\_AUDIT\_MGMT Constants

The `DBMS_AUDIT_MGMT` package defines several constants that can be used for specifying parameter values.

These constants shown in the following tables:

- [Table 28-1](#)
- [Table 28-2](#)
- [Table 28-3](#)

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. The following table lists the audit trail type constants.

**Table 28-1 DBMS\_AUDIT\_MGMT Constants - Audit Trail Types**

| Constant                               | Type                     | Description                                                                                                                                                                                                           |
|----------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>AUDIT_TRAIL_ALL</code>           | <code>PLS_INTEGER</code> | All audit trail types. This includes the standard database audit trail ( <code>SYS.AUD\$</code> , <code>SYS.FGA_LOG\$</code> and unified audit trail tables), operating system (OS) audit trail, and XML audit trail. |
| <code>AUDIT_TRAIL_AUD_STD</code>       | <code>PLS_INTEGER</code> | Standard database audit records in the <code>SYS.AUD\$</code> table                                                                                                                                                   |
| <code>AUDIT_TRAIL_DB_STD</code>        | <code>PLS_INTEGER</code> | Both standard audit ( <code>SYS.AUD\$</code> ) and FGA audit( <code>SYS.FGA_LOG\$</code> ) records                                                                                                                    |
| <code>AUDIT_TRAIL_FGA_STD</code>       | <code>PLS_INTEGER</code> | Standard database fine-grained auditing (FGA) records in the <code>SYS.FGA_LOG\$</code> table                                                                                                                         |
| <code>AUDIT_TRAIL_FILES</code>         | <code>PLS_INTEGER</code> | Both operating system (OS) and XML audit trails                                                                                                                                                                       |
| <code>AUDIT_TRAIL_OS</code>            | <code>PLS_INTEGER</code> | Operating system audit trail. This refers to the audit records stored in operating system files.                                                                                                                      |
| <code>AUDIT_TRAIL_UNIFIED</code>       | <code>PLS_INTEGER</code> | Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as <code>UNIFIED_AUDIT_TRAIL</code> .           |
| <code>AUDIT_TRAIL_UNIFIED_FILES</code> | <code>PLS_INTEGER</code> | Operating system spillover files in each database (primary or standby); used in archive or purge operations                                                                                                           |
| <code>AUDIT_TRAIL_UNIFIED_TABLE</code> | <code>PLS_INTEGER</code> | Records from the <code>AUDSYS.AUD\$UNIFIED</code> table; used in archive or purge operations                                                                                                                          |
| <code>AUDIT_TRAIL_XML</code>           | <code>PLS_INTEGER</code> | XML audit trail. This refers to the audit records stored in XML files.                                                                                                                                                |

Audit trail properties determine the audit configuration settings. The following table lists the constants related to audit trail properties.

**Table 28-2 DBMS\_AUDIT\_MGMT Constants - Audit Trail Properties**

| Constant               | Type        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIT_TRAIL_WRITE_MODE | PLS_INTEGER | <p><b>Note:</b> AUDIT_TRAIL_WRITE_MODE has been deprecated starting in Oracle Database 12c release 12.2. It is retained only for backwards compatibility, and has no effect on Oracle Database versions 12.2 and higher.</p> <p>A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUED_WRITE indicates that the audit record can be queued and persisting can be done according the database's flushing strategy.</p> <p>See Also <i>Oracle Database Security Guide</i></p> |
| CLEAN_UP_INTERVAL      | PLS_INTEGER | Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DB_DELETE_BATCH_SIZE   | PLS_INTEGER | Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.                                                                                                                                                                                                                                                                                                                                                                                                        |
| FILE_DELETE_BATCH_SIZE | PLS_INTEGER | Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.                                                                                                                                                                                                                                                                                                                                                                                                            |
| OS_FILE_MAX_AGE        | PLS_INTEGER | Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OS_FILE_MAX_SIZE       | PLS_INTEGER | Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The audit trail purge job cleans the audit trail. The following table lists the constants related to purge job status values.

**Table 28-3 DBMS\_AUDIT\_MGMT Constants - Purge Job Status**

| Constant          | Type        | Description          |
|-------------------|-------------|----------------------|
| PURGE_JOB_DISABLE | PLS_INTEGER | Disables a purge job |
| PURGE_JOB_ENABLE  | PLS_INTEGER | Enables a purge job  |

## 28.5 DBMS\_AUDIT\_MGMT Views

DBMS\_AUDIT\_MGMT views are used to display DBMS\_AUDIT\_MGMT configuration and cleanup events.

These views listed in the following table.

**Table 28-4 Views used by DBMS\_AUDIT\_MGMT**

| View                         | Description                                                   |
|------------------------------|---------------------------------------------------------------|
| DBA_AUDIT_MGMT_CLEAN_EVENTS  | Displays the cleanup event history                            |
| DBA_AUDIT_MGMT_CLEANUP_JOBS  | Displays the currently configured audit trail purge jobs      |
| DBA_AUDIT_MGMT_CONFIG_PARAMS | Displays the currently configured audit trail properties      |
| DBA_AUDIT_MGMT_LAST_ARCH_TS  | Displays the last archive timestamps set for the audit trails |

**See Also:**

*Oracle Database Reference* for more information on these views

## 28.6 DBMS\_AUDIT\_MGMT Subprogram Groups

The `DBMS_AUDIT_MGMT` package subprograms can be grouped into two categories: Audit Trail Management Subprograms and Audit Trail Cleanup Subprograms.

- [Audit Trail Management Subprograms](#)
- [Audit Trail Cleanup Subprograms](#)

### 28.6.1 DBMS\_AUDIT\_MGMT Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

**Table 28-5 Audit Trail Management Subprograms**

| Subprogram                                              | Description                                                                                                                  |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_PARTITION_INTERVAL Procedure</a>      | Changes the unified audit internal relational table's partition interval                                                     |
| <a href="#">CLEAR_AUDIT_TRAIL_PROPERTY Procedure</a>    | Clears the value for the audit trail property that you specify                                                               |
| <a href="#">FLUSH_UNIFIED_AUDIT_TRAIL Procedure</a>     | Writes the unified audit trail records in the SGA queue to disk (deprecated starting with Oracle Database 12c release 12.2)  |
| <a href="#">GET_AUDIT_TRAIL_PROPERTY_VALUE Function</a> | Returns the property value set by the <a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a>                                     |
| <a href="#">GET_LAST_ARCHIVE_TIMESTAMP Function</a>     | Returns the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a> in that database instance              |
| <a href="#">LOAD_UNIFIED_AUDIT_FILES Procedure</a>      | Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace |
| <a href="#">SET_AUDIT_TRAIL_LOCATION Procedure</a>      | Moves the audit trail tables from their current tablespace to a user-specified tablespace                                    |
| <a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a>      | Sets an audit trail property for the audit trail type that you specify                                                       |

**Table 28-5 (Cont.) Audit Trail Management Subprograms**

| Subprogram                                               | Description                                                                                                                 |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>     | Sets a timestamp indicating when the audit records or files were last archived                                              |
| <a href="#">TRANSFER_UNIFIED_AUDIT_RECORDS Procedure</a> | Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD\$UNIFIED relational table |

The [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#) contains a complete listing of all subprograms in the package.

## 28.6.2 DBMS\_AUDIT\_MGMT Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

**Table 28-6 Audit Trail Cleanup Subprograms**

| Subprogram                                              | Description                                                                                                             |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLEAN_AUDIT_TRAIL Procedure</a>             | Deletes audit trail records or files that have been archived                                                            |
| <a href="#">CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</a>  | Clears the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>                                    |
| <a href="#">CREATE_PURGE_JOB Procedure</a>              | Creates a purge job for periodically deleting the audit trail records or files                                          |
| <a href="#">DEINIT_CLEANUP Procedure</a>                | Undoes the setup and initialization performed by the <a href="#">INIT_CLEANUP Procedure</a>                             |
| <a href="#">DROP_OLD_UNIFIED_AUDIT_TABLES Procedure</a> | Drops old unified audit tables following the cloning of a pluggable database (PDB)                                      |
| <a href="#">DROP_PURGE_JOB Procedure</a>                | Drops the purge job created using the <a href="#">CREATE_PURGE_JOB Procedure</a>                                        |
| <a href="#">INIT_CLEANUP Procedure</a>                  | Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records or files        |
| <a href="#">IS_CLEANUP_INITIALIZED Function</a>         | Checks to see if the <a href="#">INIT_CLEANUP Procedure</a> has been run for an audit trail type                        |
| <a href="#">SET_PURGE_JOB_INTERVAL Procedure</a>        | Sets the interval at which the <a href="#">CLEAN_AUDIT_TRAIL Procedure</a> is called for the purge job that you specify |
| <a href="#">SET_PURGE_JOB_STATUS Procedure</a>          | Enables or disables the purge job that you specify                                                                      |

The [Summary of DBMS\\_AUDIT\\_MGMT Subprograms](#) contains a complete listing of all subprograms in the package.

## 28.7 Summary of DBMS\_AUDIT\_MGMT Subprograms

This table lists and describes the subprograms of the DBMS\_AUDIT\_MGMT package

**Table 28-7 DBMS\_AUDIT\_MGMT Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                 |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_PARTITION_INTERVAL Procedure</a>       | Changes the unified audit internal relational table's partition interval                                                                                    |
| <a href="#">CLEAN_AUDIT_TRAIL Procedure</a>              | Deletes audit trail records that have been archived                                                                                                         |
| <a href="#">CLEAR_AUDIT_TRAIL_PROPERTY Procedure</a>     | Clears the value for the audit trail property that you specify                                                                                              |
| <a href="#">CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</a>   | Clears the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>                                                                        |
| <a href="#">CREATE_PURGE_JOB Procedure</a>               | Creates a purge job for periodically deleting the audit trail records                                                                                       |
| <a href="#">DEINIT_CLEANUP Procedure</a>                 | Undoes the setup and initialization performed by the <a href="#">INIT_CLEANUP Procedure</a>                                                                 |
| <a href="#">DROP_OLD_UNIFIED_AUDIT_TABLES Procedure</a>  | Drops old unified audit tables following the cloning of a pluggable database (PDB)                                                                          |
| <a href="#">DROP_PURGE_JOB Procedure</a>                 | Drops the purge job created using the <a href="#">CREATE_PURGE_JOB Procedure</a>                                                                            |
| <a href="#">FLUSH_UNIFIED_AUDIT_TRAIL Procedure</a>      | Writes the unified audit trail records in the SGA queue to disk                                                                                             |
| <a href="#">GET_AUDIT_COMMIT_DELAY Function</a>          | Returns the audit commit delay time as the number of seconds. This is the maximum time that it takes to COMMIT an audit record to the database audit trail. |
| <a href="#">GET_AUDIT_TRAIL_PROPERTY_VALUE Function</a>  | Returns the property value set by the <a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a>                                                                    |
| <a href="#">GET_LAST_ARCHIVE_TIMESTAMP Function</a>      | Returns the timestamp set by the <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a> in that database instance                                             |
| <a href="#">INIT_CLEANUP Procedure</a>                   | Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records                                                     |
| <a href="#">IS_CLEANUP_INITIALIZED Function</a>          | Checks to see if the <a href="#">INIT_CLEANUP Procedure</a> has been run for an audit trail type                                                            |
| <a href="#">LOAD_UNIFIED_AUDIT_FILES Procedure</a>       | Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace                                |
| <a href="#">SET_AUDIT_TRAIL_LOCATION Procedure</a>       | Moves the audit trail tables from their current tablespace to a user-specified tablespace                                                                   |
| <a href="#">SET_AUDIT_TRAIL_PROPERTY Procedure</a>       | Sets the audit trail properties for the audit trail type that you specify                                                                                   |
| <a href="#">SET_LAST_ARCHIVE_TIMESTAMP Procedure</a>     | Sets a timestamp indicating when the audit records were last archived                                                                                       |
| <a href="#">SET_PURGE_JOB_INTERVAL Procedure</a>         | Sets the interval at which the <a href="#">CLEAN_AUDIT_TRAIL Procedure</a> is called for the purge job that you specify                                     |
| <a href="#">SET_PURGE_JOB_STATUS Procedure</a>           | Enables or disables the purge job that you specify                                                                                                          |
| <a href="#">TRANSFER_UNIFIED_AUDIT_RECORDS Procedure</a> | Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD\$UNIFIED relational table                                 |

## 28.7.1 ALTER\_PARTITION\_INTERVAL Procedure

This procedure changes the unified audit internal relational table's partition interval.

### Syntax

```
DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
    interval_number      IN BINARY_INTEGER,
    interval_frequency   IN VARCHAR2);
```

### Parameters

**Table 28-8 ALTER\_PARTITION\_INTERVAL Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interval_number    | Sets how often the database creates partitions for the unified audit internal relational table. For example, to specify that the partition is created every two days, you must enter 2.                                                                       |
| interval_frequency | Sets the frequency for the value that was set in the interval_number setting. For example, for a partition to be created every two days, with interval_number set to 2, you must set interval_frequency to DAY.<br>Supported values are YEAR, MONTH, and DAY. |

### Usage Notes

- The interval frequency that you choose depends on the rate of audit records that are generated in your database. The default setting is for one month. If you have a high audit record rate and are using the default, then too many audit records may be generated in the same partition. In this case, you should change the interval frequency to a more frequent interval, such as one month or one day. If the audit record rate generation is not so high, then you may want to keep it at the default of one month.

### Example

The following example sets the partition interval to occur every two months.

```
BEGIN
  DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL(
    interval_number      => 2,
    interval_frequency   => 'MONTH');
END;
```

## 28.7.2 CLEAN\_AUDIT\_TRAIL Procedure

This procedure deletes audit trail records.

The `CLEAN_AUDIT_TRAIL` procedure is usually called after the [SET\\_LAST\\_ARCHIVE\\_TIMESTAMP Procedure](#) has been used to set the last archived timestamp for the audit records.

### Syntax

```
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type      IN PLS_INTEGER,
    use_last_arch_timestamp IN BOOLEAN DEFAULT TRUE,
```

```

container          IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
database_id        IN NUMBER DEFAULT NULL,
container_guid     IN VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 28-9 CLEAN\_AUDIT\_TRAIL Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type        | The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in <a href="#">Table 28-1</a> .                                                                                                                                                                                                                                                                                                                                                                                                 |
| use_last_arch_timestamp | <p>If you set the If you set the</p> <p>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.</p> <p>A value of <code>TRUE</code> indicates that only audit records created before the last archive timestamp should be deleted.</p> <p>A value of <code>FALSE</code> indicates that all audit records should be deleted.</p> <p>The default value is <code>TRUE</code>. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.</p> |
| container               | <p>Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code>, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.</p>                                                                                                                                                                                                               |
| database_id             | Database ID (DBID) of the audit records to cleanup                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| container_guid          | <p>Container GUID of the audit records to cleanup</p> <p><b>Note:</b> This parameter has been deprecated but is currently retained for backward compatibility.</p>                                                                                                                                                                                                                                                                                                                                                                       |

## Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the `AUDIT_FILE_DEST` parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the `*.aud` files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

### See Also:

"AUDIT\_SYSLOG\_LEVEL" in the *Oracle Database Reference*

- When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (`*.xml`) from the current audit directory.

Oracle database maintains a book-keeping file (`adx_${ORACLE_SID}.txt`) for the XML audit files. This file is not removed by the cleanup procedure.

- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `TRUE`:
  - If you set the `database_id` value for the cleanup operation, then this value is used with the last archive timestamp while `CLEAN_AUDIT_TRAIL` runs. While cleaning up the unified audit records that are present in the database tables, if the `HIGH_VALUE` of an audit table partition is less than last archive timestamp, then those partitions will be dropped directly and for remaining audit table partitions, records will be deleted based on the `database_id` value along with last archive timestamp. However, for the unified audit records that are present during the cleanup of spillover operating system audit files, the `database_id` value is ignored. Cleanup for operating system audit files is based on the last archive timestamp only. If you want to have the `database_id` value used for the cleanup operation of unified audit trail records that are present in the spillover operating system audit files, then load the contents of these files into database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.
  - If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges unified audit records based on the last archive timestamp value irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside. During cleanup, last archive timestamp value of current database ID of the container will be used.
  - The last archive timestamp (LAT) should be set in the individual PDBs. Each individual PDB may have a different LAT. If this is not done, there is a risk that uncollected audit records will be deleted.
- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `FALSE`:
  - If you set the `database_id` value for the cleanup operation, then this value is used while `CLEAN_AUDIT_TRAIL` cleans up the unified audit trail records that are present in database tables. However, the `database_id` value is not used for the cleanup of unified audit trail records that are present in spillover operating system files. If want the `database_id` value to be used in the `CLEAN_AUDIT_TRAIL` operation of unified audit records that are present in spillover operating system audit files, then load the contents of these files to the database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.
  - If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges all unified audit records irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside.

## Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
  audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  use_last_arch_timestamp => TRUE);
END;
```

## 28.7.3 CLEAR\_AUDIT\_TRAIL\_PROPERTY Procedure

This procedure clears the value for the specified audit trail property.

Audit trail properties are set using the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#).

The `CLEAR_AUDIT_TRAIL_PROPERTY` procedure can optionally reset the property value to its default value through the `use_default_values` parameter.

### Syntax

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    audit_trail_type      IN PLS_INTEGER,
    audit_trail_property  IN PLS_INTEGER,
    use_default_values    IN BOOLEAN DEFAULT FALSE) ;
```

### Parameters

**Table 28-10 CLEAR\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_type</code>     | The audit trail type for which the property needs to be cleared. Audit trail types are listed in <a href="#">Table 28-1</a>                                                                                                                                                                                                                                             |
| <code>audit_trail_property</code> | The audit trail property whose value needs to be cleared. You cannot clear the value for the <code>CLEANUP_INTERVAL</code> property. Audit trail properties are listed in <a href="#">Table 28-2</a>                                                                                                                                                                    |
| <code>use_default_values</code>   | Specifies whether the default value of the <code>audit_trail_property</code> should be used in place of the cleared value. A value of <code>TRUE</code> causes the default value of the parameter to be used. A value of <code>FALSE</code> causes the <code>audit_trail_property</code> to have no value. The default value for this parameter is <code>FALSE</code> . |

### Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the `OS_FILE_MAX_SIZE` property.  
  
You can also use this procedure to reset an audit trail property to its default value. You need to set `use_default_values` to `TRUE` when invoking the procedure.
- The `DB_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- If you clear the value of the `DB_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `DB_DELETE_BATCH_SIZE` is still assumed. This is because audit records are always deleted in batches.
- The `FILE_DELETE_BATCH_SIZE` property needs to be individually cleared for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot clear this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.

- If you clear the value of the `FILE_DELETE_BATCH_SIZE` property with `use_default_value` set to `FALSE`, the default value of `FILE_DELETE_BATCH_SIZE` is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the `CLEANUP_INTERVAL` property.
- You cannot clear the value for the `AUDIT_TRAIL_WRITE_MODE` property.

### Examples

The following example calls the `CLEAR_AUDIT_TRAIL_PROPERTY` procedure to clear the value for the audit trail property, `OS_FILE_MAX_SIZE`. The procedure uses a value of `FALSE` for the `USE_DEFAULT_VALUES` parameter. This means that there will be no maximum size threshold for operating system (OS) audit files.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY (
  AUDIT_TRAIL_TYPE      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  AUDIT_TRAIL_PROPERTY  => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
  USE_DEFAULT_VALUES    => FALSE );
END;
```

## 28.7.4 CLEAR\_LAST\_ARCHIVE\_TIMESTAMP Procedure

This procedure clears the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure.

### Syntax

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type      IN PLS_INTEGER,
  rac_instance_number   IN PLS_INTEGER DEFAULT NULL,
  container             IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
  database_id          IN NUMBER DEFAULT NULL,
  container_guid        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 28-11** CLEAR\_LAST\_ARCHIVE\_TIMESTAMP Procedure Parameters

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_type</code>    | The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in <a href="#">Table 28-1</a> .                                                                                                                                                                                                    |
| <code>rac_instance_number</code> | The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is <code>NULL</code> . The <code>rac_instance_number</code> is not relevant for single instance databases. You can find the instance number by issuing the <code>SHOW PARAMETER INSTANCE_NUMBER</code> command in SQL*Plus. |
| <code>container</code>           | Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code> , this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB. |
| <code>database_id</code>         | Database ID (DBID) of the audit records to cleanup                                                                                                                                                                                                                                                                                |

**Table 28-11 (Cont.) CLEAR\_LAST\_ARCHIVE\_TIMESTAMP Procedure Parameters**

| Parameter      | Description                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| container_guid | Container GUID of the audit records to cleanup<br><b>Note:</b> This parameter has been deprecated but is currently retained for backward compatibility. |

### Usage Notes

The following usage notes apply:

- The timestamp for only one `audit_trail_type` can be cleared at a time.
- The following are invalid `audit_trail_type` values for this procedure and cannot be used:
  - `AUDIT_TRAIL_ALL`
  - `AUDIT_TRAIL_DB_STD`
  - `AUDIT_TRAIL_FILES`

### Examples

The following example calls the `CLEAR_LAST_ARCHIVE_TIMESTAMP` procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    rac_instance_number => 1);
END;
```

### Related Topics

- [SET\\_LAST\\_ARCHIVE\\_TIMESTAMP Procedure](#)  
This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

## 28.7.5 CREATE\_PURGE\_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the [CLEAN\\_AUDIT\\_TRAIL Procedure](#) to perform the cleanup operation.

The [SET\\_PURGE\\_JOB\\_INTERVAL Procedure](#) is used to modify the frequency of the purge job.

The [SET\\_PURGE\\_JOB\\_STATUS Procedure](#) is used to enable or disable the purge job.

The [DROP\\_PURGE\\_JOB Procedure](#) is used to drop a purge job created with the `CREATE_PURGE_JOB` procedure.

### Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type          IN PLS_INTEGER,
    audit_trail_purge_interval IN PLS_INTEGER,
    audit_trail_purge_name    IN VARCHAR2,
```

```
use_last_arch_timestamp    IN BOOLEAN DEFAULT TRUE,
container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT) ;
```

## Parameters

**Table 28-12 CREATE\_PURGE\_JOB Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type           | The audit trail type for which the purge job needs to be created. Audit trail types are listed in <a href="#">Table 28-1</a> .                                                                                                                                                                                                                                                   |
| audit_trail_purge_interval | The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.                                                                                                                                                                                                                                                 |
| audit_trail_purge_name     | A name to identify the purge job.                                                                                                                                                                                                                                                                                                                                                |
| use_last_arch_timestamp    | Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.<br>A value of <code>TRUE</code> indicates that only audit records created before the last archive timestamp should be deleted.<br>A value of <code>FALSE</code> indicates that all audit records should be deleted.<br>The default value is <code>TRUE</code> . |
| container                  | Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code> , it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.                                                    |

## Usage Notes

Use this procedure to schedule the [CLEAN\\_AUDIT\\_TRAIL Procedure](#) for your audit trail records.

If the `use_last_arch_timestamp` parameter is set to `TRUE`, the last archive timestamp (LAT) should be set in the individual PDBs. Each individual PDB may have a different LAT. If this is not done, there is a risk that uncollected audit records will be deleted.

## Examples

The following example calls the `CREATE_PURGE_JOB` procedure to create a cleanup job called `CLEANUP`, for all audit trail types. It sets the `audit_trail_purge_interval` parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the `use_last_arch_timestamp` parameter value to `TRUE`. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB (
  audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
  audit_trail_purge_interval => 100 /* hours */,
  audit_trail_purge_name    => 'CLEANUP',
  use_last_arch_timestamp   => TRUE);
END;
```

## 28.7.6 DEINIT\_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the `INIT_CLEANUP` Procedure. The `DEINIT_CLEANUP` procedure clears the value of the `default_cleanup_interval` parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

### Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(  
    audit_trail_type IN PLS_INTEGER,  
    container        IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

### Parameters

**Table 28-13 DEINIT\_CLEANUP Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_type</code> | The audit trail type for which the procedure needs to be called. Audit trail types are listed in <a href="#">Table 28-1</a>                                                                                                                                                                                                                                                                 |
| <code>container</code>        | Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code> , this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only. |

### Usage Notes

You cannot invoke this procedure for `AUDIT_TRAIL_UNIFIED`. Doing so it will raise `ORA-46250`: Invalid value for argument 'AUDIT\_TRAIL\_TYPE'

### Examples

The following example clears the `default_cleanup_interval` parameter setting for the standard database audit trail:

```
BEGIN  
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(  
    AUDIT_TRAIL_TYPE => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);  
END;
```

### Related Topics

- [INIT\\_CLEANUP Procedure](#)  
This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

## 28.7.7 DROP\_OLD\_UNIFIED\_AUDIT\_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable database (PDB).

### Syntax

```
DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (
    container_guid    IN VARCHAR2) ;
```

### Parameters

**Table 28-14 DROP\_OLD\_UNIFIED\_AUDIT\_TABLES Procedure Parameters**

| Parameter      | Description                                    |
|----------------|------------------------------------------------|
| container_guid | Container GUID of the old unified audit tables |

### Usage Notes

When a pluggable database gets cloned, the unified audit tables get newly created in the new pluggable database. To drop the old unified audit tables, use the `DROP_OLD_UNIFIED_AUDIT_TABLES` by specifying the old GUID of the PDB from which the clone was created. You can query the historical GUIDs from the `DBA_PDB_HISTORY` view for the given PDB.

If the `CONTAINER_GUID` that is passed as part of the `DROP_OLD_UNIFIED_AUDIT_TABLES` procedure is the same as the current GUID of the PDB then make sure no audit records are present in the old unified audit tables (common logging infrastructure (CLI) back-end tables), otherwise an `ORA-46250: Invalid value for argument 'CONTAINER_GUID'` error will appear. To avoid the `ORA-46250` error execute the

`DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure by passing the GUID to ensure that you move the unified audit records from old unified audit tables (CLI back-end tables) to the `AUDSYS.AUD$UNIFIED` table.

Only use the `DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES` procedure if the database was upgraded from Oracle Database release 12.1 or earlier. If the database was upgraded from a later release (including release 12.2), then an `ORA-55906: Secure file log [id: 0 name: ORA$AUDIT_NEXTGEN_LOG] does not exist` error will appear. This is because starting with release 12.2, the common logging infrastructure tables that this procedure searches are no longer being created. Instead, the `AUD$UNIFIED` relational table stores the unified audit records.

### Examples

```
BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (
        container_guid => 'E4721865A9321CB5E043EFA9E80A2D77');
END;
```

### Related Topics

- [TRANSFER\\_UNIFIED\\_AUDIT\\_RECORDS Procedure](#)  
This procedure transfers unified audit records that were in a pre-upgraded Oracle database to an internal relational table that is designed to improve read performance.

## 28.7.8 DROP\_PURGE\_JOB Procedure

This procedure drops the purge job created using the CREATE\_PURGE\_JOB Procedure. The name of the purge job is passed as an argument.

### Syntax

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(  
    audit_trail_purge_name    IN VARCHAR2) ;
```

### Parameters

**Table 28-15 DROP\_PURGE\_JOB Procedure Parameters**

| Parameter              | Description                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_purge_name | The name of the purge job which is being deleted. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> . |

### Examples

The following example calls the DROP\_PURGE\_JOB procedure to drop the purge job called CLEANUP.

```
BEGIN  
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(  
    AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');  
END;
```

### Related Topics

- [CREATE\\_PURGE\\_JOB Procedure](#)  
This procedure creates a purge job for periodically deleting the audit trail records.

## 28.7.9 FLUSH\_UNIFIED\_AUDIT\_TRAIL Procedure

This deprecated procedure writes the unified audit trail records in the SGA queue to disk.

### Note:

This procedure has been deprecated starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL (  
    flush_type      IN BINARY_INTEGER  DEFAULT FLUSH_CURRENT_INSTANCE,  
    container       IN BINARY_INTEGER  DEFAULT CONTAINER_CURRENT);
```

## Parameters

**Table 28-16 FLUSH\_UNIFIED\_AUDIT\_TRAIL Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                           |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flush_type | Takes one of the following two arguments: <ul style="list-style-type: none"> <li>FLUSH_CURRENT_INSTANCE - Flushes the audit records from SGA queues in that particular RAC instance</li> <li>FLUSH_ALL_INSTANCES - Flushes the audit records from SGA queues in all the RAC instances</li> </ul>                                      |
| container  | The containers where the SGA queues should be flushed. It takes one of the following two arguments: <ul style="list-style-type: none"> <li>CONTAINER_CURRENT - Flushes the audit records from SGA queues in that particular PDB</li> <li>CONTAINER_ALL - Flushes the audit records from SGA queues in all the active PDBs.</li> </ul> |

## 28.7.10 GET\_AUDIT\_COMMIT\_DELAY Function

This function returns the audit commit delay time as the number of seconds. audit commit delay time is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

### Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
RETURN NUMBER;
```

## 28.7.11 GET\_AUDIT\_TRAIL\_PROPERTY\_VALUE Function

This procedure returns the property value set by the SET\_AUDIT\_TRAIL\_PROPERTY Procedure.

### Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE (
    audit_trail_type      IN PLS_INTEGER,
    audit_trail_property  IN PLS_INTEGER)
RETURN NUMBER;
```

## Parameters

**Table 28-17 GET\_AUDIT\_TRAIL\_PROPERTY\_VALUE Function Parameters**

| Parameter            | Description                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------|
| audit_trail_type     | The audit trail type for the timestamp to be retrieved. Audit trail types are listed in <a href="#">Table 28-1</a> . |
| audit_trail_property | The audit trail property that is being queried. Audit trail properties are listed in <a href="#">Table 28-2</a> .    |

## Return Values

If the property value is cached in SGA memory, this function will return the value set by the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#). Else it will return NULL.

The `GET_AUDIT_TRAIL_PROPERTY_VALUE` function may return an ORA-46250 error if the audit trail property value has been set to `DBMS_AUDIT_MGMT.CLEAN_UP_INTERVAL`. To find the cleanup interval of the purge job, query `SYS.DAM_CLEANUP_JOBS$`.

## Examples

The following example prints the property value of `OS_FILE_MAX_AGE` set by the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#).

```
SET AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
  OS_MAX_AGE_VAL NUMBER;
BEGIN
  OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE (
    audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property  => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE);
  IF OS_MAX_AGE_VAL is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
      OS_MAX_AGE_VAL);
  END IF;
END;
```

## Related Topics

- [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#)  
This procedure sets an audit trail property for the audit trail type that is specified.

## 28.7.12 GET\_LAST\_ARCHIVE\_TIMESTAMP Function

This procedure returns the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure in that database instance.

### Syntax

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP (
  audit_trail_type      IN PLS_INTEGER)
RETURN TIMESTAMP;
```

### Parameters

**Table 28-18** GET\_LAST\_ARCHIVE\_TIMESTAMP Function Parameters

| Parameter                     | Description                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_type</code> | The audit trail type for the timestamp to be retrieved. Supported Audit trail types for this procedure are <code>AUDIT_TRAIL_OS</code> , <code>AUDIT_TRAIL_XML</code> and <code>AUDIT_TRAIL_UNIFIED</code> . All Audit trail types are listed in <a href="#">Table 28-1</a> . |

## Return Values

In a database that is opened for `READ WRITE`, since there will no timestamp stored in SGA memory, this function will return `NULL`. But in a database that is opened for `READ ONLY`, if a timestamp is set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure, the timestamp will be returned. Else it will return `NULL`.

## Usage Notes

This function will return `NULL` on a database that is opened `READ WRITE`. Use `DBA_AUDIT_MGMT_LAST_ARCH_TS` view to check the timestamp set in such a case.

## Examples

The following example prints the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure on a `READ ONLY` database.

```
SET SERVEROUTPUT ON
DECLARE
  LAT_TS TIMESTAMP;
BEGIN
  LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
  IF LAT_TS is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
  END IF;
END;
```

## Related Topics

- [SET\\_LAST\\_ARCHIVE\\_TIMESTAMP Procedure](#)  
This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

## 28.7.13 INIT\_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

If the audit trail tables are in the `SYSTEM` tablespace, then the procedure moves them to the `SYSAUX` tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the `SYSAUX` tablespace by default. If you are not using unified auditing, refer to *Oracle Database Upgrade Guide* for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the `SYSTEM` tablespace enhances overall database performance. The `INIT_CLEANUP` procedure moves the audit trail tables to the `SYSAUX` tablespace. If the [SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure](#) has already moved the audit tables elsewhere, then no tables are moved.

The [SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure](#) enables you to specify an alternate target tablespace for the database audit tables.

The `INIT_CLEANUP` procedure is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. No preliminary set up is required for these audit trail types.

**See Also:**

[Table 28-1](#) for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

**Syntax**

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(  
    audit_trail_type          IN PLS_INTEGER,  
    default_cleanup_interval  IN PLS_INTEGER  
    container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

**Parameters**

**Table 28-19** INIT\_CLEANUP Procedure Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type         | The audit trail type for which the clean up operation needs to be initialized.<br><br>Audit trail types are listed in <a href="#">Table 28-1</a> except AUDIT_TRAIL_UNIFIED                                                                                                                                                                                                                                                                                                                 |
| default_cleanup_interval | The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.                                                                                                                                                                                                                                                                                                                                                     |
| container                | Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all Open and Available pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this initializes the audit trails for clean up in all the Open and Available pluggable databases, otherwise this initializes the audit trail in the connected PDB only. When you add a new PDB you need to initialize the audit trails for clean up in the new PDB using the CONTAINER_CURRENT option. |

**Usage Notes**

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default\_cleanup\_interval later using the [SET\\_AUDIT\\_TRAIL\\_PROPERTY Procedure](#).
- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS\_AUDIT\_MGMT.SET\_AUDIT\_TRAIL\_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT\_CLEANUP procedure.
- Invoking this procedure with AUDIT\_TRAIL\_UNIFIED results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

#### See Also:

["SET\\_AUDIT\\_TRAIL\\_LOCATION Procedure"](#)

### Examples

The following example calls the `INIT_CLEANUP` procedure to set a `default_cleanup_interval` of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type    => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval => 12 /* hours */);
END;
```

#### See Also:

[Table 28-1](#) for a list of all audit trail types

## 28.7.14 IS\_CLEANUP\_INITIALIZED Function

This function checks to see if the `INIT_CLEANUP` Procedure has been run for an audit trail type.

The `IS_CLEANUP_INITIALIZED` function returns `TRUE` if the procedure has already been run for the audit trail type. It returns `FALSE` if the procedure has not been run for the audit trail type.

This function is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The function always returns `TRUE` for these audit trail types. No preliminary set up is required for these audit trail types.

#### See Also:

[Table 28-1](#) for a list of all audit trail types

### Syntax

```
DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
    audit_trail_type IN PLS_INTEGER
    container        IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
RETURN BOOLEAN;
```

## Parameters

**Table 28-20** IS\_CLEANUP\_INITIALIZED Function Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type | The audit trail type for which the function needs to be called. Note that this does not apply to AUDIT_TRAIL_UNIFIED.<br>Audit trail types are listed in <a href="#">Table 28-1</a>                                                                                                                                                                                                                                                                                                       |
| container        | Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). <ul style="list-style-type: none"><li>When CONTAINER is set to CONTAINER_ALL, this function returns the initialization status of all the pluggable databases. The function returns FALSE even if one of the PDBs is not initialized.</li><li>When CONTAINER is set to CONTAINER_CURRENT, this returns the initialization status of the connected PDB.</li></ul> |

## Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the [INIT\\_CLEANUP Procedure](#) to initialize the audit trail type.

```
BEGIN
  IF
    NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD)
  THEN
    DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval => 12 /* hours */);
  END IF;
END;
```

## Related Topics

- [INIT\\_CLEANUP Procedure](#)  
This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

## 28.7.15 LOAD\_UNIFIED\_AUDIT\_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

### See Also:

*Oracle Database Security Guide* for information about moving the OS audit trail records into the unified audit trail

## Syntax

```
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES (
    container          IN BINARY_INTEGER);
```

## Parameters

**Table 28-21** LOAD\_UNIFIED\_AUDIT\_FILES Procedure Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| load_batch_size | Specifies the number of spillover OS audit files to be loaded into the designated unified audit trail tablespace. The load_batch_size parameter can have a minimum value of 1 and maximum value of 32767. The default value is equivalent to DEFAULT_FILE_LOAD_BATCH_SIZE. |

## Usage Notes

- Ensure that you set the audit data designated tablespace to be online before you run the LOAD\_UNIFIED\_AUDIT\_FILES procedure.

## 28.7.16 SET\_AUDIT\_TRAIL\_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET\_AUDIT\_TRAIL\_LOCATION procedure is not relevant for the AUDIT\_TRAIL\_OS, AUDIT\_TRAIL\_XML, and AUDIT\_TRAIL\_FILES audit trail types. The AUDIT\_FILE\_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

### See Also:

- [Table 28-1](#) for a list of all audit trail types
- AUDIT\_FILE\_DEST in the *Oracle Database Reference*

## Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type      IN PLS_INTEGER,
    audit_trail_location_value IN VARCHAR2) ;
```

## Parameters

**Table 28-22** SET\_AUDIT\_TRAIL\_LOCATION Procedure Parameters

| Parameter                  | Description                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type           | The audit trail type for which the audit trail location needs to be set.<br>Audit trail types are listed in <a href="#">Table 28-1</a> |
| audit_trail_location_value | Target location or tablespace for the audit trail records                                                                              |

## Usage Notes

The following usage notes apply:

- Before changing the audit trail location, check the block size of the new location that you plan to use. The block size must be the same size as that of the current audit trail location. Otherwise, an `ORA-14520: Tablespace string block size [string] does not match existing object block size [string] error` appears. To check the block size of a tablespace, query the `USER_TABLESPACES` or `DBA_TABLESPACES` data dictionary view. See *Oracle Database VLDB and Partitioning Guide* for more information about partition restrictions for multiple block sizes.
- By default, audit trail records are written to the `SYSAUX` tablespace. You can change the tablespace location to a user tablespace using this procedure. However the designated tablespace must be an automatic storage space management (ASSM) tablespace.
- This procedure is valid for the following `audit_trail_type` values:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`
  - `AUDIT_TRAIL_UNIFIED`
- For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, you should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.
- This procedure involves data movement across tablespaces. For the `audit_trail_type` values `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, and `AUDIT_TRAIL_DB_STD`, this can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You optionally can specify an encrypted tablespace for the audit trail location.
- When `AUDIT_TRAIL_TYPE` is `AUDIT_TRAIL_UNIFIED`, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource intensive for the unified audit trail.
- The `UNIFIED_AUDIT_TRAIL` data dictionary view is built on top of an internal relational table. This table is an interval partitioned table (irrespective of database editions) with a default interval of 1 month. This setting means that when you execute the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure, only newly created partitions of the internal table are created in the new tablespace that is set as part of this procedure. Existing partitions of this table remain in the earlier tablespace (`SYSAUX` is the default tablespace for this internal table). If you want to change this table's partition interval, then use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure.
- As a best practice to improve performance and the availability of audit records, enable the `AUTOEXTEND` option on the audit tablespace.
- If the tablespace that is specified for the `audit_trail_location_value` parameter has a block size that is different from the current tablespace, then this procedure for `AUDIT_TRAIL_UNIFIED` `audit_trail_type` fails with an `ORA-14520: Tablespace string block size [string] does not match existing object block size [string] error`. This is due to the restrictions of multiple block sizes for partition tables.

## Examples

The following example moves the database audit trail tables, AUD\$ and FGA\_LOG\$, from the current tablespace to a user-created tablespace called RECORDS:

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type          => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value => 'RECORDS');
END;
```

## 28.7.17 SET\_AUDIT\_TRAIL\_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets the properties OS\_FILE\_MAX\_SIZE, OS\_FILE\_MAX\_AGE, and FILE\_DELETE\_BATCH\_SIZE for operating system (OS) and XML audit trail types. The OS\_FILE\_MAX\_SIZE and OS\_FILE\_MAX\_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE\_DELETE\_BATCH\_SIZE property specifies the number of audit trail files that are deleted in one batch.

The procedure sets the properties DB\_DELETE\_BATCH\_SIZE and CLEANUP\_INTERVAL for the database audit trail type. DB\_DELETE\_BATCH\_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP\_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

### Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type          IN PLS_INTEGER,
    audit_trail_property      IN PLS_INTEGER,
    audit_trail_property_value IN PLS_INTEGER) ;
```

### Parameters

**Table 28-23 SET\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

| Parameter            | Description                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------|
| audit_trail_type     | The audit trail type for which the property needs to be set. Audit trail types are listed in <a href="#">Table 28-1</a> |
| audit_trail_property | The audit trail property that is being set. Audit trail properties are listed in <a href="#">Table 28-2</a>             |

**Table 28-23 (Cont.) SET\_AUDIT\_TRAIL\_PROPERTY Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| audit_trail_property_value | <p>The value of the property specified using <code>audit_trail_property</code>. The following are valid values for audit trail properties:</p> <ul style="list-style-type: none"> <li>• <code>OS_FILE_MAX_SIZE</code> can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. <code>OS_FILE_MAX_SIZE</code> is measured in kilobytes (KB).</li> <li>• <code>OS_FILE_MAX_AGE</code> can have a minimum value of 1 and a maximum value of 497. The default value is 5. <code>OS_FILE_MAX_AGE</code> is measured in days.</li> <li>• <code>DB_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. <code>DB_DELETE_BATCH_SIZE</code> is measured as the number of audit records that are deleted in one batch.</li> <li>• <code>FILE_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. <code>FILE_DELETE_BATCH_SIZE</code> is measured as the number of audit files that are deleted in one batch.</li> <li>• <code>CLEANUP_INTERVAL</code> can have a minimum value of 1 and a maximum value of 999. The default value is set using the <a href="#">INIT_CLEANUP Procedure</a>. <code>CLEANUP_INTERVAL</code> is measured in hours.</li> </ul> |

### Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.
- If you have set both the `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

For example, let us take a scenario where `OS_FILE_MAX_SIZE` is 10000 and `OS_FILE_MAX_AGE` is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.

- The `DB_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_AUD_STD` and `AUDIT_TRAIL_FGA_STD` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_DB_STD` and `AUDIT_TRAIL_ALL` audit trail types.
- The `DB_DELETE_BATCH_SIZE` property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
- The `FILE_DELETE_BATCH_SIZE` property needs to be individually set for the `AUDIT_TRAIL_OS` and `AUDIT_TRAIL_XML` audit trail types. You cannot set this property collectively using the `AUDIT_TRAIL_FILES` and `AUDIT_TRAIL_ALL` audit trail types.
- The `FILE_DELETE_BATCH_SIZE` property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the `GEN0` background process for a long time.

- In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is `SYSAUX`. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

### Examples

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_SIZE` property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property  => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    audit_trail_property_value => 102400 /* 100MB*/ );
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `OS_FILE_MAX_AGE` property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property  => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
    audit_trail_property_value => 5 /* days */);
END;
```

The following example calls the `SET_AUDIT_TRAIL_PROPERTY` procedure to set the `DB_DELETE_BATCH_SIZE` property for the `AUDIT_TRAIL_AUD_STD` audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the `SYS.AUD$` table in batches of size 100000.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
    audit_trail_property  => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
    audit_trail_property_value => 100000 /* delete batch size */);
END;
```

## 28.7.18 SET\_LAST\_ARCHIVE\_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

The [CLEAN\\_AUDIT\\_TRAIL Procedure](#) uses this timestamp to decide on the audit records to be deleted.

### Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type      IN PLS_INTEGER,
    last_archive_time     IN TIMESTAMP,
    rac_instance_number   IN PLS_INTEGER DEFAULT NULL,
    container             IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id           IN NUMBER DEFAULT NULL,
    container_guid        IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 28-24 SET\_LAST\_ARCHIVE\_TIMESTAMP Procedure Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_type</code>    | The audit trail type for which the timestamp needs to be set. Audit trail types are listed in <a href="#">Table 28-1</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>last_archive_time</code>   | The <code>TIMESTAMP</code> value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>rac_instance_number</code> | <p>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is <code>NULL</code>.</p> <p>The <code>rac_instance_number</code> parameter is not accepted when <code>AUDIT_TRAIL_TYPE</code> has values:</p> <ul style="list-style-type: none"> <li><code>audit_trail_all</code></li> <li><code>audit_trail_aud_std</code></li> <li><code>audit_trail_db_std</code></li> <li><code>audit_trail_fga_std</code></li> <li><code>audit_trail_unified</code></li> </ul> <p>Set <code>rac_instance_number</code> to 1 for a single-instance database.</p> |
| <code>container</code>           | <p>Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code>, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.</p>                                                                                                                                                                                                                             |
| <code>database_id</code>         | Database ID (DBID) of the audit records to cleanup                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>container_guid</code>      | <p>Container GUID of the audit records to cleanup</p> <p><b>Note:</b> This parameter has been deprecated but is currently retained for backward compatibility.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Usage Notes

The following usage notes apply:

- The `last_archive_time` must be specified in Coordinated Universal Time (UTC) when the audit trail types are `AUDIT_TRAIL_AUD_STD`, `AUDIT_TRAIL_FGA_STD`, or `AUDIT_TRAIL_UNIFIED`. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The `last_archive_time` must be specified as the local time zone time when the audit trail types are `AUDIT_TRAIL_OS` or `AUDIT_TRAIL_XML`. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.
- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

## Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the [CLEAN\\_AUDIT\\_TRAIL Procedure](#), with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2012 14:10:10.0.

```
BEGIN
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
  audit_trail_type      => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
  last_archive_time     => TO_TIMESTAMP('12-SEP-0714:10:10.0', 'DD-MON-RRHH24:MI:SS.FF'),
  rac_instance_number  => 1);
END;
```

## 28.7.19 SET\_PURGE\_JOB\_INTERVAL Procedure

This procedure sets the interval at which the `CLEAN_AUDIT_TRAIL` Procedure is called for the purge job specified.

The purge job must have already been created using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  audit_trail_purge_name      IN VARCHAR2,
  audit_trail_interval_value  IN PLS_INTEGER) ;
```

### Parameters

**Table 28-25 SET\_PURGE\_JOB\_INTERVAL Procedure Parameters**

| Parameter                               | Description                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_purge_name</code>     | The name of the purge job for which the interval is being set. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> .                                           |
| <code>audit_trail_interval_value</code> | The interval, in hours, at which the clean up procedure should be called. This value modifies the <code>audit_trail_purge_interval</code> parameter set using the <a href="#">CREATE_PURGE_JOB Procedure</a> |

### Usage Notes

Use this procedure to modify the `audit_trail_purge_interval` parameter set using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Examples

The following example calls the `SET_PURGE_JOB_INTERVAL` procedure to change the frequency at which the purge job called `CLEANUP` is invoked. The new interval is set to 24 hours.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  AUDIT_TRAIL_PURGE_NAME      => 'CLEANUP',
```

```
AUDIT_TRAIL_INTERVAL_VALUE => 24 );  
END;
```

### Related Topics

This procedure deletes audit trail records.

## 28.7.20 SET\_PURGE\_JOB\_STATUS Procedure

This procedure enables or disables the specified purge job.

The purge job must have already been created using the [CREATE\\_PURGE\\_JOB Procedure](#).

### Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(  
    audit_trail_purge_name    IN VARCHAR2,  
    audit_trail_status_value  IN PLS_INTEGER) ;
```

### Parameters

**Table 28-26 SET\_PURGE\_JOB\_STATUS Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                           |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>audit_trail_purge_name</code>   | The name of the purge job for which the status is being set. This is the purge job name that you specified with the <a href="#">CREATE_PURGE_JOB Procedure</a> .                                                      |
| <code>audit_trail_status_value</code> | One of the values specified in <a href="#">Table 28-3</a> .<br>The value <code>PURGE_JOB_ENABLE</code> enables the specified purge job.<br>The value <code>PURGE_JOB_DISABLE</code> disables the specified purge job. |

### Examples

The following example calls the `SET_PURGE_JOB_STATUS` procedure to enable the `CLEANUP` purge job.

```
BEGIN  
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(  
    audit_trail_purge_name    => 'CLEANUP',  
    audit_trail_status_value  => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);  
END;
```

## 28.7.21 TRANSFER\_UNIFIED\_AUDIT\_RECORDS Procedure

This procedure transfers unified audit records that were in a pre-upgraded Oracle database to an internal relational table that is designed to improve read performance.

In the pre-upgraded Oracle database, these records resided in the common logging infrastructure (CLI) SGA back-end tables.

### Syntax

```
DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS (  
    container_guid    IN VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 28-27 TRANSFER\_UNIFIED\_AUDIT\_RECORDS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container_guid | The GUID of the container of the associated CLI back-end table. This back-end table contains the audit records from the pre-upgraded Oracle database. If you omit this setting, then the GUID of the current container is used. |

## Usage Notes

- It is not mandatory to run `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` after an upgrade, but for better read performance of the unified audit trail, Oracle highly recommends that you run this procedure.
- The `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` is designed to be a one-time operation, to be performed after you upgrade from Oracle Database 12c release 12.1.
- There is one CLI back-end table per GUID of the container. You can find the GUIDs for containers by querying the `PDB_GUID` column of the `DBA_PDB_HISTORY` data dictionary view. Execute the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure by passing each of these GUIDs one by one to ensure that you move the unified audit records from these CLI back-end tables to the `AUDSYS.AUD$UNIFIED` table.
- In a multitenant environment, you must run the `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` procedure only in the container to which the transfer operation applies, whether it is the root or an individual PDB. You cannot run this procedure in the root, for example, to transfer audit records in a PDB.
- If you have a high rate of audit record generation and your database supports partitioning, then you may want to use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure to alter the partition interval setting for the internal relational table. See [ALTER\\_PARTITION\\_INTERVAL Procedure](#) for more information.

# DBMS\_AUDIT\_UTIL

The `DBMS_AUDIT_UTIL` package provides functions that enable you to format the output of queries to the `DBA_FGA_AUDIT_TRAIL`, `DBA_AUDIT_TRAIL`, `UNIFIED_AUDIT_TRAIL`, and `V$XML_AUDIT_TRAIL` views.

This chapter contains the following topics:

- [DBMS\\_AUDIT\\_UTIL Overview](#)
- [DBMS\\_AUDIT\\_UTIL Security Model](#)
- [DBMS\\_AUDIT\\_UTIL Views](#)
- [Summary of DBMS\\_AUDIT\\_UTIL Subprograms](#)

## 29.1 DBMS\_AUDIT\_UTIL Overview

The functions in the `DBMS_AUDIT_UTIL` package enable you to format the output of queries to the `RLS_INFO` column of several audit trail views so that the output appear in separate rows.

These functions use a cursor to find and format each row of the corresponding view. To use the functions in this package, include the function in a query to one of the following views:

- `DBA_FGA_AUDIT_TRAIL` data dictionary view, for the `DECODE_RLS_INFO_ATRAIL_FGA` function
- `DBA_AUDIT_TRAIL` data dictionary view, for the `DECODE_RLS_INFO_ATRAIL_STD` function
- `UNIFIED_AUDIT_TRAIL` data dictionary view, for the `DECODE_RLS_INFO_ATRAIL_UNI` function
- `V$XML_AUDIT_TRAIL` dynamic view, for the `DECODE_RLS_INFO_ATRAIL_XML` function

## 29.2 DBMS\_AUDIT\_UTIL Security Model

All `DBMS_AUDIT_UTIL` subprograms require the user to have `EXECUTE` privilege on the `DBMS_AUDIT_UTIL` package.

The `SYSDBA` administrative privilege and `AUDIT_ADMIN` and `AUDIT_VIEWER` roles have the `EXECUTE` privilege on the `DBMS_AUDIT_UTIL` package by default. An auditor can view audit data after being granted the `AUDIT_VIEWER` role.

Oracle strongly recommends that only audit administrators have the `EXECUTE` privilege on the `DBMS_AUDIT_UTIL` package and be granted the `AUDIT_VIEWER` role.

## 29.3 DBMS\_AUDIT\_UTIL Views

The views in this section display the audit information used by the `DBMS_AUDIT_UTIL` package function.

[Table 29-1](#) displays the `DBMS_AUDIT_UTIL` views.

**Table 29-1 Views Used by DBMS\_AUDIT\_UTIL**

| View                | Description                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| DBA_FGA_AUDIT_TRAIL | Displays fine-grained audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_FGA function |
| DBA_AUDIT_TRAIL     | Displays standard audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_STD function     |
| UNIFIED_AUDIT_TRAIL | Displays unified audit trail information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_XML function       |
| V\$XML_AUDIT_TRAIL  | Displays XML audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATTRAIL_UNI function          |

## 29.4 Summary of DBMS\_AUDIT\_UTIL Subprograms

This table lists the DBMS\_AUDIT\_UTIL subprograms and their descriptions.

**Table 29-2 DBMS\_AUDIT\_UTIL Package Subprograms**

| Subprogram                                           | Description                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <a href="#">DECODE_RLS_INFO_ATTRAIL_FGA Function</a> | Reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view |
| <a href="#">DECODE_RLS_INFO_ATTRAIL_STD Function</a> | Reformats the output for queries to the RLS_INFO column of the DBA_AUDIT_TRAIL data dictionary view     |
| <a href="#">DECODE_RLS_INFO_ATTRAIL_UNI Function</a> | Reformats the output for queries to the RLS_INFO column of the UNIFIED_AUDIT_TRAIL data dictionary view |
| <a href="#">DECODE_RLS_INFO_ATTRAIL_XML Function</a> | Reformats the output for queries to the RLS_INFO column of the V\$XML_AUDIT_TRAIL dynamic view          |

### 29.4.1 DECODE\_RLS\_INFO\_ATTRAIL\_FGA Function

This function reformats the output for queries to the RLS\_INFO column of the DBA\_FGA\_AUDIT\_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple fine-grained audit policies in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

**See Also:**

*Oracle Database Security Guide* regarding fine-grained auditing

## Syntax

```
DECODE_RLS_INFO_ATRAIL_FGA(  
    IN_CURSOR          REF CURSOR          IN)  
RETURN PIPELINED ROW;
```

## Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_FGA` function are the same as the columns in the `DBA_FGA_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

## Usage Notes

- To use this function, include it in a query to the `DBA_FGA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `DBA_FGA_AUDIT_TRAIL` data dictionary view.

## Example

```
SELECT DB_USER, OBJECT_NAME, SQL_TEXT  
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME  
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA  
             (CURSOR (SELECT * FROM DBA_FGA_AUDIT_TRAIL)));
```

## Return Values

A piped row with decoded values of `DBA_FGA_AUDIT_TRAIL.RLS_INFO` column.

## 29.4.2 DECODE\_RLS\_INFO\_ATRAIL\_STD Function

This function reformats the output for queries to the `RLS_INFO` column of the `DBA_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple standard audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

### See Also:

*Oracle Database Security Guide* regarding auditing

## Syntax

```
DECODE_RLS_INFO_ATRAIL_STD(  
    IN_CURSOR          REF CURSOR          IN)  
RETURN PIPELINED ROW;
```

## Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_STD` function are the same as the columns in the `DBA_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

### Usage Notes

- To use this function, include it in a query to the `DBA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `DBA_AUDIT_TRAIL` data dictionary view.

### Example

```
SELECT USERNAME, USERHOST, ACTION, OBJ_NAME, OBJ_PRIVILEGE
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD
             (CURSOR (SELECT * FROM DBA_AUDIT_TRAIL)));
```

### Return Values

A piped row with decoded values of `DBA_AUDIT_TRAIL.RLS_INFO` column

## 29.4.3 DECODE\_RLS\_INFO\_ATRAIL\_UNI Function

This function reformats the output for queries to the `RLS_INFO` column of the `V$XML_AUDIT_TRAIL` dynamic view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple XML audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

### See Also:

*Oracle Database Security Guide* regarding unified auditing

### Syntax

```
DECODE_RLS_INFO_ATRAIL_UNI (
    IN_CURSOR          REF CURSOR
)
RETURN PIPELINED ROW;
```

### Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_UNI` function are the same as the columns in the `V$XML_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

### Usage Notes

- To use this function, include it in a query to the `V$XML_AUDIT_TRAIL` dynamic view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `V$XML_AUDIT_TRAIL` dynamic view.

### Example

```
SELECT OBJECT_NAME, SQL_TEXT
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
```

```
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI
(CURSOR (SELECT * FROM V$XML_AUDIT_TRAIL)));
```

### Return Values

A piped row with decoded values of V\$XML\_AUDIT\_TRAIL.RLS\_INFO column

## 29.4.4 DECODE\_RLS\_INFO\_ATRAIL\_XML Function

This function reformats the output for queries to the RLS\_INFO column of the UNIFIED\_AUDIT\_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple audit records from unified audit policies. It returns the output in separate rows.

### See Also:

*Oracle Database Security Guide* regarding auditing

### Syntax

```
DECODE_RLS_INFO_ATRAIL_XML(
  IN_CURSOR          REF CURSOR          IN)
RETURN PIPELINED ROW;
```

### Parameters

Except for the IN\_CURSOR parameter, the parameters for the DECODE\_RLS\_INFO\_ATRAIL\_XML function are the same as the columns in the UNIFIED\_AUDIT\_TRAIL data dictionary view. See *Oracle Database Reference* for more information about this view.

### Usage Notes

- To use this function, include it in a query to the UNIFIED\_AUDIT\_TRAIL data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the UNIFIED\_AUDIT\_TRAIL data dictionary view.

### Example

```
SELECT DBUSERNAME, ACTION_NAME, OBJECT_NAME, SQL_TEXT,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML
(CURSOR (SELECT * FROM UNIFIED_AUDIT_TRAIL)));
```

### Return Values

A piped row with decoded values of UNIFIED\_AUDIT\_TRAIL.RLS\_INFO column

# DBMS\_AUTO\_SQLTUNE

The `DBMS_AUTO_SQLTUNE` package is the interface for managing the Automatic SQL Tuning task. Unlike `DBMS_SQLTUNE`, the `DBMS_AUTO_SQLTUNE` package requires the `DBA` role.

The chapter contains the following topics:

- [DBMS\\_AUTO\\_SQLTUNE Overview](#)
- [DBMS\\_AUTO\\_SQLTUNE Security Model](#)
- [Summary of DBMS\\_AUTO\\_SQLTUNE Subprograms](#)

## 30.1 DBMS\_AUTO\_SQLTUNE Overview

The `DBMS_AUTO_SQLTUNE` package is the interface to SQL Tuning Advisor (`DBMS_SQLTUNE`) when run within the AutoTask framework.

The database creates the automated system task `SYS_AUTO_SQL_TUNING_TASK` as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the `SET_AUTO_TUNING_TASK_PARAMETER` API to set the `ACCEPT_SQL_PROFILES` parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the `DBA_ADVISOR_EXECUTIONS` view for information about task executions. To view reports that span multiple executions, use the [REPORT\\_AUTO\\_TUNING\\_TASK](#) Function.

## 30.2 DBMS\_AUTO\_SQLTUNE Security Model

This package is available to users with the `DBA` role. For other users, you must grant the `EXECUTE` privilege on the package explicitly. Note that the `EXECUTE_AUTO_TUNING_TASK` procedure is an exception: only `SYS` can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the `ADVISOR` privilege to have access to this package.

## 30.3 Summary of DBMS\_AUTO\_SQLTUNE Subprograms

The `DBMS_AUTO_SQLTUNE` package contains `EXECUTE`, `REPORT`, and `SET` subprograms.

**Table 30-1 DBMS\_AUTO\_SQLTUNE Package Subprograms**

| Subprogram                                                      | Description                                                   |
|-----------------------------------------------------------------|---------------------------------------------------------------|
| <a href="#">EXECUTE_AUTO_TUNING_TASK Function and Procedure</a> | Executes the Automatic SQL Tuning task immediately (SYS only) |
| <a href="#">REPORT_AUTO_TUNING_TASK Function</a>                | Displays a text report of the automatic tuning task's history |
| <a href="#">SET_AUTO_TUNING_TASK_PARAMETER Procedures</a>       | Changes a task parameter value for the daily automatic runs   |

### 30.3.1 EXECUTE\_AUTO\_TUNING\_TASK Function and Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS\_AUTO\_SQL\_TUNING\_TASK).

Both the function and the procedure run in the context of a new task execution. The difference is that the function returns the name of the new execution.

#### Syntax

```
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2           := NULL,
    execution_params  IN DBMS_ADVISOR.argList := NULL,
    execution_desc    IN VARCHAR2           := NULL)
RETURN VARCHAR2;

DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2           := NULL,
    execution_params  IN DBMS_ADVISOR.argList := NULL,
    execution_desc    IN VARCHAR2           := NULL);
```

#### Parameters

**Table 30-2 EXECUTE\_AUTO\_TUNING\_TASK Function and Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| execution_name   | A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.                                                                                                                                                                             |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the <a href="#">SET_AUTO_TUNING_TASK_PARAMETER Procedures</a> ). |
| execution_desc   | A 256-length string describing the execution                                                                                                                                                                                                                                                        |

#### Usage Notes

Only SYS can invoke this subprogram. A tuning task can be executed multiple times without having to reset it.

## Examples

```
EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK('SYS_AUTO_SQL_TUNING_TASK');
```

## 30.3.2 REPORT\_AUTO\_TUNING\_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

### Syntax

```
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
  begin_exec      IN   VARCHAR2      := NULL,
  end_exec        IN   VARCHAR2      := NULL,
  type            IN   VARCHAR2      := 'TEXT',
  level           IN   VARCHAR2      := 'TYPICAL',
  section         IN   VARCHAR2      := ALL,
  object_id       IN   NUMBER         := NULL,
  result_limit    IN   NUMBER         := NULL)
RETURN CLOB;
```

### Parameters

**Table 30-3 REPORT\_AUTO\_TUNING\_TASK Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| begin_exec   | Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.                                                                                                                                                                                                                                                                        |
| end_exec     | Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.                                                                                                                                                                                                                                                                           |
| type         | Type of the report to produce. Possible values are TEXT which produces a text report.                                                                                                                                                                                                                                                                                                    |
| level        | Level of detail in the report: <ul style="list-style-type: none"> <li>BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul> |
| section      | Section of the report to include: <ul style="list-style-type: none"> <li>SUMMARY: summary information</li> <li>FINDINGS: tuning findings</li> <li>PLAN: explain plans</li> <li>INFORMATION: general information</li> <li>ERROR: statements with errors</li> <li>ALL: all sections</li> </ul>                                                                                             |
| object_id    | Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                 |
| result_limit | Maximum number of SQL statements to show in the report                                                                                                                                                                                                                                                                                                                                   |

### Return Values

A CLOB containing the desired report.

### Examples

```
-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec,
'TEXT',
        'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
        'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
```

## 30.3.3 SET\_AUTO\_TUNING\_TASK\_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER for SYS\_AUTO\_SQL\_TUNING\_TASK.

### Syntax

```
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```

## Parameters

**Table 30-4 SET\_AUTO\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter | <p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> <li>• <b>MODE</b>: tuning scope (comprehensive, limited)</li> <li>• <b>USERNAME</b>: user name under which the statement is parsed</li> <li>• <b>DAYS_TO_EXPIRE</b>: number of days until the task is deleted</li> <li>• <b>EXECUTION_DAYS_TO_EXPIRE</b>: number of days until the task execution is deleted</li> <li>• <b>DEFAULT_EXECUTION_TYPE</b>: default execution when none is specified by the <a href="#">EXECUTE_AUTO_TUNING_TASK Function and Procedure</a></li> <li>• <b>TIME_LIMIT</b>: global timeout in seconds</li> <li>• <b>LOCAL_TIME_LIMIT</b>: per-statement timeout in seconds</li> <li>• <b>TEST_EXECUTE</b>: <ul style="list-style-type: none"> <li>– <b>FULL</b> - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</li> <li>– <b>AUTO</b> - test-execute for an automatically chosen time proportional to the tuning time</li> <li>– <b>OFF</b> - do not test-execute</li> </ul> </li> <li>• <b>BASIC_FILTER</b>: basic filter for SQL tuning set</li> <li>• <b>OBJECT_FILTER</b>: object filter for SQL tuning set</li> <li>• <b>PLAN_FILTER</b>: plan filter for SQL tuning set (see <a href="#">SELECT_SQLSET</a> for possible values)</li> <li>• <b>RANK_MEASURE1</b>: first ranking measure for SQL tuning set</li> <li>• <b>RANK_MEASURE2</b>: second ranking measure for SQL tuning set</li> <li>• <b>RANK_MEASURE3</b>: third ranking measure for SQL tuning set</li> <li>• <b>RESUME_FILTER</b>: extra filter for SQL tuning sets besides <b>BASIC_FILTER</b></li> <li>• <b>SQL_LIMIT</b>: maximum number of SQL statements to tune</li> <li>• <b>SQL_PERCENTAGE</b>: percentage filter of SQL tuning set statements</li> </ul> <p>The following parameters are supported for the automatic tuning task only:</p> <ul style="list-style-type: none"> <li>• <b>ACCEPT_SQL_PROFILES</b>: whether the task should accept SQL profiles automatically (TRUE or FALSE)</li> <li>• <b>MAX_AUTO_SQL_PROFILES</b>: maximum number of automatic SQL profiles allowed on the system, in sum</li> <li>• <b>MAX_SQL_PROFILES_PER_EXEC</b>: maximum number of SQL profiles that can be automatically implemented per execution of the task.</li> </ul> |
| value     | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## DBMS\_AUTO\_INDEX

The `DBMS_AUTO_INDEX` package provides the interface for managing auto indexes in an Oracle database.

This chapter contains the following topics:

- [DBMS\\_AUTO\\_INDEX Overview](#)
- [Summary of DBMS\\_AUTO\\_INDEX Subprograms](#)

### 31.1 DBMS\_AUTO\_INDEX Overview

The `DBMS_AUTO_INDEX` package is the interface for configuring auto indexes and generating reports of auto indexing operations in an Oracle database.

### 31.2 Summary of DBMS\_AUTO\_INDEX Subprograms

This table lists the `DBMS_AUTO_INDEX` package subprograms and briefly describes them.

**Table 31-1 DBMS\_AUTO\_INDEX Package Subprograms**

| Procedure                                        | Description                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CONFIGURE Procedure</a>              | Configures settings related to automatic indexing.                                                                            |
| <a href="#">DROP_AUTO_INDEXES Procedure</a>      | This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting. |
| <a href="#">DROP_SECONDARY_INDEXES Procedure</a> | Deletes all the indexes, except the ones used for constraints, from a schema or a table.                                      |
| <a href="#">REPORT_ACTIVITY Function</a>         | Returns a report of the automatic indexing operations executed during a specific period in a database.                        |
| <a href="#">REPORT_LAST_ACTIVITY Function</a>    | Returns a report of the last automatic indexing operation executed in a database.                                             |

#### 31.2.1 CONFIGURE Procedure

This procedure configures settings related to automatic indexing.

##### Syntax

```
DBMS_AUTO_INDEX.CONFIGURE (  
    parameter_name      IN VARCHAR2,  
    parameter_value     IN VARCHAR2,  
    allow               IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 31-2 CONFIGURE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter_name | <p>Automatic indexing configuration setting. It can have one of the following values:</p> <ul style="list-style-type: none"> <li>AUTO_INDEX_MODE: Modes of operation of auto indexes. It can have one of the following values: <ul style="list-style-type: none"> <li>IMPLEMENT: In this mode, new auto indexes are created as <i>visible</i> indexes and any existing <i>invisible</i> auto indexes are also set to <i>visible</i> indexes. In this mode, auto indexes are available to be used in SQL statements.</li> <li>REPORT ONLY: In this mode, new auto indexes are created as <i>invisible</i> indexes and are not available to be used in SQL statements.</li> <li>OFF: Setting the mode to OFF prevents new auto indexes from being considered and created. However, it does not disable existing auto indexes.</li> </ul> </li> <li>AUTO_INDEX_SCHEMA: Schemas to include or exclude from using auto indexes. Its value is case-sensitive and can include wildcards. Its behavior is controlled by the <code>allow</code> parameter. <p>The automatic indexing process manages two schema lists – the <i>inclusion list</i> and the <i>exclusion list</i>. The inclusion list contains the schemas that can use auto indexes. The exclusion list contains the schemas that cannot use auto indexes. Initially, both these lists are empty and all the schemas in the database can use auto indexes when automatic indexing is enabled for a database.</p> <p>If the inclusion list contains at least one schema, then only the schemas listed in the inclusion list can use auto indexes.</p> <p>If the inclusion list is empty and the exclusion list contains at least one schema, then all the schemas can use auto indexes, except the schemas listed in the exclusion list.</p> <p>If both the lists (the inclusion list and the exclusion list) contain at least one schema, then all the schemas can use auto indexes, except the schemas listed in the exclusion list.</p> </li> <li>AUTO_INDEX_RETENTION_FOR_AUTO: Number of days for which the unused auto indexes are retained in the database, after which they are deleted. Default value is 373 days.</li> <li>AUTO_INDEX_RETENTION_FOR_MANUAL: Number of days for which the unused manually created indexes (non-auto indexes) are retained in the database, after which they are</li> </ul> |

**Table 31-2 (Cont.) CONFIGURE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                 | <p>deleted. When it is set to NULL, the manually created indexes are not deleted by the automatic indexing process. Default value is NULL.</p> <ul style="list-style-type: none"> <li>AUTO_INDEX_REPORT_RETENTION: Number of days for which automatic indexing logs are retained in the database before they are deleted. As automatic indexing report is generated based on these logs, automatic indexing report cannot be generated for a period beyond the value specified for AUTO_INDEX_REPORT_RETENTION. Default value is 373 days.</li> <li>AUTO_INDEX_DEFAULT_TABLESPACE: Tablespace to use to store auto indexes. Default is NULL, which means the default permanent tablespace specified during the database creation is used to store auto indexes.</li> <li>AUTO_INDEX_SPACE_BUDGET: Percentage of tablespace size to use for auto indexes. This configuration setting can be used only when the default tablespace specified during the database creation is used for storing auto indexes.</li> <li>AUTO_INDEX_COMPRESSION: <ul style="list-style-type: none"> <li>Values to enable and disable advanced index compression for auto indexes. The supported values are: <ul style="list-style-type: none"> <li>ON: to enable advanced index compression for auto indexes</li> <li>OFF: to disable advanced index compression for auto indexes</li> </ul> </li> <li>The default value is OFF.</li> </ul> </li> </ul> |
| parameter_value | <p>Value for the configuration setting specified in parameter_name.</p> <p>When it is set to NULL, the configuration setting is assigned the default value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| allow           | <p>This parameter is applicable only for the AUTO_INDEX_SCHEMA configuration setting and it can have one of the following values:</p> <ul style="list-style-type: none"> <li>TRUE: Add the specified schema to the inclusion list.</li> <li>FALSE: Add the specified schema to the exclusion list.</li> <li>NULL: Remove the specified schema from the list to which it is currently added.</li> </ul> <p>Refer to the description of the AUTO_INDEX_SCHEMA configuration setting for more information about the inclusion list and the exclusion list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Examples

These examples are based on the assumption that the inclusion list and the exclusion list are initially empty.

The following example adds the SH and HR schemas to the exclusion list, so that only the SH and HR schemas cannot use auto indexes.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'SH',
    allow          => FALSE);

  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow          => FALSE);
end;
```

The following example removes the HR schema from the exclusion list, so that it can also use auto indexes. Now, only the SH schema cannot use auto indexes, because it is the only schema added to the exclusion list.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow          => NULL);
end;
```

The following example removes all the schemas from the exclusion list, so that all the schemas can use auto indexes.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => NULL,
    allow          => TRUE);
end;
```

The following example adds the HR schema to the inclusion list, so that only the HR schema can use auto indexes.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_SCHEMA',
    parameter_value => 'HR',
    allow          => TRUE);
end;
```

The following example sets the retention period for auto indexes to 90 days.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_RETENTION_FOR_AUTO',
    parameter_value => '90');
end;
```

The following example sets the retention period for auto indexes to the default value of 373 days.

```
begin
  dbms_auto_index.configure(
    parameter_name => 'AUTO_INDEX_RETENTION_FOR_AUTO',
    parameter_value => NULL);
end;
```

## 31.2.2 DROP\_AUTO\_INDEXES Procedure

This procedure can be used to manually drop the automatically created indexes that overrides the retention parameter setting.

### Syntax

```
DBMS_AUTO_INDEX.DROP_AUTO_INDEXES (
  owner          IN  VARCHAR2 DEFAULT NULL,
  index_name     IN  VARCHAR2 DEFAULT NULL,
  allow_recreate IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 31-3 DROP\_AUTO\_INDEXES Procedure Parameters**

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| owner          | The name of the index owner.                                                           |
| index_name     | The name of the index.                                                                 |
| allow_recreate | Set this parameter to allow or disallow automatic creation of the dropped index again. |

### Examples

Drop a single index and allow recreate:

```
exec dbms_auto_index.drop_auto_indexes('SH','SYS_AI_612ud3j5ngf0c',TRUE);
```

Drop all indexes owned by SH and allow recreate:

```
exec dbms_auto_index.drop_auto_indexes('SH',NULL,TRUE);
```

Drop all indexes owned by HR, disallowing recreate and then change the recreation status back to allow:

```
exec dbms_auto_index.drop_auto_indexes('HR',NULL);
exec dbms_auto_index.drop_auto_indexes('HR', NULL, TRUE);
```

### Usage Notes

- If the values of the parameters `owner` and `index_name` are explicitly set to `NULL`, all auto indexes which the user has privileges on will be dropped.
- If `owner` is explicitly specified and `index_name` is set to `NULL`, all auto indexes within the given schema will be dropped. The dropped indexes are not recreated automatically by the system by default. Set `allow_recreate` parameter to `TRUE` to change this behavior.
- This procedure updates the `allow_recreate` status associated with the dropped indexes from `FALSE` to `TRUE` and vice-versa.

## 31.2.3 DROP\_SECONDARY\_INDEXES Procedure

This procedure deletes all the indexes, except the ones used for constraints, from a schema or a table.

### Syntax

```
DBMS_AUTO_INDEX.DROP_SECONDARY_INDEXES (  
    ownname      IN  VARCHAR2 DEFAULT NULL,  
    tabname      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 31-4 DROP\_SECONDARY\_INDEXES Procedure Parameters**

| Parameter | Description                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | (Optional) Name of the schema from which all the indexes need to be deleted.<br><b>Note:</b> The indexes used for constraints are not deleted. |
| tabname   | (Optional) Name of the table from which all the indexes need to be deleted.<br><b>Note:</b> The indexes used for constraints are not deleted.  |

### Examples

The following example deletes all the indexes, except the ones used for constraints, from the SH schema.

```
begin  
    dbms_auto_index.drop_secondary_indexes('SH');  
end;
```

The following example deletes all the indexes, except the ones used for constraints, from the EMP table in the HR schema.

```
begin  
    dbms_auto_index.drop_secondary_indexes('HR', 'EMP');  
end;
```

The following example deletes all the indexes, except the ones used for constraints, for which the user has the delete privileges from all the schemas in a database.

```
begin  
    dbms_auto_index.drop_secondary_indexes;  
end;
```

### 31.2.4 REPORT\_ACTIVITY Function

This function returns a report of the automatic indexing operations executed during a specific period in a database.

#### Syntax

```
DBMS_AUTO_INDEX.REPORT_ACTIVITY (  
    activity_start IN TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP - 1,  
    activity_end   IN TIMESTAMP WITH TIME ZONE DEFAULT SYSTIMESTAMP,  
    type           IN VARCHAR2 DEFAULT 'TEXT',  
    section        IN VARCHAR2 DEFAULT 'ALL',  
    level          IN VARCHAR2 DEFAULT 'TYPICAL')  
RETURN CLOB;
```

#### Parameters

**Table 31-5** REPORT\_ACTIVITY Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| activity_start | Time starting from which the executed automatic indexing operations are considered for the report. If NULL is specified, the last executed automatic indexing operation is considered for the report. If no value is specified for this parameter, then the current time minus one day (24 hours) is considered at the start time. |
| activity_end   | Time till which the executed automatic indexing operations are considered for the report. If no value is specified, then the current time is considered as the end time.                                                                                                                                                           |
| type           | Format of the report. It can have one of the following values: <ul style="list-style-type: none"><li>• TEXT</li><li>• HTML</li><li>• XML</li></ul> The default value is TEXT.                                                                                                                                                      |

**Table 31-5 (Cont.) REPORT\_ACTIVITY Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| section   | <p>Sections to include in the report. It can have a combination of the following values:</p> <ul style="list-style-type: none"> <li>SUMMARY: Include only the summary details section in the report.</li> <li>INDEX_DETAILS: Include only the auto index details section in the report.</li> <li>VERIFICATION_DETAILS: Include only the auto index verification details section in the report.</li> <li>ERRORS: Include only the error details section in the report.</li> <li>ALL: Include all the sections (summary details, auto index details, auto index verification details, and error details) in the report. This is the default value.</li> </ul> <p>A combination of these values can be specified using the + or - operators as shown in the following examples:</p> <ul style="list-style-type: none"> <li>SUMMARY +INDEX_DETAILS +ERRORS: Include summary details, auto index details, and error details sections in the report.</li> <li>ALL -ERRORS: Include all the sections in the report, except the error details section.</li> </ul> |
| level     | <p>Level of automatic indexing information to include in the report. It can have one of the following values:</p> <ul style="list-style-type: none"> <li>BASIC: Include basic automatic indexing information in the report.</li> <li>TYPICAL: Include typical automatic indexing information in the report. This is the default value.</li> <li>ALL: Include all the automatic indexing information in the report.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Return Value

A report of the automatic indexing operations executed during the specified period in a database.

### Examples

The following example generates a typical report of the automatic indexing operations executed in the last 24 hours. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```
declare
    report clob := null;
begin
    report := dbms_auto_index.report_activity();
end;
```

### 31.2.5 REPORT\_LAST\_ACTIVITY Function

This function returns a report of the last automatic indexing operation executed in a database.

#### Syntax

```
DBMS_AUTO_INDEX.REPORT_LAST_ACTIVITY (  
    type          IN  VARCHAR2 DEFAULT 'TEXT',  
    section       IN  VARCHAR2 DEFAULT 'ALL',  
    level        IN  VARCHAR2 DEFAULT 'TYPICAL')  
RETURN CLOB;
```

#### Parameters

**Table 31-6** REPORT\_LAST\_ACTIVITY Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | <p>Format of the report. It can have one of the following values:</p> <ul style="list-style-type: none"><li>• TEXT</li><li>• HTML</li><li>• XML</li></ul> <p>The default value is TEXT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| section   | <p>Sections to include in the report. It can have a combination of the following values:</p> <ul style="list-style-type: none"><li>• SUMMARY: Include only the summary details section in the report.</li><li>• INDEX_DETAILS: Include only the auto index details section in the report.</li><li>• VERIFICATION_DETAILS: Include only the auto index verification details section in the report.</li><li>• ERRORS: Include only the error details section in the report.</li><li>• ALL: Include all the sections (summary details, auto index details, auto index verification details, and error details) in the report. This is the default value.</li></ul> <p>A combination of these values can be specified using the + or - operators as shown in the following examples:</p> <ul style="list-style-type: none"><li>• SUMMARY +INDEX_DETAILS +ERRORS: Include summary details, auto index details, and error details sections in the report.</li><li>• ALL -ERRORS: Include all the sections in the report, except the error details section.</li></ul> |

**Table 31-6 (Cont.) REPORT\_LAST\_ACTIVITY Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level     | <p>Level of automatic indexing information to include in the report. It can have one of the following values:</p> <ul style="list-style-type: none"><li>• <b>BASIC:</b> Include basic automatic indexing information in the report.</li><li>• <b>TYPICAL:</b> Include typical automatic indexing information in the report. This is the default value.</li><li>• <b>ALL:</b> Include all the automatic indexing information in the report.</li></ul> |

**Return Value**

A report of the last automatic indexing operation executed in a database.

**Examples**

The following example generates a typical report of the last automatic indexing operation executed in a database. The report is generated in the text format and contains all the sections (summary details, auto index details, auto index verification details, and error details).

```
declare
    report clob := null;
begin
    report := dbms_auto_index.report_last_activity();
end;
```

# DBMS\_AUTO\_REPORT

The `DBMS_AUTO_REPORT` package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

## See Also:

*Oracle Database SQL Tuning Guide* for more information about reporting database operations

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_AUTO\\_REPORT Subprograms](#)

## 32.1 DBMS\_AUTO\_REPORT Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR. Captured data are stored in AWR and exposed via 2 views:

`DBA_HIST_REPORTS` and `DBA_HIST_REPORTS_DETAILS`.

## 32.2 DBMS\_AUTO\_REPORT Security Model

This package is available to `PUBLIC` and performs its own security checking.

## 32.3 Summary of DBMS\_AUTO\_REPORT Subprograms

This table describes the parameters of the `DBMS_AUTO_REPORT` package subprograms.

**Table 32-1 DBMS\_AUTO\_REPORT Package Subprograms**

| Subprogram                                             | Description                                                                                                              |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <a href="#">FINISH_REPORT_CAPTURE Procedure</a>        | Ends the complete capture of SQL monitor data that was started with the <a href="#">START_REPORT_CAPTURE Procedure</a> . |
| <a href="#">REPORT_REPOSITORY_DE TAIL Function</a>     | Obtains the stored report for a given report ID                                                                          |
| <a href="#">REPORT_REPOSITORY_DE TAIL_XML Function</a> | Obtains the stored XML report for a given report ID                                                                      |

**Table 32-1 (Cont.) DBMS\_AUTO\_REPORT Package Subprograms**

| Subprogram                                          | Description                                                                                                                       |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_REPOSITORY_LIST_XML Function</a> | Obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR                                          |
| <a href="#">START_REPORT_CAPTURE Procedure</a>      | Captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR. |

### 32.3.1 FINISH\_REPORT\_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the `START_REPORT_CAPTURE` procedure.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time\*DOP in case of PQ) whose monitoring has completed.

#### Syntax

```
DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;
```

#### Related Topics

- [START\\_REPORT\\_CAPTURE Procedure](#)  
This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

### 32.3.2 REPORT\_REPOSITORY\_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

#### Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (
    rid            IN NUMBER      DEFAULT NULL,
    type           IN VARCHAR2    DEFAULT 'XML',
    base_path      IN VARCHAR2    DEFAULT NULL)
RETURNS CLOB
```

#### Parameters

**Table 32-2 REPORT\_REPOSITORY\_DETAIL Function Parameters**

| Parameter | Description                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rid       | ID of the stored report which returned by the function                                                                                                                                     |
| type      | Desired format of the report. Values can be 'XML', 'TEXT', 'HTML', 'EM' or 'ACTIVE'. The last two options generate a report in the same format called active HTML. Default value is 'XML'. |
| base_path | Unused/Non-operative                                                                                                                                                                       |

### Return Values

The persisted report for the given record ID

## 32.3.3 REPORT\_REPOSITORY\_DETAIL\_XML Function

This procedure obtains the stored XML report for a given report ID.

### Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (
    rid            IN NUMBER      DEFAULT NULL,
    base_path      IN VARCHAR2   DEFAULT NULL)
RETURNS XMLTYPE
```

### Parameters

**Table 32-3** *REPORT\_REPOSITORY\_DETAIL\_XML Function Parameters*

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| rid       | ID of the stored report which returned by the function |
| base_path | Unused/Non-operative                                   |

### Return Values

The persisted XML report for the given record ID

## 32.3.4 REPORT\_REPOSITORY\_LIST\_XML Function

This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR.

The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

### Syntax

```
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (
    active_since      IN DATE      DEFAULT NULL,
    active_upto       IN DATE      DEFAULT NULL,
    snapshot_id       IN NUMBER    DEFAULT NULL,
    dbid              IN NUMBER    DEFAULT NULL,
    inst_id           IN NUMBER    DEFAULT NULL,
    con_dbid          IN NUMBER    DEFAULT NULL,
    session_id        IN NUMBER    DEFAULT NULL,
    session_serial     IN NUMBER    DEFAULT NULL,
    component_name     IN VARCHAR2 DEFAULT NULL,
    key1              IN VARCHAR2 DEFAULT NULL,
    key2              IN VARCHAR2 DEFAULT NULL,
    key3              IN VARCHAR2 DEFAULT NULL,
    report_level       IN VARCHAR2 DEFAULT 'TYPICAL',
    base_path         IN VARCHAR2 DEFAULT NULL)
RETURNS XMLTYPE
```

## Parameters

**Table 32-4** *REPORT\_REPOSITORY\_LIST\_XML Function Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>active_since</code>   | Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.                             |
| <code>active_upto</code>    | Same as <code>active_since</code> except that it is the end of the time range                                                                                                                                                                                                                       |
| <code>snapshot_id</code>    | If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.                                                                                                             |
| <code>dbid</code>           | If a value is specified, only those data captured for the specified database ID are included in the list report. If no value is specified, no filtering is performed on database ID                                                                                                                 |
| <code>inst_id</code>        | If a value is specified, only those data captured on the specified instance number are included in the list report. If no value is specified, no filtering is performed on the instance ID.                                                                                                         |
| <code>con_dbid</code>       | If a value is specified, only those data captured on the specified container DBID are included in the list report. If no value is specified, no filtering is performed on the container DBID.                                                                                                       |
| <code>session_id</code>     | If a value is specified, only those data captured for the specified session ID are included in the list report. If no value is specified, no filtering is performed on session ID.                                                                                                                  |
| <code>session_serial</code> | If a value is specified, only those data captured for the specified session are included in the list report. If no value is specified, no filtering is performed on session serial number. This parameter should be used in conjunction with the <code>session_id</code> parameter.                 |
| <code>component_name</code> | Can be 'sqlmonitor' for SQL Monitor data or 'rtaddm' for Real-time ADDM data. If a value is specified then data pertaining only to the specified component will be included in the list report. If no value is specified, no filtering is performed.                                                |
| <code>key1</code>           | Key value relevant to a component. For SQL Monitor, <code>key1</code> is the SQL ID of the captured SQL statement. If a value is specified, only those data having specified value for <code>key1</code> are included, else no filtering is performed on <code>key1</code> .                        |
| <code>key2</code>           | Key value relevant to a component. For SQL Monitor, <code>key2</code> is the SQL execution ID of the captured SQL statement. If a value is specified, only those data having specified value for <code>key2</code> are included, else no filtering is performed on <code>key2</code> .              |
| <code>key3</code>           | Key value relevant to a component. For SQL Monitor, <code>key3</code> is the SQL execution start time of the captured SQL statement. If a value is specified, then only those data having specified value for <code>key3</code> are included, else no filtering is performed on <code>key3</code> . |
| <code>report_level</code>   | Currently only 'TYPICAL' is used                                                                                                                                                                                                                                                                    |
| <code>base_path</code>      | Unused/Non-operative                                                                                                                                                                                                                                                                                |

### 32.3.5 START\_REPORT\_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the [FINISH\\_REPORT\\_CAPTURE Procedure](#). In the case of a RAC system, the capture will start on each node of the cluster.

#### Syntax

```
DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
```

## DBMS\_AUTO\_TASK\_ADMIN

The `DBMS_AUTO_TASK_ADMIN` package provides an interface to `AUTOTASK` functionality. It is used by the DBA as well as Enterprise Manager to access the `AUTOTASK` controls. Enterprise Manager also uses the `AUTOTASK` Advisor.

### See Also:

*Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_AUTO\\_TASK\\_ADMIN Subprograms](#)

### 33.1 DBMS\_AUTO\_TASK\_ADMIN Deprecated Subprograms

The `DBMS_AUTO_TASK_ADMIN` `OVERRIDE_PRIORITY` subprogram has been deprecated.

### Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [OVERRIDE\\_PRIORITY Procedures](#)

### 33.2 DBMS\_AUTO\_TASK\_ADMIN Security Model

`DBMS_AUTO_TASK_ADMIN` is a definer's rights package, and `EXECUTE` is automatically granted to DBA, `IMP_FULL_DATABASE` and `DATAPUMP_IMP_FULL_DATABASE`.

### 33.3 DBMS\_AUTO\_TASK\_ADMIN Constants

The `DBMS_AUTO_TASK_ADMIN` package defines several constants that can be used for specifying parameter values.

These constants shown in the following table:

**Table 33-1 DBMS\_AUTO\_TASK\_ADMIN Constants**

| Name            | Type     | Value    | Description                                                                      |
|-----------------|----------|----------|----------------------------------------------------------------------------------|
| PRIORITY_MEDIUM | VARCHAR2 | 'MEDIUM' | Task with this priority should be executed as time permits                       |
| PRIORITY_HIGH   | VARCHAR2 | 'HIGH'   | Task with this priority should be executed within the current Maintenance Window |
| PRIORITY_URGENT | VARCHAR2 | 'URGENT' | Task with this priority is to be executed at the earliest opportunity            |

## 33.4 Summary of DBMS\_AUTO\_TASK\_ADMIN Subprograms

This table lists the DBMS\_AUTO\_TASK\_ADMIN subprograms and briefly describes them.

**Table 33-2 DBMS\_AUTO\_TASK\_ADMIN Package Subprograms**

| Method                                          | Description                                                                                                            |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DISABLE Procedures</a>              | Prevents AUTOTASK from executing any requests from a specified client or operation.                                    |
| <a href="#">ENABLE Procedures</a>               | Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control |
| <a href="#">GET_CLIENT_ATTRIBUTES Procedure</a> | Returns values of select client attributes                                                                             |
| <a href="#">GET_P1_RESOURCES Procedure</a>      | Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups                                  |
| <a href="#">OVERRIDE_PRIORITY Procedures</a>    | Manually overrides task priority.                                                                                      |
| <a href="#">SET_CLIENT_SERVICE Procedure</a>    | Associates an AUTOTASK Client with a specified Service                                                                 |
| <a href="#">SET_P1_RESOURCES Procedure</a>      | Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients               |

### 33.4.1 DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

#### Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name      IN   VARCHAR2);
```

## Parameters

**Table 33-3 DISABLE Procedure Parameters**

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| client_name | Name of the client, as found in DBA_AUTOTASK_CLIENT View          |
| operation   | Name of the operation as specified in DBA_AUTOTASK_OPERATION View |
| window_name | Optional name of the window in which client is to be disabled     |

## Usage Notes

- If operation and window\_name are both NULL, the client is disabled.
- If operation is not NULL, window\_name is ignored and the operation is disabled
- If operation is NULL and window\_name is not NULL, the client is disabled in the specified window.

## 33.4.2 ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.

Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

## Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name     IN   VARCHAR2);
```

## Parameters

**Table 33-4 ENABLE Procedure Parameters**

| Parameter   | Description                                                       |
|-------------|-------------------------------------------------------------------|
| client_name | Name of the client, as found in DBA_AUTOTASK_CLIENT View          |
| operation   | Name of the operation as specified in DBA_AUTOTASK_OPERATION View |
| window_name | Optional name of the window in which client is to be enabled      |

### Usage Notes

- If operation and window\_name are both NULL, the client is enabled.
- If operation is not NULL, window\_name is ignored and the specified operation is enabled
- If operation is NULL and window\_name is not NULL, the client is enabled in the specified window.

## 33.4.3 GET\_CLIENT\_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES (
    client_name      IN   VARCHAR2,    service_name      OUT   VARCHAR2,
    window_group     OUT   VARCHAR2);
```

### Parameters

**Table 33-5 GET\_CLIENT\_ATTRIBUTES Procedure Parameters**

| Parameter    | Description                                              |
|--------------|----------------------------------------------------------|
| client_name  | Name of the client, as found in DBA_AUTOTASK_CLIENT View |
| service_name | Service name for client, may be NULL                     |
| window_group | Name of the window group in which the client is active   |

## 33.4.4 GET\_P1\_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES (
    stats_group_pct   OUT   NUMBER,
    seg_group_pct     OUT   NUMBER,
    tune_group_pct    OUT   NUMBER,
    health_group_pct  OUT   NUMBER);
```

### Parameters

**Table 33-6 GET\_P1\_RESOURCES Procedure Parameters**

| Parameter        | Description                         |
|------------------|-------------------------------------|
| stats_group_pct  | %resources for Statistics Gathering |
| seg_group_pct    | %resources for Space Management     |
| tune_group_pct   | %resources for SQL Tuning           |
| health_group_pct | %resources for Health Checks        |

## Usage Notes

Values will add up to 100%.

### 33.4.5 OVERRIDE\_PRIORITY Procedures

This deprecated procedure is used to manually override task priority.

#### Note:

This subprogram is deprecated and becomes nonoperative with Oracle Database 12c.

This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to **URGENT** causes a high priority job to be generated at the start of the maintenance window. Setting priority to **CLEAR** removes the override.

## Syntax

### Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

### Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

### Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  task_target_type IN   VARCHAR2,
  task_target_name IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

## Parameters

**Table 33-7** OVERRIDE\_PRIORITY Procedure Parameters

| Parameter        | Description                                                             |
|------------------|-------------------------------------------------------------------------|
| client_name      | Name of the client, as found in DBA_AUTOTASK_CLIENT View                |
| priority         | URGENT, HIGH, MEDIUM or LOW                                             |
| operation        | Name of the operation as specified in DBA_AUTOTASK_OPERATION View       |
| task_target_type | Type of target to be affected, as found in V\$AUTOTASK_TARGET_TYPE View |

**Table 33-7 (Cont.) OVERRIDE\_PRIORITY Procedure Parameters**

| Parameter        | Description                                |
|------------------|--------------------------------------------|
| task_target_name | Name of the specific target to be affected |

## 33.4.6 SET\_CLIENT\_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE (
    client_name      IN   VARCHAR2,
    service_name     IN   VARCHAR2);
```

### Parameters

**Table 33-8 SET\_CLIENT\_SERVICE Procedure Parameters**

| Parameter    | Description                                              |
|--------------|----------------------------------------------------------|
| client_name  | Name of the client, as found in DBA_AUTOTASK_CLIENT View |
| service_name | Service name for client, may be NULL                     |

### Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

## 33.4.7 SET\_P1\_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

### Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES (
    stats_group_pct  OUT  NUMBER,
    seq_group_pct    OUT  NUMBER,
    tune_group_pct   OUT  NUMBER,
    health_group_pct OUT  NUMBER);
```

### Parameters

**Table 33-9 SET\_P1\_RESOURCES Procedure Parameters**

| Parameter        | Description                         |
|------------------|-------------------------------------|
| stats_group_pct  | %resources for Statistics Gathering |
| seq_group_pct    | %resources for Space Management     |
| tune_group_pct   | %resources for SQL Tuning           |
| health_group_pct | %resources for Health Checks        |

### **Usage Notes**

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

# DBMS\_AW\_STATS

DBMS\_AW\_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

## See Also:

*Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- [Using DBMS\\_AW\\_STATS](#)
- [Summary of DBMS\\_AW\\_STATS Subprograms](#)

## 34.1 Using DBMS\_AW\_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

## 34.2 Summary of DBMS\_AW\_STATS Subprograms

DBMS\_AW\_STATS uses the ANALYZE and CLEAR procedures.

**Table 34-1 DBMS\_AW\_STATS Package Subprograms**

| Subprogram                        | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| <a href="#">ANALYZE Procedure</a> | Generates optimizer statistics on cubes and cube dimensions. |
| <a href="#">CLEAR Procedure</a>   | Clears optimizer statistics from cubes and cube dimensions.  |

### 34.2.1 ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension.

These statistics are used to generate some execution plans, as described in "[Using DBMS\\_AW\\_STATS](#)".

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

### Syntax

```
DBMS_AW_STATS.ANALYZE  
    (inname          IN VARCHAR2);
```

### Parameters

**Table 34-2 ANALYZE Procedure Parameters**

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inname    | The qualified name of a cube or a dimension.<br>For a cube, the format of a qualified name is <i>owner.cube_name</i> .<br>For a dimension, the format is <i>owner.dimension_name</i> . |

### Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

### Example

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```
BEGIN  
    DBMS_AW_STATS.ANALYZE('time');  
    DBMS_AW_STATS.ANALYZE('customer');  
    DBMS_AW_STATS.ANALYZE('product');  
    DBMS_AW_STATS.ANALYZE('channel');  
    DBMS_AW_STATS.ANALYZE('units_cube');  
END;  
/
```

The following statements create and display an execution plan for a `SELECT` statement that joins columns from `UNITS_CUBE_VIEW`, `CUSTOMER_PRIMARY_VIEW`, and the `ACCOUNTS` table:

```
EXPLAIN PLAN FOR SELECT  
    cu.long_description customer,
```

```

        a.city city,
        a.zip_pc zip,
        cu.level_name "LEVEL",
        round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
     product_primary_view p,
     customer_view cu,
     channel_view ch,
     units_cube_view f,
     account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
      AND p.level_name = 'TOTAL'
      AND cu.customer_account_id like 'COMP%'
      AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
      AND t.dim_key = f.TIME
      AND p.dim_key = f.product
      AND cu.dim_key = f.customer
      AND ch.dim_key = f.channel
      AND a.account_id = cu.customer_account_id
ORDER BY zip;

```

SQL> SELECT plan\_table\_output FROM TABLE(dbms\_xplan.display());

PLAN\_TABLE\_OUTPUT

-----  
Plan hash value: 3890178023

| Id  | Operation                      | Name       | Rows | Bytes | Cost (%CPU) | Time     |
|-----|--------------------------------|------------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT               |            | 1    | 89    | 6 (34)      | 00:00:01 |
| 1   | SORT ORDER BY                  |            | 1    | 89    | 6 (34)      | 00:00:01 |
| * 2 | HASH JOIN                      |            | 1    | 89    | 5 (20)      | 00:00:01 |

30 rows selected.

## 34.2.2 CLEAR Procedure

This procedure clears the statistics generated by the ANALYZE procedure.

### Syntax

```
DBMS_AW_STATS.CLEAR (  
    inname          IN  VARCHAR2;
```

### Parameters

**Table 34-3** CLEAR Procedure Parameters

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inname    | The qualified name of a cube or a dimension.<br>For a cube, the format of a qualified name is <i>owner.cube_name</i> .<br>For a dimension, the format is <i>owner.dimension_name</i> . |

### Examples

The following scripts clears the statistics from UNITS\_CUBE and its dimensions.

```
BEGIN  
    DBMS_AW_STATS.clear('units_cube');  
    DBMS_AW_STATS.clear('time');  
    DBMS_AW_STATS.clear('customer');  
    DBMS_AW_STATS.clear('product');  
    DBMS_AW_STATS.clear('channel');  
END;  
/
```

# DBMS\_BLOCKCHAIN\_TABLE

A blockchain table is an append-only table designed for centralized blockchain applications. The `DBMS_BLOCKCHAIN_TABLE` package allows you do the following: delete rows in a blockchain table that are beyond the row retention defined for the blockchain table; get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row; sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table; and have the database verify the hashes on some or all rows in a blockchain table. Blockchain tables support only DER encoding for X.509 certificates, not PEM encoding.

This chapter contains the following topics:

- [DBMS\\_BLOCKCHAIN\\_TABLE Overview](#)
- [DBMS\\_BLOCKCHAIN\\_TABLE Security Model](#)
- [Summary of DBMS\\_BLOCKCHAIN\\_TABLE Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see Hidden Columns in Blockchain Tables

## 35.1 DBMS\_BLOCKCHAIN\_TABLE Overview

In Oracle Blockchain Table, peers are database users who trust the database to maintain a tamper-resistant ledger.

The ledger is implemented as a blockchain table, which is defined and managed by the application. Existing applications can protect against fraud without requiring a new infrastructure or programming model. Although transaction throughput is lower than for a standard table, performance for a blockchain table is better than for a decentralized blockchain.

The `DBMS_BLOCKCHAIN_TABLE` package lets you do the following:

- delete rows in a blockchain table that are beyond the row retention defined for the blockchain table
- get the bytes that are input to the signature algorithm so you can sign a row you inserted into the blockchain table
- get the bytes that are input to the cryptographic hash for a row so you can verify the hash in the row

- sign a row you inserted into a blockchain table after the row is added to a chain in the blockchain table
- have the database verify the hashes and signatures on some or all rows in a blockchain table.

## 35.2 DBMS\_BLOCKCHAIN\_TABLE Security Model

The `DBMS_BLOCKCHAIN_TABLE` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). Thus any user with select privileges on the blockchain table should be able to validate the row contents of that table.

Any user with delete privileges on the blockchain table can delete rows beyond the retention period defined for the blockchain table.

A user that inserted a row into the blockchain table can add a digital signature to the row after the row is added to a chain in the blockchain table.

## 35.3 Summary of DBMS\_BLOCKCHAIN\_TABLE Subprograms

The `DBMS_BLOCKCHAIN_TABLE` package uses `DELETE_EXPIRED_ROWS`, `GET_BYTES_FOR_ROW_HASH`, `GET_BYTES_FOR_ROW_SIGNATURE`, `GET_SIGNED_BLOCKCHAIN_DIGEST_FOR_SELECTED_ROWS`, `SIGN_ROW`, `VERIFY_ROWS`, and `VERIFY_TABLE_BLOCKCHAIN` subprograms to perform various functions.

**Table 35-1 DBMS\_BLOCKCHAIN\_TABLE Package Subprograms**

| Subprogram                                         | Description                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>DELETE_EXPIRED_ROWS</code> Procedure         | Deletes rows outside the retention window created before <code>before_timestamp</code> if the time stamp is specified; otherwise, deletes all rows outside the retention window.                                                                                                              |
| <code>GET_BYTES_FOR_ROW_HASH</code> Procedure      | Returns in <code>row_data</code> the bytes (series of {meta-data-value} {column-data-value} in column position order} for the particular row identified, followed by the hash (in data format) for previous row in the chain, in the data format supported.                                   |
| <code>GET_BYTES_FOR_ROW_SIGNATURE</code> Procedure | The bytes returned are the bytes in the row hash. No metadata is included.                                                                                                                                                                                                                    |
| <code>GET_SIGNED_BLOCKCHAIN_DIGEST</code> Function | This function generates and returns the signed digest on specified blockchain table using schema user's certificate. The <code>signed_bytes</code> , <code>signed_row_indexes</code> , and <code>schema_certificate_guid</code> are also returned.                                            |
| <code>SIGN_ROW</code> Procedure                    | This procedure can be used by the current user to provide a signature on row content of a previously inserted row. The user who inserted a row into a blockchain table is the only user that can sign the row.                                                                                |
| <code>VERIFY_ROWS</code> Procedure                 | Verifies all rows on all applicable chains for integrity of <code>HASH</code> column value for rows created in the range of <code>LOW_TIMESTAMP</code> to <code>HIGH_TIMESTAMP</code> . Row signatures can be verified as an option.                                                          |
| <code>VERIFY_TABLE_BLOCKCHAIN</code> Procedure     | This procedure verifies all rows whose creation-time fall between the minimum value for the row-creation time from <code>signed_bytes_previous</code> and the maximum value for row-creation time from <code>signed_bytes_latest</code> and returns the number of successfully verified rows. |

### 35.3.1 DELETE\_EXPIRED\_ROWS Procedure

This procedure deletes rows outside the retention window created `before_timestamp` if the time stamp is specified; otherwise, deletes all rows outside the retention window. The number of rows deleted is returned in `number_of_rows_deleted` parameter.

#### Syntax

```
DBMS_BLOCKCHAIN_TABLE.DELETE_EXPIRED_ROWS(  
    schema_name          IN VARCHAR2,  
    table_name           IN VARCHAR2,  
    before_timestamp     IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    number_of_rows_deleted OUT NUMBER);
```

#### Parameters

**Table 35-2** DELETE\_EXPIRED\_ROWS Procedure Parameters

| Parameter                           | Description                                                                                                                                                                                                                   |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schema_name</code>            | The name of the schema.                                                                                                                                                                                                       |
| <code>table_name</code>             | The name of the blockchain table.                                                                                                                                                                                             |
| <code>before_timestamp</code>       | The end time for the range of rows deleted by the procedure, subject to the row retention time currently associated with the blockchain table.<br><br>This is an optional parameter. The default value is <code>NULL</code> . |
| <code>number_of_rows_deleted</code> | The count of the number of rows deleted.                                                                                                                                                                                      |

### 35.3.2 GET\_BYTES\_FOR\_ROW\_HASH Procedure

This procedure returns the bytes in `column_data` that the database hashed to get the hash value for the row identified by parameters `instance_id`, `chain_id`, and `sequence_id`. These bytes are a concatenation of metadata and data bytes for each column of the table in column position order, followed by the hash value for the previous row in the chain.

#### Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_HASH(  
    schema_name          IN VARCHAR2,  
    table_name           IN VARCHAR2,  
    instance_id          IN NUMBER,  
    chain_id             IN NUMBER,  
    sequence_id          IN NUMBER,  
    data_format          IN NUMBER,  
    row_data             IN OUT BLOB);
```

#### Parameters

**Table 35-3** GET\_BYTES\_FOR\_ROW\_HASH Procedure Parameters

| Parameter                | Description                       |
|--------------------------|-----------------------------------|
| <code>schema_name</code> | The name of the schema.           |
| <code>table_name</code>  | The name of the blockchain table. |

**Table 35-3 (Cont.) GET\_BYTES\_FOR\_ROW\_HASH Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>instance_id</code> | The instance that inserted the row.<br>Valid values are 1, 2, and so on.                                                                                                                             |
| <code>chain_id</code>    | The chain containing the row. There are 32 chains in each instance, and they are numbered from 0 to 31.                                                                                              |
| <code>sequence_id</code> | The position of the row on the specified chain.                                                                                                                                                      |
| <code>data_format</code> | The version of the data layout for the hash in the specified row. Must be 1 in this release.                                                                                                         |
| <code>row_data</code>    | The bytes for the specified row in the specified data format that can be input to the cryptographic hash function to verify the value of the hash in the row. Any bytes in the BLOB are overwritten. |

### Usage Notes

All parameters are required input parameters.

The metadata bytes for a column are 20 bytes that encode the blockchain algorithm version used to hash the row, the column position, the column data type, whether the column value is NULL, and the actual length of the column value in bytes.

The column data bytes are the actual bytes representing the column value on disk for non-character columns. For character columns, the values are normalized to specific character sets. For CHAR and NCHAR columns, blank trimming is also done.

Few metadata bytes are reserved for future use.

## 35.3.3 GET\_BYTES\_FOR\_ROW\_SIGNATURE Procedure

The routine returns in `row_data` the bytes in the hash in the row without any metadata. No other columns are involved either in the row or in the previous row.

### Syntax

```
DBMS_BLOCKCHAIN_TABLE.GET_BYTES_FOR_ROW_SIGNATURE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    instance_id      IN NUMBER,
    chain_id         IN NUMBER,
    sequence_id      IN NUMBER,
    data_format      IN NUMBER,
    row_data         IN OUT BLOB);
```

### Parameters

**Table 35-4 GET\_BYTES\_FOR\_ROW\_SIGNATURE Procedure Parameters**

| Parameter                | Description                                                                      |
|--------------------------|----------------------------------------------------------------------------------|
| <code>schema_name</code> | The name of the schema.                                                          |
| <code>table_name</code>  | The name of the blockchain table.                                                |
| <code>instance_id</code> | The instance on which the row was inserted.<br>Valid values are 1, 2, and so on. |

**Table 35-4 (Cont.) GET\_BYTES\_FOR\_ROW\_SIGNATURE Procedure Parameters**

| Parameter   | Description                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| chain_id    | The chain on which the row was inserted. There are 32 chains in each instance, and they are numbered from 0 to 31. |
| sequence_id | The position of the row on the chain.                                                                              |
| data_format | The format of the data in row_data. The value must be 1 in the DB20c release.                                      |
| row_data    | A sequence of bytes that must be signed.                                                                           |

**Usage Notes**

All parameters are required input parameters.

### 35.3.4 GET\_SIGNED\_BLOCKCHAIN\_DIGEST Function

This function generates and returns the signed digest for a specified blockchain table using the table owner's private key stored in the database wallet. The `signed_bytes`, `signed_row_indexes`, and `schema_certificate_guid` are also returned.

**Syntax**

```
DBMS_BLOCKCHAIN_TABLE.GET_SIGNED_BLOCKCHAIN_DIGEST(
  schema_name          IN      VARCHAR2,
  table_name           IN      VARCHAR2,
  signed_bytes         IN OUT  BLOB,
  signed_rows_indexes  OUT     ORABCTAB_ROW_ARRAY_T,
  schema_certificate_guid OUT    RAW,
  signature_algo       IN      NUMBER default SIGN_ALGO_DEFAULT)
RETURN RAW;
```

**Parameters****Table 35-5 GET\_SIGNED\_BLOCKCHAIN\_DIGEST Function Parameters**

| Parameter               | Description                                                                                                                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name             | The name of the schema.                                                                                                                                                                                                          |
| table_name              | The name of the blockchain table.                                                                                                                                                                                                |
| signed_bytes            | The BLOB value that contains a header followed by an array of row-info. The caller must pass an empty BLOB for this parameter.                                                                                                   |
| signed_rows_indexes     | This parameter specifies the rows in the blockchain that were digitally signed.                                                                                                                                                  |
| schema_certificate_guid | A unique identifier for the certificate of the blockchain table owner stored in the database that may be used to verify the digital signature.                                                                                   |
| signature_algo          | The digital signature the algorithm must use. The parameter must be one of the following package constants: <code>SIGN_ALGO_RSA_SHA2_256</code> , <code>SIGN_ALGO_RSA_SHA2_384</code> , or <code>SIGN_ALGO_RSA_SHA2_512</code> . |

**Usage Notes**

- Database computes the signature on `signed_bytes` using PKI private key of blockchain table owner.

- The certificate of blockchain table owner must be added to database using `DBMS_USER_CERTS.ADD_CERTIFICATE()`.
- The PKI private key and certificate of blockchain table owner must exist in a wallet located under `<WALLET_ROOT>/bctable/` directory for a non-container database.
- The PKI private key and certificate of blockchain table owner must exist in a wallet located under `<WALLET_ROOT>/pdb_guid/bctable/` directory for a container database.
- A blockchain table digest created by the `GET_SIGNED_BLOCKCHAIN_DIGEST` function has table information specific to a pluggable database. Such a digest can be used only in the pluggable database in which the digest was created and only for the table that was used to create the digest. For `DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN`, these requirements mean that both blockchain table digests must have been generated in the current pluggable database for the same blockchain table.

#### Note:

The `bctable` subdirectory is the name of a database component that uses wallets. It is not the name of a blockchain table.

## 35.3.5 SIGN\_ROW Procedure

This procedure can be used by the current user to provide a signature on row content of a previously inserted row. The transaction that inserted the row into the blockchain table must have committed before the `SIGN_ROW` procedure is called.

### Syntax

```
DBMS_BLOCKCHAIN_TABLE.SIGN_ROW(
  schema_name      IN VARCHAR2,
  table_name        IN VARCHAR2,
  instance_id       IN NUMBER,
  chain_id          IN NUMBER,
  sequence_id       IN NUMBER,
  hash              IN RAW DEFAULT NULL,
  signature          IN RAW,
  certificate_guid   IN RAW,
  signature_algo     IN NUMBER);
```

### Parameters

**Table 35-6 SIGN\_ROW Procedure Parameters**

| Parameter                | Description                                 |
|--------------------------|---------------------------------------------|
| <code>schema_name</code> | The name of the schema.                     |
| <code>table_name</code>  | The name of the blockchain table.           |
| <code>instance_id</code> | The instance on which the row was inserted. |

**Table 35-6 (Cont.) SIGN\_ROW Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| chain_id         | The chain containing the row to be signed. There are 32 chains in each instance, and they are numbered from 0 to 31.                                                                                                                                                                            |
| sequence_id      | The position of the row on the chain.<br>Valid values are 1, 2, and so on.                                                                                                                                                                                                                      |
| hash             | If non-NULL, the expected value of the hash in the row to be signed. If NULL, the hash in the row to be signed is not checked.                                                                                                                                                                  |
| signature        | The user's digital signature on the hash value stored in the row.                                                                                                                                                                                                                               |
| certificate_guid | A unique identifier for the certificate stored in the database that may be used to verify the digital signature.                                                                                                                                                                                |
| signature_algo   | The algorithm used to create the digital signature. The algorithm must be one of the following constants defined in the DBMS_BLOCKCHAIN_TABLE package: <ul style="list-style-type: none"> <li>SIGN_ALGO_RSA_SHA2_256</li> <li>SIGN_ALGO_RSA_SHA2_384</li> <li>SIGN_ALGO_RSA_SHA2_512</li> </ul> |

**Note:**

For information on hidden columns in blockchain tables, see [Hidden Columns in Blockchain Tables](#)

**Usage Notes**

- All parameters are required input parameters except for `hash`.
- The database will verify that:
  - the current user's `obj#` matches the `user#` hidden column value (ensures that the user owns the row)
  - the user has insert privileges for the blockchain table '`schema_name`'.'`table_name`'
  - the hash (if provided) matches the hash column content for the row
  - the `signature` column value for the specific row identified by '`instance_id`', '`chain_id`', and '`sequence_id`' is NULL
  - if the verification succeeds, the signature value is stored for the row.

## 35.3.6 VERIFY\_ROWS Procedure

Verifies all rows on all applicable chains for integrity of `HASH` column value and optionally the `SIGNATURE` column value for rows created in the range of `low_timestamp` to `high_timestamp`. An appropriate exception is thrown if the integrity of chains is compromised.

**Syntax**

```
DBMS_BLOCKCHAIN_TABLE.VERIFY_ROWS(
  schema_name      IN VARCHAR2,
  table_name       IN VARCHAR2,
  low_timestamp    IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  high_timestamp   IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
```

```
instance_id          IN NUMBER DEFAULT NULL,
chain_id            IN NUMBER DEFAULT NULL,
number_of_rows_verified OUT NUMBER,
verify_signature    IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 35-7 VERIFY\_ROWS Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name             | The name of the schema.                                                                                                                                                                              |
| table_name              | The name of the blockchain table.                                                                                                                                                                    |
| low_timestamp           | If specified, the low end of the time range for verifying rows.<br>The default value is NULL.                                                                                                        |
| high_timestamp          | If specified, the high end of the time range for verifying rows.<br>The default value is NULL.                                                                                                       |
| instance_id             | If specified, restricts row verification to rows inserted on the specified instance.                                                                                                                 |
| chain_id                | If specified, restricts row verification to rows on the specified chain. There are 32 chains in each instance, and they are numbered from 0 to 31.                                                   |
| number_of_rows_verified | The number of rows verified.                                                                                                                                                                         |
| verify_signature        | If verify_signature is TRUE, both the hash on each row and any signature on the row are verified. If verify_signature is FALSE, only the hash on each row is verified.<br>The default value is TRUE. |

## Usage Notes

- The hash on the first element in the time range for verifying rows in a chain is verified only if its sequence number is 1.
- schema\_name and table\_name are required input parameters
- All others input parameters are optional, with the following exceptions:
  - If chain\_id is specified, instance\_id must be specified
  - Valid values for instance\_id are 1, 2, ... etc.
  - If neither instance\_id, nor chain\_id is specified, then it implies \*all\* chains. If only instance\_id is specified, then it implies \*all\* chains on that instance. If both are specified, it implies the specific chain provided by the combination.
  - If both low\_timestamp and high\_timestamp are specified, then high\_timestamp must be later than low\_timestamp.  
  
If low\_timestamp is not specified, then the range is the oldest row in the blockchain to high\_timestamp.  
  
If high\_timestamp is not specified then the range is low\_timestamp to the timestamp of the last row inserted in the table.

### 35.3.7 VERIFY\_TABLE\_BLOCKCHAIN Procedure

This procedure verifies all rows whose creation-time fall between the minimum value for the row-creation time from `signed_bytes_previous` and the maximum value for row-creation time from `signed_bytes_latest` and returns the number of successfully verified rows.

**Syntax**

```
DBMS_BLOCKCHAIN_TABLE.VERIFY_TABLE_BLOCKCHAIN(  
    signed_bytes_latest      IN      BLOB,  
    signed_bytes_previous    IN      BLOB,  
    number_of_rows_verified OUT      NUMBER);
```

**Parameters**

**Table 35-8    VERIFY\_TABLE\_BLOCKCHAIN Procedure Parameters**

| Parameter                            | Description                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <code>signed_bytes_latest</code>     | A BLOB created by a call to <code>get_signed_blockchain_digest</code> .                                                             |
| <code>signed_bytes_previous</code>   | A BLOB created by a call to <code>get_signed_blockchain_digest</code> before the <code>signed_bytes_latest</code> BLOB was created. |
| <code>number_of_rows_verified</code> | The count of the rows in the blockchain table that were verified.                                                                   |

**Usage Notes**

The BLOBs in `signed_bytes_latest` and `signed_bytes_previous` must be associated with the same blockchain table.

## DBMS\_CAPTURE\_ADM

The `DBMS_CAPTURE_ADM` package, one of a set of Oracle Replication packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_CAPTURE\\_ADM Subprograms](#)

### 36.1 DBMS\_CAPTURE\_ADM Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

#### See Also:

*Oracle Database Concepts* for more information about CDBs and PDBs

### 36.2 DBMS\_CAPTURE\_ADM Security Model

The `DBMS_CAPTURE_ADM` security can be controlled in one of two ways.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Replication configuration, it requires that the user is granted the privileges of an Oracle Replication administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

 **Note:**

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
- Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

 **See Also:**

*Oracle Database XStream Guide* for information about configuring an XStream administrator

## 36.3 Summary of DBMS\_CAPTURE\_ADM Subprograms

This table lists the DBMS\_CAPTURE\_ADM subprograms and briefly describes them.

**Table 36-1 DBMS\_CAPTURE\_ADM Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                                |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ABORT_GLOBAL_INSTANTIATION Procedure</a> | Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures                                 |
| <a href="#">ABORT_SCHEMA_INSTANTIATION Procedure</a> | Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures                                                                |
| <a href="#">ABORT_SYNC_INSTANTIATION Procedure</a>   | Reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure                                                                                                   |
| <a href="#">ABORT_TABLE_INSTANTIATION Procedure</a>  | Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure                                                                                                  |
| <a href="#">ALTER_CAPTURE Procedure</a>              | Alters a capture process                                                                                                                                                   |
| <a href="#">ALTER_SYNC_CAPTURE Procedure</a>         | Alters a synchronous capture                                                                                                                                               |
| <a href="#">BUILD Procedure</a>                      | Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns |
| <a href="#">CREATE_CAPTURE Procedure</a>             | Creates a capture process                                                                                                                                                  |
| <a href="#">CREATE_SYNC_CAPTURE Procedure</a>        | Creates a synchronous capture                                                                                                                                              |
| <a href="#">DROP_CAPTURE Procedure</a>               | Drops a capture process                                                                                                                                                    |
| <a href="#">INCLUDE_EXTRA_ATTRIBUTE Procedure</a>    | Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture                                  |

**Table 36-1 (Cont.) DBMS\_CAPTURE\_ADM Package Subprograms**

| Subprogram                                             | Description                                                                                                                                                                                    |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PREPARE_GLOBAL_INSTANTIATION Procedure</a> | Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables |
| <a href="#">PREPARE_SCHEMA_INSTANTIATION Procedure</a> | Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables       |
| <a href="#">PREPARE_SYNC_INSTANTIATION Function</a>    | Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN                                                                    |
| <a href="#">PREPARE_TABLE_INSTANTIATION Procedure</a>  | Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table                         |
| <a href="#">SET_PARAMETER Procedure</a>                | Sets a capture process parameter to the specified value                                                                                                                                        |
| <a href="#">START_CAPTURE Procedure</a>                | Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue                                                                            |
| <a href="#">STOP_CAPTURE Procedure</a>                 | Stops the capture process from mining redo logs                                                                                                                                                |

**Note:**

All subprograms commit unless specified otherwise.

## 36.3.1 ABORT\_GLOBAL\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

### Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
    container    IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameter

**Table 36-2 ABORT\_GLOBAL\_INSTANTIATION Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container | <p>Either CURRENT , ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure removes supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure removes supplemental logging for the specified PDB.</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p> |

## 36.3.2 ABORT\_SCHEMA\_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE\_SCHEMA\_INSTANTIATION procedure. It also reverses the effects of running the PREPARE\_TABLE\_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE\_SCHEMA\_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE\_TABLE\_INSTANTIATION procedure for tables in the specified schema

## Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
  schema_name IN VARCHAR2,
  container   IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameter

**Table 36-3 ABORT\_SCHEMA\_INSTANTIATION Procedure Parameter**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema_name | The name of the schema for which to abort the effects of preparing instantiation                                                                                                                                                                                                                                                                                                                                                                                                                   |
| container   | <p>Either CURRENT , ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure removes supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure removes supplemental logging for the specified PDB.</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p> |

### 36.3.3 ABORT\_SYNC\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SYNC_INSTANTIATION` procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

#### Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

#### Parameters

**Table 36-4 ABORT\_SYNC\_INSTANTIATION Procedure Parameter**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_names</code> | <p>When the <code>table_names</code> parameter is <code>VARCHAR2</code> datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries.</p> <p>When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.</p> <p>In either version of the procedure, specify the name of each table in the form <code>[schema_name.]table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p> |

### 36.3.4 ABORT\_TABLE\_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

#### Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name IN VARCHAR2);
container IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameter

**Table 36-5 ABORT\_TABLE\_INSTANTIATION Procedure Parameter**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name | The name of the table for which to abort the effects of preparing instantiation, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.                                                                                                                                                                                                                                                       |
| container  | <p>Either CURRENT, ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure removes supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure removes supplemental logging for the specified PDB.</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p> |

## 36.3.5 ALTER\_CAPTURE Procedure

This procedure alters a capture process.

### Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE (
  capture_name          IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set       IN  BOOLEAN    DEFAULT FALSE,
  start_scn             IN  NUMBER     DEFAULT NULL,
  use_database_link     IN  BOOLEAN    DEFAULT NULL,
  first_scn             IN  NUMBER     DEFAULT NULL,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE,
  capture_user          IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER  DEFAULT NULL,
  start_time            IN  TIMESTAMP  DEFAULT NULL,
  oldest_scn            IN  NUMBER     DEFAULT NULL);
```

### Parameters

**Table 36-6 ALTER\_CAPTURE Procedure Parameters**

| Parameter    | Description                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------|
| capture_name | The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner. |

**Table 36-6 (Cont.) ALTER\_CAPTURE Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rule_set_name</code>   | <p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>To change the positive rule set for the capture process, specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p> |
| <code>remove_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified capture process.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then ensure that this parameter is set to <code>FALSE</code>.</p>                                                                                                                                                                      |
| <code>start_scn</code>       | <p>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN.</p> <p>An error is returned if an invalid SCN is specified or if the capture process is enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 36-6 (Cont.) ALTER\_CAPTURE Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>use_database_link</code> | <p>If <b>TRUE</b>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify <b>TRUE</b>. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>If <b>FALSE</b>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify <b>FALSE</b>. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.</p> <p>If <b>NULL</b>, then the current value of this parameter for the capture process is not changed.</p>                                                                                                                                                                                                                                              |
| <code>first_scn</code>         | <p>The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</p> <ul style="list-style-type: none"> <li>• It must be greater than the current first SCN for the capture process.</li> <li>• It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.</li> <li>• It must be less than or equal to the required checkpoint SCN for the capture process.</li> </ul> <p>An error is returned if the specified SCN does not meet the first three requirements. See "<a href="#">Usage Notes</a>" for information about determining an SCN value that meets all of these conditions.</p> <p>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See <a href="#">BUILD Procedure</a> for more information about a LogMiner data dictionary.</p> <p>If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</p> |

**Table 36-6 (Cont.) ALTER\_CAPTURE Procedure Parameters**

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>negative_rule_set_name</code>   | <p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>To change the negative rule set for the capture process, specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p> |
| <code>remove_negative_rule_set</code> | <p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified capture process.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then ensure that this parameter is set to <code>FALSE</code>.</p>                                                                                                                                                                                                                                                                                                                             |

**Table 36-6 (Cont.) ALTER\_CAPTURE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_user              | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the <code>ALTER_CAPTURE</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> <li>• <code>EXECUTE</code> privilege on the rule sets used by the capture process</li> <li>• <code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>These privileges can be granted directly to the capture user, or they can be granted through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using <code>DROP USER . . . CASCADE</code>, then the capture process is also dropped automatically.</p> |
| checkpoint_retention_time | <p>Either the number of days that a capture process retains checkpoints before purging them automatically, or <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically. If <code>NULL</code>, then the checkpoint retention time is not changed.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| start_time                | <p>A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time.</p> <p>An error is returned if an invalid time is specified or if the capture process is enabled.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| oldest_scn                | <p>The oldest SCN of the transactions currently being processed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter.

## Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

## 36.3.6 ALTER\_SYNC\_CAPTURE Procedure

This procedure alters a synchronous capture.

### Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE (
    capture_name    IN  VARCHAR2,
    rule_set_name   IN  VARCHAR2  DEFAULT NULL,
    capture_user    IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 36-7 ALTER\_SYNC\_CAPTURE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>capture_name</code>  | The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>rule_set_name</code> | <p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist.</p> <p>If <code>NULL</code>, then the rule set is not changed.</p> |

**Table 36-7 (Cont.) ALTER\_SYNC\_CAPTURE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_user | <p>The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If <code>NULL</code>, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the <code>ALTER_SYNC_CAPTURE</code> procedure must be granted the <code>DBA</code> role. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>If you change the capture user, then this procedure grants the new capture user <code>enqueue</code> privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:</p> <ul style="list-style-type: none"> <li><code>EXECUTE</code> privilege on the rule sets used by the synchronous capture</li> <li><code>EXECUTE</code> privilege on all rule-based transformation functions used in the rule set</li> </ul> <p>These privileges can be granted directly to the capture user, or they can be granted through roles.</p> <p>In addition, the capture user must be granted <code>EXECUTE</code> privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> |

#### Usage Notes

If the capture user for a synchronous capture is dropped using `DROP USER . . . CASCADE`, then the synchronous capture is also dropped automatically.

## 36.3.7 BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the SQL statement `ALTER DATABASE ADD SUPPLEMENTAL LOG DATA`;

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

#### Syntax

```
DBMS_CAPTURE_ADM.BUILD(
    first_scn OUT NUMBER);
```

```
DBMS_CAPTURE_ADM.BUILD;
```

#### Parameters

**Table 36-8 BUILD Procedure Parameter**

| Parameter | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| first_scn | Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process |

## Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.
- In a CDB, the `BUILD` procedure must be executed from the root.

## 36.3.8 CREATE\_CAPTURE Procedure

This procedure creates a capture process.

### See Also:

[DBMS\\_RULE\\_ADM](#) for more information about rules and rule sets

## Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE (
  queue_name          IN  VARCHAR2,
  capture_name        IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  start_scn           IN  NUMBER     DEFAULT NULL,
  source_database     IN  VARCHAR2  DEFAULT NULL,
  use_database_link   IN  BOOLEAN    DEFAULT FALSE,
  first_scn           IN  NUMBER     DEFAULT NULL,
  logfile_assignment  IN  VARCHAR2  DEFAULT 'implicit',
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  capture_user        IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER  DEFAULT 60,
  start_time          IN  TIMESTAMP  DEFAULT NULL,
  source_root_name    IN  VARCHAR2  DEFAULT NULL,
  capture_class       IN  VARCHAR2  DEFAULT 'Streams');
```

## Parameters

**Table 36-9 CREATE\_CAPTURE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name      | <p>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form <code>[schema_name.]queue_name</code>. For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> The <code>queue_name</code> setting cannot be altered after the capture process is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| capture_name    | <p>The name of the capture process being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p><b>Note:</b> The <code>capture_name</code> setting cannot be altered after the capture process is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rule_set_name   | <p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.</p> |
| start_scn       | <p>A valid SCN for the database from which the capture process starts capturing changes.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information setting the <code>start_scn</code> parameter</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| source_database | <p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.EXAMPLE.COM</code>, then the procedure specifies <code>DBS1.EXAMPLE.COM</code> automatically.</p> <p>If <code>NULL</code>, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for <code>use_database_link</code> and <code>first_scn</code> can be specified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 36-9 (Cont.) CREATE\_CAPTURE Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>use_database_link</code> | <p>If <code>TRUE</code>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>The capture process uses the database link to prepare database objects for instantiation at the source database and run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database, if necessary.</p> <p>During the creation of a downstream capture process, if the <code>first_scn</code> parameter is set to <code>NULL</code>, then the <code>use_database_link</code> parameter must be set to <code>TRUE</code>. Otherwise, an error is returned.</p> <p>If <code>FALSE</code>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:</p> <ul style="list-style-type: none"> <li>• Run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.</li> <li>• Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.</li> <li>• Prepare source database objects for instantiation.</li> </ul> |
| <code>first_scn</code>         | <p>The lowest SCN in the redo log from which a capture process can capture changes. A non-<code>NULL</code> value for this parameter is valid only if the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run at least once at the source database.</p> <p>You can query the <code>FIRST_CHANGE#</code> column of the <code>V\$ARCHIVED_LOG</code> dynamic performance view where the <code>DICTIONARY_BEGIN</code> column is <code>YES</code> to determine whether the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run on a source database. Any of the values returned by such a query can be used as a <code>first_scn</code> value if the redo log containing that SCN value is still available.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information setting the <code>first_scn</code> parameter</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 36-9 (Cont.) CREATE\_CAPTURE Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| logfile_assignment     | <p>If <code>implicit</code>, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.</p> <p>If <code>explicit</code>, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the <code>FOR logminer_session_name</code> clause. If <code>explicit</code>, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created.</p> <p>If you specify <code>explicit</code> for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for information about adding redo log files manually</p>                                                                                                                                                                                                                                                                                                                        |
| negative_rule_set_name | <p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p> |
| capture_user           | <p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the user who runs the <code>CREATE_CAPTURE</code> procedure is used.</p> <p><b>Note:</b> If the capture user for a capture process is dropped using <code>DROP USER . . . CASCADE</code>, then the capture process is also dropped automatically.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information about this parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 36-9 (Cont.) CREATE\_CAPTURE Procedure Parameters**

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>checkpoint_retention_time</code> | <p>Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> |
| <code>start_time</code>                | <p>A valid time from which the capture process starts capturing changes.</p> <p>An error is returned if an invalid time is specified.</p> <p>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information setting the <code>start_time</code> parameter</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>source_root_name</code>          | <p>The global name of the root in the source CDB.</p> <p>If you specify <code>NULL</code>, or if the specified name is the same as the global name of the current root, then local capture is assumed.</p> <p>If not <code>NULL</code>, then remote capture is assumed and a condition is added to the generated rules to filter the LCRs based on the root in the source CDB.</p> <p><b>Note:</b> In a downstream capture configuration, if the capture database is CDB and the source database is a non-CDB, then specify the same value for <code>source_root_name</code> and <code>source_database</code>. The <code>source_root_name</code> parameter does not need to be specified for local capture for either a CDB or a non-CDB.</p>                                         |
| <code>capture_class</code>             | <p>The valid values are <code>'Streams'</code>, <code>'XStream'</code> or <code>'GoldenGate'</code>.</p> <p>If <code>NULL</code> is specified, then <code>'Streams'</code> is assumed.</p> <p><b>Note:</b> The <code>capture_class</code> parameter cannot be set to <code>'Streams'</code> or <code>NULL</code> when the capture database is a CDB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Usage Notes

Consider the following usage notes when you run this procedure:

- [DBA Role Requirement](#)
- [Capture User Requirements](#)
- [First SCN and Start SCN Settings](#)
- [Explicit Log File Assignment](#)

DBA Role Requirement

If the user who invokes this procedure is different from the user specified in the `capture_user` parameter, then the invoking user must be granted the `DBA` role. If the user who invokes this procedure is the same as the user specified in the `capture_user` parameter, then the `DBA` role is not required for the invoking user. Only the `SYS` user can set the `capture_user` to `SYS`.

### Capture User Requirements

The `capture_user` parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- `EXECUTE` privilege on the rule sets used by the capture process
- `EXECUTE` privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted `EXECUTE` privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

#### Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

### First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

#### Note:

When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

| first_scn Setting | start_scn Setting | Capture Process Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|-------------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Non-NULL          | NULL              | Local or Downstream  | <p>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the <code>first_scn</code> parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised when the capture process is started.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p>                                                                                                                                                                                                                               |
| Non-NULL          | Non-NULL          | Local or Downstream  | <p>If the specified value for the <code>start_scn</code> parameter is greater than or equal to the specified value for the <code>first_scn</code> parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the <code>start_scn</code> parameter is less than the specified value for the <code>first_scn</code> parameter, then an error is raised.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been called at least once before on the source database, and the specified <code>first_scn</code> must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p> |

| first_scn<br>Setting | start_scn<br>Setting | Capture<br>Process Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL                 | Non-NULL             | Local                   | <p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>There is no existing capture process for the local source database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</li> <li>There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database.</li> </ul> <p>In either of these cases, the <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the <code>BUILD</code> procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.</p> <p>However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.</p> |

| first_scn Setting | start_scn Setting | Capture Process Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL              | Non-NULL          | Downstream           | <p>When the <code>CREATE_CAPTURE</code> procedure creates a downstream capture process, the <code>use_database_link</code> parameter must be set to <code>TRUE</code> when the <code>first_scn</code> parameter is set to <code>NULL</code>. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database.</p> <p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> <li>• There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the source database.</li> <li>• There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the source database.</li> </ul> <p>In either of these cases, the <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the <code>BUILD</code> procedure waits until these transactions commit before completing.</p> <p>However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified <code>start_scn</code> parameter value is less than the current SCN for the source database, then an error is raised.</p> |
| NULL              | NULL              | Local or Downstream  | <p>The behavior is the same as setting the <code>first_scn</code> parameter to <code>NULL</code> and setting the <code>start_scn</code> parameter to the current SCN of the source database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

[BUILD Procedure](#) for more information about the `BUILD` procedure and the LogMiner data dictionary

#### Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
    file_name FOR capture_process;
```

Here, *file\_name* is the name of the redo log file being added and *capture\_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture\_process* is equivalent to the *logminer\_session\_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the `DBMS_FILE_TRANSFER` package, FTP, or some other transfer method.

## 36.3.9 CREATE\_SYNC\_CAPTURE Procedure

This procedure creates a synchronous capture.

### Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE (
    queue_name      IN  VARCHAR2,
    capture_name    IN  VARCHAR2,
    rule_set_name   IN  VARCHAR2,
    capture_user    IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 36-10** CREATE\_SYNC\_CAPTURE Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queue_name    | <p>The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form <code>[schema_name.]queue_name</code>. For example, to specify a queue in the <code>strmadmin</code> schema named <code>streams_queue</code>, enter <code>strmadmin.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p><b>Note:</b> The <code>queue_name</code> setting cannot be altered after the synchronous capture is created.</p>                                                                                                             |
| capture_name  | <p>The name of the synchronous capture being created. A <code>NULL</code> specification is not allowed. Do not specify an owner.</p> <p><b>Note:</b> The <code>capture_name</code> setting cannot be altered after the synchronous capture is created.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| rule_set_name | <p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>strmadmin</code> schema named <code>sync_cap_rules</code>, enter <code>strmadmin.sync_cap_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist.</p> <p>If <code>NULL</code>, then an error is returned.</p> |

Table 36-10 (Cont.) CREATE\_SYNC\_CAPTURE Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_user | <p>The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If <code>NULL</code>, then the user who runs the <code>CREATE_SYNC_CAPTURE</code> procedure is used.</p> <p>Only a user who is granted the <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p><b>Note:</b> If the capture user for a synchronous capture is dropped using <code>DROP USER . . . CASCADE</code>, then the synchronous capture is also dropped automatically.</p> <p><b>See Also:</b> "<a href="#">Usage Notes</a>" for more information about this parameter.</p> |

### Usage Notes

When the `CREATE_SYNC_CAPTURE` procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The `capture_user` parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- `ENQUEUE` privilege on the queue specified in the `queue_name` parameter
- `EXECUTE` privilege on the rule set used by the synchronous capture
- `EXECUTE` privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted `EXECUTE` privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

#### Note:

A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

## 36.3.10 DROP\_CAPTURE Procedure

This procedure drops a capture process.

### Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 36-11 DROP\_CAPTURE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_name          | The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| drop_unused_rule_sets | If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Replication client. Oracle Replication clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.<br><br>If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules. |

### Usage Notes

The following usage notes apply to this procedure:

- [The Capture Process Must Be Stopped Before It Is Dropped](#)
- [The DROP\\_CAPTURE Procedure and Rules-related Information](#)

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

#### See Also:

[STOP\\_CAPTURE Procedure](#)

### The DROP\_CAPTURE Procedure and Rules-related Information

When you use this procedure to drop a capture process, rules-related information for the capture process is removed from the data dictionary views for Oracle Replication rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Replication rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES

- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_RULES

### 36.3.11 INCLUDE\_EXTRA\_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

#### Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE (
    capture_name    IN  VARCHAR2,
    attribute_name  IN  VARCHAR2,
    include         IN  BOOLEAN   DEFAULT TRUE);
```

#### Parameters

**Table 36-12 INCLUDE\_EXTRA\_ATTRIBUTE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_name   | The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| attribute_name | <p>The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings:</p> <ul style="list-style-type: none"> <li>• row_id<br/>The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</li> <li>• serial#<br/>The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>• session#<br/>The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>• thread#<br/>The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>• tx_name<br/>The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>• username<br/>The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> |
| include        | <p>If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture.</p> <p>If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

## 36.3.12 PREPARE\_GLOBAL\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

## Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
  supplemental_logging IN VARCHAR2 DEFAULT 'KEYS',
  container             IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameter

**Table 36-13 PREPARE\_GLOBAL\_INSTANTIATION Procedure Parameter**

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>supplemental_logging</code> | <p>Either <code>NONE</code>, <code>KEYS</code>, or <code>ALL</code>.</p> <p>If <code>NONE</code> is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If <code>KEYS</code> is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying <code>KEYS</code> does not enable supplemental logging of bitmap join index columns.</p> <p>If <code>ALL</code> is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: <code>LOB</code>, <code>LONG</code>, <code>LONG RAW</code>, user-defined types, and Oracle-supplied types.</p> |

**Table 36-13 (Cont.) PREPARE\_GLOBAL\_INSTANTIATION Procedure Parameter**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| container | <p>Either CURRENT , ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure adds supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure adds supplemental logging for the specified PDB.</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p> |

#### Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

### 36.3.13 PREPARE\_SCHEMA\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

#### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name          IN  VARCHAR2,
    supplemental_logging IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

#### Parameters

**Table 36-14 PREPARE\_SCHEMA\_INSTANTIATION Procedure Parameters**

| Parameter   | Description                              |
|-------------|------------------------------------------|
| schema_name | The name of the schema. For example, hr. |

**Table 36-14 (Cont.) PREPARE\_SCHEMA\_INSTANTIATION Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| supplemental_logging | <p>Either NONE, KEYS, or ALL.</p> <p>If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</p> <p>If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p> |
| container            | <p>Either CURRENT , ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure adds supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure adds supplemental logging for the specified PDB</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

## 36.3.14 PREPARE\_SYNC\_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The *table\_names* parameter is VARCHAR2 datatype in one version and DBMS\_UTILITY.UNCL\_ARRAY datatype in the other version.

#### Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN VARCHAR2)
```

```
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

## Parameters

**Table 36-15 PREPARE\_SYNC\_INSTANTIATION Function Parameter**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_names | <p>When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.</p> <p>When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</p> <p>In either version of the function, specify the name of each table in the form [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</p> |

## 36.3.15 PREPARE\_TABLE\_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table

This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

## Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name          IN VARCHAR2,
    supplemental_logging IN VARCHAR2 DEFAULT 'KEYS',
    container           IN VARCHAR2 DEFAULT 'CURRENT');
```

## Parameters

**Table 36-16 PREPARE\_TABLE\_INSTANTIATION Procedure Parameters**

| Parameter  | Description                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name | The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. |

**Table 36-16 (Cont.) PREPARE\_TABLE\_INSTANTIATION Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| supplemental_logging | <p>Either NONE, KEYS, or ALL.</p> <p>If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.</p> <p>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</p> <p>If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p> |
| container            | <p>Either CURRENT , ALL, or <i>pdb_name</i>.</p> <p>If CURRENT is specified, then this procedure adds supplemental logging for the current container.</p> <p>If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.</p> <p>If <i>pdb_name</i> is specified, then this procedure adds supplemental logging for the specified PDB.</p> <p>ALL and <i>pdb_name</i> are valid only when you invoke the procedure from the root.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

## 36.3.16 SET\_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

### Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER (
  capture_name  IN  VARCHAR2,
  parameter     IN  VARCHAR2,
  value         IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 36-17 SET\_PARAMETER Procedure Parameters**

| Parameter    | Description                                               |
|--------------|-----------------------------------------------------------|
| capture_name | The name of the capture process. Do not specify an owner. |

**Table 36-17 (Cont.) SET\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| parameter | The name of the parameter you are setting.                                                           |
| value     | The value to which the parameter is set.<br>If NULL, then the parameter is set to its default value. |

### Capture Process Parameters

The following table lists the parameters for the capture process.

**Table 36-18 Capture Process Parameters**

| Parameter Name        | Possible Values                                 | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| annotatedddlsize      | 0 or a positive integer up to 4294967296 (4 GB) | 0       | <p>The maximum length of the DDL text, in bytes, up to which the DDL can be chosen for annotation, if applicable for the DDL. Any DDL text whose size is greater than the specified size is not annotated.</p> <p>The default, 0, indicates that no DDL text processed by this capture process is annotated. Annotating DDL can simplify filtering and transformation of the DDL within Oracle GoldenGate.</p> <p><b>Note:</b> This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Replication environment or in an XStream environment.</p>                                                                                                                                                                                                                                                                                                                                                 |
| capture_idkey_objects | Y or N                                          | N       | <p>If Y, then the capture process captures ID key logical change records (LCRs).</p> <p>If N, then the capture process does not capture ID key LCRs.</p> <p>Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter and <i>Oracle Database XStream Guide</i> for more information about ID key LCRs</p> |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name               | Possible Values | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_sequence_n<br>extval | Y or N          | N       | <p>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as SYS and SYSTEM. The capture process's rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs.</p> <p>If N, then the capture process does not capture sequence LCRs.</p> <p>An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter and <a href="#">"SET_PARAMETER Procedure"</a> for information about the apply_sequence_nextval apply process parameter</p> |
| disable_on_limit             | Y or N          | N       | <p>If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter.</p> <p>If N, then the capture process is restarted immediately after stopping because it reached a limit.</p> <p>When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CPnn) remains the same.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name            | Possible Values                                 | Default                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-------------------------------------------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| downstream_real_time_mine | Y or N                                          | Y for local capture processes<br>N for downstream capture processes | <p>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement <code>ALTER SYSTEM ARCHIVE LOG CURRENT</code> to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database.</p> <p>If N, then the capture process is an archived-log downstream capture process.</p> <p>An error is raised if an attempt is made to set this parameter for a local capture process.</p>                                                                                                                                                                                                                        |
| excludetag                | Comma-delimited list of Oracle Replication tags | NULL                                                                | <p>Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Replication tags.</p> <p>Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. **Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name           | Possible Values                       | Default | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|---------------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ignore_transaction       | A valid transaction ID or NULL        | NULL    | <p>Instructs the capture process to ignore the specified transaction from the source database, effective immediately.</p> <p>The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database.</p> <p>If NULL, then the capture process ignores this parameter.</p> <p>Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.</p> <p>To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter.</p>                                                                                          |
| ignore_unsupported_table | A fully qualified table name, *, or - | *       | <p>Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table.</p> <p>A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process's rule sets exclude unsupported tables.</p> <p>When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form <i>table_owner. table_name</i>. For example, <i>hr.employees</i>. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure.</p> <p>When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log.</p> <p>When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.</p> |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name          | Possible Values                                      | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|------------------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| include_objects         | A list of tables or schema names separated by commas | none     | <p>Directs capture to include changes from the specified tables or schemas.</p> <p>An LCR that is selected by <code>include_objects</code> is passed to the outbound server regardless of any further filtering that is specified.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter</p>                |
| inline_lob_optimization | Y or N                                               | N        | <p>If Y, then LOBs that can be processed inline (such as small LOBs) are included in the LCR directly, rather than sending LOB chunk LCRs.</p> <p>If N, then each LOB column is sent as NULL followed by LOB chunk LCRs to update the LOB column.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter</p> |
| maximum_scn             | A valid SCN or INFINITE                              | INFINITE | <p>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified.</p> <p>If INFINITE, then the capture process runs regardless of the SCN value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name  | Possible Values                                                     | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_sga_size    | A positive integer                                                  | INFINITE | <p>Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log.</p> <p>The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled.</p> <p><b>Note:</b> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the <code>STREAMS_POOL_SIZE</code> initialization parameter.</p> <p>If <code>NULL</code>, then the capture component uses the original default value. A <code>NULL</code> value has the same effect as resetting the parameter to its default value.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter</p> |
| merge_threshold | A negative integer, 0, a positive integer, or <code>INFINITE</code> | 60       | <p>The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process.</p> <p>Specifically, if the difference, in seconds, between the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the <code>MERGE_STREAMS</code> procedure.</p> <p>This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the <code>split_threshold</code> parameter is set to a value other than <code>INFINITE</code>.</p> <p>If a negative value is specified, then automatic merge is disabled.</p> <p>If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge.</p> <p>If <code>INFINITE</code> is specified, then automatic merging starts immediately.</p>                                                                                                                                                                                                                                                      |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name              | Possible Values                | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message_limit               | A positive integer or INFINITE | INFINITE | <p>The capture process stops after capturing the specified number of messages.</p> <p>If INFINITE, then the capture process continues to run regardless of the number of messages captured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| message_tracking_frequency  | 0 or a positive integer        | 2000000  | <p>The frequency at which messages captured by the capture process are tracked automatically.</p> <p>For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically.</p> <p>The tracking label used for automatic message tracking is <code>capture_process_name:AUTOTRACK</code>, where <code>capture_process_name</code> is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes.</p> <p>If 0 (zero), then no messages are tracked automatically.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| parallelism                 | A positive integer             | 1        | <p>The number of preparer servers that can concurrently mine the redo log for the capture process.</p> <p>A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the <code>parallelism</code> capture process parameter. So, if <code>parallelism</code> is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server.</p> <p>Setting the <code>parallelism</code> parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the <code>PROCESSES</code> initialization parameter is set appropriately when you set the <code>parallelism</code> capture process parameter.</p> <p><b>Note:</b> When you change the value of this parameter, the capture process is stopped and restarted automatically.</p> |
| skip_autofiltered_table_ddl | Y or N                         | Y        | <p>If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process.</p> <p>If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name  | Possible Values                    | Default  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| split_threshold | 0, a positive integer, or INFINITE | 1800     | <p>The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned.</p> <p>In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled.</p> <p>This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes.</p> <p>If 0 (zero), then automatic splitting starts immediately.</p> <p>If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken.</p> <p>This parameters is designed to be used with the merge_threshold parameter.</p> |
| startup_seconds | 0, a positive integer, or INFINITE | 0        | <p>The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually.</p> <p>If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| time_limit      | A positive integer or INFINITE     | INFINITE | <p>The capture process stops as soon as possible after the specified number of seconds since it started.</p> <p>If INFINITE, then the capture process continues to run until it is stopped explicitly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| trace_level     | 0 or a positive integer            | 0        | <p>Set this parameter only under the guidance of Oracle Support Services.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 36-18 (Cont.) Capture Process Parameters**

| Parameter Name     | Possible Values | Default                                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| use_rac_service    | Y or N          | Y if Replication<br>N if XStream                                                                                                 | <p>If Y, then the capture process is run in the owning instance of its queue.</p> <p>If N, then the client specifies where the capture process is to run.</p> <p><b>Note:</b> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See <a href="#">"ENABLE_GG_XSTREAM_FOR_STREAMS Procedure"</a> for information about enabling XStream optimizations.</p> <p><b>See Also:</b> <a href="#">"Usage Notes"</a> for more information about this parameter</p>   |
| write_alert_log    | Y or N          | Y                                                                                                                                | <p>If Y, then the capture process writes a message to the alert log on exit.</p> <p>If N, then the capture process does not write a message to the alert log on exit.</p> <p>The message specifies the reason the capture process stopped.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| xout_client_exists | Y or N          | Y if the capture process sends LCRs to XStream outbound servers<br>N if the capture process sends LCRs to Oracle Apply processes | <p>Y indicates that the capture process sends LCRs to one or more XStream outbound servers.</p> <p>N indicates that the capture process sends LCRs to one or more Oracle Apply processes.</p> <p>A single capture process cannot send LCRs to both outbound servers and apply processes.</p> <p>In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server.</p> <p><b>Note:</b> Using XStream requires purchasing a license for the Oracle GoldenGate product. See <i>Oracle Database XStream Guide</i>.</p> |

### Usage Notes

The following usage notes apply to the `SET_PARAMETER` procedure:

- [Delays Are Possible Before New Parameter Settings Take Effect](#)
- [Parameters Interpreted as Positive Integers](#)
- [Parameters with a System Change Number \(SCN\) Setting](#)
- [Parameters that Require XStream Optimizations](#)
- [XStream or Oracle GoldenGate Integrated Capture Configurations](#)

**Delays Are Possible Before New Parameter Settings Take Effect**

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

### Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `INFINITE` for larger values.

### Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

### Parameters that Require XStream Optimizations

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Replication components:

- `capture_idkey_objects`
- `capture_sequence_nextval`
- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `include_objects`
- `inline_lob_optimization`
- `max_sga_size`
- `use_rac_services`

The `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure enables XStream optimizations for Oracle Replication. When XStream optimizations are not enabled by the `DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS` procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Replication and the `capture_idkey_objects` parameter is set to `Y`, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.

To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```
SELECT OWNER, OBJECT_NAME
FROM DBA_XSTREAM_OUT_SUPPORT_MODE
WHERE SUPPORT_MODE='ID KEY';
```

#### Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**See Also:**

*Oracle Database XStream Guide* for more information about ID key LCRs

### XStream or Oracle GoldenGate Integrated Capture Configurations

In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- `capture_idkey_objects`
- `capture_sequence_nextval`
- `excludetag`
- `excludetrans`
- `excludeuser`
- `excludeuserid`
- `getapplops`
- `getreplicates`
- `include_objects`
- `inline_lob_optimization`
- `max_sga_size`
- `use_rac_services`

You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.

If an integrated configuration performs bi-directional replication, then, to avoid change cycling, the capture process should not capture the changes made by the Oracle GoldenGate Replicat process. To accomplish this goal, use the default settings for the `getapplops` and `getreplicates` parameters and exclude changes made by the user running the Replicat process. To exclude these changes, specify this user in the `excludeuserid` or `excludeuser` parameter. Typically, the user running the Oracle GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by applications or by the Replicat process. For example, an intermediate database in a replication environment might capture all of the changes made to the database, including both application changes and Replicat process changes, and send these changes to a different destination database.

[Table 36-19](#) describes the capture process behavior when at least one of the exclude parameters is non-NULL.

**Table 36-19 Behavior When at Least One exclude Parameter Is Non-NULL**

| getapplops Setting | getreplicates Setting | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Y                  | Y                     | The capture process captures all DML changes.                                                                                                                                                                                                                                                                                                                                                                     |
| Y                  | N                     | The capture process captures the DML changes made by the users that are not in the <code>excludeuserid</code> or <code>excludeuser</code> parameters.<br>The capture process captures the DML changes that are not in the transactions in the <code>excludetrans</code> parameter.<br>The capture process captures only the DML changes that do not have a tag that is in the <code>excludetags</code> parameter. |
| N                  | Y                     | The capture process captures only the DML changes made by the users that are in the <code>excludeuserid</code> or <code>excludeuser</code> parameters.<br>The capture process captures only the DML changes that are in the transactions in the <code>excludetrans</code> parameter.<br>The capture process captures only the DML changes that have a tag that is in the <code>excludetags</code> parameter.      |
| N                  | N                     | The capture process does not capture any DML changes.                                                                                                                                                                                                                                                                                                                                                             |

Table 36-19 describes the capture process behavior when all of the exclude parameters are set to NULL.

**Table 36-20 Behavior When All exclude Parameters Are Set to NULL**

| getapplops Setting | getreplicates Setting | Description                                           |
|--------------------|-----------------------|-------------------------------------------------------|
| Y                  | Y                     | The capture process captures all DML changes.         |
| Y                  | N                     | The capture process captures all DML changes.         |
| N                  | Y                     | The capture process does not capture any DML changes. |
| N                  | N                     | The capture process does not capture any DML changes. |

See the documentation for the Oracle GoldenGate product for more information:

[http://docs.oracle.com/cd/E15881\\_01/index.htm](http://docs.oracle.com/cd/E15881_01/index.htm)

**Note:**

A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process's rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process's rule sets.

**See Also:***Oracle Database XStream Guide*

## 36.3.17 START\_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

### Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(  
    capture_name IN VARCHAR2);
```

### Parameters

**Table 36-21** START\_CAPTURE Procedure Parameter

| Parameter    | Description                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_name | The name of the capture process. Do not specify an owner.<br>The capture process uses LogMiner to capture changes in the redo information. A <code>NULL</code> setting is not allowed. |

### Usage Notes

The capture process status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup. A capture process (`cnnn`) is an Oracle background process.

## 36.3.18 STOP\_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

### Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(  
    capture_name IN VARCHAR2,  
    force        IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 36-22 STOP\_CAPTURE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>capture_name</code> | The name of the capture process. A <code>NULL</code> setting is not allowed. Do not specify an owner.                                                                                                                                                                                                                                                                                        |
| <code>force</code>        | <p>If <code>TRUE</code>, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts.</p> <p>If <code>FALSE</code>, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.</p> |

## Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form `CPnn`, where `nn` can include letters and numbers.
- The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the stop status of a capture process.

## DBMS\_CLOUD

The `DBMS_CLOUD` package provides comprehensive support for working with data in Object Storage.

This chapter contains the following topics:

- [DBMS\\_CLOUD Overview](#)
- [Installing the DBMS\\_CLOUD Package](#)
- [DBMS\\_CLOUD Security Model](#)
- [DBMS\\_CLOUD Exceptions](#)
- [Summary of DBMS\\_CLOUD Subprograms](#)
- [DBMS\\_CLOUD Package File URI Formats](#)
- [DBMS\\_CLOUD Package Format Options](#)
- [DBMS\\_CLOUD Avro and Parquet Support](#)

### 37.1 DBMS\_CLOUD Overview

Using `DBMS_CLOUD` to work with data in Object Storage you can do the following:

- Manage your credentials for accessing Object Store.
- Copy data as-is: External data is loaded into the database in a single one-step operation, without the need to create any objects in the database. The load operation is monitored and tracked inside the database.
- Manage the information about your load operations.
- Validate the content of external data prior to consumption. Prior to consumption of external data you verify its content and identify rows that do not conform to the expected external data format.
- Create an external table. Create the necessary object in the database for flexible and continuous consumption.
- Work with objects in object stores and directories.

### 37.2 Installing the DBMS\_CLOUD Package

The `DBMS_CLOUD` package provides a comprehensive support for working with data in Object Storage starting with Oracle Database 19c and later releases. However, this package is not pre-installed with Oracle Database. You need to manually install the `DBMS_CLOUD` package and also configure users or roles to use this package.

For information on installing the `DBMS_CLOUD` package and configuring users/roles, see the MOS-NOTE with Doc ID [2748362.1](#).

## 37.3 DBMS\_CLOUD Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles.

## 37.4 DBMS\_CLOUD Exceptions

The following table describes exceptions for `DBMS_CLOUD`.

| Exception                                | Code  | Description                                                                                                             |
|------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------|
| <code>reject_limit</code>                | 20003 | The reject limit of an external table was reached.                                                                      |
| <code>credential_not_exist</code>        | 20004 | A credential object does not exist.                                                                                     |
| <code>table_not_exist</code>             | 20005 | A table does not exist.                                                                                                 |
| <code>unsupported_obj_store</code>       | 20006 | An unsupported object store URI was provided.                                                                           |
| <code>iden_too_long</code>               | 20008 | An identifier is too long.                                                                                              |
| <code>invalid_format</code>              | 20009 | A format argument is not valid.                                                                                         |
| <code>missing_credential</code>          | 20010 | Mandatory credential object information was not specified.                                                              |
| <code>invalid_object_uri</code>          | 20011 | An invalid object URI was provided.                                                                                     |
| <code>invalid_partitioning_clause</code> | 20012 | An partitioning clause is missing or was not provided.                                                                  |
| <code>unsupported_feature</code>         | 20013 | An unsupported feature was used that is not existent in the current database version.                                   |
| <code>part_not_exist</code>              | 20014 | A partition or subpartition does not exist, or a table is not a partitioned external table or hybrid partitioned table. |
| <code>invalid_table_name</code>          | 20016 | An invalid table name was used.                                                                                         |
| <code>invalid_schema_name</code>         | 20017 | An invalid schema name was used.                                                                                        |
| <code>invalid_dir_name</code>            | 20018 | An invalid directory name was used.                                                                                     |
| <code>invalid_file_name</code>           | 20019 | An invalid file name was used.                                                                                          |
| <code>invalid_cred_attribute</code>      | 20020 | Invalid credential attributes were specified.                                                                           |
| <code>table_exist</code>                 | 20021 | A table already exists.                                                                                                 |
| <code>credential_exist</code>            | 20022 | A credential object already exists.                                                                                     |
| <code>invalid_req_method</code>          | 20023 | A request method is either too long or invalid.                                                                         |
| <code>invalid_req_header</code>          | 20024 | An invalid request header was specified.                                                                                |
| <code>file_not_exist</code>              | 20025 | A file does not exist.                                                                                                  |
| <code>invalid_response</code>            | 20026 | An HTTP response was not valid.                                                                                         |
| <code>invalid_operation</code>           | 20027 | An invalid task class or ID was specified.                                                                              |
| <code>invalid_user_name</code>           | 20028 | An invalid username was specified.                                                                                      |

## 37.5 Summary of DBMS\_CLOUD Subprograms

This section covers the `DBMS_CLOUD` subprograms provided with Oracle Database.

| Subprogram                          | Description                                                                             |
|-------------------------------------|-----------------------------------------------------------------------------------------|
| <a href="#">COPY_DATA Procedure</a> | This procedure loads data into existing Oracle Database tables from files in the Cloud. |

| Subprogram                                                                | Description                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">COPY_DATA Procedure for Avro or Parquet Files</a>             | This procedure with the <code>format</code> parameter <code>type</code> set to the value <code>avro</code> or <code>parquet</code> loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud. Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table. |
| <a href="#">CREATE_CREDENTIAL Procedure</a>                               | This procedure stores cloud service credentials in Oracle Database.                                                                                                                                                                                                                                                                             |
| <a href="#">CREATE_EXTERNAL_TABLE Procedure</a>                           | This procedure creates an external table on files in the Cloud. This allows you to run queries on external data from Oracle Database.                                                                                                                                                                                                           |
| <a href="#">CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files</a> | This procedure with the <code>format</code> parameter <code>type</code> set to the value <code>avro</code> or <code>parquet</code> creates an external table with either Avro or Parquet format files in the Cloud. This allows you to run queries on external data from Oracle Database.                                                       |
| <a href="#">CREATE_EXTERNAL_PART_TABLE Procedure</a>                      | This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.                                                                                                                                                                                               |
| <a href="#">CREATE_HYBRID_PART_TABLE Procedure</a>                        | This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.                                                                                                                                                                                                              |
| <a href="#">DELETE_ALL_OPERATIONS Procedure</a>                           | This procedure clears either all data load operations logged in the <code>user_load_operations</code> table in your schema or clears all the data load operations of the specified type, as indicated with the <code>type</code> parameter.                                                                                                     |
| <a href="#">DELETE_FILE Procedure</a>                                     | This procedure removes the specified file from the specified directory on Oracle Database.                                                                                                                                                                                                                                                      |
| <a href="#">DELETE_OBJECT Procedure</a>                                   | This procedure deletes the specified object on object store.                                                                                                                                                                                                                                                                                    |
| <a href="#">DROP_CREDENTIAL Procedure</a>                                 | This procedure removes an existing credential from Oracle Database.                                                                                                                                                                                                                                                                             |
| <a href="#">GET_OBJECT Procedure and Function</a>                         | This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a <code>BLOB</code> to Oracle Database.                                                                                                    |
| <a href="#">LIST_FILES Function</a>                                       | This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.                                                                                                                       |
| <a href="#">LIST_OBJECTS Function</a>                                     | This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.                                                                                                          |
| <a href="#">PUT_OBJECT Procedure</a>                                      | This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a <code>BLOB</code> from Oracle Database to the Cloud Object Storage.                                                                                                              |

| <a href="#">VALIDATE_HYBRID_PART_TABLE Procedure</a>   | This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a <i>badfile</i> table on Oracle Database.      |

## 37.5.1 COPY\_DATA Procedure

This procedure loads data into existing Oracle Database tables from files in the Cloud. The overloaded form enables you to use the `operation_id` parameter.

### Syntax

```
DBMS_CLOUD.COPY_DATA (
    table_name      IN VARCHAR2,
    credential_name IN VARCHAR2,
    file_uri_list   IN CLOB,
    schema_name     IN VARCHAR2,
    field_list      IN CLOB,
    format          IN CLOB);

DBMS_CLOUD.COPY_DATA (
    table_name      IN VARCHAR2,
    credential_name IN VARCHAR2 DEFAULT NULL,
    file_uri_list   IN CLOB DEFAULT NULL,
    schema_name     IN VARCHAR2 DEFAULT NULL,
    field_list      IN CLOB DEFAULT NULL,
    format          IN CLOB DEFAULT NULL,
    operation_id    OUT NOCOPY NUMBER);
```

### Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code>      | The name of the target table on the database. The target table needs to be created before you run <code>COPY_DATA</code> .                                                                                                                                                                                                                                                                                 |
| <code>credential_name</code> | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                                                                                                                                                                             |
| <code>file_uri_list</code>   | Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character.<br><br>The format of the URIs depend on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> . |
| <code>schema_name</code>     | The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.                                                                                                                                                                                                                                         |

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>field_list</code>   | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the target table definition. This argument's syntax is the same as the <code>field_list</code> clause in regular Oracle external tables. For more information about <code>field_list</code> see <i>Oracle® Database Utilities</i> .<br>For an example using <code>field_list</code> , see <a href="#">CREATE_EXTERNAL_TABLE Procedure</a> . |
| <code>format</code>       | The options describing the format of the source files. For the list of the options and how to specify the values see <a href="#">DBMS_CLOUD Package Format Options</a> .<br>For Avro or Parquet file format options, see <a href="#">DBMS_CLOUD Package Format Options for Avro or Parquet</a> .                                                                                                                                                                                                |
| <code>operation_id</code> | Use this parameter to track the progress and final status of the load operation as the corresponding ID in the <code>USER_LOAD_OPERATIONS</code> view.                                                                                                                                                                                                                                                                                                                                          |

## 37.5.2 COPY\_DATA Procedure for Avro or Parquet Files

This procedure with the `format` parameter type set to the value `avro` or `parquet` loads data into existing Oracle Database tables from Avro or Parquet files in the Cloud. Similar to text files, the data is copied from the source Avro or Parquet file into the preexisting internal table.

### Syntax

```
DBMS_CLOUD.COPY_DATA (  
    table_name      IN VARCHAR2,  
    credential_name IN VARCHAR2,  
    file_uri_list   IN CLOB,  
    schema_name     IN VARCHAR2 DEFAULT,  
    field_list      IN CLOB DEFAULT,  
    format          IN CLOB DEFAULT);
```

### Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code>      | The name of the target table on the database. The target table needs to be created before you run <code>COPY_DATA</code> .                                                                                                                                                                                                                                                                                 |
| <code>credential_name</code> | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                                                                                                                                                                             |
| <code>file_uri_list</code>   | Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character.<br><br>The format of the URIs depend on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> . |
| <code>schema_name</code>     | The name of the schema where the target table resides. The default value is NULL meaning the target table is in the same schema as the user running the procedure.                                                                                                                                                                                                                                         |

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>field_list</code> | <p>Ignored for Avro or Parquet files.</p> <p>The fields in the source match the external table columns by name. Source data types are converted to the external table column data type.</p> <p>For Parquet files, see <a href="#">DBMS_CLOUD Package Parquet to Oracle Data Type Mapping</a> for details on mapping.</p> <p>For Avro files, see <a href="#">DBMS_CLOUD Package Avro to Oracle Data Type Mapping</a> for details on mapping.</p> |
| <code>format</code>     | <p>The options describing the format of the source files. For Avro or Parquet files, only two options are supported: see <a href="#">DBMS_CLOUD Package Format Options for Avro or Parquet</a>.</p>                                                                                                                                                                                                                                             |

### Usage Notes

- As with other data files, Avro and Parquet data loads generate logs that are viewable in the tables `dba_load_operations` and `user_load_operations`. Each load operation adds a record to `dba[user]_load_operations` that indicates the table containing the logs. The log table provides summary information about the load.
- For Avro or Parquet, when the `format` parameter type is set to the value `avro` or `parquet`, the `BADFILE_TABLE` table is always empty.
  - For Parquet files, `PRIMARY KEY` constraint errors throw an `ORA` error.
  - If data for a column encounters a conversion error, for example, the target column is not large enough to hold the converted value, the value for the column is set to `NULL`. This does not produce a rejected record.

## 37.5.3 CREATE\_CREDENTIAL Procedure

This procedure stores cloud service credentials in Oracle Database.

Use stored cloud service credentials to access the cloud service for data loading, for querying external data residing in the cloud, or for other cases when you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure is overloaded. Use the Oracle Cloud Infrastructure-related parameters, including: `user_ocid`, `tenancy_ocid`, `private_key`, and `fingerprint` only when you are using Oracle Cloud Infrastructure Signing Keys authentication.

### Syntax

```
DBMS_CLOUD.CREATE_CREDENTIAL (
  credential_name  IN VARCHAR2,
  username         IN VARCHAR2,
  password        IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_CLOUD.CREATE_CREDENTIAL (
  credential_name IN VARCHAR2,
  user_ocid      IN VARCHAR2,
  tenancy_ocid   IN VARCHAR2,
  private_key    IN VARCHAR2,
  fingerprint    IN VARCHAR2);
```

## Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                         |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>credential_name</code> | The name of the credential to be stored.                                                                                                                                                                                                                                                                            |
| <code>username</code>        | The <code>username</code> and <code>password</code> arguments together specify your cloud service credentials. See below for what to specify for the <code>username</code> and <code>password</code> for different cloud services.                                                                                  |
| <code>password</code>        | The <code>username</code> and <code>password</code> arguments together specify your cloud service credentials.                                                                                                                                                                                                      |
| <code>user_ocid</code>       | Specifies the user's OCID. See <a href="#">Where to Get the Tenancy's OCID and User's OCID</a> for details on obtaining the User's OCID.                                                                                                                                                                            |
| <code>tenancy_ocid</code>    | Specifies the tenancy's OCID. See <a href="#">Where to Get the Tenancy's OCID and User's OCID</a> for details on obtaining the Tenancy's OCID.                                                                                                                                                                      |
| <code>private_key</code>     | Specifies the generated private key. Private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See <a href="#">How to Generate an API Signing Key</a> for details on generating a key pair in PEM format.                                              |
| <code>fingerprint</code>     | Specifies a fingerprint. After a generated public key is uploaded to the user's account the fingerprint is displayed in the console. Use the displayed fingerprint for this argument. See <a href="#">How to Get the Key's Fingerprint</a> and <a href="#">How to Generate an API Signing Key</a> for more details. |

## Usage Notes

- This operation stores the credentials in the database in an encrypted format.
- You can see the credentials in your schema by querying the `user_credentials` table.
- The `ADMIN` user can see all the credentials by querying the `dba_credentials` table.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for `DBMS_CLOUD` procedures that require a `credential_name` parameter.
- This procedure is overloaded. If you provide one of the key based authentication attributes, `user_ocid`, `tenancy_ocid`, `private_key`, or `fingerprint`, the call is assumed to be an Oracle Cloud Infrastructure Signing Key based credential.
- On Oracle Cloud Infrastructure, private keys generated with a passphrase are not supported. You need to generate the private key without a passphrase. See [How to Generate an API Signing Key](#) for more information.

## Oracle Cloud Infrastructure Credentials (Auth Tokens)

For Oracle Cloud Infrastructure the `username` is your Oracle Cloud Infrastructure user name. The `password` is your Oracle Cloud Infrastructure auth token. See [Working with Auth Tokens](#).

## Oracle Cloud Infrastructure Object Storage Classic Credentials

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, the `username` is your Oracle Cloud Infrastructure Classic user name and the `password` is your Oracle Cloud Infrastructure Classic password.

### Amazon Web Services (AWS) Credentials

If your source files reside in Amazon S3 or you are calling an AWS API, the `username` is your AWS access key ID and the `password` is your AWS secret access key. See [AWS Identity and Access Management](#).

### Microsoft Azure Credentials

If your source files reside in Azure Blob Storage or you are calling an Azure API, the `username` is your Azure storage account name and the `password` is an Azure storage account access key. See [About Azure storage accounts](#).

## 37.5.4 CREATE\_EXTERNAL\_TABLE Procedure

This procedure creates an external table on files in the Cloud. This allows you to run queries on external data from Oracle Database.

### Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
  table_name      IN VARCHAR2,
  credential_name IN VARCHAR2,
  file_uri_list   IN CLOB,
  column_list     IN CLOB,
  field_list      IN CLOB DEFAULT,
  format          IN CLOB DEFAULT);
```

### Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code>      | The name of the external table.                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>credential_name</code> | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                                                                                                                                                                                   |
| <code>file_uri_list</code>   | <p>Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character.</p> <p>The format of the URIs depend on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a>.</p> |
| <code>column_list</code>     | Comma-delimited list of column names and data types for the external table.                                                                                                                                                                                                                                                                                                                                      |
| <code>field_list</code>      | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the <code>column_list</code> parameter. This argument's syntax is the same as the <code>field_list</code> clause in regular Oracle external tables. For more information about <code>field_list</code> see <i>Oracle® Database Utilities</i> .               |
| <code>format</code>          | <p>The options describing the format of the source files. For the list of the options and how to specify the values see <a href="#">DBMS_CLOUD Package Format Options</a>.</p> <p>For Avro or Parquet format files, see <a href="#">CREATE_EXTERNAL_TABLE Procedure for Avro or Parquet Files</a>.</p>                                                                                                           |

### Usage Notes

- The procedure `DBMS_CLOUD.CREATE_EXTERNAL_TABLE` supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3

The credential is a table level property; therefore, the external files must be on the same object store.

See [DBMS\\_CLOUD Package File URI Formats](#) for more information.

### Example

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_TABLE(
    table_name => 'WEATHER_REPORT_DOUBLE_DATE',
    credential_name => 'OBJ_STORE_CRED',
    file_uri_list => '&base_URL/
Charlotte_NC_Weather_History_Double_Dates.csv',
    format => json_object('type' value 'csv', 'skipheaders' value '1'),
    field_list => 'REPORT_DATE DATE 'mm/dd/yy'',
                  REPORT_DATE_COPY DATE 'yyyy-mm-dd'',
                  ACTUAL_MEAN_TEMP,
                  ACTUAL_MIN_TEMP,
                  ACTUAL_MAX_TEMP,
                  AVERAGE_MIN_TEMP,
                  AVERAGE_MAX_TEMP,
                  AVERAGE_PRECIPITATION',
    column_list => 'REPORT_DATE DATE,
                  REPORT_DATE_COPY DATE,
                  ACTUAL_MEAN_TEMP NUMBER,
                  ACTUAL_MIN_TEMP NUMBER,
                  ACTUAL_MAX_TEMP NUMBER,
                  AVERAGE_MIN_TEMP NUMBER,
                  AVERAGE_MAX_TEMP NUMBER,
                  AVERAGE_PRECIPITATION NUMBER');

END;
/

SELECT * FROM WEATHER_REPORT_DOUBLE_DATE where
  actual_mean_temp > 69 and actual_mean_temp < 74
```

## 37.5.5 CREATE\_EXTERNAL\_TABLE Procedure for Avro or Parquet Files

This procedure with the `format` parameter type set to the value `avro` or `parquet` creates an external table with either Avro or Parquet format files in the Cloud. This allows you to run queries on external data from Oracle Database.

### Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_TABLE (
  table_name          IN VARCHAR2,
```

```
credential_name IN VARCHAR2,
file_uri_list   IN CLOB,
column_list     IN CLOB,
field_list      IN CLOB DEFAULT,
format          IN CLOB DEFAULT);
```

## Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | The name of the external table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| credential_name | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| file_uri_list   | Comma-delimited list of source file URIs. You can use wildcards in the file names in your URIs. The character "*" can be used as the wildcard for multiple characters, the character "?" can be used as the wildcard for a single character.<br><br>The format of the URIs depend on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> .                                                                                                                                                                                                                                                                                     |
| column_list     | (Optional) This field, when specified, overrides the <code>format-&gt;schema</code> parameter which specifies that the schema, columns, and data types, are derived automatically. See the <code>format</code> parameter for details.<br><br>When the <code>column_list</code> is specified for Avro or Parquet source, the column names must match those columns found in the file. Oracle data types must map appropriately to the Avro or Parquet data types.<br><br>For Parquet files, see <a href="#">DBMS_CLOUD Package Parquet to Oracle Data Type Mapping</a> for details.<br><br>For Avro files, see <a href="#">DBMS_CLOUD Package Avro to Oracle Data Type Mapping</a> for details. |
| field_list      | Ignored for Avro or Parquet files.<br><br>The fields in the source match the external table columns by name. Source data types are converted to the external table column data type.<br><br>For Parquet files, see <a href="#">DBMS_CLOUD Package Parquet to Oracle Data Type Mapping</a> for details.<br><br>For Avro files, see <a href="#">DBMS_CLOUD Package Avro to Oracle Data Type Mapping</a> for details.                                                                                                                                                                                                                                                                             |
| format          | For Avro or Parquet, there are only two supported parameters. See <a href="#">DBMS_CLOUD Package Format Options for Avro or Parquet</a> for details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Examples Avro

```
format => '{"type":"avro", "schema": "all"}'
```

```
format => json_object('type' value 'avro', 'schema' value 'first')
```

## Examples Parquet

```
format => '{"type":"parquet", "schema": "all"}'
```

```
format => json_object('type' value 'parquet', 'schema' value 'first')
```

## Avro or Parquet Column Name Mapping to Oracle Column Names

See [DBMS\\_CLOUD Package Avro and Parquet to Oracle Column Name Mapping](#) for information on column name mapping and column name conversion usage in Oracle SQL.

## 37.5.6 CREATE\_EXTERNAL\_PART\_TABLE Procedure

This procedure creates an external partitioned table on files in the Cloud. This allows you to run queries on external data from Oracle Database.

### Syntax

```
DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE (
    table_name          IN VARCHAR2,
    credential_name     IN VARCHAR2,
    partitioning_clause IN CLOB,
    column_list         IN CLOB,
    field_list          IN CLOB DEFAULT,
    format              IN CLOB DEFAULT);
```

### Parameters

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name          | The name of the external table.                                                                                                                                                                                                                                                                                                                                                  |
| credential_name     | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                                                                                                                                                   |
| partitioning_clause | Specifies the complete partitioning clause, including the location information for individual partitions.                                                                                                                                                                                                                                                                        |
| column_list         | Comma-delimited list of column names and data types for the external table.                                                                                                                                                                                                                                                                                                      |
| field_list          | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the <i>column_list</i> parameter. This argument's syntax is the same as the <i>field_list</i> clause in regular Oracle external tables. For more information about <i>field_list</i> see <i>Oracle® Database Utilities</i> . |
| format              | The options describing the format of the source files. For the list of the options and how to specify the values see <a href="#">DBMS_CLOUD Package Format Options</a> .                                                                                                                                                                                                         |

### Usage Notes

- With Avro or Parquet data format using `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE`, the `schema` format option is not available and the `column_list` parameter must be specified. The `schema` format option is available with `DBMS_CLOUD.CREATE_EXTERNAL_TABLE`.
- The procedure `DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE` supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3

See [DBMS\\_CLOUD Package File URI Formats](#) for more information.

### Example

```
BEGIN
  DBMS_CLOUD.CREATE_EXTERNAL_PART_TABLE(
    table_name => 'PET1',
    credential_name => 'OBJ_STORE_CRED',
    format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'characterset' value 'us7ascii'),
    column_list => 'col1 number, col2 number, col3 number',
    partitioning_clause => 'partition by range (col1)
                          (partition p1 values less than (1000) location
                           ( '&base_URL//file_11.txt' )
                          ,
                           partition p2 values less than (2000) location
                           ( '&base_URL/file_21.txt' )
                          ,
                           partition p3 values less than (3000)
                           ( '&base_URL/file_31.txt' )
                          )'
    location
  );
END;
/
```

## 37.5.7 CREATE\_HYBRID\_PART\_TABLE Procedure

This procedure creates a hybrid partitioned table. This allows you to run queries on hybrid partitioned data from Oracle Database.

### Syntax

```
DBMS_CLOUD.CREATE_HYBRID_PART_TABLE (
  table_name          IN VARCHAR2,
  credential_name      IN VARCHAR2,
  partitioning_clause IN CLOB,
  column_list         IN CLOB,
  field_list          IN CLOB DEFAULT,
  format              IN CLOB DEFAULT);
```

### Parameters

| Parameter           | Description                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| table_name          | The name of the external table.                                                                           |
| credential_name     | The name of the credential to access the Cloud Object Storage.                                            |
| partitioning_clause | Specifies the complete partitioning clause, including the location information for individual partitions. |
| column_list         | Comma-delimited list of column names and data types for the external table.                               |

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>field_list</code> | Identifies the fields in the source files and their data types. The default value is NULL meaning the fields and their data types are determined by the <code>column_list</code> parameter. This argument's syntax is the same as the <code>field_list</code> clause in regular Oracle external tables. For more information about <code>field_list</code> see <i>Oracle® Database Utilities</i> . |
| <code>format</code>     | The options describing the format of the source files. For the list of the options and how to specify the values see <a href="#">DBMS_CLOUD Package Format Options</a> .                                                                                                                                                                                                                           |

### Usage Note

- The procedure `DBMS_CLOUD.CREATE_HYBRID_PART_TABLE` supports external partitioned files in the supported cloud object storage services, including:
  - Oracle Cloud Infrastructure Object Storage
  - Azure Blob Storage
  - Amazon S3

The credential is a table level property; therefore, the external files must be on the same object store.

See [DBMS\\_CLOUD Package File URI Formats](#) for more information.

### Example

```
BEGIN
  DBMS_CLOUD.CREATE_HYBRID_PART_TABLE(
    table_name => 'HPT1',
    credential_name => 'OBJ_STORE_CRED',
    format => json_object('delimiter' value ',', 'recorddelimiter' value
'newline', 'character set' value 'us7ascii'),
    column_list => 'col1 number, col2 number, col3 number',
    partitioning_clause => 'partition by range (col1)
                          (partition p1 values less than (1000)
external location
                          ( '&base_URL/file_11.txt' )
                          ,
                          partition p2 values less than (2000)
external location
                          ( '&base_URL/file_21.txt' )
                          ,
                          partition p3 values less than (3000)
                          )'
    );
END;
```

## 37.5.8 DELETE\_ALL\_OPERATIONS Procedure

This procedure clears either all data load operations logged in the `user_load_operations` table in your schema or clears all the data load operations of the specified type, as indicated with the `type` parameter.

## Syntax

```
DBMS_CLOUD.DELETE_ALL_OPERATIONS (  
    type          IN VARCHAR DEFAULT NULL);
```

## Parameters

| Parameter | Description                                                                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | Specifies the type of operation to delete. Type values can be found in the <code>TYPE</code> column in the <code>user_load_operations</code> table.<br><br>If no <code>type</code> is specified all rows are deleted. |

## Usage Note

- `DBMS_CLOUD.DELETE_ALL_OPERATIONS` does not delete currently running operations (operations in a "Running" status).

## 37.5.9 DELETE\_FILE Procedure

This procedure removes the specified file from the specified directory on Oracle Database.

## Syntax

```
DBMS_CLOUD.DELETE_FILE (  
    directory_name    IN VARCHAR2,  
    file_name         IN VARCHAR2);
```

## Parameters

| Parameter      | Description                                                |
|----------------|------------------------------------------------------------|
| directory_name | The name of the directory on the Oracle Database instance. |
| file_name      | The name of the file to be removed.                        |

### Note:

To run `DBMS_CLOUD.DELETE_FILE` you need to grant write privileges on the directory that contains the file to the user. For example, run the following command as `ADMIN` to grant write privileges to `db_user`:

```
GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
```

## Example

```
BEGIN  
    DBMS_CLOUD.DELETE_FILE(  
        directory_name => 'DATA_PUMP_DIR',  
        file_name => 'expl.dmp' );
```

```
END;  
/
```

## 37.5.10 DELETE\_OBJECT Procedure

This procedure deletes the specified object on object store.

### Syntax

```
DBMS_CLOUD.DELETE_OBJECT (  
    credential_name      IN VARCHAR2,  
    object_uri           IN VARCHAR2);
```

### Parameters

| Parameter       | Description                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| credential_name | The name of the credential to access the Cloud Object Storage.                                                                                                                                      |
| object_uri      | Object or file URI for the object to delete. The format of the URI depends on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> . |

### Example

```
BEGIN  
    DBMS_CLOUD.DELETE_OBJECT(  
        credential_name => 'DEF_CRED_NAME',  
        object_uri => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/  
namespace-string/b/bucketname/o/exp1.dmp');  
END;  
/
```

## 37.5.11 DROP\_CREDENTIAL Procedure

This procedure removes an existing credential from Oracle Database.

### Syntax

```
DBMS_CLOUD.DROP_CREDENTIAL (  
    credential_name      IN VARCHAR2);
```

### Parameters

| Parameter       | Description                               |
|-----------------|-------------------------------------------|
| credential_name | The name of the credential to be removed. |

## 37.5.12 GET\_OBJECT Procedure and Function

This procedure is overloaded. The procedure form reads an object from Cloud Object Storage and copies it to Oracle Database. The function form reads an object from Cloud Object Storage and returns a BLOB to Oracle Database.

### Syntax

```
DBMS_CLOUD.GET_OBJECT (
    credential_name      IN VARCHAR2,
    object_uri           IN VARCHAR2,
    directory_name       IN VARCHAR2,
    file_name            IN VARCHAR2 DEFAULT NULL,
    startoffset          IN NUMBER DEFAULT 0,
    endoffset            IN NUMBER DEFAULT 0,
    compression          IN VARCHAR2 DEFAULT NULL);

DBMS_CLOUD.GET_OBJECT (
    credential_name      IN VARCHAR2 DEFAULT NULL,
    object_uri           IN VARCHAR2,
    startoffset          IN NUMBER DEFAULT 0,
    endoffset            IN NUMBER DEFAULT 0,
    compression          IN VARCHAR2 DEFAULT NULL)
RETURN BLOB;
```

### Parameters

| Parameter       | Description                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| credential_name | The name of the credential to access the Cloud Object Storage.                                                                                                                                                                                          |
| object_uri      | Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> .                                                                              |
| directory_name  | The name of the directory on the database.<br><a href="#">1</a>                                                                                                                                                                                         |
| file_name       | Specifies the name of the file to create. If file name is not specified, the file name is taken from after the last slash in the object_uri parameter. For special cases, for example when the file name contains slashes, use the file_name parameter. |
| startoffset     | The offset, in bytes, from where the procedure starts reading.                                                                                                                                                                                          |
| endoffset       | The offset, in bytes, until where the procedure stops reading.                                                                                                                                                                                          |
| compression     | Specifies the compression used to store the object. When compression is set to 'AUTO' the file is uncompressed (the value 'AUTO' implies the object specified with object_uri is compressed with Gzip).                                                 |

**Note:**

To run `DBMS_CLOUD.GET_OBJECT`, you need to grant `WRITE` privileges on the directory to the user. For example, run the following command as `ADMIN` to grant write privileges to `db_user`:

```
GRANT WRITE ON DIRECTORY data_pump_dir TO db_user;
```

**Return Values**

The function form reads from Object Store and `DBMS_CLOUD.GET_OBJECT` returns a `BLOB`.

**Examples**

```
BEGIN
  DBMS_CLOUD.GET_OBJECT(
    credential_name => 'OBJ_STORE_CRED',
    object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt',
    directory_name => 'DATA_PUMP_DIR');
END;
/
```

To read character data from a file in Object Store:

```
SELECT to_clob(
  DBMS_CLOUD.GET_OBJECT(
    credential_name => 'OBJ_STORE_CRED',
    object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/file.txt'))
FROM DUAL;
```

To add an image stored on Object Store in a `BLOB` in the database:

```
DECLARE
  l_blob BLOB := NULL;
BEGIN
  l_blob := DBMS_CLOUD.GET_OBJECT(
    credential_name => 'OBJ_STORE_CRED',
    object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/MyImage.gif' );
END;
/
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

## 37.5.13 LIST\_FILES Function

This function lists the files in the specified directory. The results include the file names and additional metadata about the files such as file size in bytes, creation timestamp, and the last modification timestamp.

### Syntax

```
DBMS_CLOUD.LIST_FILES (  
    directory_name      IN VARCHAR2)  
    RETURN TABLE;
```

### Parameters

| Parameter      | Description                                |
|----------------|--------------------------------------------|
| directory_name | The name of the directory on the database. |

### Usage Notes

- DBMS\_CLOUD.LIST\_FILES is only supported for directory objects mapping to Oracle File System (OFS) or Database File System (DBFS) file systems.
- To run DBMS\_CLOUD.LIST\_FILES, you need to grant read privileges on the directory to the user. For example, run the following command as ADMIN to grant read privileges to db\_user:

```
GRANT READ ON DIRECTORY data_pump_dir TO db_user;
```

- This is a pipelined table function with return type as DBMS\_CLOUD\_TYPES.list\_object\_ret\_t.
- DBMS\_CLOUD.LIST\_FILES does not obtain the checksum value and returns NULL for this field.

### Example

This is a pipelined function that returns a row for each file. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_FILES('DATA_PUMP_DIR');
```

| OBJECT_NAME          | BYTES | CHECKSUM | CREATED              | LAST_MODIFIED |
|----------------------|-------|----------|----------------------|---------------|
| -----                | ----- | -----    | -----                | -----         |
| -----                |       |          |                      |               |
| cwallet.sso          | 2965  |          | 2018-12-12T18:10:47Z |               |
| 2019-11-23T06:36:54Z |       |          |                      |               |

## 37.5.14 LIST\_OBJECTS Function

This function lists objects in the specified location on object store. The results include the object names and additional metadata about the objects such as size, checksum, creation timestamp, and the last modification timestamp.

Syntax

```
DBMS_CLOUD.LIST_OBJECTS (
    credential_name      IN VARCHAR2,
    location_uri         IN VARCHAR2)
RETURN TABLE;
```

Parameters

| Parameter       | Description                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| credential_name | The name of the credential to access the Cloud Object Storage.                                                                                                             |
| location_uri    | Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> . |

Usage Notes

- Depending on the capabilities of the object store, DBMS\_CLOUD.LIST\_OBJECTS does not return values for certain attributes and the return value for the field is NULL in this case.
- All supported Object Stores return values for the OBJECT\_NAME, BYTES, and CHECKSUM fields.
- The following table shows support for the fields CREATED and LAST\_MODIFIED by Object Store:

| Object Store                        | CREATED           | LAST_MODIFIED     |
|-------------------------------------|-------------------|-------------------|
| Oracle Cloud Infrastructure Native  | Returns timestamp | Returns NULL      |
| Oracle Cloud Infrastructure Swift   | Returns NULL      | Returns timestamp |
| Oracle Cloud Infrastructure Classic | Returns NULL      | Returns timestamp |
| Amazon S3                           | Returns NULL      | Returns timestamp |
| Azure                               | Returns timestamp | Returns timestamp |

- The checksum value is the MD5 checksum. This is a 32-character hexadecimal number that is computed on the object contents. It is expected to have a different checksum value if OCI\$RESOURCE\_PRINCIPAL credential is used.
- This is a pipelined table function with return type as DBMS\_CLOUD\_TYPES.list\_object\_ret\_t.

Example

This is a pipelined function that returns a row for each object. For example, use the following query to use this function:

```
SELECT * FROM DBMS_CLOUD.LIST_OBJECTS('OBJ_STORE_CRED',
    'https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/
    bucketname/o/');
```

|             |               |          |
|-------------|---------------|----------|
| OBJECT_NAME | BYTES         | CHECKSUM |
| CREATED     | LAST_MODIFIED |          |
| -----       | -----         | -----    |
| -----       | -----         | -----    |

```
cwallet.sso    2965    2339a2731ba24a837b26d344d643dc07
2019-11-23T06:36:54Z
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

## 37.5.15 PUT\_OBJECT Procedure

This procedure is overloaded. In one form the procedure copies a file from Oracle Database to the Cloud Object Storage. In another form the procedure copies a BLOB from Oracle Database to the Cloud Object Storage.

### Syntax

```
DBMS_CLOUD.PUT_OBJECT (
    credential_name    IN VARCHAR2,
    object_uri         IN VARCHAR2,
    directory_name     IN VARCHAR2,
    file_name          IN VARCHAR2);
```

```
DBMS_CLOUD.PUT_OBJECT (
    credential_name    IN VARCHAR2,
    object_uri         IN VARCHAR2,
    contents           IN BLOB,
    file_name          IN VARCHAR2);
```

### Parameters

| Parameter                    | Description                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>credential_name</code> | The name of the credential to access the Cloud Object Storage.                                                                                                             |
| <code>object_uri</code>      | Object or file URI. The format of the URI depends on the Cloud Object Storage service you are using, for details see <a href="#">DBMS_CLOUD Package File URI Formats</a> . |
| <code>directory_name</code>  | The name of the directory on the Oracle Database.<br><a href="#">1</a>                                                                                                     |
| <code>file_name</code>       | The name of the file in the specified directory.                                                                                                                           |

#### Note:

To run `DBMS_CLOUD.PUT_OBJECT`, you need to grant read privileges on the directory to the user. For example, run the following command as ADMIN to grant read privileges to `db_user`:

```
GRANT READ ON DIRECTORY data_pump_dir TO db_user;
```

### Example

To handle BLOB data after in-database processing and then store the data directly into a file in the object store:

```
DECLARE
    my_blob_data BLOB;
BEGIN
    /* Some processing producing BLOB data and populating my_blob_data */
    DBMS_CLOUD.PUT_OBJECT(
        credential_name => 'OBJ_STORE_CRED',
        object_uri => 'https://objectstorage.us-phoenix-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/my_new_file',
        contents => my_blob_data);
END;
/
```

### Usage Notes

Depending on your Cloud Object Storage, the size of the object you transfer is limited as follows:

| Cloud Object Storage Service               | Object Transfer Size Limit |
|--------------------------------------------|----------------------------|
| Oracle Cloud Infrastructure Object Storage | 50 GB                      |
| Amazon S3                                  | 5 GB                       |
| Azure Blob Storage                         | 256 MB                     |

Oracle Cloud Infrastructure object store does not allow writing files into a public bucket without supplying credentials (Oracle Cloud Infrastructure allows users to download objects from public buckets). Thus, you must supply a credential name with valid credentials to store an object in an Oracle Cloud Infrastructure public bucket using `PUT_OBJECT`.

See [DBMS\\_CLOUD Package File URI Formats](#) for more information.

## 37.5.16 UPDATE\_CREDENTIAL Procedure

This procedure updates cloud service credential attributes in Oracle Database.

Use stored credentials for data loading, for querying external data residing in the Cloud, or wherever you use `DBMS_CLOUD` procedures with a `credential_name` parameter. This procedure lets you update an attribute with a new value for a specified `credential_name`.

### Syntax

```
DBMS_CLOUD.UPDATE_CREDENTIAL (
    credential_name    IN VARCHAR2,
    attribute          IN VARCHAR2,
    value              IN VARCHAR2);
```

## Parameters

| Parameter       | Description                                        |
|-----------------|----------------------------------------------------|
| credential_name | The name of the credential to be stored.           |
| attribute       | Name of attribute to update: USERNAME or PASSWORD. |
| value           | New value for the selected attribute.              |

## Usage Notes

- The user name is case sensitive. It cannot contain double quotes or spaces.
- You only need to create credentials once unless your cloud service credentials change. Once you store the credentials you can then use the same credential name for DBMS\_CLOUD procedures that require a credential\_name parameter.

## Example

```
BEGIN
  DBMS_CLOUD.UPDATE_CREDENTIAL(
    credential_name => 'OBJ_STORE_CRED',
    attribute => 'PASSWORD',
    value => 'password');
END;
/
```

## 37.5.17 VALIDATE\_EXTERNAL\_TABLE Procedure

This procedure validates the source files for an external table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database. The overloaded form enables you to use the operation\_id parameter.

## Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE (
  table_name      IN VARCHAR2,
  schema_name     IN VARCHAR2 DEFAULT,
  rowcount        IN NUMBER DEFAULT,
  stop_on_error   IN BOOLEAN DEFAULT);

DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE (
  table_name      IN VARCHAR2,
  operation_id     OUT NOCOPY NUMBER,
  schema_name     IN VARCHAR2 DEFAULT NULL,
  rowcount        IN NUMBER DEFAULT 0,
  stop_on_error   IN BOOLEAN DEFAULT TRUE);
```

## Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>table_name</code>    | The name of the external table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>operation_id</code>  | Use this parameter to track the progress and final status of the load operation as the corresponding ID in the <code>USER_LOAD_OPERATIONS</code> view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>schema_name</code>   | The name of the schema where the external table resides. The default value is <code>NULL</code> meaning the external table is in the same schema as the user running the procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>rowcount</code>      | Number of rows to be scanned. The default value is <code>NULL</code> meaning all the rows in the source files are scanned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>stop_on_error</code> | <p>Determines if the validate should stop when a row is rejected. The default value is <code>TRUE</code> meaning the validate stops at the first rejected row. Setting the value to <code>FALSE</code> specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the <code>rowcount</code> parameter.</p> <p>If the external table refers to Avro or Parquet files then the validate stops at the first rejected row.</p> <p>When the external table specifies the <code>format</code> parameter type set to the value <code>avro</code> or <code>parquet</code>, the parameter <code>stop_on_error</code> effectively always has the value <code>TRUE</code>. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.</p> |

## Usage Notes

- `DBMS_CLOUD.VALIDATE_EXTERNAL_TABLE` works with both partitioned external tables and hybrid partitioned tables. This potentially reads data from all external partitions until `rowcount` is reached or `stop_on_error` applies. You do not have control over which partition, or parts of a partition, is read in which order.

## 37.5.18 VALIDATE\_EXTERNAL\_PART\_TABLE Procedure

This procedure validates the source files for an external partitioned table, generates log information, and stores the rows that do not match the format options specified for the external table in a *badfile* table on Oracle Database. The overloaded form enables you to use the `operation_id` parameter.

## Syntax

```
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
    table_name          IN VARCHAR2,
    partition_name      IN CLOB DEFAULT,
    schema_name         IN VARCHAR2 DEFAULT,
    rowcount            IN NUMBER DEFAULT,
    partition_key_validation IN BOOLEAN DEFAULT,
    stop_on_error        IN BOOLEAN DEFAULT);
```

```
DBMS_CLOUD.VALIDATE_EXTERNAL_PART_TABLE (
    table_name          IN VARCHAR2,
    operation_id         OUT NUMBER,
```

```

partition_name      IN CLOB DEFAULT,
schema_name        IN VARCHAR2 DEFAULT,
rowcount           IN NUMBER DEFAULT,
partition_key_validation IN BOOLEAN DEFAULT,
stop_on_error      IN BOOLEAN DEFAULT);

```

## Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name               | The name of the external table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| operation_id             | Use this parameter to track the progress and final status of the load operation as the corresponding ID in the USER_LOAD_OPERATIONS view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| partition_name           | If defined, then only a specific partition is validated. If not specified then read all partitions sequentially until rowcount is reached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| schema_name              | The name of the schema where the external table resides. The default value is NULL meaning the external table is in the same schema as the user running the procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| rowcount                 | Number of rows to be scanned. The default value is NULL meaning all the rows in the source files are scanned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| partition_key_validation | For internal use only. Do not use this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| stop_on_error            | <p>Determines if the validate should stop when a row is rejected. The default value is TRUE meaning the validate stops at the first rejected row. Setting the value to FALSE specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the rowcount parameter.</p> <p>If the external table refers to Avro or Parquet files then the validate stops at the first rejected row.</p> <p>When the external table specifies the format parameter type set to the value avro or parquet, the parameter stop_on_error effectively always has the value TRUE. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.</p> |

## 37.5.19 VALIDATE\_HYBRID\_PART\_TABLE Procedure

This procedure validates the source files for a hybrid partitioned table, generates log information, and stores the rows that do not match the format options specified for the hybrid table in a *badfile* table on Oracle Database. The overloaded form enables you to use the operation\_id parameter.

### Syntax

```

DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (
    table_name      IN VARCHAR2,
    partition_name  IN CLOB DEFAULT,
    schema_name     IN VARCHAR2 DEFAULT,
    rowcount       IN NUMBER DEFAULT,
    partition_key_validation IN BOOLEAN DEFAULT,
    stop_on_error   IN BOOLEAN DEFAULT);

```

```

DBMS_CLOUD.VALIDATE_HYBRID_PART_TABLE (

```

```

table_name          IN VARCHAR2,
operation_id        OUT NUMBER,
partition_name      IN CLOB DEFAULT,
schema_name         IN VARCHAR2 DEFAULT,
rowcount            IN NUMBER DEFAULT,
partition_key_validation IN BOOLEAN DEFAULT,
stop_on_error       IN BOOLEAN DEFAULT);

```

### Parameters

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name               | The name of the external table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| operation_id             | Use this parameter to track the progress and final status of the load operation as the corresponding ID in the <code>USER_LOAD_OPERATIONS</code> view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| partition_name           | If defined, then only a specific partition is validated. If not specified then read from all external partitions sequentially until <code>rowcount</code> is reached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| schema_name              | The name of the schema where the external table resides. The default value is <code>NULL</code> meaning the external table is in the same schema as the user running the procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| rowcount                 | Number of rows to be scanned. The default value is <code>NULL</code> meaning all the rows in the source files are scanned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| partition_key_validation | For internal use only. Do not use this parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| stop_on_error            | <p>Determines if the validate should stop when a row is rejected. The default value is <code>TRUE</code> meaning the validate stops at the first rejected row. Setting the value to <code>FALSE</code> specifies that the validate does not stop at the first rejected row and validates all rows up to the value specified for the <code>rowcount</code> parameter.</p> <p>If the external table refers to Avro or Parquet files then the validate stops at the first rejected row.</p> <p>When the external table specifies the <code>format</code> parameter type set to the value <code>avro</code> or <code>parquet</code>, the parameter <code>stop_on_error</code> effectively always has the value <code>TRUE</code>. Thus, the table badfile will always be empty for an external table referring to Avro or Parquet files.</p> |

## 37.6 DBMS\_CLOUD Package File URI Formats

Describes the format of the source file URIs in operations with `DBMS_CLOUD`. The format depends on the object storage service you are using.

`DBMS_CLOUD` guarantees secure communication and any URI that you specify must use `HTTPS`, with `https://` as the prefix for the URI.

### Topics

- [Oracle Cloud Infrastructure Object Storage Native URI Format](#)
- [Oracle Cloud Infrastructure Object Storage Swift URI Format](#)
- [Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL](#)
- [URI Format Using Public URL](#)
- [Oracle Cloud Infrastructure Object Storage Classic URI Format](#)

- [Amazon S3 URI Format](#)
- [Azure Blob Storage URI Format](#)

## 37.6.1 Oracle Cloud Infrastructure Object Storage Native URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure native URIs, with the format:

```
https://objectstorage.region.oraclecloud.com/n/namespace-string/b/bucket/o/  
filename
```

For example, the Native URI for the file `channels.txt` in the `bucketname` bucket in the Phoenix data center is:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/n/namespace-string/b/  
bucketname/o/channels.txt
```

In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

You can find the URI from the Oracle Cloud Infrastructure Object Storage "Object Details" in the right hand side ellipsis menu in the Object Store:

1. From the Oracle Cloud Infrastructure left navigation list click **Object Storage** → **Object Storage**.
2. From the **Name** column, select a bucket.
3. In the Objects area, click **View Object Details**.

4. On the **Object Details** page, the **URL Path (URI)** field shows the URI to access the object.

**Note:**

The source files need to be stored in an Object Storage tier bucket. Oracle Database does not support buckets in the Archive Storage tier. See [Overview of Object Storage](#) for more information.

## 37.6.2 Oracle Cloud Infrastructure Object Storage Swift URI Format

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure Swift URIs with the format:

```
https://swiftobjectstorage.region.oraclecloud.com/v1/namespace-string/bucket/
filename
```

For example, the Swift URI for the file `channels.txt` in the `bucketname` bucket in the Phoenix data center is:

```
https://swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1/namespace-string/
bucketname/channels.txt
```

In this example, `namespace-string` is the Oracle Cloud Infrastructure object storage namespace and `bucketname` is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

**Note:**

The source files need to be stored in an Object Storage tier bucket. Oracle Database does not support buckets in the Archive Storage tier. See [Overview of Object Storage](#) for more information.

## 37.6.3 Oracle Cloud Infrastructure Object Storage URI Format Using Pre-Authenticated Request URL

If your source files reside on the Oracle Cloud Infrastructure Object Storage you can use Oracle Cloud Infrastructure pre-authenticated URIs. When you create a pre-authenticated request, a unique URL is generated. You can then provide the unique URL to users in your organization, partners, or third parties to access the Object Storage resource target identified in the pre-authenticated request.

**Note:**

Carefully assess the business requirement for and the security ramifications of pre-authenticated access. When you create the pre-authenticated request URL, note the **Expiration** and the **Access Type** to make sure they are appropriate for your use. A pre-authenticated request URL gives anyone who has the URL access to the targets identified in the request for as long as the request is active. In addition to considering the operational needs of pre-authenticated access, it is equally important to manage its distribution.

The format for pre-authenticated request URLs is:

```
https://objectstorage.region.oraclecloud.com/p/encrypted_string/n/namespace-string/b/bucket/o/filename
```

For example, a sample pre-authenticated URI for the file `channels.txt` in the *bucketname* bucket in the Phoenix data center is:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/p/2xN-uDtWJNsiD910UCYGue/n/namespace-string/b/bucketname/o/channels.txt
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

You can use a pre-authenticated URL in any `DBMS_CLOUD` procedure that takes a URL to access files in Oracle Cloud Infrastructure object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example:

```
BEGIN
  DBMS_CLOUD.COPY_DATA(
    table_name => 'CHANNELS',
    file_uri_list => 'https://objectstorage.us-phoenix-1.oraclecloud.com/p/
unique-pre-authenticated-string/n/namespace-string/b/bucketname/o/
channels.txt',
    format => json_object('delimiter' value ',') );
END;
/
```

**Note:**

A list of mixed URLs is valid. If the URL list contains both pre-authenticated URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the pre-authenticated URLs the specified `credential_name` is ignored.

See [Using Pre-Authenticated Requests](#) for more information.

## 37.6.4 URI Format Using Public URL

If your source files reside on an Object Store that provides public URLs, you can use public URLs with `DBMS_CLOUD` procedures. Public means the Object Storage service supports anonymous, unauthenticated access to the Object Store files. See your Cloud Object Storage service for details on how to make an object public in a supported Object Store.

### Note:

Carefully assess the business requirement for and the security ramifications of using public URLs. When you use public URLs, due to the file content not being authenticated, make sure this is appropriate for your use.

You can use a public URL in any `DBMS_CLOUD` procedure that takes a URL to access files in your object store, without the need to create a credential. You need to either specify the `credential_name` parameter as `NULL` or not supply a `credential_name` parameter.

For example the following uses `DBMS_CLOUD.COPY_DATA` without a `credential_name`:

```
BEGIN
  DBMS_CLOUD.COPY_DATA (
    table_name => 'CHANNELS',
    file_uri_list => 'https://objectstorage.us-ashburn-1.oraclecloud.com/n/
namespace-string/b/bucketname/o/chan_v3.dat',
    format => json_object('delimiter' value ',') );
END;
/
```

In this example, *namespace-string* is the Oracle Cloud Infrastructure object storage namespace and *bucketname* is the bucket name. See [Understanding Object Storage Namespaces](#) for more information.

### Note:

A list of mixed URLs is valid. If the URL list contains both public URLs and URLs that require authentication, `DBMS_CLOUD` uses the specified `credential_name` to access the URLs that require authentication and for the public URLs the specified `credential_name` is ignored.

See [Public Buckets](#) for information on using Oracle Cloud Infrastructure public buckets.

## 37.6.5 Oracle Cloud Infrastructure Object Storage Classic URI Format

If your source files reside in Oracle Cloud Infrastructure Object Storage Classic, see the REST page for a description of the URI format for accessing your files: [About REST URLs for Oracle Cloud Infrastructure Object Storage Classic Resources](#).

## 37.6.6 Amazon S3 URI Format

If your source files reside in Amazon S3, see the following for a description of the URI format for accessing your files: [Accessing a Bucket](#).

For example the following refers to the file `channels.txt` in the `adb` bucket in the `us-west-2` region.

```
https://s3-us-west-2.amazonaws.com/adb/channels.txt
```

### Note:

DBMS\_CLOUD only supports native S3 storage, and no S3-compliant APIs or storage devices.

## 37.6.7 Azure Blob Storage URI Format

If your source files reside in Azure Blob Storage, see the following for a description of the URI format for accessing your files: [Resource URI Syntax](#).

For example the following refers to the file `channels.txt` in the `adb` container in the storage account `db_user`:

```
https://db_user.blob.core.windows.net/adb/channels.txt
```

### Note:

You can use Shared Access Signatures (SAS) URL in any DBMS\_CLOUD procedure that takes a URL to access files in Azure Blob Storage, without the need to create a credential. To use a Shared Access Signature (SAS) URL, either specify the `credential_name` parameter as `NULL`, or do not supply a `credential_name` parameter. See Grant Limited Access to Azure Storage Resources Using Shared Access Signatures (SAS) for more information.

## 37.7 DBMS\_CLOUD Package Format Options

The format argument in DBMS\_CLOUD specifies the format of source files.

The two ways to specify the format argument are:

```
format => '{"format_option" : "format_value" }'
```

And:

```
format => json_object('format_option' value 'format_value')
```

Examples:

```
format => json_object('type' VALUE 'CSV')
```

To specify multiple format options, separate the values with a ",".

For example:

```
format => json_object('ignoremissingcolumns' value 'true', 'removequotes' value 'true',
                    'dateformat' value 'YYYY-MM-DD-HH24-MI-SS', 'blankasnull'
                    value 'true')
```

#### Note:

For Avro or Parquet format options, see [DBMS\\_CLOUD Package Format Options for Avro or Parquet](#).

| Format Option    | Description                                                                                                                                                                                                                                                                             | Syntax                                                                                                  |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| blankasnull      | When set to <code>true</code> , loads fields consisting of spaces as null.                                                                                                                                                                                                              | <code>blankasnull : true</code><br>Default value: <code>False</code>                                    |
| characterset     | Specifies the character set of source files                                                                                                                                                                                                                                             | <code>characterset : string</code><br>Default value: Database character set                             |
| compression      | Specifies the compression type of the source file. ZIP archiving format is not supported. Specifying the value <code>auto</code> checks for the compression types: <code>gzip</code> , <code>zlib</code> , <code>bzip2</code> .                                                         | <code>compression : auto gzip zlib bzip2</code><br>Default value: Null value meaning no compression.    |
| conversionerrors | If a row is rejected because of data type conversion errors, the related columns are stored as null or the row is rejected.                                                                                                                                                             | <code>conversionerrors : reject_record   store_null</code><br>Default value: <code>reject_record</code> |
| dateformat       | Specifies the date format in the source file. The format option <code>AUTO</code> searches for the following formats:<br><br>J<br>MM-DD-YYYYBC<br>MM-DD-YYYY<br>YYYYMMDD HHMISS<br>YYMMDD HHMISS<br>YYYY.DDD<br>YYYY-MM-DD                                                              | <code>dateformat : string</code><br>Default value: Database date format                                 |
| delimiter        | Specifies the field delimiter.<br>To use a special character as the delimiter, specify the HEX value of the ASCII code of the character. For example, the following specifies the TAB character as the delimiter:<br><br><code>format =&gt; json_object('delimiter' value 'X'9')</code> | <code>delimiter : character</code><br>Default value   (pipe character)                                  |
| escape           | The character "\" is used as the escape character when specified.                                                                                                                                                                                                                       | <code>escape : true</code><br>Default value: <code>False</code>                                         |
| ignoreblanklines | Blank lines are ignored when set to <code>true</code> .                                                                                                                                                                                                                                 | <code>ignoreblanklines : true</code><br>Default value: <code>False</code>                               |

| Format Option        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Syntax                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ignoremissingcolumns | If there are more columns in the <code>field_list</code> than there are in the source files, the extra columns are stored as null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <code>ignoremissingcolumns : true</code><br>Default value <code>False</code>                                                                                                                                                                        |
| language             | Specifies a language name (for example, FRENCH), from which locale-sensitive information can be derived.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <code>language: string</code><br>Default value: <code>Null</code><br>See <i>Locale Data in Oracle Database Globalization Support Guide</i> for a listing of Oracle-supported languages.                                                             |
| numericcharacters    | Specifies the characters to use as the group separator and decimal character.<br><i>decimal_character</i> : The decimal separates the integer portion of a number from the decimal portion.<br><i>group_separator</i> : The group separator separates integer groups (that is, thousands, millions, billions, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <code>numericcharacters:</code><br><code>'decimal_character</code><br><code>group_separator'</code><br>Default value: <code>". , "</code><br>See <i>NLS_NUMERIC_CHARACTERS in Oracle Database Globalization Support Guide</i> for more information. |
| numberformat         | Specifies the number format model. Number format models cause the number to be rounded to the specified number of significant digits. A number format model is composed of one or more number format elements.<br>This is used in combination with <code>numericcharacters</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <code>numberformat:</code><br><code>number_format_model</code><br>Default value: is derived from the setting of the <code>NLS_TERRITORY</code> parameter<br>See <i>Number Format Models in SQL Language Reference</i> for more information.         |
