| <a href="#">IP_REMOVE_PDB_ACL Procedure</a> | Removes all entries from the ACL for all the database services in a pluggable database (PDB).                |

### 158.4.1 COMMIT\_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT\_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT\_ACL procedure again.

This procedure returns when the operation has completed successfully.

#### Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

#### Parameters

None

### 158.4.2 IP\_ADD\_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

#### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (  
    p_service_name IN VARCHAR2,  
    p_host          IN  VARCHAR2);
```

## Parameters

**Table 158-2 IP\_ADD\_ACE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_service_name | The name of the database service for which you want to add an access control entry.                                                                                                       |
| p_host         | The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. |

## 158.4.3 IP\_ADD\_PDB\_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (  
    p_pdb_name IN VARCHAR2,  
    p_host      IN VARCHAR2);
```

## Parameters

**Table 158-3 IP\_ADD\_PDB\_ACE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_pdb_name | The name of the PDB.                                                                                                                                                                                           |
| p_host     | The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed. |

## 158.4.4 IP\_REMOVE\_ACE Procedure

This procedure removes an entry from the ACL for a database service.

### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (  
    p_service_name IN VARCHAR2,  
    p_host          IN VARCHAR2);
```

## Parameters

**Table 158-4 IP\_REMOVE\_ACE Procedure Parameters**

| Parameter      | Description                                                                             |
|----------------|-----------------------------------------------------------------------------------------|
| p_service_name | The name of the database service from which you want to remove an access control entry. |

**Table 158-4 (Cont.) IP\_REMOVE\_ACE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_host    | The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.<br><br>This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service. |

## 158.4.5 IP\_REMOVE\_ACL Procedure

This procedure removes all entries from the ACL for a database service.

### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (  
    p_service_name IN VARCHAR2);
```

### Parameters

**Table 158-5 IP\_REMOVE\_ACL Procedure Parameters**

| Parameter      | Description                                                   |
|----------------|---------------------------------------------------------------|
| p_service_name | The name of the database service whose ACL you want to clear. |

## 158.4.6 IP\_REMOVE\_PDB\_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (  
    p_pdb_name IN VARCHAR2,  
    p_host     IN VARCHAR2);
```

### Parameters

**Table 158-6 IP\_REMOVE\_PDB\_ACE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_pdb_name | The name of the PDB.                                                                                                                                                                                                                                                                                              |
| p_host     | The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard "*" for IPv4 and CIDR format are also allowed.<br><br>This has to match the existing value exactly. You can query the IP_ACL table to get the list of entries for a database service. |

## 158.4.7 IP\_REMOVE\_PDB\_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

### Syntax

```
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL (  
    p_pdb_name IN VARCHAR2);
```

### Parameters

**Table 158-7 IP\_REMOVE\_PDB\_ACL Procedure Parameters**

| Parameter  | Description          |
|------------|----------------------|
| p_pdb_name | The name of the PDB. |

# DBMS\_SODA

The `DBMS_SODA` package is a `PL/SQL` package implementing Simple Oracle Document Access (`SODA`). `SODA` allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by `SODA` is that of document collections. The `DBMS_SODA` package allows you to create, list, and delete document collections from `PL/SQL`, and to perform `CRUD` (create, replace, update, delete) operations on documents. All `DDL` functions are encapsulated within this package.

This chapter contains the following topics:

- [DBMS\\_SODA Security Model](#)
- [Summary of DBMS\\_SODA Subprograms](#)

 **See Also:**

- *Oracle Database SODA for PL/SQL Developer's Guide*
- [SODA Types](#)

## 159.1 DBMS\_SODA Security Model

This package is available to users with the `SODA_APP` role.

All `SODA` types (packages and types) are `SYS` types. `PUBLIC` is granted `EXECUTE` privilege on the `DBMS_SODA` described in this chapter.

## 159.2 Summary of DBMS\_SODA Subprograms

This table lists the `DBMS_SODA` subprograms in alphabetical order and briefly describes them.

**Table 159-1    DBMS\_SODA Package Subprograms**

| Subprogram                                   | Purpose                                                                                                     |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_COLLECTION Function</a>   | Creates a collection using the collection name and metadata.                                                |
| <a href="#">DROP_COLLECTION Function</a>     | Drops an existing collection from the user's schema. This also removes all the documents in the collection. |
| <a href="#">GET_AS_OF_SCN Function</a>       | This function returns the current database SCN number.                                                      |
| <a href="#">GET_AS_OF_TIMESTAMP Function</a> | This function returns the current database timestamp value.                                                 |

**Table 159-1 (Cont.) DBMS\_SODA Package Subprograms**

| Subprogram                                     | Purpose                                                                                                                                                                                   |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LIST_COLLECTION_NAMES Function</a> | Lists the collection names in the user's schema as a table of NVARCHAR2.                                                                                                                  |
| <a href="#">OPEN_COLLECTION Function</a>       | Opens an existing collection.                                                                                                                                                             |
| <a href="#">TO_UUID Function</a>               | This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP_DATA feature of Data Pump. |

## 159.2.1 CREATE\_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to NULL, a collection is created with default metadata. The returned collection is open for `read` and/or `write` operations. If a collection already exists, the function just opens and returns the collection object.

### Syntax

```
DBMS_SODA.CREATE_COLLECTION (
    collection_Name      IN NVARCHAR2,
    metadata             IN VARCHAR2 DEFAULT NULL,
    create_Mode          IN PLS_INTEGER DEFAULT CREATE_MODE_DDL)
RETURN SODA_Collection_T;
```

### Parameters

**Table 159-2 CREATE\_COLLECTION Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>collection_Name</code> | The name of the collection.<br>The value of <code>collection_Name</code> is case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>metadata</code>        | The metadata of the collection in VARCHAR2 format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>create_Mode</code>     | Valid values are: <ul style="list-style-type: none"> <li>DBMS_SODA.CREATE_MODE_DDL (default). First attempts to create a new table for the collection. If table exists already, tries to map that existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).</li> <li>DBMS_SODA.CREATE_MODE_MAP. Tries to map an existing table to the collection. Minimal checking is performed to ensure the table shape matches supplied collection metadata (if not, then an error is returned).</li> </ul> |

### Return Values

The function returns a `Soda_Collection_T` object representing the collection.

### Exceptions

- **Descriptor Error**—if the input descriptor is invalid
- **Error**—if an error occurs while creating the collection

#### See Also:

*Oracle Database SODA for PL/SQL Developer's Guide*

## 159.2.2 DROP\_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

### Syntax

```
DBMS_SODA.DROP_COLLECTION (  
    collection_Name      IN NVARCHAR2,  
    purge                IN BOOLEAN DEFAULT FALSE,  
    drop_Mapped_Table    IN BOOLEAN DEFAULT FALSE)  
RETURN NUMBER;
```

### Parameters

**Table 159-3 DROP\_COLLECTION Parameters**

| Parameter         | Description                                                                    |
|-------------------|--------------------------------------------------------------------------------|
| collection_Name   | The name of the collection.<br>The value of collection_Name is case-sensitive. |
| purge             | The default value is FALSE.                                                    |
| drop_Mapped_Table | The default value is FALSE.                                                    |

### Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

### Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

#### See Also:

*Oracle Database SODA for PL/SQL Developer's Guide*

## 159.2.3 GET\_AS\_OF\_SCN Function

This function returns the current database SCN number.

### Syntax

```
DBMS_SODA.GET_AS_OF_SCN ( )  
RETURN NUMBER;
```

### Return values

This function returns the current database SCN number.

## 159.2.4 GET\_AS\_OF\_TIMESTAMP Function

This function returns the current database timestamp value.

### Syntax

```
DBMS_SODA.GET_AS_OF_TIMESTAMP ( )  
RETURN NUMBER;
```

### Return values

This function returns the current database timestamp value.

## 159.2.5 LIST\_COLLECTION\_NAMES Function

This function returns a list of collection names in the user's schema as a table of NVARCHAR2.

### Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ()  
RETURN SODA_CollName_List_T;
```

### Return Values

This function returns a list of collection names as a table of NVARCHAR2 (255) . The collection list is empty if there are no collections in the schema.

### Exceptions

**Error**—if an error occurs while listing the collection names.

### See Also:

*Oracle Database SODA for PL/SQL Developer's Guide*

## 159.2.6 OPEN\_COLLECTION Function

Opens an existing collection for `read` and/or `write` operations.

## Syntax

```
DBMS_SODA.OPEN_COLLECTION (  
    collection_Name      IN NVARCHAR2)  
RETURN SODA_Collection_T;
```

## Parameters

**Table 159-4 OPEN\_COLLECTION Parameters**

| Parameter       | Description                                                                    |
|-----------------|--------------------------------------------------------------------------------|
| collection_Name | The name of the collection.<br>The value of collection_Name is case-sensitive. |

## Return Values

This function returns the following values:

- a collection object which is open
- NULL, if the collection does not exist

## Exceptions

**Error**—if an error occurs while creating the collection

### See Also:

- Opening an Existing Document Collection with SODA for PL/SQL
- Checking Whether a Given Collection Exists with SODA for PL/SQL

## 159.2.7 TO\_UUID Function

This function is used to remap the version column of the collection table during Data Pump Import to UUID values. This function is only for use with the REMAP\_DATA feature of Data Pump.

## Syntax

```
DBMS_SODA.TO_UUID (  
    placeholder      IN NVARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 159-5 TO\_UUID Parameters**

| Parameter   | Description                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| placeholder | This parameter is not used and can be ignored. It is used due to the syntactic constraints for the Data Pump REMAP_DATA function. |

### Return values

This function returns a hexadecimal string that can be used as a `UUID` value.

# DBMS\_SHARED\_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS\\_SHARED\\_POOL Subprograms](#)

## 160.1 DBMS\_SHARED\_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

`DBMS_SHARED_POOL` is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, `DBMS_SHARED_POOL` supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. `DBMS_SHARED_POOL` is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

## 160.2 DBMS\_SHARED\_POOL Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

## 160.3 Summary of DBMS\_SHARED\_POOL Subprograms

This table lists the `DBMS_SHARED_POOL` subprograms and briefly describes them.

**Table 160-1** *DBMS\_SHARED\_POOL Package Subprograms*

| Subprogram                                          | Description                                                |
|-----------------------------------------------------|------------------------------------------------------------|
| <a href="#">ABORTED_REQUEST_THRESHOLD Procedure</a> | Sets the aborted request threshold for the shared pool     |
| <a href="#">KEEP Procedure</a>                      | Keeps an object in the shared pool                         |
| <a href="#">MARKHOT Procedure</a>                   | Marks a library cache object as a hot object               |
| <a href="#">PURGE Procedure</a>                     | Purges the named object or specified heap(s) of the object |

**Table 160-1 (Cont.) DBMS\_SHARED\_POOL Package Subprograms**

| Subprogram                          | Description                                                              |
|-------------------------------------|--------------------------------------------------------------------------|
| <a href="#">SIZES Procedure</a>     | Shows objects in the shared pool that are larger than the specified size |
| <a href="#">UNKEEP Procedure</a>    | Unkeeps the named object                                                 |
| <a href="#">UNMARKHOT Procedure</a> | Unmarks a library cache object as a hot object                           |

## 160.3.1 ABORTED\_REQUEST\_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

### Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (  
    threshold_size NUMBER);
```

### Parameters

**Table 160-2 ABORTED\_REQUEST\_THRESHOLD Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>threshold_size</code> | Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of <code>threshold_size</code> is 5000 to ~2 GB inclusive. |

### Exceptions

An exception is raised if the threshold is not in the valid range.

### Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED\_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than `thresh_hold` size. This user gets the 'out of memory' error without attempting to search the LRU list.

## 160.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

### Syntax

```
DBMS_SHARED_POOL.KEEP (  
    name          VARCHAR2,  
    flag          CHAR DEFAULT 'P');
```

```
DBMS_SHARED_POOL.KEEP (  
    schema          VARCHAR2,  
    objname         VARCHAR2,  
    namespace       NUMBER,  
    heaps           NUMBER,  
    edition_name    VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.KEEP (  
    hash            VARCHAR2,  
    namespace       NUMBER,  
    heaps           NUMBER);
```

## Parameters

**Table 160-3 KEEP Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name         | The name of the object to keep.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| flag         | <p>A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional.</p> <p>If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.</p> <ul style="list-style-type: none"><li>• Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function.</li><li>• Set to 'Q' or 'q' to specify that the input is the name of a sequence.</li><li>• Set to 'R' or 'r' to specify that the input is the name of a trigger.</li><li>• Set to 'T' or 't' to specify that the input is the name of a type.</li><li>• Set to 'JS' or 'js' to specify that the input is the name of a java source.</li><li>• Set to 'JC' or 'jc' to specify that the input is the name of a java class.</li><li>• Set to 'JD' or 'jd' to specify that the input is the name of a java shared data.</li><li>• Set to 'C' or 'c' to specify that the input is the name of a cursor.</li></ul> |
| schema       | The user name or the schema to which the object belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| objname      | The name of the object to keep.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| namespace    | A number indicating the library cache namespace in which the object has to be searched for.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| heaps        | The heaps to keep. For example, if heap 0 and heap 6 are to be kept.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| edition_name | The name of the edition that the target object resides in. This parameter is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| hash         | A 16-byte hash value for the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Exceptions

An exception is raised if the named object is not found.

## Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, types, and Java objects, which are specified by name.

- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by DBMS\_SHARED\_POOL.KEEP('0034CDFF', 20348871, 'C'), 0034CDFF being the ADDRESS and 20348871 the HASH\_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.

## 160.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

### Syntax

```
DBMS_SHARED_POOL.MARKHOT (  
    schema          VARCHAR2,  
    objname         VARCHAR2,  
    namespace       NUMBER DEFAULT 1,  
    global          BOOLEAN DEFAULT TRUE,  
    edition_name     VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.MARKHOT (  
    hash            VARCHAR2,  
    namespace       NUMBER DEFAULT 1,  
    global          BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 160-4 MARKHOT Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema       | User name or the schema to which the object belongs                                                                                                                                                                     |
| objname      | Name of the object                                                                                                                                                                                                      |
| namespace    | Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ\$. |
| global       | If TRUE (default), mark the object hot on all Oracle RAC instances                                                                                                                                                      |
| hash         | 16-byte hash value for the object                                                                                                                                                                                       |
| edition_name | Denotes the name of the edition that the target object resides in. This parameter is optional.                                                                                                                          |

### Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

## Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

Users can examine column, `V$DB_OBJECT_CACHE.PROPERTY`, to see whether or not the object has been marked hot. The values for `PROPERTY` are:

- `HOTCOPYnnn`- An object that is a hot copy with integer identifier of 'nnn'. For example, `HOTCOPY5`, `HOTCOPY94`, and `HOTCOPY125`.
- `HOTCOPY`-As above but the identifier is unknown
- `HOT`-The "root" kgl object that has been marked as hot
- `NULL`-A normal object

## 160.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

### Syntax

```
DBMS_SHARED_POOL.PURGE (  
    name          VARCHAR2,  
    flag          CHAR DEFAULT 'P',  
    heaps         NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (  
    schema        VARCHAR2,  
    objname       VARCHAR2,  
    namespace     NUMBER,  
    heaps         NUMBER,  
    edition_name  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.PURGE (  
    hash          VARCHAR2,  
    namespace     NUMBER,  
    heaps         NUMBER);
```

### Parameters

**Table 160-5 PURGE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the object to purge.<br><br>The value for this identifier is the concatenation of the address and <code>hash_value</code> columns from the <code>v\$sqlarea</code> view. This is displayed by the <code>SIZES</code> procedure.<br><br>Currently, <code>TABLE</code> and <code>VIEW</code> objects may not be purged. |

**Table 160-5 (Cont.) PURGE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flag         | <p>(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name.</p> <p>Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function.</p> <p>Set to 'T' or 't' to specify that the input is the name of a type.</p> <p>Set to 'R' or 'r' to specify that the input is the name of a trigger.</p> <p>Set to 'Q' or 'q' to specify that the input is the name of a sequence.</p> <p>In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.</p> |
| heaps        | <p>Heaps to be purged. For example, if heap 0 and heap 6 are to be purged:</p> <p>1&lt;&lt;0   1&lt;&lt;6 =&gt; hex 0x41 =&gt; decimal 65, so specify heaps =&gt;65.</p> <p>Default value is 1, that is, heap 0 which means the whole object would be purged</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| schema       | User name or the schema to which the object belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| objname      | Name of the object to purge                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| namespace    | Parameter is a number indicating the library cache namespace in which the object is to be searched                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| hash         | 16-byte hash value for the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| edition_name | <p>The name of the edition that the target object resides in.</p> <p>This parameter is optional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

### Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

## 160.3.5 SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

### Syntax

```
DBMS_SHARED_POOL.SIZES (
    minsize NUMBER);
```

## Parameters

**Table 160-6 SIZES Procedure Parameters**

| Parameter | Description                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------|
| minsize   | Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed. |

## Usage Notes

Issue the SQLDBA or SQLPLUS 'SET SERVEROUTPUT ON SIZE XXXXX' command prior to using this procedure so that the results are displayed.

## 160.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

### Syntax

```
DBMS_SHARED_POOL.UNKEEP (  
    name          VARCHAR2,  
    flag          CHAR DEFAULT 'P');  
  
DBMS_SHARED_POOL.UNKEEP (  
    schema        VARCHAR2,  
    objname       VARCHAR2,  
    namespace     NUMBER,  
    edition_name  VARCHAR2 DEFAULT NULL);  
  
DBMS_SHARED_POOL.UNKEEP (  
    hash          VARCHAR2,  
    namespace     NUMBER);
```

### **WARNING:**

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

## Parameters

**Table 160-7 UNKEEP Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | The name of the object to unkeep.                                                                                                                                                                                                                                                                         |
| flag      | A character string indicating what kind of object to keep the name identifies. The string is not case sensitive.<br>This parameter is optional.<br>If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name. |
| schema    | The user name or the schema to which the object belongs to.                                                                                                                                                                                                                                               |

**Table 160-7 (Cont.) UNKEEP Procedure Parameters**

| Parameter    | Description                                                                                     |
|--------------|-------------------------------------------------------------------------------------------------|
| objname      | The name of the object to unkeep.                                                               |
| namespace    | A number that indicates the library cache namespace in which the object has to be searched for. |
| edition_name | The name of the edition that the target object resides in.<br>This parameter is optional.       |
| hash         | A 16-byte hash value for the object.                                                            |

**Exceptions**

ORA-06502: An exception is raised if the named object cannot be found

## 160.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

**Syntax**

```
DBMS_SHARED_POOL.UNMARKHOT (  
    schema          VARCHAR2,  
    objname         VARCHAR2,  
    namespace       NUMBER DEFAULT 1,  
    global          BOOLEAN DEFAULT TRUE,  
    edition_name     VARCHAR2 DEFAULT NULL);
```

```
DBMS_SHARED_POOL.UNMARKHOT (  
    hash           VARCHAR2,  
    namespace      NUMBER DEFAULT 1,  
    global         BOOLEAN DEFAULT TRUE);
```

**Parameters****Table 160-8 UNMARKHOT Procedure Parameters**

| Parameter    | Description                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------|
| schema       | User name or the schema to which the object belongs                                                         |
| objname      | Name of the object                                                                                          |
| namespace    | Number indicating the library cache namespace in which the object is to be searched                         |
| global       | If TRUE, unmark the object hot on all Oracle RAC instances.<br>The default value of this parameter is TRUE. |
| hash         | A 16-byte hash value for the object                                                                         |
| edition_name | Denotes the name of the edition that the target object resides in.<br>This parameter is optional.           |

**Exceptions**

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

#### **Usage Notes**

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

# DBMS\_SPACE

The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Security Model](#)
- [Data Structures](#)
- [Summary of DBMS\\_SPACE Subprograms](#)

## 161.1 DBMS\_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

## 161.2 DBMS\_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

### OBJECT Types

[CREATE\\_TABLE\\_COST\\_COLINFO Object Type](#)

### RECORD Types

[ASA\\_RECO\\_ROW Record Type](#)

### TABLE Types

[ASA\\_RECO\\_ROW\\_TB Table Type](#)

### 161.2.1 DBMS\_SPACE CREATE\_TABLE\_COST\_COLINFO Object Type

This type describes the datatype and size of a column in the table.

#### Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
    col_type    VARCHAR(200),  
    col_size    NUMBER)
```

#### Attributes

**Table 161-1** CREATE\_TABLE\_COST\_COLINFO Object Type

| Attribute | Description |
|-----------|-------------|
| col_type  | Column type |

**Table 161-1 (Cont.) CREATE\_TABLE\_COST\_COLINFO Object Type**

| Attribute | Description |
|-----------|-------------|
| col_size  | Column size |

## 161.2.2 DBMS\_SPACE ASA\_RECO\_ROW Record Type

This type contains the column type of individual columns returned by the ASA\_RECOMMENDATIONS Function.

### Syntax

```
TYPE asa_reco_row IS RECORD (  
    tablespace_name    VARCHAR2(30),  
    segment_owner      VARCHAR2(30),  
    segment_name       VARCHAR2(30),    segment_type    VARCHAR2(18),  
    partition_name     VARCHAR2(30),  
    allocated_space    NUMBER,  
    used_space         NUMBER,  
    reclaimable_space  NUMBER,  
    chain_rowexcess    NUMBER,  
    recommendations    VARCHAR2(1000),  
    c1                 VARCHAR2(1000),  
    c2                 VARCHAR2(1000),  
    c3                 VARCHAR2(1000),  
    task_id            NUMBER,  
    mesg_id            NUMBER);
```

### Attributes

**Table 161-2 ASA\_RECO\_ROW Attributes**

| Field             | Description                                                  |
|-------------------|--------------------------------------------------------------|
| tablespace_name   | Name of the tablespace containing the object                 |
| segment_owner     | Name of the schema                                           |
| segment_name      | Name of the object                                           |
| segment_type      | Type of the segment 'TABLE','INDEX' and so on                |
| partition_name    | Name of the partition                                        |
| allocated_space   | Space allocated to the segment                               |
| used_space        | Space actually used by the segment                           |
| reclaimable_space | Reclaimable free space in the segment                        |
| chain_rowexcess   | Percentage of excess chain row pieces that can be eliminated |
| recommendations   | Recommendation or finding for this segment                   |
| c1                | Command associated with the recommendation                   |
| c2                | Command associated with the recommendation                   |
| c3                | Command associated with the recommendation                   |
| task_id           | Advisor Task that processed this segment                     |
| mesg_id           | Message ID corresponding to the recommendation               |

**Related Topics**

- [DBMS\\_SPACE ASA\\_RECOMMENDATIONS Function](#)  
This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

## 161.2.3 DBMS\_SPACE ASA\_RECO\_ROW\_TB Table Type

The type `asa_reco_row_tb` is a table of `asa_reco_row`.

**Syntax**

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

## 161.3 Summary of DBMS\_SPACE Subprograms

This table lists the `DBMS_SPACE` subprograms and briefly describes them.

**Table 161-3** *DBMS\_SPACE Package Subprograms*

| Subprogram                                         | Description                                                                                                         |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <a href="#">ASA_RECOMMENDATIONS Function</a>       | Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user |
| <a href="#">CREATE_INDEX_COST Procedure</a>        | Determines the cost of creating an index on an existing table                                                       |
| <a href="#">CREATE_TABLE_COST Procedures</a>       | Determines the size of the table given various attributes                                                           |
| <a href="#">FREE_BLOCKS Procedure</a>              | Returns information about free blocks in an object (table, index, or cluster)                                       |
| <a href="#">ISDATAFILEDROPPABLE_NAME Procedure</a> | Checks whether a datafile is droppable                                                                              |
| <a href="#">OBJECT_DEPENDENT_SEGMENTS Function</a> | Returns the list of segments that are associated with the object                                                    |
| <a href="#">OBJECT_GROWTH_TREND Function</a>       | A table function where each row describes the space usage of the object at a specific point in time                 |
| <a href="#">SPACE_USAGE Procedures</a>             | Returns information about free blocks in an auto segment space managed segment                                      |
| <a href="#">UNUSED_SPACE Procedure</a>             | Returns information about unused space in an object (table, index, or cluster)                                      |

### 161.3.1 DBMS\_SPACE ASA\_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

**Syntax**

```
DBMS_SPACE.ASA_RECOMMENDATIONS (  
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,  
    show_manual       IN    VARCHAR2 DEFAULT := TRUE,  
    show_findings     IN    VARCHAR2 DEFAULT := FALSE)  
RETURN ASA_RECO_ROW_TB PIPELINED;
```

## Parameters

**Table 161-4 ASA\_RECOMMENDATIONS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>all_runs</code>      | Returns the results of all the auto advisor runs or only the results of the latest run. The valid values are <code>TRUE</code> and <code>FALSE</code> . The default value is <code>TRUE</code> .<br><br>If <code>TRUE</code> , returns recommendations/findings for all runs of auto segment advisor. If <code>FALSE</code> , returns the results of the <code>LATEST</code> run only. <code>LATEST</code> does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.                                                                                                                                                              |
| <code>show_manual</code>   | This parameter is used to indicate if the results of manual jobs should be included.<br><br>If <code>TRUE</code> , results of manual tasks are shown. If <code>FALSE</code> , results of manual tasks are not shown. Specifying <code>manual=true</code> does not negate the specification of auto advisor tasks.<br><br>However, the <code>all_runs</code> settings may override manual. If <code>all_runs</code> is <code>FALSE</code> , implying we only want to see the latest of auto advisor job, then manual may not be specified as <code>TRUE</code> .<br><br>The valid values are <code>TRUE</code> and <code>FALSE</code> . The default value is <code>TRUE</code> . |
| <code>show_findings</code> | Shows only the findings instead of the recommendations. The valid values are <code>TRUE</code> and <code>FALSE</code> . The default value is <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 161-5 Parameter Usage**

| <code>all_runs</code> | <code>show_manual</code> | <code>show_findings</code> | Outcome                                                 |
|-----------------------|--------------------------|----------------------------|---------------------------------------------------------|
| <code>TRUE</code>     | <code>TRUE</code>        | <code>TRUE</code>          | All findings from auto advisor and manual tasks.        |
| <code>TRUE</code>     | <code>TRUE</code>        | <code>FALSE</code>         | All recommendations from auto advisor and manual tasks. |
| <code>TRUE</code>     | <code>FALSE</code>       | <code>TRUE</code>          | All findings from auto advisor tasks.                   |
| <code>TRUE</code>     | <code>FALSE</code>       | <code>FALSE</code>         | All recommendations from all auto advisor tasks.        |
| <code>FALSE</code>    | <code>TRUE</code>        | <code>TRUE</code>          | N/A                                                     |
| <code>FALSE</code>    | <code>TRUE</code>        | <code>FALSE</code>         | N/A                                                     |
| <code>FALSE</code>    | <code>FALSE</code>       | <code>TRUE</code>          | Findings for the latest auto advisor task.              |
| <code>FALSE</code>    | <code>FALSE</code>       | <code>FALSE</code>         | Recommendations from the latest auto advisor task.      |

## 161.3.2 CREATE\_INDEX\_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

### Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (  
    ddl            IN    VARCHAR2,  
    used_bytes     OUT   NUMBER,  
    alloc_bytes    OUT   NUMBER,  
    plan_table     IN    VARCHAR2 DEFAULT NULL);
```

### Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

### Parameters

**Table 161-6 CREATE\_INDEX\_COST Procedure Parameters**

| Parameter   | Description                                            |
|-------------|--------------------------------------------------------|
| ddl         | The create index DDL statement                         |
| used_bytes  | The number of bytes representing the actual index data |
| alloc_bytes | Size of the index when created in the tablespace       |
| plan_table  | Which plan table to use, default NULL                  |

### Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

## 161.3.3 CREATE\_TABLE\_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

## Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);
```

## Parameters

**Table 161-7 CREATE\_TABLE\_COST Procedure Parameters**

| Parameter       | Description                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------|
| tablespace_name | The tablespace in which the object will be created. The default is SYSTEM tablespace.           |
| avg_row_size    | The anticipated average row size in the table                                                   |
| colinfos        | The description of the columns                                                                  |
| row_count       | The anticipated number of rows in the table                                                     |
| pct_free        | The percentage of free space in each block for future expansion of existing rows due to updates |
| used_bytes      | The space used by user data                                                                     |
| alloc_bytes     | The size of the object taking into account the tablespace extent characteristics                |

## Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

## Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
```

```

SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/

```

## 161.3.4 FREE\_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See [SPACE\\_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

### Syntax

```

DBMS_SPACE.FREE_BLOCKS (
  segment_owner      IN  VARCHAR2,
  segment_name       IN  VARCHAR2,
  segment_type       IN  VARCHAR2,
  freelist_group_id  IN  NUMBER,
  free_blks          OUT NUMBER,
  scan_limit         IN  NUMBER DEFAULT NULL,
  partition_name     IN  VARCHAR2 DEFAULT NULL);

```

### Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

### Parameters

**Table 161-8 FREE\_BLOCKS Procedure Parameters**

| Parameter     | Description                                |
|---------------|--------------------------------------------|
| segment_owner | Schema name of the segment to be analyzed  |
| segment_name  | Segment name of the segment to be analyzed |

**Table 161-8 (Cont.) FREE\_BLOCKS Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| segment_type      | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"><li>• TABLE</li><li>• TABLE PARTITION</li><li>• TABLE SUBPARTITION</li><li>• INDEX</li><li>• INDEX PARTITION</li><li>• INDEX SUBPARTITION</li><li>• CLUSTER</li><li>• LOB</li><li>• LOB PARTITION</li><li>• LOB SUBPARTITION</li></ul> |
| freelist_group_id | Freelist group (instance) whose free list size is to be computed                                                                                                                                                                                                                                                                        |
| free_blks         | Returns count of free blocks for the specified group                                                                                                                                                                                                                                                                                    |
| scan_limit        | Maximum number of free list blocks to read (optional).<br>Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"                                                                                                                                                                         |
| partition_name    | Partition name of the segment to be analyzed.<br>This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.                                                                                                                                                                      |

### Examples

The following uses the `CLUS` cluster in `SCOTT` schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in `CLUS`.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

#### Note:

An error is raised if `scan_limit` is not a positive number.

## 161.3.5 ISDATAFILEDROPPABLE\_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

### Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (  
    filename      IN      VARCHAR2,  
    value         OUT     NUMBER);
```

### Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

## Parameters

**Table 161-9 ISDATAFILEDROPPABLE\_NAME Procedure Parameters**

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| filename  | Name of the file                                                    |
| value     | Values: 0 if the file is not droppable, 1 if the file is droppable. |

## Examples

```
DECLARE  fname    VARCHAR2(100);  retval  NUMBER;BEGIN  SELECT file_name  INTO
fname    FROM dba_data_files  WHERE file_name like
'%empty%';DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,
retval);DBMS_OUTPUT.PUT_LINE(retval);END;/
```

## 161.3.6 OBJECT\_DEPENDENT\_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

## Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
    objowner    IN    VARCHAR2,
    objname     IN    VARCHAR2,
    partname    IN    VARCHAR2,
    objtype     IN    NUMBER)
RETURN dependent_segments_table PIPELINED;
```

## Parameters

**Table 161-10 OBJECT\_DEPENDENT\_SEGMENTS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| objowner  | The schema containing the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| objname   | The name of the object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| partname  | The name of the partition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| objtype   | Type of the object: <ul style="list-style-type: none"><li>• OBJECT_TYPE_TABLE constant positive := 1;</li><li>• OBJECT_TYPE_NESTED_TABLE constant positive := 2;</li><li>• OBJECT_TYPE_INDEX constant positive := 3;</li><li>• OBJECT_TYPE_CLUSTER constant positive := 4;</li><li>• OBJECT_TYPE_TABLE_PARTITION constant positive := 7;</li><li>• OBJECT_TYPE_INDEX_PARTITION constant positive := 8;</li><li>• OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9;</li><li>• OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10;</li><li>• OBJECT_TYPE_MV constant positive := 13;</li><li>• OBJECT_TYPE_MVLOG constant positive := 14;</li></ul> |

## Return Values

The content of one row of a dependent\_segments\_table:

```
TYPE object_dependent_segment IS RECORD (
    segment_owner      VARCHAR2(100),
    segment_name       VARCHAR2(100),
    segment_type       VARCHAR2(100),
    tablespace_name    VARCHAR2(100),
    partition_name     VARCHAR2(100),
    lob_column_name    VARCHAR2(100));
```

**Table 161-11 OBJECT\_DEPENDENT\_SEGMENT Type Parameters**

| Parameter       | Description                                          |
|-----------------|------------------------------------------------------|
| segment_owner   | The schema containing the segment                    |
| segment_name    | The name of the segment                              |
| segment_type    | The type of the segment, such as table, index or LOB |
| tablespace_name | The name of the tablespace                           |
| partition_name  | The name of the partition, if any                    |
| lob_column_name | The name of the LOB column, if any                   |

## 161.3.7 OBJECT\_GROWTH\_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

### Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
    object_owner      IN   VARCHAR2,
    object_name       IN   VARCHAR2,
    object_type       IN   VARCHAR2,
    partition_name    IN   VARCHAR2 DEFAULT NULL,
    start_time        IN   TIMESTAMP DEFAULT NULL,
    end_time          IN   TIMESTAMP DEFAULT NULL,
    interval          IN   DSINTERVAL UNCONSTRAINED DEFAULT NULL,
    skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
    timeout_seconds   IN   NUMBER DEFAULT NULL,
    single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

### Parameters

**Table 161-12 OBJECT\_GROWTH\_TREND Function Parameters**

| Parameter    | Description                      |
|--------------|----------------------------------|
| object_owner | The schema containing the object |
| object_name  | The name of the object           |

**Table 161-12 (Cont.) OBJECT\_GROWTH\_TREND Function Parameters**

| Parameter              | Description                                                                      |
|------------------------|----------------------------------------------------------------------------------|
| object_type            | The type of the object                                                           |
| partition_name         | The name of the partition                                                        |
| start_time             | Statistics generated after this time will be used in generating the growth trend |
| end_time               | Statistics generated until this time will be used in generating the growth trend |
| interval               | The interval at which to sample                                                  |
| skip_interpolated      | Whether interpolation of missing values should be skipped                        |
| timeout_seconds        | The time-out value for the function in seconds                                   |
| single_data_point_flag | Whether in the absence of statistics the segment should be sampled               |

**Return Values**

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(  
    timepoint      TIMESTAMP,  
    space_usage    NUMBER,  
    space_alloc    NUMBER,  
    quality        VARCHAR(20));
```

**Table 161-13 OBJECT\_GROWTH\_TREND\_ROW Type Parameters**

| Parameter   | Description                                                 |
|-------------|-------------------------------------------------------------|
| timepoint   | The time at which the statistic was recorded                |
| space_usage | The space used by data                                      |
| space_alloc | The size of the segment including overhead and unused space |
| quality     | The quality of result: "GOOD", "INTERPOLATED", "PROJECTION" |

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

## 161.3.8 SPACE\_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

#### Note:

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

#### Syntax

```
DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);

DBMS_SPACE.SPACE_USAGE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    segment_size_blocks OUT NUMBER,
    segment_size_bytes OUT NUMBER,
    used_blocks        OUT NUMBER,
    used_bytes         OUT NUMBER,
    expired_blocks     OUT NUMBER,
    expired_bytes      OUT NUMBER,
    unexpired_blocks   OUT NUMBER,
    unexpired_bytes    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 161-14 SPACE\_USAGE Procedure Parameters**

| Parameter                   | Description                                  |
|-----------------------------|----------------------------------------------|
| <code>segment_owner</code>  | Schema name of the segment to be analyzed    |
| <code>segment_name</code>   | Name of the segment to be analyzed           |
| <code>partition_name</code> | Partition name of the segment to be analyzed |

**Table 161-14 (Cont.) SPACE\_USAGE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| segment_type        | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> <li>• TABLE</li> <li>• TABLE PARTITION</li> <li>• TABLE SUBPARTITION</li> <li>• INDEX</li> <li>• INDEX PARTITION</li> <li>• INDEX SUBPARTITION</li> <li>• CLUSTER</li> <li>• LOB</li> <li>• LOB PARTITION</li> <li>• LOB SUBPARTITION</li> </ul> |
| unformatted_blocks  | For LOB segments, the number of blocks that is returned from unformatted_blocks is actually the number of chunks for the LOB segment.                                                                                                                                                                                                              |
| unformatted_bytes   | Total number of bytes unformatted                                                                                                                                                                                                                                                                                                                  |
| fs1_blocks          | Number of blocks having at least 0 to 25% free space                                                                                                                                                                                                                                                                                               |
| fs1_bytes           | Number of bytes having at least 0 to 25% free space                                                                                                                                                                                                                                                                                                |
| fs2_blocks          | Number of blocks having at least 25 to 50% free space                                                                                                                                                                                                                                                                                              |
| fs2_bytes           | Number of bytes having at least 25 to 50% free space                                                                                                                                                                                                                                                                                               |
| fs3_blocks          | Number of blocks having at least 50 to 75% free space                                                                                                                                                                                                                                                                                              |
| fs3_bytes           | Number of bytes having at least 50 to 75% free space                                                                                                                                                                                                                                                                                               |
| fs4_blocks          | Number of blocks having at least 75 to 100% free space                                                                                                                                                                                                                                                                                             |
| fs4_bytes           | Number of bytes having at least 75 to 100% free space                                                                                                                                                                                                                                                                                              |
| full_blocks         | The number of blocks that is returned from full_blocks is actually the number of chunks for the LOB segment                                                                                                                                                                                                                                        |
| full_bytes          | Total number of bytes full in the segment                                                                                                                                                                                                                                                                                                          |
| segment_size_blocks | Number of blocks allocated to the segment                                                                                                                                                                                                                                                                                                          |
| segment_size_bytes  | Number of bytes allocated to the segment                                                                                                                                                                                                                                                                                                           |
| used_blocks         | Number blocks allocated to the LOB that contains active data                                                                                                                                                                                                                                                                                       |
| used_bytes          | Number bytes allocated to the LOB that contains active data                                                                                                                                                                                                                                                                                        |
| expired_blocks      | Number of expired blocks used by the LOB to keep version data                                                                                                                                                                                                                                                                                      |
| expired_bytes       | Number of expired bytes used by the LOB to keep version data                                                                                                                                                                                                                                                                                       |
| unexpired_blocks    | Number of unexpired blocks used by the LOB to keep version data                                                                                                                                                                                                                                                                                    |
| unexpired_bytes     | Number of unexpired bytes used by the LOB to keep version data                                                                                                                                                                                                                                                                                     |
| partition_name      | Name of the partition (NULL if not a partition)                                                                                                                                                                                                                                                                                                    |

### Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
```

```
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                      'TABLE',
                      :unf, :unfb,
                      :fs1, :fs1b,
                      :fs2, :fs2b,
                      :fs3, :fs3b,
                      :fs4, :fs4b,
                      :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

## 161.3.9 UNUSED\_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

### Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    total_blocks       OUT NUMBER,
    total_bytes        OUT NUMBER,
    unused_blocks      OUT NUMBER,
    unused_bytes       OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 161-15** UNUSED\_SPACE Procedure Parameters

| Parameter     | Description                                |
|---------------|--------------------------------------------|
| segment_owner | Schema name of the segment to be analyzed  |
| segment_name  | Segment name of the segment to be analyzed |

**Table 161-15 (Cont.) UNUSED\_SPACE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| segment_type              | Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"><li>• TABLE</li><li>• TABLE PARTITION</li><li>• TABLE SUBPARTITION</li><li>• INDEX</li><li>• INDEX PARTITION</li><li>• INDEX SUBPARTITION</li><li>• CLUSTER</li><li>• LOB</li><li>• LOB PARTITION</li><li>• LOB SUBPARTITION</li></ul> |
| total_blocks              | Returns total number of blocks in the segment                                                                                                                                                                                                                                                                                           |
| total_bytes               | Returns total number of blocks in the segment, in bytes                                                                                                                                                                                                                                                                                 |
| unused_blocks             | Returns number of blocks which are not used                                                                                                                                                                                                                                                                                             |
| unused_bytes              | Returns, in bytes, number of blocks which are not used                                                                                                                                                                                                                                                                                  |
| last_used_extent_file_id  | Returns the file ID of the last extent which contains data                                                                                                                                                                                                                                                                              |
| last_used_extent_block_id | Returns the starting block ID of the last extent which contains data                                                                                                                                                                                                                                                                    |
| last_used_block           | Returns the last block within this extent which contains data                                                                                                                                                                                                                                                                           |
| partition_name            | Partition name of the segment to be analyzed.<br>This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.                                                                                                                                                                        |

### Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,  
:total_bytes,:unused_blocks, :unused_bytes, :lastextf,  
:last_extb, :lastusedblock);
```

# DBMS\_SPACE\_ADMIN

The DBMS\_SPACE\_ADMIN package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Summary of DBMS\\_SPACE\\_ADMIN Subprograms](#)

**See Also:**

*Oracle Database Administrator's Guide* for an example and description of using DBMS\_SPACE\_ADMIN.

## 162.1 DBMS\_SPACE\_ADMIN Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

## 162.2 DBMS\_SPACE\_ADMIN Constants

The DBMS\_SPACE\_ADMIN package provides constants that can be used for specifying parameter values.

**Table 162-1 DBMS\_SPACE\_ADMIN Constants**

| Constant                      | Type     | Value | Description                                                                                                                                                   |
|-------------------------------|----------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEGMENT_VERIFY_EXTENTS        | POSITIVE | 1     | Verifies that the space owned by segment is appropriately reflected in the bitmap as used                                                                     |
| SEGMENT_VERIFY_EXTENTS_GLOBAL | POSITIVE | 2     | Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it |
| SEGMENT_MARK_CORRUPT          | POSITIVE | 3     | Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)                                     |

**Table 162-1 (Cont.) DBMS\_SPACE\_ADMIN Constants**

| Constant                     | Type     | Value | Description                                                                                                                                                                    |
|------------------------------|----------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SEGMENT_MARK_VALID           | POSITIVE | 4     | Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally. |
| SEGMENT_DUMP_EXTENT_MAP      | POSITIVE | 5     | Dumps the extent map for a given segment                                                                                                                                       |
| TABLESPACE_VERIFY_BITMAP     | POSITIVE | 6     | Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent                                                |
| TABLESPACE_EXTENT_MAKE_FREE  | POSITIVE | 7     | Marks the block range (extent) as free in the bitmaps                                                                                                                          |
| TABLESPACE_EXTENT_MAKE_USED  | POSITIVE | 8     | Marks the block range (extent) as used in the bitmaps                                                                                                                          |
| SEGMENT_VERIFY_BASIC         | POSITIVE | 9     | Performs the basic metadata checks                                                                                                                                             |
| SEGMENT_VERIFY_DEEP          | POSITIVE | 10    | Performs deep verification                                                                                                                                                     |
| SEGMENT_VERIFY_SPECIFIC      | POSITIVE | 11    | Performs a specific check for the segment                                                                                                                                      |
| HWM_CHECK                    | POSITIVE | 12    | Checks high water mark (HWM)                                                                                                                                                   |
| BMB_CHECK                    | POSITIVE | 13    | Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)                                                                                                                     |
| SEG_DICT_CHECK               | POSITIVE | 14    | Checks consistency of segment header with corresponding SEG entry                                                                                                              |
| EXTENT_TS_BITMAP_CHECK       | POSITIVE | 15    | Checks whether the tablespace bitmaps corresponding to the extent map are marked used                                                                                          |
| DB_BACKPOINTER_CHECK         | POSITIVE | 16    | Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment                                                                                  |
| EXTENT_SEGMENT_BITMAP_CHECK  | POSITIVE | 17    | Checks whether the bitmap blocks are consistent with the extent map                                                                                                            |
| BITMAPS_CHECK                | POSITIVE | 18    | Checks from the datablocks that the bitmap states representing the blocks are consistent                                                                                       |
| TS_VERIFY_BITMAPS            | POSITIVE | 19    | Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace                                                                             |
| TS_VERIFY_DEEP               | POSITIVE | 20    | Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option                                                                                                             |
| TS_VERIFY_SEGMENTS           | POSITIVE | 21    | Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option                                                                     |
| SEGMENTS_DUMP_BITMAP_SUMMARY | POSITIVE | 27    | Dumps only bitmap block summaries                                                                                                                                              |

## 162.3 DBMS\_SPACE\_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

## 162.4 Summary of DBMS\_SPACE\_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

**Table 162-2 DBMS\_SPACE\_ADMIN Package Subprograms**

| Subprogram                                                      | Description                                                                                                     |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">ASSM_SEGMENT_VERIFY Procedure</a>                   | Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces                              |
| <a href="#">ASSM_TABLESPACE_VERIFY Procedure</a>                | Verifies ASSM tablespaces                                                                                       |
| <a href="#">DROP_EMPTY_SEGMENTS Procedure</a>                   | Drops segments from empty tables or table fragments and dependent objects                                       |
| <a href="#">GET_SEGADV_ATTRIB Procedure</a>                     | returns the values of attributes of <code>DBSM_SPACE_ADMIN</code> package                                       |
| <a href="#">MATERIALIZE_DEFERRED_SEGMENT_CREATION Procedure</a> | Materializes segments for tables and table fragments with deferred segment creation and their dependent objects |
| <a href="#">SEGMENT_CORRUPT Procedure</a>                       | Marks the segment corrupt or valid so that appropriate error recovery can be done                               |
| <a href="#">SEGMENT_DROP_CORRUPT Procedure</a>                  | Drops a segment currently marked corrupt (without reclaiming space)                                             |
| <a href="#">SEGMENT_DUMP Procedure</a>                          | Dumps the segment header and extent maps of a given segment                                                     |
| <a href="#">SEGMENT_VERIFY Procedure</a>                        | Verifies the consistency of the extent map of the segment                                                       |
| <a href="#">SET_SEGADV_ATTRIB Procedure</a>                     | Sets/changes the values of attributes of <code>DBSM_SPACE_ADMIN</code> package                                  |
| <a href="#">TABLESPACE_FIX_BITMAPS Procedure</a>                | Marks the appropriate block range (extent) as free or used in bitmap                                            |
| <a href="#">TABLESPACE_FIX_SEGMENT_STATISTICS Procedure</a>     | Fixes the state of the segments in a tablespace in which migration was aborted                                  |
| <a href="#">TABLESPACE_MIGRATE_FROM_LOCAL Procedure</a>         | Migrates a locally managed tablespace to dictionary-managed tablespace                                          |
| <a href="#">TABLESPACE_MIGRATE_TO_LOCAL Procedure</a>           | Migrates a tablespace from dictionary-managed format to locally managed format                                  |

**Table 162-2 (Cont.) DBMS\_SPACE\_ADMIN Package Subprograms**

| Subprogram                                            | Description                                                                                   |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">TABLESPACE_REBUILD_BITMAPS Procedure</a>  | Rebuilds the appropriate bitmaps                                                              |
| <a href="#">TABLESPACE_REBUILD_QUOTAS Procedure</a>   | Rebuilds quotas for given tablespace                                                          |
| <a href="#">TABLESPACE_RELOCATE_BITMAPS Procedure</a> | Relocates the bitmaps to the destination specified                                            |
| <a href="#">TABLESPACE_VERIFY Procedure</a>           | Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized |

## 162.4.1 ASSM\_SEGMENT\_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

### Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (  
    segment_owner    IN VARCHAR2,  
    segment_name     IN VARCHAR2,  
    segment_type     IN VARCHAR2,  
    partition_name   IN VARCHAR2,  
    verify_option    IN POSITIVE DEFAULT SEGMENT_VERIFY_BASIC,  
    attrib           IN POSITIVE DEFAULT NULL);
```

### Parameters

**Table 162-3 ASSM\_SEGMENT\_VERIFY Procedure Parameters**

| Parameter                   | Description                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>segment_owner</code>  | Schema that owns the segment                                                                                                                                      |
| <code>segment_name</code>   | Name of the segment to be verified                                                                                                                                |
| <code>segment_type</code>   | Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER |
| <code>partition_name</code> | Name of the partition or subpartition                                                                                                                             |

**Table 162-3 (Cont.) ASSM\_SEGMENT\_VERIFY Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| verify_option | <p>One of the following options:</p> <ul style="list-style-type: none"> <li>SEGMENT_VERIFY_BASIC := 9. Performs the basic metadata checks (Default)</li> <li>SEGMENT_VERIFY_DEEP := 10. Performs deep verification</li> <li>SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| attrib        | <p>When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following:</p> <ul style="list-style-type: none"> <li>HWM_CHECK := 12. Checks whether high water mark information is accurate</li> <li>BMB_CHECK := 13. Checks whether space bitmap blocks have correct backpointers to the segment header</li> <li>SEG_DICT_CHECK := 14. Checks whether dictionary information for segment is accurate</li> <li>EXTENT_TS_BITMAP_CHECK := 15. Checks whether extent maps are consistent with file level bitmaps</li> <li>DB_BACKPOINTER_CHECK := 16. Checks whether datablocks have correct backpointers to the space metadata blocks</li> <li>EXTENT_SEGMENT_BITMAP_CHECK := 17. Checks whether extent map in the segment matches the bitmaps in the segment</li> <li>BITMAPS_CHECK := 18. Checks whether space bitmap blocks are accurate</li> </ul> |

#### Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header\_relative\_file and header\_block parameters) by querying DBA\_SEGMENTS.
- This procedure outputs a dump file named sid\_oracle\_process\_ID.trc to the location specified in the USER\_DUMP\_DEST initialization parameter.

## 162.4.2 ASSM\_TABLESPACE\_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

#### Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name  IN VARCHAR2,
    ts_option        IN POSITIVE,
    segment_option   IN POSITIVE DEFAULT NULL);
```

## Parameters

**Table 162-4 ASSM\_TABLESPACE\_VERIFY Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tablespace_name | Name of the tablespace to verify. The tablespace must be an ASSM tablespace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ts_option       | <ul style="list-style-type: none"> <li>TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file.</li> <li>TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments.</li> <li>TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.</li> </ul> |
| segment_option  | <p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> <li>SEGMENT_VERIFY_BASIC := 9</li> <li>SEGMENT_VERIFY_DEEP := 10</li> </ul> <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p>                                                                                                                                                                                                                                                                                                                                                 |

## Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named sid\_ora\_process\_ID.trc to the location specified in the USER\_DUMP\_DEST initialization parameter.

## 162.4.3 DROP\_EMPTY\_SEGMENTS Procedure

This procedures drops segments from empty tables or table fragments and dependent objects.

### Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (
    schema_name      IN      VARCHAR2  DEFAULT NULL,
    table_name       IN      VARCHAR2  DEFAULT NULL,
    partition_name   IN      VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 162-5 DROP\_EMPTY\_SEGMENTS Procedure Parameters**

| Parameter      | Description       |
|----------------|-------------------|
| schema_name    | Name of schema    |
| table_name     | Name of table     |
| partition_name | Name of partition |

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

162.4.4 GET\_SEGADV\_ATTRIB Procedure

This procedure returns the values of attributes of DBMS\_SPACE\_ADMIN package.

Syntax

```
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(  
    attribute IN NUMBER,  
    value     OUT NUMBER);
```

Parameters

Table 162-6 GET\_SEGADV\_ATTRIB Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute | Supported attributes: <ul style="list-style-type: none"><li>• COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor.</li><li>• COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.</li></ul> |
| value     | Supported values: <ul style="list-style-type: none"><li>• ATTR_ENABLE : 1</li><li>• ATTR_DISABLE : 0</li></ul>                                                                                                                                                                                                                                                                                                                                                                                 |

162.4.5 MATERIALIZE\_DEFERRED\_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (  
    schema_name IN VARCHAR2 DEFAULT NULL,
```

```
table_name      IN      VARCHAR2  DEFAULT NULL,  
partition_name  IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 162-7 MATERIALIZE\_DEFERRED\_SEGMENTS Procedure Parameters**

| Parameter      | Description       |
|----------------|-------------------|
| schema_name    | Name of schema    |
| table_name     | Name of table     |
| partition_name | Name of partition |

### Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No `schema_name` is specified, in which case tables belonging to all schemas are scanned
- Both `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

## 162.4.6 SEGMENT\_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the `SYSTEM` tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (  
    tablespace_name      IN      VARCHAR2,  
    header_relative_file  IN      POSITIVE,  
    header_block         IN      NUMBER,  
    corrupt_option        IN      POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);
```

### Parameters

**Table 162-8 SEGMENT\_CORRUPT Procedure Parameters**

| Parameter            | Description                                          |
|----------------------|------------------------------------------------------|
| tablespace_name      | Name of tablespace in which segment resides          |
| header_relative_file | Relative file number of segment header               |
| header_block         | Block number of segment header                       |
| corrupt_option       | SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID |

## Usage Notes

You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

## Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,  
DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33,  
DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

## 162.4.7 SEGMENT\_DROP\_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

## Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
    tablespace_name      IN      VARCHAR2,  
    header_relative_file  IN      POSITIVE,  
    header_block         IN      NUMBER);
```

## Parameters

**Table 162-9** SEGMENT\_DROP\_CORRUPT Procedure Parameters

| Parameter                         | Description                                 |
|-----------------------------------|---------------------------------------------|
| <code>tablespace_name</code>      | Name of tablespace in which segment resides |
| <code>header_relative_file</code> | Relative file number of segment header      |
| <code>header_block</code>         | Block number of segment header              |

## Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE\\_FIX\\_BITMAPS Procedure](#) or the [TABLESPACE\\_REBUILD\\_BITMAPS Procedure](#).
- The procedure cannot be used on the `SYSTEM` tablespace.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

## Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

## 162.4.8 SEGMENT\_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the `USER_DUMP_DEST` initialization parameter.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
    tablespace_name      IN    VARCHAR2,
    header_relative_file  IN    POSITIVE,
    header_block         IN    NUMBER,
    dump_option          IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

### Parameters

**Table 162-10** SEGMENT\_DUMP Procedure Parameters

| Parameter                         | Description                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>tablespace_name</code>      | Name of tablespace in which segment resides                                                                                                                            |
| <code>header_relative_file</code> | Relative file number of segment header                                                                                                                                 |
| <code>header_block</code>         | Block number of segment header                                                                                                                                         |
| <code>dump_option</code>          | One of the following options: <ul style="list-style-type: none"> <li><code>SEGMENT_DUMP_EXTENT_MAP</code></li> <li><code>SEGMENT_DUMP_BITMAP_SUMMARY</code></li> </ul> |

### Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

## 162.4.9 SEGMENT\_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
    tablespace_name      IN    VARCHAR2,
    header_relative_file  IN    POSITIVE,
    header_block         IN    NUMBER,
    verify_option        IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

## Parameters

**Table 162-11 SEGMENT\_VERIFY Procedure Parameters**

| Parameters           | Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------|
| tablespace_name      | Name of tablespace in which segment resides                                       |
| header_relative_file | Relative file number of segment header                                            |
| header_block         | Block number of segment header                                                    |
| verify_option        | What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL |

## Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.
- You can determine the relative file number and block number (header\_relative\_file and header\_block parameter) of the segment header block by querying DBA\_SEGMENTS.

## Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33,  
DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

## 162.4.10 SET\_SEGADV\_ATTRIB Procedure

This procedure sets the values of attributes of DBMS\_SPACE\_ADMIN package.

## Syntax

```
DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB(  
    attribute IN NUMBER,  
    value     IN NUMBER);
```

## Parameters

**Table 162-12 SET\_SEGADV\_ATTRIB Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute | Supported attributes: <ul style="list-style-type: none"><li>• COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor.</li><li>• COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.</li></ul> |

**Table 162-12 (Cont.) SET\_SEGADV\_ATTRIB Procedure Parameters**

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| value     | Supported values: <ul style="list-style-type: none"><li>• ATTR_ENABLE : 1</li><li>• ATTR_DISABLE : 0</li></ul> |

## 162.4.11 TABLESPACE\_FIX\_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (  
    tablespace_name      IN      VARCHAR2,  
    dbarange_relative_file IN      POSITIVE,  
    dbarange_begin_block IN      POSITIVE,  
    dbarange_end_block   IN      POSITIVE,  
    fix_option           IN      POSITIVE);
```

### Parameters

**Table 162-13 TABLESPACE\_FIX\_BITMAPS Procedure Parameters**

| Parameter              | Description                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| tablespace_name        | Name of tablespace                                                                                                                                |
| dbarange_relative_file | Relative file number of block range (extent)                                                                                                      |
| dbarange_begin_block   | Block number of beginning of extent                                                                                                               |
| dbarange_end_block     | Block number (inclusive) of end of extent                                                                                                         |
| fix_option             | One of the following options: <ul style="list-style-type: none"><li>• TABLESPACE_EXTENT_MAKE_FREE</li><li>• TABLESPACE_EXTENT_MAKE_USED</li></ul> |

### Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83,  
DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of TABLESPACE\_EXTENT\_MAKE\_FREE marks the bits free in bitmaps. The BEGIN and END blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

## 162.4.12 TABLESPACE\_FIX\_SEGMENT\_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is

set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (  
    tablespace_name    IN    VARCHAR);
```

### Parameters

**Table 162-14** TABLESPACE\_FIX\_SEGMENT\_STATES Procedure Parameters

| Parameter Name  | Description                                         |
|-----------------|-----------------------------------------------------|
| tablespace_name | Name of the tablespace whose segments must be fixed |

### Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

## 162.4.13 TABLESPACE\_MIGRATE\_FROM\_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (  
    tablespace_name    IN    VARCHAR2);
```

### Parameter

**Table 162-15** TABLESPACE\_MIGRATE\_FROM\_LOCAL Procedure Parameter

| Parameter       | Description        |
|-----------------|--------------------|
| tablespace_name | Name of tablespace |

### Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of `SYSTEM` tablespaces are not supported.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

## 162.4.14 TABLESPACE\_MIGRATE\_TO\_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (  
    tablespace_name    IN      VARCHAR2,  
    unit_size          IN      POSITIVE DEFAULT NULL,  
    rfno               IN      POSITIVE DEFAULT NULL);
```

### Parameters

**Table 162-16** TABLESPACE\_MIGRATE\_TO\_LOCAL Procedure Parameters

| Parameter Name  | Description                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| tablespace_name | Name of the tablespace to be migrated                                                                                                              |
| unit_size       | Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks |
| rfno            | Relative File Number of the file where the bitmap blocks are placed                                                                                |

### Usage Notes

- Before you migrate the `SYSTEM` tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

#### See Also:

*Oracle Database Administrator's Guide*

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT` is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the `unit_size` calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

### Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

## 162.4.15 TABLESPACE\_REBUILD\_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the `SYSTEM` tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (  
    tablespace_name      IN      VARCHAR2,  
    bitmap_relative_file IN      POSITIVE  DEFAULT NULL,  
    bitmap_block         IN      POSITIVE  DEFAULT NULL);
```

### Parameters

**Table 162-17 TABLESPACE\_REBUILD\_BITMAPS Procedure Parameters**

| Parameter                         | Description                                     |
|-----------------------------------|-------------------------------------------------|
| <code>tablespace_name</code>      | Name of tablespace                              |
| <code>bitmap_relative_file</code> | Relative file number of bitmap block to rebuild |
| <code>bitmap_block</code>         | Block number of bitmap block to rebuild         |

### Usage Notes

Only full rebuild is supported.

### Examples

The following example rebuilds bitmaps for all the files in the `USERS` tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

## 162.4.16 TABLESPACE\_REBUILD\_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (  
    tablespace_name      IN      VARCHAR2);
```

### Parameters

**Table 162-18 TABLESPACE\_REBUILD\_QUOTAS Procedure Parameters**

| Parameter                    | Description        |
|------------------------------|--------------------|
| <code>tablespace_name</code> | Name of tablespace |

## Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

## 162.4.17 TABLESPACE\_RELOCATE\_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (  
    tablespace_name    IN      VARCHAR2,  
    filno              IN      POSITIVE,  
    blkno              IN      POSITIVE);
```

### Parameters

**Table 162-19** TABLESPACE\_RELOCATE\_BITMAPS Procedure Parameters

| Parameter Name  | Description                                  |
|-----------------|----------------------------------------------|
| tablespace_name | Name of tablespace                           |
| filno           | Relative File Number of the destination file |
| blkno           | Block Number of the destination range        |

### Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of SPACE\_HEADER segment that contains the bitmap blocks. The SPACE\_HEADER segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the TABLESPACE\_RELOCATE\_BITMAPS command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the SYSTEM tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

## Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

### Note:

The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

# 162.4.18 TABLESPACE\_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

## Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

## Parameters

Table 162-20 TABLESPACE\_VERIFY Procedure Parameters

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| tablespace_name | Name of tablespace                                |
| verify_option   | One option is supported: TABLESPACE_VERIFY_BITMAP |

## Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

# DBMS\_SPD

The `DBMS_SPD` package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Views](#)
- [Summary of DBMS\\_SPD Subprograms](#)

## See Also:

- [DBMS\\_STATS](#)
- *Oracle Database SQL Tuning Guide* regarding SQL plan directives

## 163.1 DBMS\_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

## 163.2 DBMS\_SPD Security Model

`DBMS_SPD` is an invoker-rights package. The invoker requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

## 163.3 DBMS\_SPD Views

The DBA view `DBA_SQL_PLAN_DIRECTIVES` shows all the directives created in the system and the view `DBA_SQL_PLAN_DIR_OBJECTS` displays the objects that are included in the directives.

## 163.4 Summary of DBMS\_SPD Subprograms

This table lists and briefly describes the `DBMS_SPD` package subprograms.

**Table 163-1 DBMS\_SPD Package Subprograms**

| Subprogram                                         | Description                                                                                                                         |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_SQL_PLAN_DIRECTIVE Procedure</a> | Changes different attributes of a SQL plan directive                                                                                |
| <a href="#">CREATE_STGTAB_DIRECTIVE Procedure</a>  | Creates a staging table into which to pack (export) SQL plan directives.                                                            |
| <a href="#">DROP_SQL_PLAN_DIRECTIVE Procedure</a>  | Drops a SQL plan directive                                                                                                          |
| <a href="#">FLUSH_SQL_PLAN_DIRECTIVE Procedure</a> | Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements. |
| <a href="#">GET_PREFS Function</a>                 | Gets the values for preferences for SQL plan directives                                                                             |
| <a href="#">PACK_STGTAB_DIRECTIVE Function</a>     | Packs (exports) SQL plan directives into a staging table.                                                                           |
| <a href="#">SET_PREFS Procedure</a>                | Allows the setting of different preferences for SQL plan directives                                                                 |
| <a href="#">UNPACK_STGTAB_DIRECTIVE Function</a>   | Unpacks (imports) SQL plan directives from a staging table.                                                                         |

## 163.4.1 ALTER\_SQL\_PLAN\_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

### Syntax

```
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (  
    directive_id      IN      NUMBER,  
    attribute_name     IN      VARCHAR2,  
    attribute_value    IN      VARCHAR2);
```

### Parameters

**Table 163-2 ALTER\_SQL\_PLAN\_DIRECTIVE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directive_id    | SQL plan directive ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| attribute_name  | <ul style="list-style-type: none"><li>ENABLED</li><li>AUTO_DROP</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                             |
| attribute_value | <p>Possible values:</p> <ul style="list-style-type: none"><li>ENABLED:<ul style="list-style-type: none"><li>If YES directive is enabled and may be used</li><li>If NO directive is not enabled and will not be used</li></ul></li><li>AUTO_DROP:<ul style="list-style-type: none"><li>If YES directive will be dropped automatically if not used for SPD_RETENTION_WEEKS. This is the default behavior.</li><li>If NO directive will not be dropped automatically</li></ul></li></ul> |

### Exceptions

- ORA-38171 INSUFFICIENT\_PRIVILEGE: The user does not have proper privilege to perform the operation.

- ORA-28104 INVALID\_INPUT: The input value is not valid.
- ORA-13158 OBJECT\_DOES\_NOT\_EXIST: The specified object does not exist.

### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

### Examples

```
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

## 163.4.2 CREATE\_STGTAB\_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

### Syntax

```
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  tablespace_name IN VARCHAR2 := NULL);
```

### Parameters

**Table 163-3** *CREATE\_STGTAB\_DIRECTIVE Procedure Parameters*

| Parameter       | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| table_name      | Name of staging table                                                                  |
| table_owner     | Name of schema owner of staging table. Default is current schema.                      |
| tablespace_name | Name of tablespace. Default NULL means create staging table in the default tablespace: |

### Exceptions

- ORA-38171 INSUFFICIENT\_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID\_INPUT: The input value is not valid.
- ORA-44001 INVALID\_SCHEMA: The input schema does not exist.
- ORA-13159 TABLE\_ALREADY\_EXISTS: The specified table already exists.
- ORA-29304 TABLESPACE\_MISSING: The specified tablespace does not exist.

### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

## 163.4.3 DROP\_SQL\_PLAN\_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

### Syntax

```
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (  
    directive_id      IN      NUMBER);
```

### Parameters

**Table 163-4** *DROP\_SQL\_PLAN\_DIRECTIVE Procedure Parameters*

| Parameter    | Description           |
|--------------|-----------------------|
| directive_id | SQL plan directive ID |

### Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

### Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

### Examples

```
BEGIN  
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);  
END;
```

## 163.4.4 FLUSH\_SQL\_PLAN\_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

### Syntax

```
DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
```

### Exceptions

ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.

### Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

### Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

## 163.4.5 GET\_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

### Syntax

```
DBMS_SPD.GET_PREFS (
  pname      IN   VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 163-5** *GET\_PREFS Function Parameters*

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| pname     | Preference name. The procedure supports the preference SPD_RETENTION_WEEKS. |

### Return Values

Preference value

### Exceptions

- ORA-38171 INSUFFICIENT\_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID\_INPUT: The input value is not valid.

### Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD\_RETENTION\_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

### Examples

```
SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;
```

## 163.4.6 PACK\_STGTAB\_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

### Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER
  directive_id    IN NUMBER   := NULL,
```

```
obj_list          IN OBJECTTAB := NULL)
RETURN NUMBER
```

## Parameters

**Table 163-6** *PACK\_STGTAB\_DIRECTIVE Function Parameters*

| Parameter    | Description                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Name of staging table                                                                                                                                                                          |
| table_owner  | Name of schema owner of staging table. Default is current schema.                                                                                                                              |
| directive_id | SQL plan directive ID. Default NULL means all directives in the system.                                                                                                                        |
| obj_list     | Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list. |

## Return Values

Number of SQL plan directives packed.

## Exceptions

- ORA-38171 `INSUFFICIENT_PRIVILEGE`: The user does not have proper privilege to perform the operation.
- ORA-28104 `INVALID_INPUT`: The input value is not valid.
- ORA-44001 `INVALID_SCHEMA`: The input schema does not exist.
- ORA-29304 `INVALID_STGTAB`: The specified staging table is invalid or does not exist.
- ORA-13158 `OBJECT_DOES_NOT_EXIST`: The specified object does not exist.

## Usage Notes

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required to execute this procedure.

## Examples

```
-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Pack directives relevant to objects in SH schema
DECLARE
    my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
    dir_cnt NUMBER;
BEGIN
    my_list.extend(1);
    my_list(1).owner := 'SH';           -- schema name
    my_list(1).object_name := NULL;     -- all tables in SH
    my_list(1).object_type := 'TABLE';  -- type of object

    dir_cnt :=
        DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
    DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
```

```

my_list DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
dir_cnt NUMBER;
BEGIN
    my_list.extend(2);

    -- SALES table
    my_list(1).owner := 'SH';
    my_list(1).object_name := 'SALES';
    my_list(1).object_type := 'TABLE';

    -- CUSTOMERS table
    my_list(2).owner := 'SH';
    my_list(2).object_name := 'CUSTOMERS';
    my_list(2).object_type := 'TABLE';

    dir_cnt :=
        DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
    DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

## 163.4.7 SET\_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

### Syntax

```

DBMS_SPD.SET_PREFS (
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

### Parameters

**Table 163-7** *SET\_PREFS Procedure Parameters*

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.                                                                                                                                                                                                                                                                                                                                                                         |
| pvalue    | Preference value. <ul style="list-style-type: none"> <li>SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.</li> </ul> |

### Exceptions

- ORA-38171 INSUFFICIENT\_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID\_INPUT: The input value is not valid.

### Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD\_RETENTION\_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

## Examples

```
BEGIN
  DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

## 163.4.8 UNPACK\_STGTAB\_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

### Syntax

```
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := USER,
  directive_id    IN NUMBER   := NULL,
  obj_list        IN OBJECTTAB := NULL)
RETURN NUMBER
```

### Parameters

**Table 163-8** *UNPACK\_STGTAB\_DIRECTIVE Function Parameters*

| Parameter    | Description                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Name of staging table                                                                                                                                                                              |
| table_owner  | Name of schema owner of staging table. Default is current schema.                                                                                                                                  |
| directive_id | SQL plan directive ID. Default NULL means all directives in the system.                                                                                                                            |
| obj_list     | Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list. |

### Return Values

Number of SQL plan directives unpacked.

### Exceptions

- ORA-38171 INSUFFICIENT\_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID\_INPUT: The input value is not valid.
- ORA-44001 INVALID\_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID\_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT\_DOES\_NOT\_EXIST: The specified object does not exist.

### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

### Examples

```
-- Unack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;
```

```
SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  number;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';           -- schema name
  my_list(1).object_name := null;     -- all tables in SH
  my_list(1).object_type := 'TABLE';  -- type of object

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
begin
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
```

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_SPM Subprograms](#)

#### See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*

## 164.1 DBMS\_SPM Overview

The `DBMS_SPM` package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production

configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

## 164.2 DBMS\_SPM Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS\_SPM package.

## 164.3 DBMS\_SPM Constants

The DBMS\_SPM package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the time\_limit parameter of the [EVOLVE\\_SQL\\_PLAN\\_BASELINE Function](#).

**Table 164-1 DBMS\_SPM Constants**

| Constant   | Type    | Value         | Description                                                                                             |
|------------|---------|---------------|---------------------------------------------------------------------------------------------------------|
| AUTO_LIMIT | INTEGER | 2147483647    | Oracle determines the appropriate time spent by the <a href="#">EVOLVE_SQL_PLAN_BASELINE Function</a> . |
| NO_LIMIT   | INTEGER | 2147483647 -1 | There is no limit to the time spent by the <a href="#">EVOLVE_SQL_PLAN_BASELINE Function</a> .          |

## 164.4 DBMS\_SPM Examples

These examples will help you understand use of DBMS\_SPM.

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration

## 164.5 DBMS\_SPM Data Structures

The DBMS\_SPM package defines a TABLE type.

### Table Types

- [DBMS\\_SPM NAMELIST Table Type](#)

## 164.5.1 DBMS\_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

### Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

## 164.6 Summary of DBMS\_SPM Subprograms

This table lists and briefly describes the DBMS\_SPM package subprograms.

**Table 164-2 DBMS\_SPM Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACCEPT_SQL_PLAN_BASELINE Procedure</a>      | Accepts a plan based on the recommendation of an evolve task                                                                                                 |
| <a href="#">ADD_VERIFIED_SQL_PLAN_BASELINE Function</a> | Finds the plans available for the given SQL_ID in different sources such as Cursor Cache, Auto SQL Tuning Set, and Automatic Workload Repository.            |
| <a href="#">ALTER_SQL_PLAN_BASELINE Function</a>        | Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format                                     |
| <a href="#">CANCEL_EVOLVE_TASK Procedure</a>            | Cancels a currently executing evolve task                                                                                                                    |
| <a href="#">CONFIGURE Procedure</a>                     | Sets configuration options for SQL management base, in parameter/value format                                                                                |
| <a href="#">CREATE_EVOLVE_TASK Function</a>             | Creates an advisor task and sets its parameters                                                                                                              |
| <a href="#">CREATE_STGTAB_BASELINE Procedure</a>        | Creates a staging table that used for transporting SQL plan baselines from one system to another                                                             |
| <a href="#">DROP_EVOLVE_TASK Procedure</a>              | Drops an evolved task                                                                                                                                        |
| <a href="#">DROP_SQL_PLAN_BASELINE Function</a>         | Drops a single plan, or all plans associated with a SQL statement                                                                                            |
| <a href="#">EVOLVE_SQL_PLAN_BASELINE Function</a>       | Evolves SQL plan baselines associated with one or more SQL statements                                                                                        |
| <a href="#">EXECUTE_EVOLVE_TASK Function</a>            | Executes a previously created evolve task                                                                                                                    |
| <a href="#">IMPLEMENT_EVOLVE_TASK Function</a>          | Implements a plan based on the recommendation of an evolve task                                                                                              |
| <a href="#">INTERRUPT_EVOLVE_TASK Procedure</a>         | Interrupts a currently executing evolve task                                                                                                                 |
| <a href="#">LOAD_PLANS_FROM_CURSOR_CACHE Functions</a>  | Loads one or more plans present in the cursor cache for a SQL statement                                                                                      |
| <a href="#">LOAD_PLANS_FROM_AWR Function</a>            | Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded |
| <a href="#">LOAD_PLANS_FROM_SQLSET Function</a>         | Loads plans stored in a SQL tuning set (STS) into SQL plan baselines                                                                                         |

**Table 164-2 (Cont.) DBMS\_SPM Package Subprograms**

| Subprogram                                          | Description                                                                        |
|-----------------------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">MIGRATE_STORED_OUTLINE Functions</a>    | Migrates existing stored outlines to SQL plan baselines                            |
| <a href="#">PACK_STGTAB_BASELINE Function</a>       | Packs (exports) SQL plan baselines from SQL management base into a staging table   |
| <a href="#">RESET_EVOLVE_TASK Procedure</a>         | Resets an evolve task to its initial state                                         |
| <a href="#">RESUME_EVOLVE_TASK Procedure</a>        | Resumes a previously interrupted task                                              |
| <a href="#">REPORT_AUTO_EVOLVE_TASK Function</a>    | Displays the results of an execution of an automatic evolve task.                  |
| <a href="#">REPORT_EVOLVE_TASK Function</a>         | Displays the results of an evolved task                                            |
| <a href="#">SET_EVOLVE_TASK_PARAMETER Procedure</a> | Sets a parameter of an evolve task                                                 |
| <a href="#">UNPACK_STGTAB_BASELINE Function</a>     | Unpacks (imports) SQL plan baselines from a staging table into SQL management base |

## 164.6.1 ACCEPT\_SQL\_PLAN\_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

### Syntax

```
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (  
    task_name      IN  VARCHAR2,  
    object_id      IN  NUMBER      := NULL,  
    task_owner     IN  VARCHAR2   := NULL,  
    force          IN  BOOLEAN    := FALSE);
```

### Parameters

**Table 164-3 ACCEPT\_SQL\_PLAN\_BASELINE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name  | Identifier of task to implement                                                                                                                                                                                    |
| object_id  | Identifier of the advisor framework object that represents a single plan. If <code>NULL</code> , the report is generated for all objects.                                                                          |
| task_owner | Owner of the evolve task. Defaults to the current schema owner.                                                                                                                                                    |
| force      | Accept the plan even if the advisor did not recommend such an action. The default is <code>FALSE</code> requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit. |

# 164.6.2 ADD\_VERIFIED\_SQL\_PLAN\_BASELINE Function

This function finds the plans available for the given SQL\_ID in different sources such as Cursor Cache, Auto SQL Tuning Set, and Automatic Workload Repository.

## Syntax

```
DBMS_SPM.ADD_VERIFIED_SQL_PLAN_BASELINE (
    sql_id IN VARCHAR2
);
```

## Parameters

Table 164-4 ADD\_VERIFIED\_SQL\_PLAN\_BASELINE Function Parameters

| Parameter | Description                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------|
| sql_id    | The SQL statement identifier, which is used to identify the plans in different sources, such as the cursor cache. |

## Return Value

A CLOB containing a report of SQL plan baselines verified, reproduced and accepted.

## Usage Notes

SQL plan baselines are created to ensure that the best-known plans are used for the selected SQL statement. These are the steps that the function executes:

1. Loads plans from Cursor Cache, Automatic Workload Repository, and Auto SQL Tuning Set (SYS\_AUTO\_STS) into SQL Plan Management SQL plan history in a non-accepted state.
2. Uses the SQL Plan Management Evolve Advisor internally to identify the best-performing execution plans. The best-performing plans are accepted.

When the function has completed, it will have accepted the best plans among the plans available from the Cursor Cache, AWR, and the Automatic SQL Tuning Set.

### Note:

"Administer SQL Management Object" privilege. is required.

## Examples

### Example 1:36k32wnz0v0fd923079310

```
select sql_id, plan_hash_value, sql_text
from   v$sql
where  sql_text like 'select /* SPM_TEST_QUERY%'
/
```

```
SQL_ID          PLAN_HASH_VALUE  SQL_TEXT
-----
-----
```

```
36k32wnz0v0fd 923079310 select /* SPM_TEST_QUERY */ num from
example_spm_table where id = 100
```

**Example 2:**9230793102448381833

```
select sql_text, sqlset_name, plan_hash_value
from dba_sqlset_statements
where sql_text like 'select /* SPM_TEST_QUERY%';
```

```
SQL_TEXT
SQLSET_NAME PLAN_HASH_VALUE
-----
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100
SYS_AUTO_ST$ 923079310
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100
SYS_AUTO_ST$ 2448381833
```

**Example 3:**

```
set tab off
set serveroutput on
set pagesize 100
set linesize 250
set long 100000
column report format a200

var rep clob;

BEGIN
    :rep := DBMS_SPM. ADD_VERIFIED_SQL_PLAN_BASELINE('36k32wnz0v0fd');
END;
/
```

```
select :rep report from dual;
```

```
SQL Plan Baselines verified for SQL ID: 36k32wnz0v0fd
```

```
-----
Plan Hash Value Plan Name Reproduced Accepted
Source
-----
923079310 SQL_PLAN_163tr5qgzwmgt05ce4c2e YES YES
CURSOR CACHE
2448381833 SQL_PLAN_163tr5qgzwmgt1f191f3e YES NO
SQL TUNING SET
-----
```

```
SQL Handle : SQL_130f372d9ffe4df9
SQL Text : select /* SPM_TEST_QUERY */ num from example_spm_table where
id = 100
```

#### Example 4:

```
select sql_text, accepted, enabled, sql_handle, plan_name
from   dba_sql_plan_baselines
where  sql_text like 'select /* SPM_TEST_QUERY%';
```

```
SQL_TEXT                                ACC
ENA SQL_HANDLE          PLAN_NAME
-----
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100 YES
YES SQL_130f372d9ffe4df9 SQL_PLAN_163tr5qgzwmgt05ce4c2e
select /* SPM_TEST_QUERY */ num from example_spm_table where id = 100 NO
YES SQL_130f372d9ffe4df9 SQL_PLAN_163tr5qgzwmgt1f191f3e
```

#### Example 5

```
select * from
table(dbms_xplan.display_sql_plan_baseline('SQL_130f372d9ffe4df9'));
```

```
-----
--
SQL handle: SQL_130f372d9ffe4df9
SQL text: select /* SPM_TEST_QUERY */ num from example_spm_table where id =
100
-----
--

## 164.6.3 ALTER\_SQL\_PLAN\_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

### Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  attribute_name   IN VARCHAR2,
  attribute_value  IN VARCHAR2)
RETURN PLS_INTEGER;
```

## Parameters

**Table 164-5 ALTER\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter       | Description                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_handle      | SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.                                                      |
| plan_name       | Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified. |
| attribute_name  | Name of plan attribute to set (see table below).                                                                                                                                                  |
| attribute_value | Value of plan attribute to use (see table below)                                                                                                                                                  |

**Table 164-6 Names & Values for ALTER\_SQL\_PLAN\_BASELINE Function Parameters**

| Name        | Description                                                                                                         | Possible Values               |
|-------------|---------------------------------------------------------------------------------------------------------------------|-------------------------------|
| enabled     | 'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status. | 'YES' or 'NO'                 |
| fixed       | 'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.    | 'YES' or 'NO'                 |
| autopurge   | 'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.                  | 'YES' or 'NO'                 |
| plan_name   | Name of the plan                                                                                                    | String of up to 30 characters |
| description | Plan description.                                                                                                   | String of up to 500 bytes     |

## Return Values

The number of plans altered.

## Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

## 164.6.4 CANCEL\_EVOLVE\_TASK Procedure

The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

### Syntax

```
DBMS_SPM.CANCEL_EVOLVE_TASK (
    task_name      IN VARCHAR2);
```

### Parameters

**Table 164-7 CANCEL\_EVOLVE\_TASK Procedure Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| task_name | Identifier of task to cancel |

## 164.6.5 CONFIGURE Procedure

This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

### Syntax

```
DBMS_SPM.CONFIGURE (
    parameter_name  IN VARCHAR2,
    parameter_value  IN VARCHAR2 := NULL,
    allow           IN BOOLEAN := TRUE);
```

### Parameters

**Table 164-8 CONFIGURE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter_name  | Name of parameter to set (see table below).                                                                                                                                    |
| parameter_value | Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters.                                                                         |
| allow           | Whether to include (true) or exclude (false) matching SQL statements and plans for the auto_capture_* parameters. If null, then the procedure ignores the specified parameter. |

**Table 164-9 Names and Values for CONFIGURE Procedure Parameters**

| Parameter Name      | Description                                                                                                                                                                                | Possible Values              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| auto_capture_action | Action to include (=) or exclude (<>) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. | Action name, for example, R% |

**Table 164-9 (Cont.) Names and Values for CONFIGURE Procedure Parameters**

| Parameter Name                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Possible Values                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| auto_capture_module              | Module to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.<br><br>The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.                                                                                                                                                                                                               | Module name, for example, <code>LOGGER</code>                |
| auto_capture_parsing_schema_name | Parsing schema to include (=) or exclude (<>) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.<br><br>The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.                                                                                                                                                                                                       | Schema name, for example, <code>HR</code>                    |
| auto_capture_sql_text            | Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely.<br><br>The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.                                                                                                                                                                                                                                  | Text of a SQL statement, for example, <code>SELECT a%</code> |
| auto_spm_evolve_task             | Setting to enable or disable the high-frequency SPM Evolve Advisor task. The high-frequency task runs every hour and runs for no longer than 30 minutes. These settings are not configurable. The frequent executions mean that the optimizer has more opportunities to find and evolve better performing plans.<br><br>The default value is OFF, which means the high-frequency SPM Evolve Advisor task is disabled. In this release, AUTO is equivalent to OFF. The value of allow is ignored. | ON, OFF, AUTO                                                |
| plan_retention_weeks             | Number of weeks to retain unused plans before the database purges them.<br><br>A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of allow is ignored.                                                                                                                                                                                                                                                  | 5–523 (default is 53)                                        |
| space_budget_percent             | Maximum percent of SYSAUX space that can be used for SQL management base.<br><br>The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of allow is ignored.                                                                                                                                                                                                                                                         | 1–50 (default is 10)                                         |

## Exceptions

**Table 164-10** CONFIGURE Exceptions

| Error Number | Description                     |
|--------------|---------------------------------|
| ORA-38133    | Invalid parameter name          |
| ORA-38134    | Invalid parameter value         |
| ORA-38150    | Not enough space for new filter |
| ORA-38151    | Module name too long            |
| ORA-38152    | Action name too long            |
| ORA-38304    | Missing or invalid user name    |

## Usage Notes

- When `parameter_name` is `auto_capture_sql_text`, the `parameter_value` is an automatic search filter. The filter uses the search pattern of `LIKE parameter_name` when `allow=>true`. The filter uses the pattern `NOT LIKE parameter_name` when `allow=>false`.  
  
For all other non-null `parameter_name` values, the search pattern depends on the `allow` setting. The parameter uses an equal sign (=) when `allow=>true`. The parameter uses a not-equal sign (<>) when `allow=>false`.
- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying `auto_capture_sql_text` to be `'%TABLE1%', TRUE`, and `'%TABLE2%', FALSE` will result in matching SQL text `LIKE '%TABLE1%'` and `NOT LIKE '%TABLE2%'`. The database uses these configuration settings only when the initialization parameter `OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES` is set to `TRUE`.
- A null value for `parameter_value` removes the filter for `parameter_name` entirely. By using `parameter_value=>''` in combination with `allow=FALSE`, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The `DBA_SQL_MANAGEMENT_CONFIG` view shows the current filters.
- The default space budget for SQL management base is no more than ten percent of the size of `SYSAUX` tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

## Examples

The following example creates a filter for SQL text that is like `SELECT a%:`

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the `HR` parsing schema:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any LIKE or NOT LIKE filters for the SQL text select a%:

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate (action LIKE 'R%') OR (action LIKE '%E\_'):

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL\_'):

```
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL_', 'FALSE');
```

## 164.6.6 CREATE\_EVOLVE\_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

### Syntax

```
DBMS_SPM.CREATE_EVOLVE_TASK (
  sql_handle      IN  VARCHAR2  := NULL,
  plan_name       IN  VARCHAR2  := NULL,
  time_limit      IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
  task_name       IN  VARCHAR2  := NULL,
  description     IN  VARCHAR2  := NULL)
  RETURN VARCHAR2;

DBMS_SPM.CREATE_EVOLVE_TASK (
  plan_list       IN  DBMS_SPM.NAME_LIST,
  time_limit      IN  NUMBER     := DBMS_SPM.AUTO_LIMIT,
  task_name       IN  VARCHAR2  := NULL,
  description     IN  VARCHAR2  := NULL)
  RETURN VARCHAR2;
```

### Parameters

**Table 164-11 CREATE\_EVOLVE\_TASK Function Parameters**

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| sql_handle | Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans. |
| plan_list  | List of plan names. The plans may belong to different SQL statements.                             |

**Table 164-11 (Cont.) CREATE\_EVOLVE\_TASK Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_name   | Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.                                                                                                                                                                                                                                                                                                                                                              |
| time_limit  | Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit. |
| task_name   | Evolve task name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| description | Description of the task (maximum 256 characters)                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### Return Values

SQL evolve task unique name

## 164.6.7 CREATE\_STGTAB\_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

#### Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name          IN VARCHAR2,
    table_owner         IN VARCHAR2 := NULL,
    tablespace_name     IN VARCHAR2 := NULL);
```

#### Parameters

**Table 164-12 CREATE\_STGTAB\_BASELINE Procedure Parameters**

| Parameter       | Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------|
| table_name      | Name of staging table to create for the purpose of packing and unpacking SQL plan baselines |
| table_owner     | Name of owner of the staging table. Default NULL means current schema is the table owner.   |
| tablespace_name | Name of tablespace. Default NULL means create staging table in the default tablespace.      |

#### Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table

3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

## 164.6.8 DROP\_EVOLVE\_TASK Procedure

The procedure drops an evolved task.

### Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK (
    task_name          IN VARCHAR2);
```

### Parameters

**Table 164-13 DROP\_EVOLVE\_TASK Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| task_name | Identifier of task to drop |

## 164.6.9 DROP\_SQL\_PLAN\_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

### Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
    sql_handle         IN VARCHAR2 := NULL,
    plan_name          IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

### Parameters

**Table 164-14 DROP\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter  | Description                                                                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_handle | SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If <code>NULL</code> then <code>plan_name</code> must be specified. |
| plan_name  | Plan name. It identifies a specific plan. Default <code>NULL</code> means to drop all plans associated with the SQL statement identified by <code>sql_handle</code> . |

### Return Values

The number of plans dropped

## 164.6.10 EVOLVE\_SQL\_PLAN\_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

### Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    sql_handle    IN VARCHAR2 := NULL,
    plan_name     IN VARCHAR2 := NULL,
    time_limit    IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
    verify        IN VARCHAR2 := 'YES',
    commit        IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    plan_list     IN DBMS_SPM.NAME_LIST,
    time_limit    IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
    verify        IN VARCHAR2 := 'YES',
    commit        IN VARCHAR2 := 'YES')
RETURN CLOB;
```

### Parameters

**Table 164-15 EVOLVE\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sql_handle</code> | SQL statement identifier. Unless <code>plan_name</code> is specified, <code>NULL</code> means to consider all statements with non-accepted plans in their SQL plan baselines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>plan_name</code>  | Plan identifier. Default <code>NULL</code> means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>plan_list</code>  | A list of plan names. Each plan in the list can belong to same or different SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>time_limit</code> | Time limit in number of minutes. This applies only if <code>verify = 'YES'</code> . The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> <li>• <code>DBMS_SPM.AUTO_LIMIT</code> (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done.</li> <li>• <code>DBMS_SPM.NO_LIMIT</code> means there is no time limit.</li> <li>• A positive integer value represents a user specified time limit.</li> </ul> |

**Table 164-15 (Cont.) EVOLVE\_SQL\_PLAN\_BASELINE Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| verify    | <p>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</p> <ul style="list-style-type: none"><li>• 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan</li><li>• 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans</li></ul> |
| commit    | <p>Specifies whether to update the <code>ACCEPTED</code> status of non-accepted plans from 'NO' to 'YES'.</p> <ul style="list-style-type: none"><li>• 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when <code>verify = 'YES'</code>.</li><li>• 'NO' - generate a report without any updates. Note that <code>commit = 'NO'</code> together with <code>verify = 'NO'</code> represents a no-op.</li></ul>                                                                                                                                                      |

### Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its `ACCEPTED` status, and if `verify = 'YES'` the result of their performance verification.

### Usage Notes

Invoking this subprogram requires the `ADMINISTER SQL MANAGEMENT OBJECT` privilege.

## 164.6.11 EXECUTE\_EVOLVE\_TASK Function

The function executes a previously created evolve task.

### Syntax

```
DBMS_SPM.EXECUTE_EVOLVE_TASK (  
    task_name          IN  VARCHAR2,  
    execution_name     IN  VARCHAR2  := NULL,  
    execution_desc     IN  VARCHAR2  := NULL);  
RETURN VARCHAR2;
```

### Parameters

**Table 164-16 EXECUTE\_EVOLVE\_TASK Function Parameters**

| Parameter      | Description                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------|
| task_name      | Evolve task name                                                                                                          |
| execution_name | Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function. |
| execution_desc | Description of the execution (maximum 256 characters)                                                                     |

## Return Values

Name of the new execution

## 164.6.12 IMPLEMENT\_EVOLVE\_TASK Function

The function implements all the actions recommended by an evolve task.

### Syntax

```
DBMS_SPM.IMPLEMENT_EVOLVE_TASK (
    task_name      IN  VARCHAR2,
    task_owner     IN  VARCHAR2  := NULL,
    execution_name IN  VARCHAR2  := NULL,
    force          IN  BOOLEAN   := FALSE)
RETURN NUMBER;
```

### Parameters

**Table 164-17** IMPLEMENT\_EVOLVE\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Identifier of task to report                                                                                                                                                                           |
| task_owner     | Owner of the evolve task. Defaults to the current schema owner.                                                                                                                                        |
| execution_name | Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.                                                                                              |
| force          | Accept all plans even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit. |

### Return Values

The number of plans accepted

## 164.6.13 INTERRUPT\_EVOLVE\_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

### Syntax

```
DBMS_SPM.INTERRUPT_EVOLVE_TASK (
    task_name      IN  VARCHAR2);
```

### Parameters

**Table 164-18** INTERRUPT\_EVOLVE\_TASK Procedure Parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| task_name | Identifier of task to interrupt |

## 164.6.14 LOAD\_PLANS\_FROM\_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

### Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_AWR
  begin_snap      IN  NUMBER,
  end_snap        IN  NUMBER,
  basic_filter     IN  VARCHAR2 := NULL,
  fixed           IN  VARCHAR2 := 'NO',
  enabled         IN  VARCHAR2 := 'YES',
  commit_rows     IN  NUMBER := 1000)
RETURN PLS_INTEGER;
```

### Parameters

**Table 164-19** LOAD\_PLANS\_FROM\_AWR Function Parameters

| Parameter    | Description                                                                                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| begin_snap   | Begin snapshot                                                                                                                                                                                            |
| end_snap     | End snapshot                                                                                                                                                                                              |
| basic_filter | SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected.<br>Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. |
| fixed        | Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.                                                                     |
| enabled      | Default 'YES' means the loaded plans will be considered by the optimizer                                                                                                                                  |
| commit_rows  | Number of SQL plans to load before doing a periodic commit.                                                                                                                                               |
| dbid         | The DBID that is used for imported or PDB-level AWR data.                                                                                                                                                 |

### Usage Notes

Requires the `Administer SQL Management Object` privilege

#### See Also:

For information on the SQLSET\_ROW objects, see [SQLSET\\_ROW Object Type](#).

## 164.6.15 LOAD\_PLANS\_FROM\_CURSOR\_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using `attribute_name` and `attribute_value` pair.

### Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER  := NULL,
    sql_text        IN  CLOB,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER  := NULL,
    sql_handle      IN  VARCHAR2,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    sql_id          IN  VARCHAR2,
    plan_hash_value IN  NUMBER  := NULL,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
    attribute_name  IN VARCHAR2,
    attribute_value IN VARCHAR2,
    fixed           IN VARCHAR2 := 'NO',
    enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

### Parameters

**Table 164-20** LOAD\_PLANS\_FROM\_CURSOR\_CACHE Function Parameters

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sql_id</code>          | SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.                                |
| <code>plan_hash_value</code> | Plan identifier. Default <code>NULL</code> means capture all plans present in the cursor cache for the SQL statement identified by <code>SQL_ID</code> .                                                                                                                                                                                        |
| <code>sql_text</code>        | SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement. |

**Table 164-20 (Cont.) LOAD\_PLANS\_FROM\_CURSOR\_CACHE Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_handle      | SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.                                                                                                                                                                                                                      |
| fixed           | Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.                                                                                                                                                                                                                                                                                                                                                                                       |
| attribute_name  | One of possible attribute names: <ul style="list-style-type: none"> <li>SQL_TEXT"</li> <li>'PARSING_SCHEMA_NAME'</li> <li>'MODULE'</li> <li>'ACTION'</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                            |
| attribute_value | Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'. |
| enabled         | Default 'YES' means the loaded plans are enabled for use by the optimizer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Return Values

Number of plans loaded

### Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

## 164.6.16 LOAD\_PLANS\_FROM\_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

### Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sqlset_owner     IN  VARCHAR2 := NULL,
  basic_filter     IN  VARCHAR2 := NULL,
  fixed            IN  VARCHAR2 := 'NO',
  enabled          IN  VARCHAR2 := 'YES'
  commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

## Parameters

**Table 164-21** LOAD\_PLANS\_FROM\_SQLSET Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Name of the STS from where the plans are loaded into SQL plan baselines                                                                                                                                                                                                                                                                             |
| sqlset_owner | Owner of STS. NULL means current schema is the owner.                                                                                                                                                                                                                                                                                               |
| basic_filter | A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can be specified against the view DBA_SQLSET_STATEMENTS. For example <code>basic_filter =&gt; 'sql_text like 'select /*LOAD_STS*/ %''</code> or <code>basic_filter =&gt; 'sql_id='b62q7nc33gzw''</code> . |
| fixed        | Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.                                                                                                                                                                |
| enabled      | Default 'YES' means the loaded plans are enabled for use by the optimizer                                                                                                                                                                                                                                                                           |
| commit_rows  | Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.                                                                                                                                                                                                                                                     |

## Return Values

The number of plans loaded

## Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

## 164.6.17 MIGRATE\_STORED\_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

## Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  CLOB,
    fixed             IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
```

```
    outln_list      IN  DBMS_SPM.NAME_LIST,  
    fixed          IN  VARCHAR2 := 'NO')  
RETURN CLOB;
```

## Parameters

**Table 164-22** MIGRATE\_STORED\_OUTLINE Function Parameters

| Parameter       | Description                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_name  | Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"><li>• outline_name</li><li>• sql_text</li><li>• category</li><li>• all</li></ul>                   |
| attribute_value | Based on attribute_name, this can be: <ul style="list-style-type: none"><li>• Name of stored outline to be migrated</li><li>• SQL text of stored outlines to be migrated</li><li>• Category of stored outlines to be migrated</li><li>• NULL if attribute_name is all</li></ul> |
| fixed           | NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.                                                                                                                                |
| outln_list      | List of outline names to be migrated                                                                                                                                                                                                                                            |

## Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

## Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to DEFAULT. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate all, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

## 164.6.18 PACK\_STGTAB\_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

### Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,    origin      IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted       IN VARCHAR2 := NULL,
    fixed          IN VARCHAR2 := NULL,
    module         IN VARCHAR2 := NULL,
    action         IN VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

**Table 164-23 PACK\_STGTAB\_BASELINE Function Parameters**

| Parameter   | Description                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| table_name  | Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)                      |
| table_owner | Name of staging table owner. Default NULL means current schema is the table owner                                           |
| sql_handle  | SQL handle (case sensitive)                                                                                                 |
| plan_name   | Plan name (case sensitive, % wildcards accepted)                                                                            |
| sql_text    | SQL text string (case sensitive, % wildcards accepted)                                                                      |
| creator     | Creator of SQL plan baseline (case insensitive unless double quoted)                                                        |
| origin      | Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive) |
| enabled     | Must be 'YES' or 'NO' (case insensitive)                                                                                    |
| accepted    | Must be 'YES' or 'NO' (case insensitive)                                                                                    |
| fixed       | Must be 'YES' or 'NO' (case insensitive)                                                                                    |
| module      | Module (case sensitive)                                                                                                     |
| action      | Action (case sensitive)                                                                                                     |

### Return Values

Number of SQL plan baselines packed

## 164.6.19 RESET\_EVOLVE\_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

### Syntax

```
DBMS_SPM.RESET_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

### Parameters

**Table 164-24** RESET\_EVOLVE\_TASK Procedure Parameters

| Parameter | Description                 |
|-----------|-----------------------------|
| task_name | Identifier of task to reset |

## 164.6.20 RESUME\_EVOLVE\_TASK Procedure

The procedure resumes a previously interrupted task.

### Syntax

```
DBMS_SPM.RESUME_EVOLVE_TASK (
    task_name          IN  VARCHAR2);
```

### Parameters

**Table 164-25** RESUME\_EVOLVE\_TASK Procedure Parameters

| Parameter | Description                  |
|-----------|------------------------------|
| task_name | Identifier of task to resume |

## 164.6.21 REPORT\_AUTO\_EVOLVE\_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

### Syntax

```
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK (
    type          IN  VARCHAR2  := TYPE_TEXT,
    level         IN  VARCHAR2  := LEVEL_TYPICAL,
    section       IN  VARCHAR2  := SECTION_ALL,
    object_id     IN  NUMBER     := NULL,
    execution_name IN  VARCHAR2  := NULL)
RETURN CLOB;
```

## Parameters

**Table 164-26 REPORT\_AUTO\_EVOLVE\_TASK Function Parameters**

| Parameter      | Description                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| type           | Type of the report. Possible values are TEXT, HTML, XML                                                                     |
| level          | Format of the report. Possible values are BASIC, TYPICAL, ALL.                                                              |
| section        | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.                  |
| object_id      | Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects. |
| execution_name | Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.                    |

## Return Values

The report

## 164.6.22 REPORT\_EVOLVE\_TASK Function

The procedure displays the results of an evolved task.

## Syntax

```
DBMS_SPM.REPORT_EVOLVE_TASK (
    task_name      IN  VARCHAR2,
    type           IN  VARCHAR2  := TYPE_TEXT,
    level          IN  VARCHAR2  := LEVEL_TYPICAL,
    section        IN  VARCHAR2  := SECTION_ALL,
    object_id      IN  NUMBER     := NULL,
    task_owner     IN  VARCHAR2  := NULL,
    execution_name IN  VARCHAR2  := NULL)
RETURN CLOB;
```

## Parameters

**Table 164-27 REPORT\_EVOLVE\_TASK Function Parameters**

| Parameter      | Description                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| task_name      | Identifier of task to report                                                                                                |
| type           | Type of the report. Possible values are TEXT, HTML, XML                                                                     |
| level          | Format of the report. Possible values are BASIC, TYPICAL, ALL.                                                              |
| section        | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL.                  |
| object_id      | Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects. |
| task_owner     | Owner of the evolve task. Defaults to the current schema owner.                                                             |
| execution_name | Name to qualify and identify an execution. If NULL, the report is generated for the last task execution.                    |

## Return Values

The report

## 164.6.23 SET\_EVOLVE\_TASK\_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

### Syntax

```
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2,
    parameter      IN  VARCHAR2,
    value          IN  NUMBER);

DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (
    task_name      IN  VARCHAR2 := NULL,
    parameter      IN  VARCHAR2,
    value          IN  VARCHAR2);
```

### Parameters

**Table 164-28 SET\_EVOLVE\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | Evolve task name                                   |
| parameter | Name of the parameter to set (see following table) |
| value     | Value of the parameter (see following table)       |

The following table describes parameters for the SET\_EVOLVE\_TASK\_PARAMETER procedure.

**Table 164-29 DBMS\_SPM.SET\_EVOLVE\_TASK\_PARAMETER Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                | Default                                                                                                                                                                                                                                                       |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alternate_plan_source | <p>Determines which sources to search for additional plans:</p> <ul style="list-style-type: none"> <li>AUTO (the database selects the source automatically)</li> <li>AUTOMATIC_WORKLOAD_REPOSITORY</li> <li>CURSOR_CACHE</li> <li>SQL_TUNING_SET</li> </ul> <p>You can combine multiple values with the plus sign (+).</p> | <p>The default depends on whether the SPM Evolve Advisor task is automated or manual:</p> <ul style="list-style-type: none"> <li>If automated, the default is AUTO.</li> <li>If manual, the default is CURSOR_CACHE+AUTOMATIC_WORKLOAD_REPOSITORY.</li> </ul> |

**Table 164-29 (Cont.) DBMS\_SPM.SET\_EVOLVE\_TASK\_PARAMETER Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Default                                                                                                                                                                                                                |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alternate_plan_baseline | Determines which alternative plans should be loaded: <ul style="list-style-type: none"> <li>AUTO lets Autonomous Database choose whether to load plans for statements with or without baselines.</li> <li>EXISTING loads alternate plans with for statements with existing baselines.</li> <li>NEW loads alternative plans for statements without a baseline, in which case a new baseline is created.</li> </ul> You can combine multiple values with the plus sign (+), as in EXISTING+NEW. | EXISTING                                                                                                                                                                                                               |
| alternate_plan_limit    | Specifies the maximum number of plans to load in total (that is, not the limit for each SQL statement).                                                                                                                                                                                                                                                                                                                                                                                       | The default depends on whether the SPM Evolve Advisor task is automated or manual: <ul style="list-style-type: none"> <li>If automated, the default is UNLIMITED.</li> <li>If manual, the default is 10.</li> </ul>    |
| accept_plans            | Specifies whether to accept recommended plans automatically.<br>When ACCEPT_PLANS is true, SQL plan management automatically accepts all plans recommended by the task.<br>When ACCEPT_PLANS is false, the task verifies the plans and generates a report of its findings, but does not evolve the plans automatically. You can use a report to identify new SQL plan baselines and accept them manually.                                                                                     | true (regardless of whether the advisor is run automatically or manually)                                                                                                                                              |
| time_limit              | Global time limit in seconds. This is the total time allowed for the task.                                                                                                                                                                                                                                                                                                                                                                                                                    | The default depends on whether the SPM Evolve Advisor task is automated or manual: <ul style="list-style-type: none"> <li>If automated, the default is 3600.</li> <li>If manual, the default is 2147483646.</li> </ul> |

## 164.6.24 UNPACK\_STGTAB\_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

### Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,    origin      IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted        IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := NULL,
    module          IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

**Table 164-30 UNPACK\_STGTAB\_BASELINE Function Parameters**

| Parameter   | Description                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------|
| table_name  | Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)                  |
| table_owner | Name of staging table owner.Default NULL means current schema is the table owner                                          |
| sql_handle  | SQL handle (case sensitive)                                                                                               |
| plan_name   | Plan name (case sensitive,% wildcards accepted)                                                                           |
| sql_text    | SQL text string (case sensitive, % wildcards accepted)                                                                    |
| creator     | Creator of SQL plan baseline (case insensitive unless double quoted)                                                      |
| origin      | Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE','MANUAL_SQLTUNE' or 'AUTO-QLTUNE' (case insensitive) |
| enabled     | Must be 'YES' or 'NO' (case insensitive)                                                                                  |
| accepted    | Must be 'YES' or 'NO' (case insensitive)                                                                                  |
| fixed       | Must be 'YES' or 'NO' (case insensitive)                                                                                  |
| module      | Module (case sensitive)                                                                                                   |
| action      | Action (case sensitive)                                                                                                   |

### Return Values

Number of plans unpacked

# DBMS\_SQL

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the [PARSE Procedures](#) supplied with the `DBMS_SQL` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_SQL Subprograms](#)

## See Also:

For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

## 165.1 DBMS\_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using `DBMS_SQL`. For tasks that require `DBMS_SQL`, see *Oracle Database PL/SQL Language Reference*.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

**See Also:**

*Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI binds by address and the `DBMS_SQL` package binds by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULLs` are fully supported as values of a PL/SQL variable.

## 165.2 DBMS\_SQL Security Model

`DBMS_SQL` is a SYS-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_SQL` subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

**See Also:**

*Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

### Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, `ORA-29471`, is raised when any `DBMS_SQL` subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and `DBMS_SQL` becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS\\_OPEN Function](#) denotes a cursor currently open in the session, the return value is `TRUE`. If the actual value is `NULL`, then the return value is `FALSE`. Otherwise, this raises an `ORA-29471` error.

### Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single `DBMS_SQL` subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.

- The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram, which takes a formal parameter, `security_level`, with allowed values `NULL`, 1 and 2.

- When `security_level = 1` (or is `NULL`), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

### Upgrade Considerations

This security regime is stricter than those in the previous releases. As a consequence, users of `DBMS_SQL` may encounter runtime errors on upgrade.

## 165.3 DBMS\_SQL Constants

The `DBMS_SQL Constants` package provides constants that are used with the `language_flag` parameter of the `PARSE` Procedures.

These constants are described in the following table.

**Table 165-1 DBMS\_SQL Constants**

| Name           | Type    | Value      | Description                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V6             | INTEGER | 0          | Specifies Oracle database version 6 behavior                                                                                                                                                                                                                                                                                                  |
| NATIVE         | INTEGER | 1          | Specifies normal behavior for the database to which the program is connected                                                                                                                                                                                                                                                                  |
| V7             | INTEGER | 2          | Specifies Oracle database version 7 behavior                                                                                                                                                                                                                                                                                                  |
| FOREIGN_SYNTAX | INTEGER | 4294967295 | Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set. |

### Related Topics

- [PARSE Procedures](#)  
This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

## 165.4 DBMS\_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

### Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE\\_COLUMN Procedures](#), the [DEFINE\\_COLUMN\\_LONG Procedure](#), or the [DEFINE\\_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH\\_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN\\_VALUE Procedure](#) or [COLUMN\\_VALUE\\_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH\\_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE\\_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

### Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE\\_VALUE Procedures](#) to retrieve the values assigned to the output variables.

### Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the [LAST\\_ERROR\\_POSITION Function](#) immediately after calling one of the [PARSE Procedures](#).

## 165.5 DBMS\_SQL Execution Flow

These functions comprise the `DBMS_SQL` execution flow.

1. [OPEN\\_CURSOR](#)
2. [PARSE](#)
3. [BIND\\_VARIABLE](#), [BIND\\_VARIABLE\\_PKG](#) or [BIND\\_ARRAY](#)
4. [DEFINE\\_COLUMN](#), [DEFINE\\_COLUMN\\_LONG](#) or [DEFINE\\_ARRAY](#)
5. [EXECUTE](#)
6. [FETCH\\_ROWS](#) or [EXECUTE\\_AND\\_FETCH](#)
7. [VARIABLE\\_VALUE](#), [VARIABLE\\_PKG](#), [COLUMN\\_VALUE](#) or [COLUMN\\_VALUE\\_LONG](#)
8. [CLOSE\\_CURSOR](#)

## 165.5.1 OPEN\_CURSOR

To process a SQL statement, you must have an open cursor. When you call the OPEN\_CURSOR Functions, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS\_SQL package.

### Related Topics

- [OPEN\\_CURSOR Functions](#)  
This function opens a new cursor.

## 165.5.2 PARSE

Every SQL statement must be parsed by calling the PARSE procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of DBMS\_SQL is shown in [Figure 165-1](#).

Figure 165-1 DBMS\_SQL Execution Flow

**illustration:** arpls008  
**release:** 9  
**caption:** DBMS\_SQL Execution Flow  
**date:** 7/31/01  
**platform:** pc  
**ref:** ADG8013

## Related Topics

- [PARSE Procedures](#)

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

### 165.5.3 BIND\_VARIABLE, BIND\_VARIABLE\_PKG or BIND\_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the [BIND\\_ARRAY Procedures](#), or [BIND\\_VARIABLE Procedures](#), or the [BIND\\_VARIABLE\\_PKG Procedure](#) to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS\_SQL can run a DML statement multiple times — each time with a different bind variable. The [BIND\\_ARRAY](#) procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each [EXECUTE](#). This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

### 165.5.4 DEFINE\_COLUMN, DEFINE\_COLUMN\_LONG, or DEFINE\_ARRAY

The [DEFINE\\_COLUMN](#), [DEFINE\\_COLUMN\\_LONG](#), and [DEFINE\\_ARRAY](#) procedures specify the variables that receive [SELECT](#) values on a query.

The columns of the row being selected in a [SELECT](#) statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_LONG Procedure](#), or [DEFINE\\_ARRAY Procedure](#)) to specify the variables that are to receive the [SELECT](#) values, much the way an [INTO](#) clause does for a static query.

Use the [DEFINE\\_COLUMN\\_LONG](#) procedure to define [LONG](#) columns, in the same way that [DEFINE\\_COLUMN](#) is used to define non-[LONG](#) columns. You must call [DEFINE\\_COLUMN\\_LONG](#) before using the [COLUMN\\_VALUE\\_LONG Procedure](#) to fetch from the [LONG](#) column.

Use the [DEFINE\\_ARRAY](#) procedure to define a PL/SQL collection into which you want to fetch rows in a single [SELECT](#) statement. [DEFINE\\_ARRAY](#) provides an interface to fetch multiple rows at one fetch. You must call [DEFINE\\_ARRAY](#) before using the [COLUMN\\_VALUE](#) procedure to fetch the rows.

### 165.5.5 EXECUTE

Call the [EXECUTE](#) Function to run your SQL statement.

#### Related Topics

- [EXECUTE Function](#)  
This function executes a given cursor. This function accepts the [ID](#) number of the cursor and returns the number of rows processed.

### 165.5.6 FETCH\_ROWS or EXECUTE\_AND\_FETCH

The [FETCH\\_ROWS](#) Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of

calling EXECUTE Function and then `FETCH_ROWS`, you may find it more efficient to call EXECUTE\_AND\_FETCH Function if you are calling EXECUTE for a single execution.

#### Related Topics

- [FETCH\\_ROWS Function](#)  
This function fetches a row from a given cursor.
- [EXECUTE Function](#)  
This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.
- [EXECUTE\\_AND\\_FETCH Function](#)  
This function executes the given cursor and fetches rows.

## 165.5.7 VARIABLE\_VALUE, VARIABLE\_VALUE\_PKG, COLUMN\_VALUE, or COLUMN\_VALUE\_LONG

The type of call determines which procedure or function to use.

For queries, call the [COLUMN\\_VALUE Procedure](#) to determine the value of a column retrieved by the [FETCH\\_ROWS Function](#).

For anonymous blocks containing calls to PL/SQL procedures or DML statements with `returning` clause, call the [VARIABLE\\_VALUE Procedures](#) or the [VARIABLE\\_VALUE\\_PKG Procedure](#) to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a `LONG` database column (which can be up to two gigabytes in size), use the [DEFINE\\_COLUMN\\_LONG Procedure](#). You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

## 165.5.8 CLOSE\_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the `CLOSE_CURSOR` Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

#### Related Topics

- [CLOSE\\_CURSOR Procedure](#)  
This procedure closes a given cursor.

## 165.6 DBMS\_SQL Exceptions

This exception is raised by the `COLUMN_VALUE` Procedure or the `VARIABLE_VALUE` Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

```
inconsistent_type EXCEPTION;  
pragma exception_init(inconsistent_type, -6562);
```

#### Related Topics

- [COLUMN\\_VALUE Procedure](#)  
This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

- **VARIABLE\_VALUE Procedures**  
This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

## 165.7 DBMS\_SQL Examples

These example procedures use the `DBMS_SQL` package.

### Example : Using DBMS\_SQL Demo

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The `DEMO` procedure deletes all of the employees from the `EMP` table whose salaries are greater than the salary that you specify when you run `DEMO`.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                    DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

### Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
    cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
    DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
    ret := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');
```

### Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name        of type VARCHAR2(30)
birthdate of type DATE
```

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
    destination_cursor := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(destination_cursor,
        'INSERT INTO ' || destination ||
        ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
        DBMS_SQL.NATIVE);

    -- Fetch a row from the source table and insert it into the destination table:
    LOOP
        IF DBMS_SQL.FETCH_ROWS(source_cursor) > 0 THEN
            -- get column values of the row
            DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
            DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
            DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

            -- Bind the row into the cursor that inserts into the destination table. You
            -- could alter this example to require the use of dynamic SQL by inserting an
            -- if condition before the bind.
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                                   birthdate_var);

            ignore := DBMS_SQL.EXECUTE(destination_cursor);
        END IF;
    END LOOP;
END;
```

```

ELSE

-- No more rows to copy:
    EXIT;
    END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
    WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(source_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(source_cursor);
        END IF;
        IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(destination_cursor);
        END IF;
        RAISE;
END;
/

```

#### Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS\_SQL.BIND\_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS\_SQL.VARIABLE\_VALUE

#### Note:

This process is similar to DBMS\_SQL.VARIABLE\_VALUE, which must be called after running a PL/SQL block with an outbind inside DBMS\_SQL.

#### i) Single-row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
    (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
    c NUMBER;
    n NUMBER;
begin
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

#### ii) Single-row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
(c1 NUMBER, c2 NUMBER, r out NUMBER) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
                    'WHERE rownum < 2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

### iii) Single-row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
(c1 NUMBER, r OUT NUMBER) is
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
                    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

### iv) Multiple-row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
(c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

### v) Multiple-row update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
(c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;

```

```

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

**Note:**

bnd1 and bnd2 can be arrays too. The value of the expression for all the rows updated will be in bnd3. There is no way to determine which rows were updated for each value of bnd1 and bnd2.

**vi) Multiple-row delete**

```

CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

**vii) outbind in bulk PL/SQL**

```

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

```

**Note:**

DBMS\_SQL.BIND\_ARRAY of number\_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

**Example 5: Binds and Defines of User-defined Types in DBMS\_SQL**

```

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2) IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
    DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

    r := DBMS_SQL.EXECUTE(c);

    -- Get value of outbind variable
    DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- select dept_names
    sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

    r := DBMS_SQL.EXECUTE_AND_FETCH(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections

```

```
FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
/
```

## 165.8 DBMS\_SQL Data Structures

The DBMS\_SQL package defines RECORD type and TABLE type data structures.

### RECORD Types

- [DBMS\\_SQL DESC\\_REC Record Type](#) (deprecated)
- [DBMS\\_SQL DESC\\_REC2 Record Type](#)
- [DBMS\\_SQL DESC\\_REC3 Record Type](#)
- [DBMS\\_SQL DESC\\_REC4 Record Type](#)

### TABLE Types for DESCRIBE\_COLUMNS Procedures

- [DBMS\\_SQL DESC\\_TAB Table Type](#)
- [DBMS\\_SQL DESC\\_TAB2 Table Type](#)
- [DBMS\\_SQL DESC\\_TAB3 Table Type](#)
- [DBMS\\_SQL DESC\\_TAB4 Table Type](#)

### TABLE Types For Scalar and LOB Collections

DBMS\_SQL bulk operations are only supported with these predefined DBMS\_SQL TABLE types.

- [BFILE\\_TABLE Table Type](#)
- [BINARY\\_DOUBLE\\_TABLE Table Type](#)
- [BINARY\\_FLOAT\\_TABLE Table Type](#)
- [BLOB\\_TABLE Table Type](#)
- [CLOB\\_TABLE Table Type](#)
- [DATE\\_TABLE Table Type](#)
- [INTERVAL\\_DAY\\_TO\\_SECOND\\_TABLE Table Type](#)
- [INTERVAL\\_YEAR\\_TO\\_MONTH\\_TABLE Table Type](#)
- [NUMBER\\_TABLE Table Type](#)
- [TIME\\_TABLE Table Type](#)
- [TIME\\_WITH\\_TIME\\_ZONE\\_TABLE Table Type](#)
- [TIMESTAMP\\_TABLE Table Type](#)

- [TIMESTAMP\\_WITH\\_LTZ\\_TABLE Table Type](#)
- [TIMESTAMP\\_WITH\\_TIME\\_ZONE\\_TABLE Table Type](#)
- [UROWID\\_TABLE Table Type](#)
- [VARCHAR2\\_TABLE Table Type](#)
- [VARCHAR2A Table Type](#)
- [VARCHAR2S Table Type](#)

## 165.8.1 DBMS\_SQL DESC\_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

### Note:

This type has been deprecated in favor of the [DESC\\_REC2 Record Type](#).

It is the element type of the `DESC_TAB` table type and the [DESCRIBE\\_COLUMNS Procedure](#).

### Syntax

```
TYPE desc_rec IS RECORD (  
    col_type          BINARY_INTEGER := 0,  
    col_max_len       BINARY_INTEGER := 0,  
    col_name          VARCHAR2(32)   := '',  
    col_name_len      BINARY_INTEGER := 0,  
    col_schema_name   VARCHAR2(32)   := '',  
    col_schema_name_len BINARY_INTEGER := 0,  
    col_precision     BINARY_INTEGER := 0,  
    col_scale         BINARY_INTEGER := 0,  
    col_charsetid     BINARY_INTEGER := 0,  
    col_charsetform   BINARY_INTEGER := 0,  
    col_null_ok       BOOLEAN        := TRUE);  
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

### Fields

**Table 165-2**    **DESC\_REC Fields**

| Field               | Description                  |
|---------------------|------------------------------|
| col_type            | Type of column               |
| col_max_len         | Maximum column length        |
| col_name            | Name of column               |
| col_name_len        | Length of column name        |
| col_schema_name     | Column schema name           |
| col_schema_name_len | Length of column schema name |
| col_precision       | Precision of column          |
| col_scale           | Scale of column              |
| col_charsetid       | Column character set id      |

**Table 165-2 (Cont.) DESC\_REC Fields**

| Field           | Description                              |
|-----------------|------------------------------------------|
| col_charsetform | Column character set form                |
| col_null_ok     | NULL column flag; TRUE, if NULL possible |

## 165.8.2 DBMS\_SQL DESC\_REC2 Record Type

DESC\_REC2 is the element type of the DESC\_TAB2 table type and the DESCRIBE\_COLUMNS2 Procedure.

This record type is identical to DESC\_REC except for the col\_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC\_REC because column name values can be greater than 32 characters. DESC\_REC is deprecated as a result.

### Syntax

```
TYPE desc_rec2 IS RECORD (  
    col_type          binary_integer := 0,  
    col_max_len       binary_integer := 0,  
    col_name          varchar2(32767) := '',  
    col_name_len      binary_integer := 0,  
    col_schema_name   varchar2(32)   := '',  
    col_schema_name_len binary_integer := 0,  
    col_precision     binary_integer := 0,  
    col_scale         binary_integer := 0,  
    col_charsetid     binary_integer := 0,  
    col_charsetform   binary_integer := 0,  
    col_null_ok       boolean        := TRUE);
```

### Fields

**Table 165-3 DESC\_REC2 Fields**

| Field               | Description                              |
|---------------------|------------------------------------------|
| col_type            | Type of column                           |
| col_max_len         | Maximum column length                    |
| col_name            | Name of column                           |
| col_name_len        | Length of column name                    |
| col_schema_name     | Column schema name                       |
| col_schema_name_len | Length of column schema name             |
| col_precision       | Precision of column                      |
| col_scale           | Scale of column                          |
| col_charsetid       | Column character set id                  |
| col_charsetform     | Column character set form                |
| col_null_ok         | NULL column flag; TRUE, if NULL possible |

## Related Topics

- [DESCRIBE\\_COLUMNS2 Procedure](#)  
This procedure describes the specified column. This is an alternative to DESCRIBE\_COLUMNS Procedure.

## 165.8.3 DBMS\_SQL DESC\_REC3 Record Type

DESC\_REC3 is the element type of the DESC\_TAB3 table type and the DESCRIBE\_COLUMNS3 Procedure.

DESC\_REC3 is identical to DESC\_REC2 except for two additional fields to hold the type name (type\_name) and type name len (type\_name\_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col\_type\_name and col\_type\_name\_len fields are only populated when the col\_type field's value is 109, the Oracle type number for user-defined types.

## Syntax

```
TYPE desc_rec3 IS RECORD (  
    col_type          binary_integer := 0,  
    col_max_len       binary_integer := 0,  
    col_name          varchar2(32767) := '',  
    col_name_len      binary_integer := 0,  
    col_schema_name   varchar2(32) := '',  
    col_schema_name_len binary_integer := 0,  
    col_precision     binary_integer := 0,  
    col_scale         binary_integer := 0,  
    col_charsetid     binary_integer := 0,  
    col_charsetform   binary_integer := 0,  
    col_null_ok       boolean := TRUE,  
    col_type_name     varchar2(32767) := '',  
    col_type_name_len binary_integer := 0);
```

## Fields

**Table 165-4** DESC\_REC3 Fields

| Field               | Description                              |
|---------------------|------------------------------------------|
| col_type            | Type of column                           |
| col_max_len         | Maximum column length                    |
| col_name            | Name of column                           |
| col_name_len        | Length of column name                    |
| col_schema_name     | Column schema name                       |
| col_schema_name_len | Length of column schema name             |
| col_precision       | Precision of column                      |
| col_scale           | Scale of column                          |
| col_charsetid       | Column character set ID                  |
| col_charsetform     | Column character set form                |
| col_null_ok         | NULL column flag; TRUE, if NULL possible |

**Table 165-4 (Cont.) DESC\_REC3 Fields**

| Field             | Description                                                                           |
|-------------------|---------------------------------------------------------------------------------------|
| col_type_name     | User-define type column type name, this field is valid when col_type is 109           |
| col_type_name_len | Length of user-define type column type name, this field is valid when col_type is 109 |

**Related Topics**

- [DESCRIBE\\_COLUMNS3 Procedure](#)  
This procedure describes the specified column. This is an alternative to DESCRIBE\_COLUMNS Procedure.

## 165.8.4 DBMS\_SQL DESC\_REC4 Record Type

DESC\_REC4 is the element type of the DESC\_TAB4 table type and the DESCRIBE\_COLUMNS3 Procedure.

DESC\_REC4 is identical to DESC\_REC3 except that it supports longer identifiers in the fields that hold the schema name (col\_schema\_name) and type name (col\_type\_name) of a column in a dynamic query.

**Syntax**

```
TYPE desc_rec4 IS RECORD (  
    col_type          binary_integer := 0,  
    col_max_len       binary_integer := 0,  
    col_name          varchar2(32767) := '',  
    col_name_len      binary_integer := 0,  
    col_schema_name   DBMS_ID := '',  
    col_schema_name_len binary_integer := 0,  
    col_precision     binary_integer := 0,  
    col_scale         binary_integer := 0,  
    col_charsetid     binary_integer := 0,  
    col_charsetform   binary_integer := 0,  
    col_null_ok       boolean := TRUE,  
    col_type_name     DBMS_ID := '',  
    col_type_name_len binary_integer := 0);
```

**See Also:**

*Oracle Database PL/SQL Language Reference* for more information about the predefined subtype DBMS\_ID.

**Fields****Table 165-5 DESC\_REC4 Fields**

| Field       | Description           |
|-------------|-----------------------|
| col_type    | Type of column        |
| col_max_len | Maximum column length |

**Table 165-5 (Cont.) DESC\_REC4 Fields**

| Field               | Description                                                                           |
|---------------------|---------------------------------------------------------------------------------------|
| col_name            | Name of column                                                                        |
| col_name_len        | Length of column name                                                                 |
| col_schema_name     | Column schema name                                                                    |
| col_schema_name_len | Length of column schema name                                                          |
| col_precision       | Precision of column                                                                   |
| col_scale           | Scale of column                                                                       |
| col_charsetid       | Column character set ID                                                               |
| col_charsetform     | Column character set form                                                             |
| col_null_ok         | NULL column flag; TRUE, if NULL possible                                              |
| col_type_name       | User-define type column type name, this field is valid when col_type is 109           |
| col_type_name_len   | Length of user-define type column type name, this field is valid when col_type is 109 |

**Related Topics**

- [DESCRIBE\\_COLUMNS3 Procedure](#)  
This procedure describes the specified column. This is an alternative to DESCRIBE\_COLUMNS Procedure.

## 165.8.5 DBMS\_SQL BFILE\_TABLE Table Type

This is a table of BFILE.

**Syntax**

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

## 165.8.6 DBMS\_SQL BINARY\_DOUBLE\_TABLE Table Type

This is a table of BINARY\_DOUBLE.

**Syntax**

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

## 165.8.7 DBMS\_SQL BINARY\_FLOAT\_TABLE Table Type

This is a table of BINARY\_FLOAT.

**Syntax**

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

## 165.8.8 DBMS\_SQL BLOB\_TABLE Table Type

This is a table of BLOB.

### Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

## 165.8.9 DBMS\_SQL CLOB\_TABLE Table Type

This is a table of CLOB.

### Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

## 165.8.10 DBMS\_SQL DATE\_TABLE Table Type

This is a table of DATE.

### Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

## 165.8.11 DBMS\_SQL DESC\_TAB Table Type

This is a table of DESC\_REC Record Type.

### Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

### Related Topics

- [DBMS\\_SQL DESC\\_REC Record Type](#)  
This record type holds the describe information for a single column in a dynamic query.

## 165.8.12 DBMS\_SQL DESC\_TAB2 Table Type

This is a table of DESC\_REC2 Record Type.

### Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

### Related Topics

- [DBMS\\_SQL DESC\\_REC2 Record Type](#)  
DESC\_REC2 is the element type of the DESC\_TAB2 table type and the DESCRIBE\_COLUMNS2 Procedure.

## 165.8.13 DBMS\_SQL DESC\_TAB3 Table Type

This is a table of DESC\_REC3 Record Type.

### Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

### Related Topics

- [DBMS\\_SQL DESC\\_REC3 Record Type](#)  
DESC\_REC3 is the element type of the DESC\_TAB3 table type and the DESCRIBE\_COLUMNS3 Procedure.

## 165.8.14 DBMS\_SQL DESC\_TAB4 Table Type

This is a table of DBMS\_SQL DESC\_REC4 Record Type.

### Syntax

```
TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;
```

### Related Topics

- [DBMS\\_SQL DESC\\_REC4 Record Type](#)  
DESC\_REC4 is the element type of the DESC\_TAB4 table type and the DESCRIBE\_COLUMNS3 Procedure.

## 165.8.15 DBMS\_SQL INTERVAL\_DAY\_TO\_SECOND\_TABLE Table Type

This is a table of DSINTERVAL\_UNCONSTRAINED.

### Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

## 165.8.16 DBMS\_SQL INTERVAL\_YEAR\_TO\_MONTH\_TABLE Table Type

This is a table of YMINTERVAL\_UNCONSTRAINED.

### Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

## 165.8.17 DBMS\_SQL NUMBER\_TABLE Table Type

This is a table of NUMBER.

### Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

## 165.8.18 DBMS\_SQL TIME\_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

### Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

## 165.8.19 DBMS\_SQL TIME\_WITH\_TIME\_ZONE\_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

### Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

## 165.8.20 DBMS\_SQL TIMESTAMP\_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

### Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

## 165.8.21 DBMS\_SQL TIMESTAMP\_WITH\_LTZ\_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

### Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

## 165.8.22 DBMS\_SQL TIMESTAMP\_WITH\_TIME\_ZONE\_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

### Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

## 165.8.23 DBMS\_SQL UROWID\_TABLE Table Type

This is a table of `UROWID`.

### Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

## 165.8.24 DBMS\_SQL VARCHAR2\_TABLE Table Type

This is table of VARCHAR2 (2000).

### Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

## 165.8.25 DBMS\_SQL VARCHAR2A Table Type

This is table of VARCHAR2 (32767).

### Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## 165.8.26 DBMS\_SQL VARCHAR2S Table Type

This is table of VARCHAR2 (256).

### Note:

This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

### Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

## 165.9 Summary of DBMS\_SQL Subprograms

This table lists the DBMS\_SQL subprograms and briefly describes them.

**Table 165-6 DBMS\_SQL Package Subprograms**

| Subprogram                                  | Description                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------|
| <a href="#">BIND_ARRAY Procedures</a>       | Binds a given value to a given collection.                                                   |
| <a href="#">BIND_VARIABLE Procedures</a>    | Binds a given value to a given variable.                                                     |
| <a href="#">BIND_VARIABLE_PKG Procedure</a> | Binds a given value to a given package variable.                                             |
| <a href="#">CLOSE_CURSOR Procedure</a>      | Closes given cursor and frees memory.                                                        |
| <a href="#">COLUMN_VALUE Procedure</a>      | Returns value of the cursor element for a given position in a cursor.                        |
| <a href="#">COLUMN_VALUE_LONG Procedure</a> | Returns a selected part of a LONG column, that has been defined using DEFINE_COLUMN_LONG.    |
| <a href="#">DEFINE_ARRAY Procedure</a>      | Defines a collection to be selected from the given cursor, used only with SELECT statements. |

**Table 165-6 (Cont.) DBMS\_SQL Package Subprograms**

| Subprogram                                      | Description                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DEFINE_COLUMN Procedures</a>        | Defines a column to be selected from the given cursor, used only with <code>SELECT</code> statements.                                                                                                                                                                           |
| <a href="#">DEFINE_COLUMN_CHAR Procedure</a>    | Defines a column of type <code>CHAR</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.                                                                                                                                                 |
| <a href="#">DEFINE_COLUMN_LONG Procedure</a>    | Defines a <code>LONG</code> column to be selected from the given cursor, used only with <code>SELECT</code> statements.                                                                                                                                                         |
| <a href="#">DEFINE_COLUMN_RAW Procedure</a>     | Defines a column of type <code>RAW</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.                                                                                                                                                  |
| <a href="#">DEFINE_COLUMN_ROWID Procedure</a>   | Defines a column of type <code>ROWID</code> to be selected from the given cursor, used only with <code>SELECT</code> statements.                                                                                                                                                |
| <a href="#">DESCRIBE_COLUMNS Procedure</a>      | Describes the columns for a cursor opened and parsed through <code>DBMS_SQL</code> .                                                                                                                                                                                            |
| <a href="#">DESCRIBE_COLUMNS2 Procedure</a>     | Describes the specified column, an alternative to <a href="#">DESCRIBE_COLUMNS Procedure</a> .                                                                                                                                                                                  |
| <a href="#">DESCRIBE_COLUMNS3 Procedure</a>     | Describes the specified column, an alternative to <a href="#">DESCRIBE_COLUMNS Procedure</a> .                                                                                                                                                                                  |
| <a href="#">EXECUTE Function</a>                | Executes a given cursor.                                                                                                                                                                                                                                                        |
| <a href="#">EXECUTE_AND_FETCH Function</a>      | Executes a given cursor and fetch rows.                                                                                                                                                                                                                                         |
| <a href="#">FETCH_ROWS Function</a>             | Fetches a row from a given cursor.                                                                                                                                                                                                                                              |
| <a href="#">GET_NEXT_RESULT Procedures</a>      | Gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.                                                            |
| <a href="#">IS_OPEN Function</a>                | Returns <code>TRUE</code> if given cursor is open.                                                                                                                                                                                                                              |
| <a href="#">LAST_ERROR_POSITION Function</a>    | Returns byte offset in the SQL statement text where the error occurred.                                                                                                                                                                                                         |
| <a href="#">LAST_ROW_COUNT Function</a>         | Returns cumulative count of the number of rows fetched                                                                                                                                                                                                                          |
| <a href="#">LAST_ROW_ID Function</a>            | Returns <code>ROWID</code> of last row processed.                                                                                                                                                                                                                               |
| <a href="#">LAST_SQL_FUNCTION_CODE Function</a> | Returns SQL function code for statement.                                                                                                                                                                                                                                        |
| <a href="#">OPEN_CURSOR Functions</a>           | Returns cursor ID number of new cursor.                                                                                                                                                                                                                                         |
| <a href="#">PARSE Procedures</a>                | Parses given statement.                                                                                                                                                                                                                                                         |
| <a href="#">RETURN_RESULT Procedures</a>        | Returns the result of an executed statement to the client application.                                                                                                                                                                                                          |
| <a href="#">TO_CURSOR_NUMBER Function</a>       | Takes an <code>OPENED</code> strongly or weakly-typed ref cursor and transforms it into a <code>DBMS_SQL</code> cursor number.                                                                                                                                                  |
| <a href="#">TO_REFCURSOR Function</a>           | Takes an <code>OPENED</code> , <code>PARSED</code> , and <code>EXECUTED</code> cursor and transforms/migrates it into a PL/SQL manageable <code>REF CURSOR</code> (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL. |
| <a href="#">VARIABLE_VALUE Procedures</a>       | Returns value of named variable for given cursor.                                                                                                                                                                                                                               |

**Table 165-6 (Cont.) DBMS\_SQL Package Subprograms**

| Subprogram                                   | Description                                                                                                                                                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">VARIABLE_VALUE_PKG Procedure</a> | Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification. |

## 165.9.1 BIND\_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

### Syntax

```
DBMS_SQL.BIND_ARRAY (
    c                IN INTEGER,
    name             IN VARCHAR2,
    <table_variable> IN <datatype>
[, index1          IN INTEGER,
  index2           IN INTEGER]) );
```

Where the <table\_variable> and its corresponding <datatype> can be any one of the following matching pairs:

|              |                                |
|--------------|--------------------------------|
| <clob_tab>   | Clob_Table                     |
| <bflt_tab>   | Binary_Float_Table             |
| <bdbl_tab>   | Binary_Double_Table            |
| <blob_tab>   | Blob_Table                     |
| <bfile_tab>  | Bfile_Table                    |
| <date_tab>   | Date_Table                     |
| <num_tab>    | Number_Table                   |
| <urowid_tab> | Urowid_Table                   |
| <vchr2_tab>  | Varchar2_Table                 |
| <tm_tab>     | Time_Table                     |
| <ttz_tab>    | Time_With_Time_Zone_Table      |
| <tms_tab>    | Timestamp_Table                |
| <tstz_tab>   | Timestamp_With_ltz_Table       |
| <tstz_tab>   | Timestamp_With_Time_Zone_Table |
| <ids_tab>    | Interval_Day_To_Second_Table   |
| <iym_tab>    | Interval_Year_To_Month_Table   |

Notice that the BIND\_ARRAY procedure is overloaded to accept different datatype.

### Parameters

**Table 165-7 BIND\_ARRAY Procedure Parameters**

| Parameter      | Description                                                          |
|----------------|----------------------------------------------------------------------|
| c              | ID number of the cursor to which you want to bind a value.           |
| name           | Name of the collection in the statement.                             |
| table_variable | Local variable that has been declared as <datatype>.                 |
| index1         | Index for the table element that marks the lower bound of the range. |

**Table 165-7 (Cont.) BIND\_ARRAY Procedure Parameters**

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| index2    | Index for the table element that marks the upper bound of the range. |

### Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

### Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

*Table items* are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local `DBMS_SQL` buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

### Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in `DBMS_SQL`.

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
```

```

                IS TABLE OF dsinterval_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                IS TABLE OF yminterval_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE number_table    IS TABLE OF NUMBER          INDEX BY BINARY_INTEGER;
TYPE time_table      IS TABLE OF time_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                IS TABLE OF time_tz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                IS TABLE OF timestamp_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                IS TABLE OF timestamp_ltz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                IS TABLE OF timestamp_tz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE urowid_table    IS TABLE OF UROWID          INDEX BY BINARY_INTEGER;
TYPE varchar2_table  IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

### Example 165-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array    DBMS_SQL.NUMBER_TABLE;
    empname_array   DBMS_SQL.VARCHAR2_TABLE;
    jobs_array      DBMS_SQL.VARCHAR2_TABLE;
    mgr_array       DBMS_SQL.NUMBER_TABLE;
    hiredate_array  DBMS_SQL.VARCHAR2_TABLE;
    sal_array       DBMS_SQL.NUMBER_TABLE;
    comm_array      DBMS_SQL.NUMBER_TABLE;
    deptno_array    DBMS_SQL.NUMBER_TABLE;
    c               NUMBER;
    dummy           NUMBER;
BEGIN
    empno_array(1) := 9001;
    empno_array(2) := 9002;
    empno_array(3) := 9003;
    empno_array(4) := 9004;
    empno_array(5) := 9005;
    empno_array(6) := 9006;
    empno_array(7) := 9007;

    empname_array(1) := 'Dopey';
    empname_array(2) := 'Grumpy';
    empname_array(3) := 'Doc';
    empname_array(4) := 'Happy';
    empname_array(5) := 'Bashful';
    empname_array(6) := 'Sneezy';
    empname_array(7) := 'Sleepy';

    jobs_array(1) := 'Miner';
    jobs_array(2) := 'Miner';

```

```
jobs_array(3) := 'Miner';
jobs_array(4) := 'Miner';
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES(
    :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
    :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```

```

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
    END;
/
SHOW ERRORS;

```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array DBMS_SQL.NUMBER_TABLE;
    salary_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN

    empno_array(1) := 7369;
    empno_array(2) := 7876;
    empno_array(3) := 7900;
    empno_array(4) := 7934;

    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;

    stmt := 'update emp set sal = :salary_array
            WHERE empno = :num_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
    DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
    END;
/

```

In a DELETE statement, for example, you could bind an array in the WHERE clause and have the statement be run for each element in the array:

```

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
begin
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);

```

```

DBMS_SQL.BIND_ARRAY(c, 'dept_array', dept_no_array, 1, 4);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

## 165.9.2 BIND\_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

### Syntax

```

DBMS_SQL.BIND_VARIABLE (
    c                IN INTEGER,
    name             IN VARCHAR2,
    value            IN <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED

```

Notice that `BIND_VARIABLE` is overloaded to accept different datatype.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets [] indicate an optional parameter for the `BIND_VARIABLE` procedure.

```

DBMS_SQL.BIND_VARIABLE (
    c                IN INTEGER,

```

```
name          IN VARCHAR2,  
value         IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (  
  c           IN INTEGER,  
  name        IN VARCHAR2,  
  value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (  
  c           IN INTEGER,  
  name        IN VARCHAR2,  
  value       IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (  
  c           IN INTEGER,  
  name        IN VARCHAR2,  
  value       IN ROWID);
```

### Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

### Parameters

**Table 165-8 BIND\_VARIABLE Procedures Parameters**

| Parameter      | Description                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c              | ID number of the cursor to which you want to bind a value.                                                                                                                                                                                       |
| name           | Name of the variable in the statement.<br>The length of the bind variable name must be <=30 bytes.                                                                                                                                               |
| value          | Value that you want to bind to the variable in the cursor.<br>For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.                                                              |
| out_value_size | Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable.<br>If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized. |

### Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

# 165.9.3 BIND\_VARIABLE\_PKG Procedure

This procedures binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

## Syntax

```
DBMS_SQL.BIND_VARIABLE_PKG (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN <datatype>);
```

Where <datatype> can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS\_INTEGER TABLE
- INDEX BY BINARY\_INTEGER TABLE

Table 165-9 BIND\_VARIABLE\_PKG Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor from which to get the values.                                                                                                                                                                                                                                                                                                                                                                                             |
| name      | Name of the variable in the statement for which you are retrieving the value.                                                                                                                                                                                                                                                                                                                                                                     |
| value     | <ul style="list-style-type: none"><li>• Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>.</li><li>• Array option: Local variable that has been declared <code>&lt;table_type&gt;</code></li></ul> |

## Example 165-2 Dynamic SQL using DBMS\_SQL.BIND\_VARIABLE\_PKG to Bind a Package Variable

The variables types are declared in the package specification. The `BIND_VARIABLE_PKG` is used to bind the variable `v1` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
    TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
    TYPE trec IS TABLE OF REC INDEX BY BINARY_INTEGER;
    TYPE trect IS TABLE OF NUMBER;
    TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
    dummy NUMBER;
```

```

    cur    NUMBER;
    v1 ty_pkg.trec;
    str VARCHAR2(3000);
    n1 NUMBER;
    n2 NUMBER;
BEGIN
    FOR i in 1..3 LOOP
        v1(i).n1 := i*10;
        v1(i).n2 := i*20;
    END LOOP;
    str := 'SELECT * FROM TABLE(:v1) ' ;
    cur := DBMS_SQL.OPEN_CURSOR();
    DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
    dummy := DBMS_SQL.EXECUTE(cur);
    DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
    DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);

    LOOP
        IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
            -- get column values of the row
            DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
            DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
            DBMS_OUTPUT.PUT_LINE('n1 = ' || n1 || ' n2 = ' || n2);
        ELSE
            -- No more rows
            EXIT;
        END IF;
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

```

## 165.9.4 CLOSE\_CURSOR Procedure

This procedure closes a given cursor.

### Syntax

```
DBMS_SQL.CLOSE_CURSOR (
    c      IN OUT INTEGER);
```

### Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

## Parameters

**Table 165-10 CLOSE\_CURSOR Procedure Parameters**

| Parameter | Mode | Description                                                                                                                                                       |
|-----------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | IN   | ID number of the cursor that you want to close.                                                                                                                   |
| c         | OUT  | Cursor is set to null.<br>After you call <code>CLOSE_CURSOR</code> , the memory allocated to the cursor is released and you can no longer fetch from that cursor. |

## 165.9.5 COLUMN\_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

### Syntax

```
DBMS_SQL.COLUMN_VALUE (  
    c                IN  INTEGER,  
    position         IN  INTEGER,  
    value            OUT <datatype>  
    [,column_error   OUT NUMBER]  
    [,actual_length  OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE  
BINARY_FLOAT  
BFILE  
BLOB  
CLOB CHARACTER SET ANY_CS  
DATE  
DSINTERVAL_UNCONSTRAINED  
NUMBER  
TIME_TZ_UNCONSTRAINED  
TIME_UNCONSTRAINED  
TIMESTAMP_LTZ_UNCONSTRAINED  
TIMESTAMP_TZ_UNCONSTRAINED  
TIMESTAMP_UNCONSTRAINED  
UROWID  
VARCHAR2 CHARACTER SET ANY_CS  
YMINTERVAL_UNCONSTRAINED  
user-defined object types  
collections (VARARRAYs and nested tables)  
REFs  
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (  
    c                IN  INTEGER,  
    position         IN  INTEGER,  
    value            OUT CHAR CHARACTER SET ANY_CS  
    [,column_error   OUT NUMBER]  
    [,actual_length  OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT RAW
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT ROWID
[,column_error OUT NUMBER]
[,actual_length OUT INTEGER]);
```

The following syntax enables the `COLUMN_VALUE` procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
    c           IN           INTEGER,
    position    IN           INTEGER,
    <param_name> IN OUT NOCOPY <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

|          |                                |
|----------|--------------------------------|
| bdbl_tab | Binary_Double_Table            |
| bflt_tab | Binary_Float_Table             |
| bf_tab   | Bfile_Table                    |
| bl_tab   | Blob_Table                     |
| cl_tab   | Clob_Table                     |
| d_tab    | Date_Table                     |
| ids_tab  | Interval_Day_To_Second_Table   |
| iyms_tab | Interval_Year_To_Month_Table   |
| n_tab    | Number_Table                   |
| tm_tab   | Time_Table                     |
| ttz_tab  | Time_With_Time_Zone_Table      |
| tms_tab  | Timestamp_Table                |
| tstz_tab | Timestamp_With_ltz_Table       |
| tstz_tab | Timestamp_With_Time_Zone_Table |
| ur_tab   | Urowid_Table                   |
| c_tab    | Varchar2_Table                 |

## Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

## Parameters

**Table 165-11 COLUMN\_VALUE Procedure Parameters (Single Row)**

| Parameter | Description                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor from which you are fetching the values.                                                                                                                                                                                          |
| position  | Relative position of the column in the cursor.<br>The first column in a statement has position 1.                                                                                                                                                        |
| value     | Returns the value at the specified column.<br>Oracle raises exception ORA-06562, <code>inconsistent_type</code> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code> . |

**Table 165-11 (Cont.) COLUMN\_VALUE Procedure Parameters (Single Row)**

| Parameter     | Description                                                                     |
|---------------|---------------------------------------------------------------------------------|
| column_error  | Returns any error code for the specified column value.                          |
| actual_length | The actual length, before any truncation, of the value in the specified column. |

**Table 165-12 COLUMN\_VALUE Procedure Parameters (Bulk)**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c            | ID number of the cursor from which you are fetching the values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| position     | Relative position of the column in the cursor.<br>The first column in a statement has position 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <param_name> | Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations.<br><br>For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the <a href="#">DEFINE_ARRAY Procedure</a> a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then the first call to this subprogram after calling the <a href="#">FETCH_ROWS Function</a> will populate elements at index 1..10, and the next call will populate elements 11..20, and so on. |

### Exceptions

INCONSISTENT\_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

## 165.9.6 COLUMN\_VALUE\_LONG Procedure

This procedure gets part of the value of a long column.

### Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (  
    c           IN  INTEGER,  
    position    IN  INTEGER,  
    length      IN  INTEGER,  
    offset      IN  INTEGER,  
    value       OUT VARCHAR2,  
    value_length OUT INTEGER);
```

### Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

### Parameters

**Table 165-13 COLUMN\_VALUE\_LONG Procedure Parameters**

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| c         | Cursor ID number of the cursor from which to get the value. |

**Table 165-13 (Cont.) COLUMN\_VALUE\_LONG Procedure Parameters**

| Parameter    | Description                                       |
|--------------|---------------------------------------------------|
| position     | Position of the column of which to get the value. |
| length       | Number of bytes of the long value to fetch.       |
| offset       | Offset into the long field for start of fetch.    |
| value        | Value of the column as a VARCHAR2.                |
| value_length | Number of bytes actually returned in value.       |

## 165.9.7 DEFINE\_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

### Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH Table
    IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE number_table
    IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table
    IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE urowid_table
    IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table
    IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

## Syntax

```
DBMS_SQL.DEFINE_ARRAY (
    c           IN INTEGER,
    position    IN INTEGER,
    <table_variable> IN <datatype>
    cnt         IN INTEGER,
    lower_bnd   IN INTEGER);
```

Where <table\_variable> and its corresponding <datatype> can be any one of the following matching pairs, DEFINE\_ARRAY being overloaded to accept different datatypes:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>      Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>      Date_Table
<num_tab>       Number_Table
<urowid_tab>    Urowid_Table
<vchr2_tab>     Varchar2_Table
<tm_tab>        Time_Table
<ttz_tab>       Time_With_Time_Zone_Table
<tms_tab>       Timestamp_Table
<tstz_tab>      Timestamp_With_ltz_Table
<tstz_tab>      Timestamp_With_Time_Zone_Table
<ids_tab>       Interval_Day_To_Second_Table
<iym_tab>       Interval_Year_To_Month_Table
```

## Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH\_ROWS call fetch "count" rows. When the COLUMN\_VALUE call is made, these rows are placed in positions lower\_bnd, lower\_bnd+1, lower\_bnd+2, and so on. While there are still rows coming, the user keeps issuing FETCH\_ROWS/COLUMN\_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN\_VALUE call.

## Parameters

**Table 165-14 DEFINE\_ARRAY Procedure Parameters**

| Parameter      | Description                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------|
| c              | ID number of the cursor to which you want to bind an array.                                                    |
| position       | Relative position of the column in the array being defined.<br>The first column in a statement has position 1. |
| table_variable | Local variable that has been declared as <datatype>.                                                           |
| cnt            | Number of rows that must be fetched.                                                                           |
| lower_bnd      | Results are copied into the collection, starting at this lower bound index.                                    |

## Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower\_bnd can be positive, negative, or zero. A query on which a DEFINE\_ARRAY call was issued cannot contain array binds.

## Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
  TYPE namelist IS TABLE OF employees.last_name%TYPE;
  TYPE sallist IS TABLE OF employees.salary%TYPE;
  names      namelist;
  sals       sallist;
  c          NUMBER;
  r          NUMBER;
  sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

  DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

  DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
  DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

  r := DBMS_SQL.EXECUTE(c);

  LOOP
    r := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, names);
    DBMS_SQL.COLUMN_VALUE(c, 2, sals);
    EXIT WHEN r != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  -- loop through the names and sals collections
  FOR i IN names.FIRST .. names.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
  END LOOP;
END;
/
```

### Example 165-3 Example: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```
declare
  c          NUMBER;
  d          NUMBER;
  n_tab      DBMS_SQL.NUMBER_TABLE;
  indx       NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dBSMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;
```

```

DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

Each time the preceding example calls [FETCH\\_ROWS Function](#), it fetches 10 rows that are kept in DBMS\_SQL buffers. When the [COLUMN\\_VALUE Procedure](#) is called, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` time and is updated every time `COLUMN_VALUE` is called. If you reexecute at any point, then the current index for each `DEFINE` is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```

CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)

```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```

DECLARE
    c          NUMBER;
    d          NUMBER;
    n_tab      DBMS_SQL.NUMBER_TABLE;
    d_tab1     DBMS_SQL.DATE_TABLE;
    v_tab      DBMS_SQL.VARCHAR2_TABLE;
    d_tab2     DBMS_SQL.DATE_TABLE;
    indx       NUMBER := 10;
BEGIN

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

    d := DBMS_SQL.EXECUTE(c);

    LOOP
        d := DBMS_SQL.FETCH_ROWS(c);

        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
        DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    
```

```

        DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
        DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

        EXIT WHEN d != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

/*

```

The four tables can be used for anything. One usage might be to use `BIND_ARRAY` to move the rows to another table by using a statement such as `'INSERT into SOME_T values (:a, :b, :c, :d);`

```

*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

## 165.9.8 DEFINE\_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```

DBMS_SQL.DEFINE_COLUMN (
    c                IN INTEGER,
    position         IN INTEGER,
    column           IN <datatype>);

```

Where <datatype> can be any one of the following types:

```

BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)

```

REFs  
Opaque types

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (  
    c            IN INTEGER,  
    position     IN INTEGER,  
    column       IN VARCHAR2 CHARACTER SET ANY_CS,  
    column_size  IN INTEGER);
```

**Pragmas**

```
pragma restrict_references(define_column,RNDS,WNDS);
```

**Parameters**

**Table 165-15    DEFINE\_COLUMN Procedure Parameters**

| Parameter   | Description                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------|
| c           | ID number of the cursor for the row being defined to be selected                                            |
| position    | Relative position of the column in the row being defined.The first column in a statement has position 1.    |
| column      | Value of the column being defined. The type of this value determines the type for the column being defined. |
| column_size | Maximum expected size of the column value in bytes for columns of type VARCHAR2.                            |

**Usage Notes**

When using character length semantics the maximum number of bytes that can be returned for a column value of type `VARCHAR2` is calculated as: `column_size * maximum character byte size` for the current character set. For example, specifying the `column_size` as 10 means that a maximum of 30 (10\*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

165.9.9 `DEFINE_COLUMN_CHAR` Procedure

This procedure defines a column with `CHAR` data to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_LONG Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

**Syntax**

```
DBMS_SQL.DEFINE_COLUMN_CHAR (  
    c            IN INTEGER,  
    position     IN INTEGER,  
    column       IN CHAR CHARACTER SET ANY_CS,  
    column_size  IN INTEGER);
```

## Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

## Parameters

**Table 165-16** DEFINE\_COLUMN\_CHAR Procedure Parameters

| Parameter   | Description                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------|
| c           | ID number of the cursor for the row being defined to be selected                                            |
| position    | Relative position of the column in the row being defined. The first column in a statement has position 1.   |
| column      | Value of the column being defined. The type of this value determines the type for the column being defined. |
| column_size | Maximum expected size of the column value in characters for columns of type CHAR.                           |

## 165.9.10 DEFINE\_COLUMN\_LONG Procedure

This procedure defines a `LONG` column for a `SELECT` cursor. The column being defined is identified by its relative position in the `SELECT` list of the statement for the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

## Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (  
    c           IN INTEGER,  
    position    IN INTEGER);
```

## Parameters

**Table 165-17** DEFINE\_COLUMN\_LONG Procedure Parameters

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor for the row being defined to be selected.                                            |
| position  | Relative position of the column in the row being defined.<br>The first column in a statement has position 1. |

## 165.9.11 DEFINE\_COLUMN\_RAW Procedure

This procedure defines a column of type `RAW` to be selected from the given cursor.

This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN RAW,
    column_size IN INTEGER);
```

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

### Parameters

**Table 165-18** DEFINE\_COLUMN\_RAW Procedure Parameters

| Parameter   | Description                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------|
| c           | ID number of the cursor for the row being defined to be selected.                                           |
| position    | Relative position of the column in the row being defined. The first column in a statement has position 1.   |
| column      | Value of the column being defined. The type of this value determines the type for the column being defined. |
| column_size | Maximum expected size of the column value in bytes for columns of RAW type.                                 |

## 165.9.12 DEFINE\_COLUMN\_ROWID Procedure

This procedure defines a column of type `ROWID` to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#) and [DEFINE\\_COLUMN\\_RAW Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
    c           IN INTEGER,
    position    IN INTEGER,
    column      IN ROWID);
```

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

## Parameters

**Table 165-19** DEFINE\_COLUMN\_ROWID Procedure Parameters

| Parameter | Description                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor for the row being defined to be selected                                            |
| position  | Relative position of the column in the row being defined. The first column in a statement has position 1.   |
| column    | Value of the column being defined. The type of this value determines the type for the column being defined. |

## 165.9.13 DESCRIBE\_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS\_SQL.

### Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (  
    c          IN INTEGER,  
    col_cnt    OUT INTEGER,  
    desc_t     OUT DESC_TAB);
```

### Parameters

**Table 165-20** DESCRIBE\_COLUMNS Procedure Parameters

| Parameter | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| c         | ID number of the cursor for the columns being described                            |
| col_cnt   | Number of columns in the select list of the query                                  |
| desc_t    | Describe table to fill in with the description of each of the columns of the query |

### Example 165-4 Describe Columns

This code can be used as a substitute to the SQL\*Plus DESCRIBE call by using a SELECT \* query on the table that you want to describe.

```
DECLARE  
    c          NUMBER;  
    d          NUMBER;  
    col_cnt    INTEGER;  
    f          BOOLEAN;  
    rec_tab    DBMS_SQL.DESC_TAB;  
    col_num    NUMBER;  
    PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS  
    BEGIN  
        DBMS_OUTPUT.NEW_LINE;  
        DBMS_OUTPUT.PUT_LINE('col_type           = ' || rec.col_type);  
        DBMS_OUTPUT.PUT_LINE('col_maxlen        = ' || rec.col_max_len);  
        DBMS_OUTPUT.PUT_LINE('col_name          = ' || rec.col_name);  
        DBMS_OUTPUT.PUT_LINE('col_name_len      = ' || rec.col_name_len);  
        DBMS_OUTPUT.PUT_LINE('col_schema_name   = ' || rec.col_schema_name);  
        DBMS_OUTPUT.PUT_LINE('col_schema_name_len = ' ||
```

```

rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision      =      ' || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale         =      ' || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok           =      ');
    IF (rec.col_null_ok) THEN
        DBMS_OUTPUT.PUT_LINE('true');
    ELSE
        DBMS_OUTPUT.PUT_LINE('false');
    END IF;
END;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

    d := DBMS_SQL.EXECUTE(c);

    DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
* Following loop could simply be for j in 1..col_cnt loop.
* Here we are simply illustrating some of the PL/SQL table
* features.
*/
    col_num := rec_tab.first;
    IF (col_num IS NOT NULL) THEN
        LOOP
            print_rec(rec_tab(col_num));
            col_num := rec_tab.next(col_num);
            EXIT WHEN (col_num IS NULL);
        END LOOP;
    END IF;

    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

## 165.9.14 DESCRIBE\_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE\_COLUMNS Procedure.

### Syntax

```

DBMS_SQL.DESCRIBE_COLUMNS2 (
    c           IN INTEGER,
    col_cnt     OUT INTEGER,
    desc_t      OUT DESC_TAB2);

```

### Pragmas

```

PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);

```

## Parameters

**Table 165-21 DESCRIBE\_COLUMNS2 Procedure Parameters**

| Parameter | Description                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor for the columns being described.                                                                                                                      |
| col_cnt   | Number of columns in the select list of the query.                                                                                                                            |
| desc_t    | Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query. |

## Related Topics

- [DESCRIBE\\_COLUMNS Procedure](#)  
This procedure describes the columns for a cursor opened and parsed through DBMS\_SQL.

## 165.9.15 DESCRIBE\_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE\_COLUMNS Procedure.

## Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
    c          IN  INTEGER,
    col_cnt    OUT INTEGER,
    desc_t     OUT DESC_TAB3);
```

```
BMS_SQL.DESCRIBE_COLUMNS3 (
    c          IN  INTEGER,
    col_cnt    OUT INTEGER,
    desc_t     OUT DESC_TAB4);
```

## Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

## Parameters

**Table 165-22 DESCRIBE\_COLUMNS3 Procedure Parameters**

| Parameter | Description                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor for the columns being described.                                                                                                                      |
| col_cnt   | Number of columns in the select list of the query.                                                                                                                            |
| desc_t    | Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query. |

## Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

## Examples

```

CREATE TYPE PROJECT_T AS OBJECT
    ( projname          VARCHAR2(20),
      mgr               VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
    curid          NUMBER;
    desctab        DBMS_SQL.DESC_TAB3;
    colcnt         NUMBER;
    sql_stmt       VARCHAR2(200) := 'select * from projecttab';
BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 109 THEN
            DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
            DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                                desctab(i).col_type_name);
        END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

## Related Topics

- [DESCRIBE\\_COLUMNS Procedure](#)

This procedure describes the columns for a cursor opened and parsed through DBMS\_SQL.

## 165.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed.

The return value is only valid for `INSERT`, `UPDATE`, and `DELETE` statements; for other types of statements, including `DDL`, the return value is undefined and must be ignored.

### Syntax

```

DBMS_SQL.EXECUTE (
    c      IN INTEGER)
RETURN INTEGER;

```

## Parameters

**Table 165-23 EXECUTE Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| c         | Cursor ID number of the cursor to execute. |

## Return Values

Returns number of rows processed

## Usage Notes

The `DBMS_SQL` cursor that is returned by the [TO\\_CURSOR\\_NUMBER Function](#) performs in the same way as a `DBMS_SQL` cursor that has already been executed. Consequently, calling `EXECUTE` for this cursor will cause an error.

## 165.9.17 EXECUTE\_AND\_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

## Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (  
    c                IN INTEGER,  
    exact            IN BOOLEAN DEFAULT FALSE)  
RETURN INTEGER;
```

## Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

## Parameters

**Table 165-24 EXECUTE\_AND\_FETCH Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor to execute and fetch.                                                                                                                                                                                                                                                                     |
| exact     | Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one.<br><br>Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns.<br><br>Even if an exception is raised, the rows are still fetched and available. |

## Return Values

Returns designated rows

## 165.9.18 FETCH\_ROWS Function

This function fetches a row from a given cursor.

You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

### Syntax

```
DBMS_SQL.FETCH_ROWS (
    c                IN INTEGER)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

### Parameters

**Table 165-25** `FETCH_ROWS` Function Parameters

| Parameter | Description |
|-----------|-------------|
| c         | ID number.  |

### Return Values

Returns a row from a given cursor

## 165.9.19 GET\_NEXT\_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the [RETURN\\_RESULT Procedures](#).

### Syntax

```
DBMS_SQL.GET_NEXT_RESULT (
    c                IN      INTEGER,
    rc               OUT     SYS_REFCURSOR);
```

```
DBMS_SQL.GET_NEXT_RESULT (
    c                IN      INTEGER,
    rc               OUT     INTEGER);
```

## Parameters

**Table 165-26 GET\_NEXT\_RESULT Procedure Parameters**

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| c         | Recursive statement cursor                                        |
| rc        | Cursor or ref cursor of the statement of the next returned result |

## Exceptions

ORA-01403 no\_data\_found: This is raised when there is no further returned statement result.

## Usage Notes

- After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.
- The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.

## Examples

```
DECLARE
  c INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c, statement => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
    EXCEPTIONS
      WHEN no_data_found THEN
        EXIT;
    END;
    LOOP
      FETCH rc INTO ...
      ...
    END LOOP;
  END LOOP;
END;
```

## 165.9.20 IS\_OPEN Function

This function checks to see if the given cursor is currently open.

### Syntax

```
DBMS_SQL.IS_OPEN (
  c IN INTEGER)
RETURN BOOLEAN;
```

### Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

## Parameters

**Table 165-27 IS\_OPEN Function Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| c         | Cursor ID number of the cursor to check. |

## Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE\\_CURSOR Procedure](#) Procedure `NULLs` out the cursor variable passed to it.

## Exceptions

**ORA-29471 DBMS\_SQL access denied:** This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent `DBMS_SQL` call in the same session will raise this error, meaning that `DBMS_SQL` is non-operational for this session.

## 165.9.21 LAST\_ERROR\_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

### Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

### Return Values

Returns the byte offset in the SQL statement text where the error occurred

### Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

## 165.9.22 LAST\_ROW\_COUNT Function

This function returns the cumulative count of the number of rows fetched.

### Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

### Return Values

Returns the cumulative count of the number of rows fetched

### Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

## 165.9.23 LAST\_ROW\_ID Function

This function returns the ROWID of the last row processed.

### Syntax

```
DBMS_SQL.LAST_ROW_ID  
    RETURN ROWID;
```

### Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

### Return Values

Returns the ROWID of the last row processed

### Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

## 165.9.24 LAST\_SQL\_FUNCTION\_CODE Function

This function returns the SQL function code for the statement.

These codes are listed in the *Oracle Call Interface Programmer's Guide*.

### Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
    RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

### Return Values

Returns the SQL function code for the statement

### Usage Notes

You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

# 165.9.25 OPEN\_CURSOR Functions

This function opens a new cursor.

The `security_level` parameter allows for application of fine-grained control to the security of the opened cursor.

## Syntax

```
DBMS_SQL.OPEN_CURSOR (
    treat_as_client_for_results    IN      BOOLEAN    DEFAULT FALSE)
    RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
    security_level                IN      INTEGER,
    treat_as_client_for_results    IN      BOOLEAN    DEFAULT FALSE)
    RETURN INTEGER;
```

## Parameters

**Table 165-28 OPEN\_CURSOR Function Parameters**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>security_level</code>              | <p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a <code>NULL</code> argument value is provided to this overload, as well as for cursors opened using the overload of <code>open_cursor</code> without the <code>security_level</code> parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"><li>Level 0 - allows all <code>DBMS_SQL</code> operations on the cursor without any security checks. The cursor may be fetched from, and even rebound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default.</li><li>Level 1 - requires that the referenced container, effective userid, and roles of the caller to <code>DBMS_SQL</code> for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</li><li>Level 2 - requires that the referenced container, effective userid, and roles of the caller to <code>DBMS_SQL</code> for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</li></ul> |
| <code>treat_as_client_for_results</code> | <p>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the <a href="#">GET_NEXT_RESULT Procedures</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

## Return Values

Returns the cursor ID number of the new cursor

## Usage Notes

- When you no longer need this cursor, you must close it explicitly by calling the [CLOSE\\_CURSOR Procedure](#).
- You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

## 165.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the `PARSE` procedure:

- Taking a `VARCHAR2` statement as an argument
- Taking a segmented string, one taking `VARCHAR2A`, a `TABLE OF VARCHAR2(32767)`, and another, taking `VARCHAR2S`, a `TABLE OF VARCHAR2(256)`, as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single `VARCHAR2` variable by splitting up the statement.
- Taking a `CLOB` statement as an argument. You can use the `CLOB` overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

## Syntax

Each version has multiple overloads.

```
DBMS_SQL.PARSE (
    c                      IN    INTEGER,
    statement              IN    VARCHAR2,
    language_flag          IN    INTEGER[
[,edition                IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger     IN    BOOLEAN DEFAULT TRUE]
[,schema                 IN    VARCHAR2 DEFAULT NULL]
[,container              IN    VARCHAR2)];
```

```
DBMS_SQL.PARSE (
    c                      IN    INTEGER,
    statement              IN    CLOB,
    language_flag          IN    INTEGER[
[,edition                IN    VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN    VARCHAR2 DEFAULT NULL,
    fire_apply_trigger     IN    BOOLEAN DEFAULT TRUE]
[,schema                 IN    VARCHAR2 DEFAULT NULL]
[,container              IN    VARCHAR2)];
```

```
DBMS_SQL.PARSE (
    c                      IN    INTEGER,
    statement              IN    VARCHAR2A,
    lb                     IN    INTEGER,
    ub                     IN    INTEGER,
    lfflg                  IN    BOOLEAN,
    language_flag          IN    INTEGER[
[,edition                IN    VARCHAR2 DEFAULT NULL],
```

```

        apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
        fire_apply_trigger         IN BOOLEAN DEFAULT TRUE]
[,schema                         IN VARCHAR2 DEFAULT NULL]
[,container                      IN VARCHAR2)];

DBMS_SQL.PARSE (
    c                IN INTEGER,
    statement        IN VARCHAR2s,
    lb               IN INTEGER,
    ub               IN INTEGER,
    lf_flg           IN BOOLEAN,
    language_flag    IN INTEGER[
[,edition           IN VARCHAR2 DEFAULT NULL],
    apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
    fire_apply_trigger         IN BOOLEAN DEFAULT TRUE]
[,schema           IN VARCHAR2 DEFAULT NULL]
[,container        IN VARCHAR2)];

```

## Parameters

**Table 165-29 PARSE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c             | ID number of the cursor in which to parse the statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statement     | <p>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</p> <p>Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example:</p> <pre>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</pre> <pre>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| lb            | Lower bound for elements in the statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ub            | Upper bound for elements in the statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| lf_flg        | If TRUE, then insert a linefeed after each element on concatenation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| language_flag | Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see <a href="#">DBMS_SQL Constants</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| edition       | <p>Specifies the edition in which to run the statement under the following conditions:</p> <ul style="list-style-type: none"> <li>• If NULL and container is NULL, the statement will be run in the current edition.</li> <li>• If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition.</li> <li>• Given the user and the edition with which the statement is to be executed, the user must have <b>USE</b> privilege on the edition.</li> </ul> <p>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</p> |

Table 165-29 (Cont.) PARSE Procedure Parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>apply_crossedition_trigger</code> | Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and <code>current_schema</code> setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming <code>fire_apply_trigger</code> is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's <code>dml_event_clause</code> , any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased. |
| <code>fire_apply_trigger</code>         | Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>schema</code>                     | Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>container</code>                  | Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Usage Notes**

- Using DBMS\_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```

- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload.
- If the `container` parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

### Exceptions

If you create a type, procedure, function, or package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the PL/SQL unit is still created.

## 165.9.27 RETURN\_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using `DBMS_SQL`
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

### Syntax

```
DBMS_SQL.RETURN_RESULT(  
    rc          IN OUT    SYS_REFCURSOR,  
    to_client   IN        BOOLEAN          DEFAULT TRUE);  
  
DBMS_SQL.RETURN_RESULT(  
    rc          IN OUT    INTEGER,  
    to_client   IN        BOOLEAN          DEFAULT TRUE);
```

### Parameters

**Table 165-30 RETURN\_RESULT Procedure Parameters**

| Parameter              | Description                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>rc</code>        | Statement cursor or ref cursor                                                                                   |
| <code>to_client</code> | Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller. |

### Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.

- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because `EXECUTE IMMEDIATE` statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the `EXECUTE IMMEDIATE` statement will be closed when the statement completes. To retrieve the returned statement results from a recursive statement in PL/SQL, use `DBMS_SQL` to execute the recursive statement.

### Examples

```
CREATE PROCEDURE proc AS
    rc1 sys_refcursor;
    rc2 sys_refcursor;
BEGIN
    OPEN rc1 FOR SELECT * FROM t1;
    DBMS_SQL.RETURN_RESULT(rc1);
    OPEN rc2 FOR SELECT * FROM t2;
    DBMS_SQL.RETURN_RESULT(rc2);
END;
/
```

## 165.9.28 TO\_CURSOR\_NUMBER Function

This function takes an `OPENED` strongly or weakly-typed ref cursor and transforms it into a `DBMS_SQL` cursor number.

### Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
    rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

### Parameters

**Table 165-31 TO\_CURSOR\_NUMBER Function Parameters**

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| <code>rc</code> | REF CURSOR to be transformed into a cursor number |

### Return Values

Returns a `DBMS_SQL` manageable cursor number transformed from a `REF CURSOR`

### Usage Notes

- The `REF CURSOR` passed in has to be `OPENED`, otherwise an error is raised.
- Once the `REF CURSOR` is transformed into a `DBMS_SQL` cursor number, the `REF CURSOR` is no longer accessible by any native dynamic SQL operations.
- The `DBMS_SQL` cursor that is returned by this subprogram performs in the same way as a `DBMS_SQL` cursor that has already been executed.

## Examples

```

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESC_TAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
    ELSIF desctab(i).col_type = 12 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
    .....
    ELSE
      DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
    END IF;
  END LOOP;

  -- Fetch Rows
  WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
    FOR i IN 1 .. colcnt LOOP
      IF (desctab(i).col_type = 1) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
      ELSIF (desctab(i).col_type = 2) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
      ELSIF (desctab(i).col_type = 12) THEN
        DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
      ....
    END IF;
  END LOOP;
END LOOP;

  DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

```

## 165.9.29 TO\_REFCURSOR Function

This function takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with SELECT cursors.

## Syntax

```
DBMS_SQL.TO_REFCURSOR(  
    cursor_number IN OUT INTEGER)  
RETURN SYS_REFCURSOR;
```

## Parameters

**Table 165-32 TO\_REFCURSOR Function Parameters**

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| cursor_number | Cursor number of the cursor to be transformed into REF CURSOR |

## Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS\_SQL cursor number

## Usage Notes

- The cursor passed in by the cursor\_number has to be OPENED, PARSED, and EXECUTED; otherwise an error is raised.
- Once the cursor\_number is transformed into a REF CURSOR, the cursor\_number is no longer accessible by any DBMS\_SQL operations.
- After a cursor\_number is transformed into a REF CURSOR, using DBMS\_SQL.IS\_OPEN to check to see if the cursor\_number is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a REF CURSOR.

## Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS  
    TYPE CurType IS REF CURSOR;  
    src_cur          CurType;  
    curid            NUMBER;  
    sql_stmt         VARCHAR2(200);  
    ret              INTEGER;  
    empnos           DBMS_SQL.Number_Table;  
    depts            DBMS_SQL.Number_Table;  
BEGIN  
  
    -- DBMS_SQL.OPEN_CURSOR  
    curid := DBMS_SQL.OPEN_CURSOR;  
  
    sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID  
= :b1';  
  
    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);  
    DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);  
    ret := DBMS_SQL.EXECUTE(curid);  
  
    -- Switch from DBMS_SQL to native dynamic SQL  
    src_cur := DBMS_SQL.TO_REFCURSOR(curid);  
  
    -- Fetch with native dynamic SQL  
    FETCH src_cur BULK COLLECT INTO empnos, depts;
```

```

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

```

## 165.9.30 VARIABLE\_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

### Syntax

```

DBMS_SQL.VARIABLE_VALUE (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT NOCOPY <datatype>);

```

Where <datatype> can be any one of the following types:

```

ADT (user-defined object types)
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
BOOLEAN
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NESTED table
NUMBER
OPAQUE types
REF
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
VARRAY
YMINTERVAL_UNCONSTRAINED

```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```

DBMS_SQL.VARIABLE_VALUE_CHAR (
  c          IN  INTEGER,
  name       IN  VARCHAR2,
  value      OUT CHAR CHARACTER SET ANY_CS);

DBMS_SQL.VARIABLE_VALUE_RAW (
  c          IN  INTEGER,

```

```
name          IN  VARCHAR2,  
value         OUT RAW);  
  
DBMS_SQL.VARIABLE_VALUE_ROWID (  
  c           IN  INTEGER,  
  name        IN  VARCHAR2,  
  value       OUT ROWID);
```

The following syntax enables the `VARIABLE_VALUE` procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (  
  c           IN  INTEGER,  
  name        IN  VARCHAR2,  
  value       OUT NOCOPY <table_type>);
```

For bulk operations, `<table_type>` must be a supported DBMS\_SQL predefined TABLE type.

See [DBMS\\_SQL Data Structures](#)

### Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

### Parameters

**Table 165-33 VARIABLE\_VALUE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor from which to get the values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| name      | Name of the variable for which you are retrieving the value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| value     | <ul style="list-style-type: none"><li>Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>.</li><li>Array option: Local variable that has been declared <code>&lt;table_type&gt;</code>. For bulk operations, <code>value</code> is an <code>OUT NOCOPY</code> parameter.</li></ul> |

## 165.9.31 VARIABLE\_VALUE\_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with `returning` clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

### Syntax

```
DBMS_SQL.VARIABLE_VALUE_PKG (  
  c           IN  INTEGER,  
  name        IN  VARCHAR2,  
  value       OUT NOCOPY <table_type>);
```

Where `<datatype>` can be any one of the following data types:

- RECORD
- VARRAY

- NESTED TABLE
- INDEX BY PLS\_INTEGER TABLE
- INDEX BY BINARY\_INTEGER TABLE

### Parameters

**Table 165-34 VARIABLE\_VALUE\_PKG Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c         | ID number of the cursor from which to get the values.                                                                                                                                                                                                                                                                                                                                                                                                 |
| name      | Name of the variable for which you are retrieving the value.                                                                                                                                                                                                                                                                                                                                                                                          |
| value     | <ul style="list-style-type: none"> <li>• Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE_PKG</code>.</li> <li>• Array option: Local variable that has been declared <code>&lt;table_type&gt;</code>.</li> </ul> |

### Example 165-5 Dynamic SQL using DBMS\_SQL.VARIABLE\_VALUE\_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The `VARIABLE_VALUE_PKG` is used to get the value of the bind variable `v2` in the cursor SQL statement.

```
CREATE OR REPLACE PACKAGE ty_pkg AS
TYPE rec IS RECORD
  ( n1 NUMBER,
    n2 NUMBER);
TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
  dummy NUMBER;
  cur NUMBER;
  v1 ty_pkg.trect;
  v2 ty_pkg.trect;
  str VARCHAR2(3000);
BEGIN
  v1 := ty_pkg.trect(1000);
  str := 'declare v1 ty_pkg.trect; begin v1:=:v1; v1(1) := 2000; :v2 := v1;
end;';
  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
  dummy := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
  DBMS_OUTPUT.PUT_LINE('n = '
|| v2(1));
```

```
        DBMS_SQL.CLOSE_CURSOR(cur);  
    END dyn_sql_nt;  
    /  
    EXEC dyn_sql_nt;  
  
n = 2000
```

# DBMS\_SQL\_MONITOR

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- [DBMS\\_SQL\\_MONITOR Overview](#)
- [DBMS\\_SQL\\_MONITOR Security Model](#)
- [DBMS\\_SQL\\_MONITOR Constants](#)
- [Summary of DBMS\\_SQL\\_MONITOR Subprograms](#)

**See Also:**

[DBMS\\_SQLTUNE](#)

## 166.1 DBMS\_SQL\_MONITOR Overview

The `DBMS_SQL_MONITOR` package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views.

The following subprograms begin and end monitoring of a composite database operation:

- [BEGIN\\_OPERATION Function](#)
- [END\\_OPERATION Procedure](#)

The following subprograms report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`:

- [REPORT\\_SQL\\_MONITOR Function](#)
- [REPORT\\_SQL\\_MONITOR\\_XML Function](#)
- [REPORT\\_SQL\\_MONITOR\\_LIST Function](#)
- [REPORT\\_SQL\\_MONITOR\\_LIST\\_XML Function](#)

## 166.2 DBMS\_SQL\_MONITOR Security Model

This package is available to `PUBLIC` and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role `SELECT_CATALOG_ROLE`.

## 166.3 DBMS\_SQL\_MONITOR Constants

The `DBMS_SQL_MONITOR` package uses the constants shown in the following table.

**Table 166-1 DBMS\_SQL\_MONITOR Constants**

| Constant                       | Type                      | Value            | Description                                                                                                                                          |
|--------------------------------|---------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>FORCE_TRACKING</code>    | <code>VARCHAR2(30)</code> | <code>'Y'</code> | Force track the composite database operation when the operation starts                                                                               |
| <code>NO_FORCE_TRACKING</code> | <code>VARCHAR2(30)</code> | <code>'N'</code> | Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time. |

## 166.4 Summary of DBMS\_SQL\_MONITOR Subprograms

This table lists and describes the `DBMS_SQL_MONITOR` package subprograms.

**Table 166-2 DBMS\_SQL\_MONITOR Package Subprograms**

| Subprogram                                           | Description                                                                                                                                           |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BEGIN_OPERATION Function</a>             | This function starts a database operation in the current session.                                                                                     |
| <a href="#">END_OPERATION Procedure</a>              | This function ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect. |
| <a href="#">REPORT_SQL_MONITOR Function</a>          | This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.                          |
| <a href="#">REPORT_SQL_MONITOR_XML Function</a>      | This function is identical to the <code>REPORT_SQL_MONITOR</code> function, except that the return type is <code>XMLType</code> .                     |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a>     | This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.                                 |
| <a href="#">REPORT_SQL_MONITOR_LIST_XML Function</a> | This function is identical to the <code>REPORT_SQL_MONITOR_LIST</code> function, except that it returns <code>XMLType</code> .                        |

### 166.4.1 BEGIN\_OPERATION Function

This function starts a database operation in the current session.

#### Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (  
    dbop_name          IN VARCHAR2,
```

```
dbop_eid          IN NUMBER    := NULL,  
forced_tracking  IN VARCHAR2  := NO_FORCE_TRACKING,  
attribute_list   IN VARCHAR2  := NULL,  
session_id       IN NUMBER    := NULL,  
session_serial   IN NUMBER    := NULL)  
iRETURN NUMBER;
```

## Parameters

**Table 166-3** *BEGIN\_OPERATION Procedure Parameters*

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbop_name       | Name for the composite database operation.                                                                                                                                                                                                                                                                                                                                                                                                               |
| dbop_eid        | Unique identifier for the current execution of the composite database operation.                                                                                                                                                                                                                                                                                                                                                                         |
| forced_tracking | Whether tracking is forced. Possible values are: <ul style="list-style-type: none"><li>FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y.</li><li>NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N.</li></ul> See " <a href="#">DBMS_SQL_MONITOR Constants</a> ". |
| attribute_list  | List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load').                                                                                                                                                                                                                                                                                                                       |
| session_id      | Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.                                                                                                                                                                                                                                                                                                                                         |
| session_serial  | Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.                                                                                                                                                                                                                                                                                                                 |

## Return Values

This function returns the database operation execution ID. If the value is null for `dbop_eid`, then the database generates a unique value.

## 166.4.2 END\_OPERATION Procedure

This procedure ends a database operation in the current session. If the specified database operation does not exist, then this function has no effect.

## Syntax

```
DBMS_SQL_MONITOR.END_OPERATION(  
  dbop_name      IN VARCHAR2,  
  dbop_eid       IN NUMBER);
```

## Parameters

**Table 166-4 END\_OPERATION Procedure Parameters**

| Parameter | Description                                                                     |
|-----------|---------------------------------------------------------------------------------|
| dbop_name | Name of a composite database operation                                          |
| dbop_eid  | Unique identifier for the current execution of the composite database operation |

## 166.4.3 REPORT\_SQL\_MONITOR Function

This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its `sql_id`.
- A specific execution of a database operation identified by the combination `sql_id`, `sql_exec_start`, and `sql_exec_id`.
- The last execution of a specific database operation identified by `dbop_name`.
- The specific execution of a database operation identified by the combination `dbop_name`, `dbop_exec_id`.

## Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id              IN VARCHAR2 DEFAULT NULL,

## Parameters

**Table 166-5** *REPORT\_SQL\_MONITOR Procedure Parameters*

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id             | SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.                                                                                                                                                                                                                                 |
| dbop_name          | DBOP_NAME for which monitoring information of the composite database operation is displayed                                                                                                                                                                                                                                                                                                                                                    |
| dbop_exec_id       | Execution ID for the composite database operation for which monitoring information is displayed                                                                                                                                                                                                                                                                                                                                                |
| session_id         | Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.                                                                                                                                                                                                                                                                            |
| session_serial     | In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.                                                                                                                                                                                                                                                                           |
| sql_exec_start     | Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.                                                                                                                                                                                                   |
| sql_exec_id        | A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.                                                               |
| inst_id            | Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.                                                                                                                                                                                                                                                                                                   |
| start_time_filter  | If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.                                                                                                                                                                                                                                                         |
| end_time_filter    | If not NULL, the report shows activity from V\$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.                                                                                                                                                                                                             |
| instance_id_filter | Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.                                                                                                                                                                                                                                                                                                |
| parallel_filter    | Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be: <ul style="list-style-type: none"> <li>NULL - target all parallel execution servers as wells as the query coordinator</li> <li>['qc'] [servers(&lt;svr_grp&gt;[,] &lt;svr_set&gt;[,] &lt;srv_num&gt;)] where any NULL value is interpreted as ALL</li> </ul> |

**Table 166-5 (Cont.) *REPORT\_SQL\_MONITOR* Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plan_line_filter</code>  | Selects activity and execution statistics for the specified line number in the plan of a SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>event_detail</code>      | When set to <code>NO</code> , the activity is aggregated by <code>wait_class</code> only. Use <code>YES</code> (default) to aggregate by <code>wait_class</code> , <code>event_name</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>bucket_max_count</code>  | Specifies the maximum number of buckets to create in the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>bucket_interval</code>   | Represents the exact time interval, in seconds, of all histogram buckets. If specified, <code>bucket_max_count</code> is ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>base_path</code>         | URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash <code>swf</code> file).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>last_refresh_time</code> | <p>If not <code>NULL</code> (default), the time when the report was last retrieved (<code>SYSDATE</code> attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized:</p> <ul style="list-style-type: none"> <li>• SQL text will not be returned when this option is specified</li> <li>• Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if <code>last_refresh_time</code> is after the start of that bucket</li> </ul> |

Table 166-5 (Cont.) *REPORT\_SQL\_MONITOR Procedure Parameters*

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report_level        | <p>Level of detail for the report. Of the following, only one can be specified:</p> <ul style="list-style-type: none"> <li>NONE: Minimum possible</li> <li>BASIC: This is equivalent to <code>sql_text-plan-xplan-sessions-instance-activity_histogram-plan_histogram-metrics</code> where the token "-" implies that report section will not be included in the report.</li> <li>TYPICAL: Everything but <code>plan_histogram</code></li> <li>ALL: Everything</li> </ul> <p>In addition, individual report sections can also be enabled or disabled by using a <code>±section_name</code>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>XPLAN: Shows explain plan. ON by default.</li> <li>PLAN: Shows plan monitoring statistics. ON by default.</li> <li>SESSIONS: Show session details. Applies only to parallel queries. ON by default.</li> <li>INSTANCE: Shows instance details. Applies only to parallel and cross instance queries. ON by default.</li> <li>PARALLEL: An umbrella parameter for specifying sessions as well as instance details</li> <li>ACTIVITY: Shows activity summary at global level, plan line level and session</li> <li>INSTANCE LEVEL: (If applicable). ON by default.</li> <li>BINDS: Shows bind information when available. ON by default.</li> <li>METRICS: Shows metric data (such as CPU and IOs) over time. ON by default</li> <li>ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default.</li> <li>PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default.</li> <li>OTHER: Other information. ON by default.</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>-SQL_TEXT: No SQL text in report</li> <li>+SQL_TEXT: Alright with partial SQL text, that is, up to the first 2000 chars as stored in <code>GV\$SQL_MONITOR</code></li> <li>SQL_FULLTEXT: No full SQL text, that is, <code>+sql_text</code></li> <li>+SQL_FULLTEXT: Show full SQL text (default)</li> </ul> |
| type                | <p>Report type:</p> <ul style="list-style-type: none"> <li>TEXT: text report (default)</li> <li>HTML: simple HTML report</li> <li>ACTIVE: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code> and <code>plan_histogram</code>) is only shown when this type is selected</li> <li>XML: raw data for the report</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| sql_plan_hash_value | Targets only those with the specified plan hash value. Default is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| con_name            | Container name in a multitenant database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Return Values**

SQL monitor report, an XML document.

## Usage Notes

The user invoking this function must have privilege to access the following fixed views:

- GV\$SQL\_MONITOR
- GV\$SQL\_PLAN\_MONITOR
- GV\$ACTIVE\_SESSION\_HISTORY
- GV\$SESSION\_LONGOPS
- GV\$SQL if SQL full text is requested and its length is greater than 2 KB

## 166.4.4 REPORT\_SQL\_MONITOR\_XML Function

This function is identical to the `REPORT_SQL_MONITOR` function, except that the return type is `XMLType`.

### Related Topics

- [REPORT\\_SQL\\_MONITOR Function](#)  
This function builds a detailed report with monitoring information for a SQL statement, PL/SQL block, or database operation.

## 166.4.5 REPORT\_SQL\_MONITOR\_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

### Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (
    sql_id                IN VARCHAR2 DEFAULT NULL,
    dbop_name             IN VARCHAR2 DEFAULT NULL,
    monitor_type          IN NUMBER   DEFAULT MONITOR_TYPE_ALL,
    session_id            IN NUMBER   DEFAULT NULL,
    session_serial        IN NUMBER   DEFAULT NULL,
    inst_id               IN NUMBER   DEFAULT NULL,
    active_since_date     IN DATE     DEFAULT NULL,
    active_since_sec      IN NUMBER   DEFAULT NULL,
    last_refresh_time     IN DATE     DEFAULT NULL,
    report_level           IN VARCHAR2 DEFAULT 'TYPICAL',
    auto_refresh          IN NUMBER   DEFAULT NULL,
    base_path             IN VARCHAR2 DEFAULT NULL,
    type                  IN VARCHAR2 DEFAULT 'TEXT',
    con_name              IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

## Parameters

**Table 166-6** *REPORT\_SQL\_MONITOR\_LIST Procedure Parameters*

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sql_id</code>            | SQL_ID of the simple database operation for which monitoring information should be displayed. Use <code>NULL</code> (default) to display monitoring information for the last operation monitored by Oracle Database.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>dbop_name</code>         | DBOP_NAME for which monitoring information of the composite database operation is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>monitor_type</code>      | Monitor type: <ul style="list-style-type: none"> <li>• <code>MONITOR_TYPE_SQL</code> returns only simple database operations</li> <li>• <code>MONITOR_TYPE_DBOP</code> returns composite database operations</li> <li>• <code>MONITOR_TYPE_ALL</code> returns all types</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>session_id</code>        | Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is <code>NULL</code> . Use <code>-1</code> or <code>USERENV('SID')</code> for the current session.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>session_serial</code>    | In addition to <code>session_id</code> , you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when <code>session_id</code> is <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>inst_id</code>           | Looks only at monitored database operations originating from the specified instance. Use <code>-1</code> to target the instance where the report executed. To target all instances, use <code>NULL</code> (default).                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>active_since_date</code> | If not <code>NULL</code> (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>active_since_sec</code>  | If not <code>NULL</code> (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current <code>SYSDATE</code> minus a specified number of seconds. For example, use <code>3600</code> to limit the report to all operations that have been active in the past 1 hour.                                                                                                                                                        |
| <code>last_refresh_time</code> | If not <code>NULL</code> (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified <code>last_refresh_time</code> . For other queries, the report returns the execution key ( <code>sql_id</code> , <code>sql_exec_start</code> , and <code>sql_exec_id</code> ). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned. |
| <code>report_level</code>      | Level of detail for the report. The level can be <code>BASIC</code> (SQL text up to 200 character), <code>TYPICAL</code> (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or <code>ALL</code> which is the same as <code>TYPICAL</code> .                                                                                                                                                                                                                                                                                                                                                       |
| <code>auto_refresh</code>      | Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 166-6 (Cont.) *REPORT\_SQL\_MONITOR\_LIST* Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>base_path</code> | URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash <code>swf</code> file).                                                                                                                                                                                                                                                                                        |
| <code>type</code>      | Report type: <ul style="list-style-type: none"><li>• <code>TEXT</code>: text report (default)</li><li>• <code>HTML</code>: simple HTML report</li><li>• <code>ACTIVE</code>: database active report. Some information (explain plan, <code>activity_histogram</code>, <code>metrics</code>, and <code>plan_histogram</code>) is only shown when this type is selected.</li><li>• <code>XML</code>: raw data for the report</li></ul> |
| <code>con_name</code>  | Container name in a multitenant database.                                                                                                                                                                                                                                                                                                                                                                                            |

**Return Values**

A report in text, XML, or HTML format that contains the list of the database operations monitored.

**Usage Notes**

- Use the [REPORT\\_SQL\\_MONITOR Function](#) to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views `GV$SQL_MONITOR` and `GV$SQL`.

## 166.4.6 REPORT\_SQL\_MONITOR\_LIST\_XML Function

This function is identical to the `REPORT_SQL_MONITOR_LIST` function, except that it returns `XMLType`.

**Related Topics**

- [REPORT\\_SQL\\_MONITOR\\_LIST Function](#)  
This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

# DBMS\_SQL\_TRANSLATOR

The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)
- [Summary of DBMS\\_SQL\\_TRANSLATOR Subprograms](#)

## See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

## 167.1 DBMS\_SQL\_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is an invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

## 167.2 DBMS\_SQL\_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.

**Table 167-1 DBMS\_SQL\_TRANSLATOR Constants**

| Constant                     | Value                | Type          | Description                                                                                                                                                                                                                                                                                   |
|------------------------------|----------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATTR_EDITIONABLE             | 'EDITIONABLE'        | VARCHAR2 (30) | Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see <a href="#">Operational Notes</a> ) |
| ATTR_FOREIGN_SQL_SYNTAX      | 'FOREIGN_SQL_SYNTAX' | VARCHAR2 (30) | Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see <a href="#">Operational Notes</a> )                                                                                                                                 |
| ATTR_LOG_TRANSLATION_ERROR   | 'TRANSLATION_ERROR'  | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see <a href="#">Operational Notes</a> )                                                                                                                    |
| ATTR_RAISE_TRANSLATION_ERROR | 'TRANSLATION_ERROR ' | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see <a href="#">Operational Notes</a> )                                                                                         |
| ATTR_TRANSLATE_NEW_SQL       | 'TRANSLATE_NEW_SQL'  | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see <a href="#">Operational Notes</a> )                                                                                                                            |
| ATTR_TRACE_TRANSLATION       | 'TRACE_TRANSLATION'  | VARCHAR2 (30) | Name of the SQL translation profile attribute that controls tracing (see <a href="#">Operational Notes</a> )                                                                                                                                                                                  |
| ATTR_TRANSLATOR              | 'TRANSLATOR'         | VARCHAR2 (30) | Name of the SQL translation profile attribute that specifies the translator package (see <a href="#">Operational Notes</a> )                                                                                                                                                                  |
| ATTR_VALUE_TRUE              | 'TRUE'               | VARCHAR2 (30) | Value to set a SQL translation profile attribute to true (see <a href="#">Operational Notes</a> )                                                                                                                                                                                             |
| ATTR_VALUE_FALSE             | 'FALSE'              | VARCHAR2 (30) | Value to set a SQL translation profile attribute to false (see <a href="#">Operational Notes</a> )                                                                                                                                                                                            |

## 167.3 DBMS\_SQL\_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

### ATTR\_EDITIONABLE Constant

Editionable is true by default.

### ATTR\_FOREIGN\_SQL\_SYNTAX Constant

Foreign SQL syntax is true by default.

### ATTR\_LOG\_TRANSLATION\_ERROR Constant

- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
- Log translation error is false by default.

### ATTR\_RAISE\_TRANSLATION\_ERROR Constant

Raise translation error is false by default.

### ATTR\_TRANSLATE\_NEW\_SQL Constant

- The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error
- Translate new SQL statements and errors is true by default.

### ATTR\_TRACE\_TRANSLATION Constant

- If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.
- Tracing is disabled by default.

### ATTR\_TRANSLATOR Constant

- The translator package must be a PL/SQL package with the following three procedures. The [TRANSLATE\\_SQL Procedure](#) and the [TRANSLATE\\_ERROR Procedure](#) are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

```
PROCEDURE TRANSLATE_SQL(  
    sql_text          IN CLOB,  
    translated_text OUT CLOB);  
  
PROCEDURE TRANSLATE_ERROR(  
    error_code        IN BINARY_INTEGER,  
    translated_code    OUT BINARY_INTEGER,  
    translated_sqlstate OUT VARCHAR2);
```

Parameters:

|                     |                                  |
|---------------------|----------------------------------|
| profile_name        | - profile name                   |
| sql_text            | - SQL statement to be translated |
| translated_text     | - translated SQL statement       |
| error_code          | - Oracle error code              |
| translated_code     | - translated error code          |
| translated_sqlstate | - translated SQLSTATE            |

- When NULL is returned in translated\_text, translated\_code, or translated\_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
- The name of the translator package follows the naming rules for database packages of the form [schema.]package\_name. When the schema and package names are used, they are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, translator => 'dbms\_tsql\_translator' is the same as translator => 'Dbms\_Tsql\_Translator' and translator => 'DBMS\_TSQL\_TRANSLATOR', but not the same as translator => '"dbms\_tsql\_translator"'. The default schema name is the profile owner.
- The translator attribute is not set by default.

**ATTR\_VALUE\_TRUE Constant**

The value to set a SQL translation profile attribute to true.

**ATTR\_VALUE\_FALSE Constant**

The value to set a SQL translation profile attribute to false.

## 167.4 DBMS\_SQL\_TRANSLATOR Exceptions

This table lists the exceptions raised by the `DBMS_SQL_TRANSLATOR` package.

**Table 167-2 Exceptions Raised by DBMS\_SQL\_TRANSLATOR**

| Exception              | Error Code | Description                                             |
|------------------------|------------|---------------------------------------------------------|
| BAD_ARGUMENT           | 29261      | Bad argument is passed to the PL/SQL interface          |
| INSUFFICIENT_PRIVILEGE | 1031       | User has insufficient privilege for the operation       |
| NO_SUCH_PROFILE        | 24252      | Profile does not exist                                  |
| NO_SUCH_USER           | 1918       | Profile owner does not exist                            |
| NO_TRANSLATION_FOUND   | 24253      | No translation of the SQL statement or error code found |
| PROFILE_EXISTS         | 955        | Profile already exists                                  |

## 167.5 DBMS\_SQL\_TRANSLATOR Examples

This is an example of basic SQL translation using `DBMS_SQL_TRANSLATOR`.

**Basic SQL Translation**

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
    profile_name => 'tsql_application');
  DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
    profile_name => 'tsql_application',
    attribute_name => DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
    attribute_value => 'migration_repo.sybase_tsql_translator');
END;
```

## 167.6 Summary of DBMS\_SQL\_TRANSLATOR Subprograms

This table lists the `DBMS_SQL_TRANSLATOR` subprograms and briefly describes them.

**Table 167-3 DBMS\_SQL\_TRANSLATOR Package Subprograms**

| Subprogram                                           | Description                                                                        |
|------------------------------------------------------|------------------------------------------------------------------------------------|
| <a href="#">CREATE_PROFILE Procedure</a>             | Creates a SQL translation profile                                                  |
| <a href="#">DEREGISTER_SQL_TRANSLATION Procedure</a> | Deregisters the custom translation of a SQL statement in a SQL translation profile |

**Table 167-3 (Cont.) DBMS\_SQL\_TRANSLATOR Package Subprograms**

| Subprogram                                             | Description                                                                                                   |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <a href="#">DEREGISTER_ERROR_TRANSLATION Procedure</a> | Deregisters the translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile    |
| <a href="#">DROP_PROFILE Procedure</a>                 | Drops a SQL translation profile and its contents                                                              |
| <a href="#">ENABLE_ERROR_TRANSLATION Procedure</a>     | Enables or disables a custom translation of an Oracle error code in a SQL translation profile                 |
| <a href="#">ENABLE_SQL_TRANSLATION Procedure</a>       | Enables or disables a custom translation of a SQL statement in a SQL translation profile                      |
| <a href="#">EXPORT_PROFILE Procedure</a>               | Exports the content of a SQL translation profile                                                              |
| <a href="#">IMPORT_PROFILE Procedure</a>               | Imports the content of a SQL translation profile                                                              |
| <a href="#">REGISTER_ERROR_TRANSLATION Procedure</a>   | Registers a custom translation of an Oracle error code and <code>SQLSTATE</code> in a SQL translation profile |
| <a href="#">REGISTER_SQL_TRANSLATION Procedure</a>     | Registers a custom translation of a SQL statement in a SQL translation profile                                |
| <a href="#">SET_ATTRIBUTE Procedure</a>                | Sets an attribute of a SQL translation profile                                                                |
| <a href="#">SQL_HASH Function</a>                      | Computes the hash value of a SQL statement in a SQL translation profile                                       |
| <a href="#">SQL_ID Function</a>                        | Computes the SQL identifier of a SQL statement in a SQL translation profile                                   |
| <a href="#">TRANSLATE_ERROR Procedure</a>              | Translates an Oracle error code and an ANSI <code>SQLSTATE</code> using a SQL translation profile             |
| <a href="#">TRANSLATE_SQL Procedure</a>                | Translates a SQL statement using a SQL translation profile                                                    |

## 167.6.1 CREATE\_PROFILE Procedure

This procedure creates a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN  VARCHAR2);
```

### Parameters

**Table 167-4 CREATE\_PROFILE Procedure Parameters**

| Parameter                 | Description     |
|---------------------------|-----------------|
| <code>profile_name</code> | Name of profile |

## Exceptions

**Table 167-5 CREATE\_PROFILE Procedure Exceptions**

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| PROFILE_EXISTS         | Profile already exists                            |

## Usage Notes

- A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS\_SQL\_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile `profile_name => 'tsql_application'` is the same as `profile_name => 'Tsql_Application'` and `profile_name => 'TSQL_APPLICATION'`, but not the same as `profile_name => "tsql_application"`.
- A SQL translation profile is an editable object type.
- A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).
- To destroy a SQL translation profile, use the [DROP\\_PROFILE Procedure](#).

## Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;
```

## 167.6.2 DEREGISTER\_SQL\_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (
  profile_name      IN  VARCHAR2,
  sql_text          IN  CLOB);
```

### Parameters

**Table 167-6 DEREGISTER\_SQL\_TRANSLATION Procedure Parameters**

| Parameter    | Description     |
|--------------|-----------------|
| profile_name | Name of profile |
| sql_text     | SQL statement   |

## Exceptions

**Table 167-7 Deregister\_SQL\_Translation Procedure Exceptions**

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| PROFILE_EXISTS         | Profile already exists                            |

## Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION(
        profile_name => 'tsql_application',
        sql_text      => 'select top 5 * from emp');
END;
```

## 167.6.3 DEREGISTER\_ERROR\_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
    profile_name      IN   VARCHAR2,
    error_code        IN   PLS_INTEGER);
```

### Parameters

**Table 167-8 Deregister\_Error\_Translation Procedure Parameters**

| Parameter    | Description       |
|--------------|-------------------|
| profile_name | Name of profile   |
| error_code   | Oracle error code |

## Exceptions

**Table 167-9 Deregister\_Error\_Translation Procedure Exceptions**

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    error_code   => 1);
END;
```

## 167.6.4 DROP\_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

### Syntax

```
DBMS_SQL_TRANSLATOR.DROP_PROFILE (
  profile_name IN VARCHAR2);
```

### Parameters

**Table 167-10** *DROP\_PROFILE Procedure Parameters*

| Parameter    | Description     |
|--------------|-----------------|
| profile_name | Name of profile |

### Exceptions

**Table 167-11** *DROP\_PROFILE Procedure Exceptions*

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.DROP_PROFILE(
    profile_name => 'tsql_application');
END;
```

## 167.6.5 ENABLE\_ERROR\_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (
  profile_name IN VARCHAR2,
  sql_text     IN CLOB,
  enable       IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 167-12** *ENABLE\_ERROR\_TRANSLATION Procedure Parameters*

| Parameter    | Description                       |
|--------------|-----------------------------------|
| profile_name | Name of profile                   |
| sql_text     | SQL statement                     |
| enable       | Enable or disable the translation |

## Exceptions

**Table 167-13** *ENABLE\_ERROR\_TRANSLATION Procedure Exceptions*

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'SELECT TOP 5 * FROM emp'
    enable       => TRUE);
END;
```

## 167.6.6 ENABLE\_SQL\_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
  profile_name  IN   VARCHAR2,
  sql_text      IN   CLOB,
  enable        IN   BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 167-14** *ENABLE\_SQL\_TRANSLATION Procedure Parameters*

| Parameter    | Description                       |
|--------------|-----------------------------------|
| profile_name | Name of profile                   |
| sql_text     | SQL statement                     |
| enable       | Enable or disable the translation |

## Exceptions

**Table 167-15** ENABLE\_SQL\_TRANSLATION Procedure Exceptions

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    enable       => TRUE);
END;
```

## 167.6.7 EXPORT\_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (
  profile_name  IN          VARCHAR2,
  content       OUT NOCOPY  CLOB);
```

### Parameters

**Table 167-16** EXPORT\_PROFILE Procedure Parameters

| Parameter    | Description        |
|--------------|--------------------|
| profile_name | Name of profile    |
| content      | Content of profile |

## Exceptions

**Table 167-17** EXPORT\_PROFILE Procedure Exceptions

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```
SQLTranslationProfile Translator="translator package name"
    ForeignSQLSyntax="TRUE|FALSE"
    TranslateNewSQL="TRUE|FALSE"
    RaiseTranslationError="TRUE|FALSE"
    LogTranslationError="TRUE|FALSE"
    TraceTranslation="TRUE|FALSE"
    Editionable="TRUE|FALSE">
  <SQLTranslations>
    <SQLTranslation Enabled="TRUE|FALSE">
      <SQLText>original SQL text</SQLText>
      <TranslatedText>translated SQL text</TranslatedText>
    </SQLTranslation>
    ...
  </SQLTranslations>
  <ErrorTranslations>
    <ErrorTranslation Enabled="TRUE|FALSE">
      <ErrorCode>Oracle error code</ErrorCode>
      <TranslatedCode>translated error code</TranslatedCode>
      <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
    </ErrorTranslation>
    ...
  </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the [IMPORT\\_PROFILE Procedure](#).

## Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

## 167.6.8 IMPORT\_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name  IN  VARCHAR2,
  content       IN  CLOB);
```

### Parameters

**Table 167-18** *IMPORT\_PROFILE Procedure Parameters*

| Parameter    | Description        |
|--------------|--------------------|
| profile_name | Name of profile    |
| content      | Content of profile |

## Exceptions

**Table 167-19** IMPORT\_PROFILE Procedure Exceptions

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |

## Usage Notes

- The content of the SQL translation profile must be in XML format as used by the [EXPORT\\_PROFILE Procedure](#). All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the [EXPORT\\_PROFILE Procedure](#).

## Examples

```
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
    profile_name => 'tsql_application',
    content      => content);
END;
```

## 167.6.9 REGISTER\_ERROR\_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and `SQLSTATE` in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
  profile_name      IN  VARCHAR2,
  error_code        IN  PLS_INTEGER,
  translated_code   IN  PLS_INTEGER DEFAULT NULL,
  translated_sqlstate IN VARCHAR2 DEFAULT NULL,
  enable            IN  BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 167-20** REGISTER\_ERROR\_TRANSLATION Procedure Parameters

| Parameter           | Description                       |
|---------------------|-----------------------------------|
| profile_name        | Name of profile                   |
| error_code          | Oracle error code                 |
| translated_code     | Translated error code             |
| translated_sqlstate | Translated <code>SQLSTATE</code>  |
| enable              | Enable or disable the translation |

## Exceptions

**Table 167-21 REGISTER\_ERROR\_TRANSLATION Procedure Exceptions**

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and `SQLSTATE`, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER\\_ERROR\\_TRANSLATION Procedure](#).

## Examples

```
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION(
        profile_name => 'tsql_application',
        error_code    => 1,
        translated_code => 2601);
END;
```

## 167.6.10 REGISTER\_SQL\_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name      IN VARCHAR2,
    sql_text          IN CLOB,
    translated_text    IN CLOB DEFAULT NULL,
    enable            IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 167-22 REGISTER\_SQL\_TRANSLATION Procedure Parameters**

| Parameter       | Description              |
|-----------------|--------------------------|
| profile_name    | Name of profile          |
| sql_text        | SQL statement            |
| translated_text | Translated SQL statement |

**Table 167-22 (Cont.) REGISTER\_SQL\_TRANSLATION Procedure Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| enable    | Enable or disable the translation |

### Exceptions

**Table 167-23 REGISTER\_SQL\_TRANSLATION Procedure Exceptions**

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

### Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- When `translated_text` is NULL, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the [DEREGISTER\\_SQL\\_TRANSLATION Procedure](#).

### Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

## 167.6.11 SET\_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (
  profile_name      IN  VARCHAR2,
  attribute_name    IN  VARCHAR2,
  attribute_value   IN  VARCHAR2;)
```

## Parameters

**Table 167-24** *SET\_ATTRIBUTE Procedure Parameters*

| Parameter       | Description        |
|-----------------|--------------------|
| profile_name    | Name of profile    |
| attribute_name  | Name of attribute  |
| attribute_value | Value of attribute |

## Exceptions

**Table 167-25** *SET\_ATTRIBUTE Procedure Exceptions*

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

## Usage Notes

See [Constants](#)

## 167.6.12 SQL\_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

## Syntax

```
DBMS_SQL_TRANSLATOR.SQL_HASH (  
    sql_text          IN    CLOB)  
RETURN NUMBER DETERMINISTIC;
```

## Parameters

**Table 167-26** *SQL\_HASH Function Parameters*

| Parameter | Description   |
|-----------|---------------|
| sql_text  | SQL statement |

## Return Values

Returns hash value of the SQL statement in the SQL translation profile

## Exceptions

**Table 167-27 SQL\_HASH Function Exceptions**

| Exception    | Description                                    |
|--------------|------------------------------------------------|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |

## Examples

```
DECLARE
  sqltext CLOB;
  txltext CLOB;
  sqlhash NUMBER;
BEGIN
  sqltext := 'SELECT TOP 1 * FROM emp';
  sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
  SELECT translated_text INTO txltext
    FROM user_sql_translations
   WHERE sql_hash = sqlhash
   AND DBMS_LOB.COMPARE (sql_text, sqltext) = 0;
END;
```

## 167.6.13 SQL\_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

## Syntax

```
DBMS_SQL_TRANSLATOR.SQL_ID (
  sql_text          IN CLOB)
RETURN VARCHAR2 DETERMINISTIC;
```

## Parameters

**Table 167-28 SQL\_ID Function Parameters**

| Parameter | Description   |
|-----------|---------------|
| sql_text  | SQL statement |

## Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

## Exceptions

**Table 167-29 SQL\_ID Function Exceptions**

| Exception    | Description                                    |
|--------------|------------------------------------------------|
| BAD_ARGUMENT | Bad argument is passed to the PL/SQL interface |

## Examples

```
DECLARE
  sqltext CLOB;
```

```

    sqlid   VARCHAR2(13);
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;
```

## 167.6.14 TRANSLATE\_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

### Syntax

```

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (
    error_code          IN          PLS_INTEGER,
    translated_code      OUT         PLS_INTEGER,
    translated_sqlstate  OUT NOCOPY  VARCHAR2);
```

### Parameters

**Table 167-30** *TRANSLATE\_ERROR Procedure Parameters*

| Parameter           | Description           |
|---------------------|-----------------------|
| error_code          | Oracle error code     |
| translated_code     | Translated error code |
| translated_sqlstate | Translated SQLSTATE   |

### Exceptions

**Table 167-31** *TRANSLATE\_ERROR Procedure Exceptions*

| Exception              | Description                                                |
|------------------------|------------------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface             |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation          |
| NO_SUCH_USER           | Profile owner does not exist                               |
| NO_SUCH_PROFILE        | Profile does not exist                                     |
| NO_TRANSLATION_FOUND   | No translation of the SQL statement or error code is found |

### Examples

```

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code       => 1,
        translated_code   => translated_code,
        translated_sqlstate => translated_sqlstate);
END;
```

## 167.6.15 TRANSLATE\_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

### Syntax

```
DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (
    sql_text          IN          CLOB,
    translated_text    OUT NOCOPY CLOB);
```

### Parameters

**Table 167-32** *TRANSLATE\_SQL Procedure Parameters*

| Parameter       | Description              |
|-----------------|--------------------------|
| sql_text        | SQL statement            |
| translated_text | Translated SQL statement |

### Exceptions

**Table 167-33** *TRANSLATE\_SQL Procedure Exceptions*

| Exception              | Description                                       |
|------------------------|---------------------------------------------------|
| BAD_ARGUMENT           | Bad argument is passed to the PL/SQL interface    |
| INSUFFICIENT_PRIVILEGE | User has insufficient privilege for the operation |
| NO_SUCH_USER           | Profile owner does not exist                      |
| NO_SUCH_PROFILE        | Profile does not exist                            |

### Examples

```
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;

DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text      => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```

# DBMS\_SQLDIAG

The DBMS\_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- [DBMS\\_SQLDIAG Overview](#)
- [DBMS\\_SQLDIAG Security Model](#)
- [DBMS\\_SQLDIAG Constants](#)
- [Summary of DBMS\\_SQLDIAG Subprograms](#)

## See Also:

*Oracle Database Administrator's Guide* for more information about "Managing Diagnostic Data"

## 168.1 DBMS\_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement by using the DBMS\_SQLDIAG package subprograms.

The SQL Repair Advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

## See Also:

*Oracle Database Administrator's Guide* for more information about how to run the SQL Repair Advisor using the DBMS\_SQLDIAG package subprograms.

## 168.2 DBMS\_SQLDIAG Security Model

You must have the ADVISOR role to execute the DBMS\_SQLDIAG package.

## 168.3 DBMS\_SQLDIAG Constants

DBMS\_SQLDIAG defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- [Table 168-1](#) describes the name of SQL repair advisor as seen by the advisor framework

- [Table 168-2](#) describes SQLDIAG advisor task scope parameter values
- [Table 168-3](#) describes SQLDIAG advisor `time_limit` constants
- [Table 168-4](#) describes possible formats for a report
- [Table 168-5](#) describes possible levels of detail in the report
- [Table 168-6](#) describes possible report sections (comma delimited)
- [Table 168-7](#) describes possible values for the `problem_type` parameter of the [CREATE\\_DIAGNOSIS\\_TASK Functions](#)
- [Table 168-8](#) describes possible values for the `_sql_findings_mode` parameter

**Table 168-1 DBMS\_SQLDIAG Constants - SQLDIAG Advisor Name**

| Constant          | Type          | Value              | Description                                                 |
|-------------------|---------------|--------------------|-------------------------------------------------------------|
| ADV_SQL_DIAG_NAME | VARCHAR2 (18) | SQL Repair Advisor | Name of SQL repair advisor as seen by the advisor framework |

**Table 168-2 DBMS\_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values**

| Constant            | Type          | Value         | Description                                                          |
|---------------------|---------------|---------------|----------------------------------------------------------------------|
| SCOPE_COMPREHENSIVE | VARCHAR2 (13) | COMPREHENSIVE | Detailed analysis of the problem which may take more time to execute |
| SCOPE_LIMITED       | VARCHAR2 (7)  | LIMITED       | Brief analysis of the problem                                        |

**Table 168-3 DBMS\_SQLDIAG Constants - SQLDIAG Advisor `time_limit` Constants**

| Constant           | Type   | Value | Description                                    |
|--------------------|--------|-------|------------------------------------------------|
| TIME_LIMIT_DEFAULT | NUMBER | 1800  | Default time limit for analysis of the problem |

**Table 168-4 DBMS\_SQLDIAG Constants - Report Type (possible values) Constants**

| Constant  | Type         | Value | Description                                                                 |
|-----------|--------------|-------|-----------------------------------------------------------------------------|
| TYPE_HTML | VARCHAR2 (4) | HTML  | Report from the <a href="#">REPORT_DIAGNOSIS_TASK Function</a> in HTML form |
| TYPE_TEXT | VARCHAR2 (4) | TEXT  | Report from the <a href="#">REPORT_DIAGNOSIS_TASK Function</a> in text form |
| TYPE_XML  | VARCHAR2 (3) | XML   | Report from the <a href="#">REPORT_DIAGNOSIS_TASK Function</a> in XML form  |

**Table 168-5 DBMS\_SQLDIAG Constants - Report Level (possible values) Constants**

| Constant      | Type         | Value   | Description                                                                                 |
|---------------|--------------|---------|---------------------------------------------------------------------------------------------|
| LEVEL_ALL     | VARCHAR2 (3) | ALL     | Complete report including annotations about statements skipped over                         |
| LEVEL_BASIC   | VARCHAR2 (5) | BASIC   | Shows information about every statement analyzed, including recommendations not implemented |
| LEVEL_TYPICAL | VARCHAR2 (7) | TYPICAL | Simple report shows only information about the actions taken by the advisor.                |

**Table 168-6 DBMS\_SQLDIAG Constants - Report Section (possible values) Constants**

| Constant            | Type          | Value       | Description            |
|---------------------|---------------|-------------|------------------------|
| SECTION_ALL         | VARCHAR2 (3)  | ALL         | All statements         |
| SECTION_ERRORS      | VARCHAR2 (6)  | ERRORS      | Statements with errors |
| SECTION_FINDINGS    | VARCHAR2 (8)  | FINDINGS    | Tuning findings        |
| SECTION_INFORMATION | VARCHAR2 (11) | INFORMATION | General information    |
| SECTION_PLANS       | VARCHAR2 (5)  | PLANS       | Explain plans          |
| SECTION_SUMMARY     | VARCHAR2 (7)  | SUMMARY     | Summary information    |

**Table 168-7 DBMS\_SQLDIAG Constants - Problem Type Constants**

| Constant                       | Type   | Value | Description                                            |
|--------------------------------|--------|-------|--------------------------------------------------------|
| PROBLEM_TYPE_PERFORMANCE       | NUMBER | 1     | User suspects this is a performance problem            |
| PROBLEM_TYPE_WRONG_RESULTS     | NUMBER | 2     | User suspects the query is giving inconsistent results |
| PROBLEM_TYPE_COMPILATION_ERROR | NUMBER | 3     | User sees a crash in compilation                       |
| PROBLEM_TYPE_EXECUTION_ERROR   | NUMBER | 4     | User sees a crash in execution                         |
| PROBLEM_TYPE_ALT_PLAN_GEN      | NUMBER | 5     | User to explore all alternative plans                  |

**Table 168-8 DBMS\_SQLDIAG Constants - Findings Filter Constants**

| Constant             | Type   | Value | Description                |
|----------------------|--------|-------|----------------------------|
| SQLDIAG_FINDINGS_ALL | NUMBER | 1     | Show all possible findings |

**Table 168-8 (Cont.) DBMS\_SQLDIAG Constants - Findings Filter Constants**

| Constant                       | Type   | Value | Description                                         |
|--------------------------------|--------|-------|-----------------------------------------------------|
| SQLDIAG_FINDINGS_VALIDATION    | NUMBER | 2     | Show status of validation rules over structures     |
| SQLDIAG_FINDINGS_FEATURES      | NUMBER | 3     | Show only features used by the query                |
| SQLDIAG_FINDINGS_FILTER_PLANS  | NUMBER | 4     | Show the alternative plans generated by the advisor |
| SQLDIAG_FINDINGS_CR_DIFF       | NUMBER | 5     | Show difference between two plans                   |
| SQLDIAG_FINDINGS_MASK_VARIANTS | NUMBER | 6     | Mask info for testing                               |
| SQLDIAG_FINDINGS_OBJ_FEATURES  | NUMBER | 7     | Show features usage history                         |
| SQLDIAG_FINDINGS_BASIC_INFO    | NUMBER | 8     | Show the alternative plans generated by the advisor |

## 168.4 Summary of DBMS\_SQLDIAG Subprograms

This table lists the DBMS\_SQLDIAG subprograms and briefly describes them.

**Table 168-9 DBMS\_SQLDIAG Package Subprograms**

| Subprogram                                                | Description                                                                                                 |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <a href="#">ACCEPT_SQL_PATCH Function &amp; Procedure</a> | Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task                          |
| <a href="#">ALTER_SQL_PATCH Procedure</a>                 | Alters specific attributes of an existing SQL patch object                                                  |
| <a href="#">CANCEL_DIAGNOSIS_TASK Procedure</a>           | Cancels a diagnostic task                                                                                   |
| <a href="#">CREATE_DIAGNOSIS_TASK Functions</a>           | Creates a diagnostic task in order to diagnose a single SQL statement                                       |
| <a href="#">CREATE_SQL_PATCH Function</a>                 | Creates an SQL patch based on a set of user specified hints for specific statements identified by SQL text. |
| <a href="#">CREATE_STGTAB_SQLPATCH Procedure</a>          | Creates the staging table used for transporting SQL patches from one system to another                      |
| <a href="#">DROP_DIAGNOSIS_TASK Procedure</a>             | Drops a diagnostic task                                                                                     |
| <a href="#">DROP_SQL_PATCH Procedure</a>                  | Drops the named SQL patch from the database                                                                 |
| <a href="#">EXECUTE_DIAGNOSIS_TASK Procedure</a>          | Executes a diagnostic task                                                                                  |
| <a href="#">EXPLAIN_SQL_TESTCASE Function</a>             | Explains a SQL test case                                                                                    |
| <a href="#">EXPORT_SQL_TESTCASE Procedures</a>            | Exports a SQL test case to a directory                                                                      |

**Table 168-9 (Cont.) DBMS\_SQLDIAG Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EXPORT_SQL_TESTCASE_DIR_BY_INC Function</a> | Generates a SQL Test Case corresponding to the incident ID passed as an argument.                                                                                                            |
| <a href="#">EXPORT_SQL_TESTCASE_DIR_BY_TXT Function</a> | Generates a SQL Test Case corresponding to the SQL passed as an argument                                                                                                                     |
| <a href="#">GET_FIX_CONTROL Function</a>                | Returns the value of fix control for a given bug number                                                                                                                                      |
| <a href="#">GET_SQL Function</a>                        | Imports a SQL test case                                                                                                                                                                      |
| <a href="#">IMPORT_SQL_TESTCASE Procedures</a>          | Imports a SQL test case into a schema                                                                                                                                                        |
| <a href="#">INCIDENTID_2_SQL Procedure</a>              | Initializes a <code>sql_setrow</code> from an incident ID                                                                                                                                    |
| <a href="#">INTERRUPT_DIAGNOSIS_TASK Procedure</a>      | Interrupts a diagnostic task                                                                                                                                                                 |
| <a href="#">LOAD_SQLSET_FROM_TCB Function</a>           | Loads a <code>SQLSET</code> from Test Case Builder (TCB) file                                                                                                                                |
| <a href="#">PACK_STGTAB_SQLPATCH Procedure</a>          | SQL patches into the staging table created by the <a href="#">CREATE_STGTAB_SQLPATCH Procedure</a>                                                                                           |
| <a href="#">REPLAY_SQL_TESTCASE Function</a>            | Reports on a diagnostic task                                                                                                                                                                 |

## 168.4.1 ACCEPT\_SQL\_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

### Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner     IN  VARCHAR2 := NULL,
  replace        IN  BOOLEAN := FALSE,
```

```

    force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
    task_name      IN  VARCHAR2,
    object_id      IN  NUMBER := NULL,
    name           IN  VARCHAR2 := NULL,
    description     IN  VARCHAR2 := NULL,
    category       IN  VARCHAR2 := NULL,
    task_owner     IN  VARCHAR2 := NULL,
    replace        IN  BOOLEAN := FALSE,
    force_match    IN  BOOLEAN := FALSE);

```

## Parameters

**Table 168-10 ACCEPT\_SQL\_PATCH Function & Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskname    | Name of the SQL diagnosis task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| object_id   | Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| name        | Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| description | User specified string describing the purpose of this SQL patch. Maximum size of description is 500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| category    | Category name which must match the value of the <code>SQLDIAGNOSE_CATEGORY</code> parameter in a session for the session to use this patch. It defaults to the value <code>DEFAULT</code> . This is also the default of the <code>SQLDIAGNOSE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.                                                                 |
| task_owner  | Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.                                                                                                                                                                                                                                                                                                                                                                                                       |
| replace     | If the patch already exists, it will be replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                                                             |
| force_match | If <code>TRUE</code> this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>CURSOR_SHARING</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>CURSOR_SHARING</code> parameter. |

## Return Values

Name of the SQL patch

## Usage Notes

Requires `CREATE ANY SQL PROFILE` privilege

## 168.4.2 ALTER\_SQL\_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

### Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (  
    name             IN  VARCHAR2,  
    attribute_name    IN  VARCHAR2,  
    attribute_value    IN  VARCHAR2);
```

### Parameters

**Table 168-11 ALTER\_SQL\_PATCH Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name            | Name of SQL patch to alter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| attribute_name  | Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"><li>• STATUS -&gt; can be set to ENABLED or DISABLED</li><li>• NAME -&gt; can be reset to a valid name (must be a valid Oracle identifier and must be unique).</li><li>• DESCRIPTION -&gt; can be set to any string of size no more than 500</li><li>• CATEGORY -&gt; can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text)</li></ul> This parameter is mandatory and is case sensitive. |
| attribute_value | New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Notes

Requires ALTER ANY SQL PATCH privilege

## 168.4.3 CANCEL\_DIAGNOSIS\_TASK Procedure

This procedure cancels a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname         IN  VARCHAR2);
```

### Parameters

**Table 168-12 CANCEL\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.4 CREATE\_DIAGNOSIS\_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

### Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN    CLOB,
    bind_list         IN    sql_binds := NULL,
    user_name         IN    VARCHAR2 := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN    VARCHAR2 := NULL,
    description       IN    VARCHAR2 := NULL,
    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id            IN    VARCHAR2,
    plan_hash_value   IN    NUMBER    := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,

    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN    VARCHAR2,
    basic_filter      IN    VARCHAR2 := NULL,
    object_filter     IN    VARCHAR2 := NULL,
    rank1             IN    VARCHAR2 := NULL,
    rank2             IN    VARCHAR2 := NULL,
    rank3             IN    VARCHAR2 := NULL,
    result_percentage IN    NUMBER    := NULL,
    result_limit      IN    NUMBER    := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN    VARCHAR2 := NULL,
    description       IN    VARCHAR2 := NULL,
    plan_filter       IN    VARCHAR2 := 'MAX_ELAPSED_TIME',
    sqlset_owner      IN    VARCHAR2 := NULL,
    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE) RETURN VARCHAR2;
```

### Parameters

**Table 168-13 CREATE\_DIAGNOSIS\_TASK Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| sql_text  | Text of a SQL statement |
| bind_list | Set of bind values      |

**Table 168-13 (Cont.) CREATE\_DIAGNOSIS\_TASK Function Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| plan_hash_value   | Hash value of the SQL execution plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sqlset_name       | Sqlset name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| basic_filter      | SQL predicate to filter the SQL from the SQL tuning set (STS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| object_filter     | Object filter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rank(i)           | Order-by clause on the selected SQL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| result_percentage | Percentage on the sum of a ranking measure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| result_limit      | Top L(imit) SQL from (filtered/ranked) SQL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| plan_filter       | Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> <li>LAST_GENERATED: plan with most recent timestamp</li> <li>FIRST_GENERATED: opposite to LAST_GENERATED</li> <li>LAST_LOADED: plan with most recent first_load_time stat info</li> <li>FIRST_LOADED: opposite to LAST_LOADED</li> <li>MAX_ELAPSED_TIME: plan with maximum elapsed time</li> <li>MAX_BUFFER_GETS: plan with maximum buffer gets</li> <li>MAX_DISK_READS: plan with maximum disk reads</li> <li>MAX_DIRECT_WRITES: plan with maximum direct writes</li> <li>MAX_OPTIMIZER_COST: plan with maximum optimum cost</li> </ul> |
| sqlset_owner      | Owner of the sqlset, or null for current schema owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 168.4.5 CREATE\_SQL\_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

### Syntax

```
DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_text      IN   CLOB,
    hint_text     IN   CLOB,
```

```

        name          IN   VARCHAR2      := NULL,
        description    IN   VARCHAR2      := NULL,
        category       IN   VARCHAR2      := NULL,
        validate       IN   BOOLEAN        := TRUE)
RETURN VARCHAR2;

DBMS_SQLDIAG.CREATE_SQL_PATCH (
    sql_id            IN   VARCHAR2,
    hint_text         IN   CLOB,
    name              IN   VARCHAR2      := NULL,
    description        IN   VARCHAR2      := NULL,
    category          IN   VARCHAR2      := NULL,
    validate          IN   BOOLEAN        := TRUE)
RETURN VARCHAR2;
```

## Parameters

**Table 168-14 CREATE\_SQL\_PATCH Function Parameters**

| Parameter   | Description                              |
|-------------|------------------------------------------|
| sql_text    | Text of the SQL statement                |
| sql_id      | The SQL identifier for the SQL statement |
| hint_text   | Hints to include in the SQL patch        |
| name        | Optional SQL patch name                  |
| description | Description of the SQL patch             |
| category    | Category name                            |
| validate    | Whether to validate the provided hints   |

## Return Values

Both functions return the SQL patch name.

## Notes

Refer to My Oracle Support note [1931944.1](#) on how hints should name query blocks when creating a SQL patch.

## 168.4.6 CREATE\_STGTAB\_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

## Syntax

```

DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
    table_name        IN   VARCHAR2,
    schema_name       IN   VARCHAR2 := NULL,
    tablespace_name   IN   VARCHAR2 := NULL);
```

## Parameters

**Table 168-15 CREATE\_STGTAB\_SQLPATCH Procedure Parameters**

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| table_name      | (Mandatory) Name of the table to create (case-sensitive)                                                     |
| schema_name     | Schema to create the table in, or NULL for current schema (case-sensitive)                                   |
| tablespace_name | Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive) |

## 168.4.7 DROP\_DIAGNOSIS\_TASK Procedure

This procedure drops a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname      IN   VARCHAR2);
```

## Parameters

**Table 168-16 DROP\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.8 DROP\_SQL\_PATCH Procedure

This procedure drops the named SQL patch from the database.

### Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (  
    name      IN   VARCHAR2,  ignore   IN   BOOLEAN := FALSE);
```

## Parameters

**Table 168-17 DROP\_SQL\_PATCH Function & Procedure Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| name      | Name of patch to be dropped. The name is case sensitive. |
| ignore    | Ignore errors due to object not existing.                |

### Usage Notes

Requires DROP ANY SQL PATCH privilege

## 168.4.9 EXECUTE\_DIAGNOSIS\_TASK Procedure

This procedure executes a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname      IN   VARCHAR2);
```

### Parameters

**Table 168-18 EXECUTE\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.10 EXPLAIN\_SQL\_TESTCASE Function

This procedure explains a SQL test case.

### Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase    IN   CLOB)
RETURN CLOB;
```

### Parameters

**Table 168-19 EXPLAIN\_SQL\_TESTCASE Function Parameters**

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| sqlTestCase | XML document describing the SQL test case |

## 168.4.11 EXPORT\_SQL\_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

### Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory      IN          VARCHAR2,
    sql_text       IN          CLOB,
    user_name      IN          VARCHAR2 := NULL,
    bind_list      IN          sql_binds := NULL,
    exportEnvironment IN      BOOLEAN := TRUE,
    exportMetadata  IN          BOOLEAN := TRUE,
    exportData      IN          BOOLEAN := FALSE,
    exportPkgbody   IN          BOOLEAN := FALSE,
    samplingPercent IN          NUMBER  := 100,
    ctrlOptions     IN          VARCHAR2 := NULL,
    timeLimit       IN          NUMBER   := 0,
    testcase_name   IN          VARCHAR2 := NULL,
```

```

testcase          IN OUT NOCOPY  CLOB,
preserveSchemaMapping IN          BOOLEAN := FALSE,
version           IN              VARCHAR2 := 'COMPATIBLE';

```

This variant extracts the SQL information from an incident file.

```

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory          IN              VARCHAR2,
  incident_id        IN              VARCHAR2,
  exportEnvironment  IN              BOOLEAN := TRUE,

  version           IN              VARCHAR2 := 'COMPATIBLE');

```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```

## Parameters

**Table 168-20 EXPORT\_SQL\_TESTCASE Procedure Parameters**

| Parameter         | Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------|
| directory         | Directory to store the various generated files                                                                  |
| sql_text          | Text of the SQL statement to export                                                                             |
| incident_id       | Incident ID containing the offending SQL                                                                        |
| sql_id            | Identifier of the statement in the cursor cache, automatic workload repository, or the automatic SQL tuning set |
| username          | Name of the user schema to use to parse the SQL, defaults to SYS                                                |
| bind_list         | List of bind values associated to the statement                                                                 |
| exportEnvironment | TRUE if the compilation environment should be exported                                                          |

| timeLimit             | How much time should we spend exporting the SQL test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| testcaseName          | An optional name for the SQL test case. This is used to prefix all the generated scripts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| testcase              | Resulting testcase                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| preserveSchemaMapping | TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| version               | Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted. <ul style="list-style-type: none"> <li>COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</li> <li>LATEST - the version of the metadata that specifies the current database version.</li> <li>A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.</li> </ul> |

**Usage Notes**

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)
  - a README.txt file that explain the usage of the TCB
  - the outlines used by the statement (ol.xml)
  - a list of parameters set in the exporting db/env (prmimp.sql)
  - a SQL monitor report, if any (smrpt.html)
  - an AWR report, if any (awrrpt.html)
  - a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT\_SQL\_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call `IMPORT_SQL_TESTCASE Procedures` with `importPkgbody=>TRUE`.
- To export objects statistics history, the database compatibility should be set to 12.0 or higher.
- This procedure does not export data and statistics on a Global Temporary Table (GTT).

### Examples

The user can specify multiple parameters in the `ctrlOptions` encapsulated either by using the `<parameters>` parent tag or without the parent tag.

Using the `<parameters>` tag

```
<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="diag_event">SQLEXEC_LOW</parameter>
</parameters>
```

Without the `<parameters>` tag

```
<parameter name="capture">with_runtime_info</parameter>
<parameter name="compress">yes</parameter>
```

## 168.4.12 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

### Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    exportEnvironment IN    VARCHAR2 := 'TRUE',
    exportMetadata   IN    VARCHAR2 := 'TRUE',
    exportData       IN    VARCHAR2 := 'FALSE',
    samplingPercent  IN    VARCHAR2 := '100',
    ctrlOptions      IN    VARCHAR2 := NULL,
    version          IN    VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;
```

### Parameters

**Table 168-21 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_INC Function Parameters**

| Parameter                      | Description                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>incident_id</code>       | Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> . |
| <code>directory</code>         | Directory path to the generated files                                                                                                 |
| <code>exportEnvironment</code> | TRUE if the compilation environment should be exported                                                                                |

**Table 168-21 (Cont.) EXPORT\_SQL\_TESTCASE\_DIR\_BY\_INC Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exportMetadata  | TRUE if the definition of the objects referenced in the SQL should be exported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| exportData      | TRUE if the data of the objects referenced in the SQL should be exported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| samplingPercent | If is TRUE, specify the sampling percentage to use to create the dump file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ctrlOptions     | <p>Opaque control parameters. For example, to export statistics history from a given date, set ctrlOptions as follows: &lt;parameter name="stat_history_since"&gt;26-FEB-25 12.35.03.534278 PM&lt;parameter&gt;.</p> <ul style="list-style-type: none"> <li>name="capture" - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.<br/>BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.<br/>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</li> <li>name="stat_history_since" - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.</li> </ul> |
| version         | <p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> <li>COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</li> <li>LATEST - the version of the metadata that specifies the current database version.</li> <li>A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.</li> </ul>                                                                                                                                                                                                                                  |

## 168.4.13 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

### Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
  incident_id      IN   NUMBER,
  directory        IN   VARCHAR2,
  sql_text         IN   CLOB,
  user_name        IN   VARCHAR2 := 'SYS',
  exportEnvironment IN   VARCHAR2 := 'TRUE',
  exportMetadata   IN   VARCHAR2 := 'TRUE',
  exportData       IN   VARCHAR2 := 'FALSE',
  samplingPercent  IN   VARCHAR2 := '100',
  ctrlOptions      IN   VARCHAR2 := NULL
```

```

    version          IN  VARCHAR2 := 'COMPATIBLE')
RETURN BOOLEAN;

```

## Parameters

**Table 168-22 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_TXT Function Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| exportData        | TRUE if the data of the objects referenced in the SQL should be exported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| samplingPercent   | If is TRUE, specify the sampling percentage to use to create the dump file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ctrlOptions       | <p>Opaque control parameters. For example, to export statistics history from a given date, set ctrlOptions as follows: &lt;parameter name="stat_history_since"&gt;26-FEB-25 12.35.03.534278 PM&lt;parameter&gt;.</p> <ul style="list-style-type: none"> <li>capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.<br/>BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.<br/>WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</li> <li>name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.</li> </ul> |
| version           | <p>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</p> <ul style="list-style-type: none"> <li>COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</li> <li>LATEST - the version of the metadata that specifies the current database version.</li> <li>A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database Release 10.0.0.</li> </ul>                                                                                                                                                                                                                         |

## 168.4.14 GET\_FIX\_CONTROL Function

This function returns the value of fix control for a given bug number.

### Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (  
    bug_number    IN      NUMBER)  
    RETURN NUMBER;
```

### Parameters

**Table 168-23** GET\_FIX\_CONTROL Function Parameters

| Parameter  | Description |
|------------|-------------|
| bug_number | Bug number  |

## 168.4.15 GET\_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

### Syntax

```
DBMS_SQLDIAG.GET_SQL (  
    incident_id    IN      VARCHAR2)  
    RETURN SQLSET_ROW;
```

### Parameters

**Table 168-24** GET\_SQL Function Parameters

| Parameter   | Description                |
|-------------|----------------------------|
| incident_id | Identifier of the incident |

## 168.4.16 IMPORT\_SQL\_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

### Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (  
    directory          IN   VARCHAR2,  
    sqlTestCase        IN   CLOB,  
    importEnvironment  IN   BOOLEAN    := TRUE,  
    importMetadata     IN   BOOLEAN    := TRUE,  
    importData         IN   BOOLEAN    := TRUE,  
    importPkgbody      IN   BOOLEAN    := FALSE,  
    importDiagnosis    IN   BOOLEAN    := TRUE,  
    ignoreStorage      IN   BOOLEAN    := TRUE,  
    ctrlOptions        IN   VARCHAR2   := NULL,  
    preserveSchemaMapping IN   BOOLEAN    := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory          IN   VARCHAR2,
    filename           IN   VARCHAR2,
    importEnvironment  IN   BOOLEAN := TRUE,
    importMetadata     IN   BOOLEAN := TRUE,
    importData         IN   BOOLEAN := TRUE,
    importPkgbody      IN   BOOLEAN := FALSE,
    importDiagnosis    IN   BOOLEAN := TRUE,
    ignoreStorage      IN   BOOLEAN := TRUE,
    ctrlOptions        IN   VARCHAR2 := NULL,
    preserveSchemaMapping IN BOOLEAN := FALSE);
```

## Parameters

**Table 168-25 IMPORT\_SQL\_TESTCASE Procedure Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| directory             | Directory containing test case files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| filename              | Name of a file containing an XML document describing the SQL test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| importEnvironment     | TRUE if the compilation environment should be imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| importMetadata        | TRUE if the definition of the objects referenced in the SQL should be imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| importData            | TRUE if the data of the objects referenced in the SQL should be imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| importPkgbody         | TRUE if the body of the packages referenced in the SQL are imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| importDiagnosis       | TRUE if the diagnostic information associated to the task should be imported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ignoreStorage         | TRUE if the storage attributes should be ignored                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ctrlOptions           | Opaque control parameters, of which only <code>capture</code> is valid for this subprogram. <ul style="list-style-type: none"> <li><code>capture - BASIC (default) or WITH_RUNTIME_INFO</code>. This parameter defines the mode of TCB capture.<br/> BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.<br/> WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</li> </ul> |
| preserveSchemaMapping | TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database). Note that when an import is run with <code>preservesSchemaMapping</code> set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects.                                                                                                                                                                                                                                                               |

## Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (`.dmp`)

- the explain plan for the statements (in advanced mode)
- diagnostic information gathered on the offending statement
- an import script to execute to reload the objects
- a SQL script to replay system statistics of the source
- a table of contents file describing the SQL test case
- metadata. (xxxxmain.xml)
- a README.txt file that explain the usage of the TCB
- the outlines used by the statement (ol.xml)
- a list of parameters set in the exporting db/env (prmimp.sql)
- a SQL monitor report, if any (smrpt.html)
- an AWR report, if any (awrrpt.html)
- a list of binds used in this statement (bndlst.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT\\_SQL\\_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT\\_SQL\\_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT\\_SQL\\_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.
- The `capture` value used when invoking the [EXPORT\\_SQL\\_TESTCASE Procedures](#) must be used when calling this procedure.

## 168.4.17 INCIDENTID\_2\_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

### Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id    IN    VARCHAR2,
    sql_stmt       OUT   SQLSET_ROW,
    problem_type   OUT   NUMBER,
    err_code       OUT   BINARY_INTEGER,
    err_mesg       OUT   VARCHAR2);
```

### Parameters

**Table 168-26 INCIDENTID\_2\_SQL Procedure Parameters**

| Parameter                | Description                |
|--------------------------|----------------------------|
| <code>incident_id</code> | Identifier of the incident |

**Table 168-26 (Cont.) INCIDENTID\_2\_SQL Procedure Parameters**

| Parameter    | Description                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------|
| sql_stmt     | Resulting SQL                                                                                                         |
| problem_type | Tentative type of SQL problem (currently among<br>PROBLEM_TYPE_COMPILATION_ERROR and<br>PROBLEM_TYPE_EXECUTION_ERROR) |
| err_code     | Error code if any otherwise it is set to NULL                                                                         |
| err_msg      | Error message if any otherwise it is set to NULL                                                                      |

## 168.4.18 INTERRUPT\_DIAGNOSIS\_TASK Procedure

This procedure interrupts a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (  
    taskname          IN    VARCHAR2);
```

### Parameters

**Table 168-27 INTERRUPT\_DIAGNOSIS\_TASK Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.19 LOAD\_SQLSET\_FROM\_TCB Function

This function loads a SQLSET from a Test Case Builder file.

### Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (  
    directory          IN    VARCHAR2,  
    filename           IN    VARCHAR2,  
    sqlset_name        IN    VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 168-28 LOAD\_SQLSET\_FROM\_TCB Function Parameters**

| Parameter   | Description       |
|-------------|-------------------|
| directory   | Name of directory |
| filename    | Name of file      |
| sqlset_name | Name of SQLSET    |

## 168.4.20 PACK\_STGTAB\_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE\_STGTAB\_SQLPATCH Procedure.

### Syntax

```
DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH (  
    patch_name          IN  VARCHAR2 := '%',  
    patch_category      IN  VARCHAR2 := 'DEFAULT',  
    staging_table_name   IN  VARCHAR2,  
    staging_schema_owner IN  VARCHAR2 := NULL);
```

### Parameters

**Table 168-29** PACK\_STGTAB\_SQLPATCH Procedure Parameters

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| patch_name           | Name of patch to pack (% wildcards acceptable, case-sensitive)               |
| patch_category       | Category to which to pack patches (% wildcards acceptable, case-insensitive) |
| staging_table_name   | (Mandatory) Name of the table to use (case-sensitive)                        |
| staging_schema_owner | Schema where the table resides, or NULL for current schema (case-sensitive)  |

### Usage Notes

- **Requires:** ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

### Related Topics

- [CREATE\\_STGTAB\\_SQLPATCH Procedure](#)  
This procedure creates the staging table used for transporting SQL patches from one system to another.

## 168.4.21 REPLAY\_SQL\_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

### Syntax

```
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (  
    directory      IN  VARCHAR2,  
    filename       IN  VARCHAR2,  
    ctrlOptions    IN  VARCHAR2 := NULL,  
    format         IN  VARCHAR2 := 'TEXT')  
RETURN CLOB;  
  
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (  
    directory      IN  VARCHAR2,  
    sqlTestCase    IN  CLOB,
```

```
ctrlOptions      IN   VARCHAR2  := NULL,
format           IN   VARCHAR2  := 'TEXT')
RETURN CLOB;
```

## Parameters

**Table 168-30 REPLAY\_SQL\_TESTCASE Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory   | Directory containing test case files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| filename    | Name of a file containing an XML document describing the SQL test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ctrlOptions | <p>Opaque control parameters. For example, to replay using outlines, set ctrlOptions as follows: &lt;parameter name="replay"&gt;OUTLINE&lt;parameter&gt;.</p> <ul style="list-style-type: none"> <li>replay - EXPLAIN (default), OUTLINE, EXECUTION or OUTLINE EXECUTION. This parameter defines TCB replay functionality. <p>EXPLAIN: Replay explains the statement without using outlines</p> <p>OUTLINE: Replay uses outlines mode and explains the statement using outlines</p> <p>EXECUTION: Replay executes the statement without using outlines</p> <p>OUTLINE EXECUTION: Replay executes the statement using outlines</p> </li> </ul> |
| sqlTestCase | SQL test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| format      | Format of the replay report. Possible formats are: TEXT, XML and HTML..                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Examples

TCB Replay Mode: Execute

```
SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp where
emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000 /* tcbdynpl_1
*/
```

Explain Plan

Plan Hash Value : 2219294842

| Id  | Operation                   | Name           | Rows |
|-----|-----------------------------|----------------|------|
| 0   | SELECT STATEMENT            |                | 13   |
| * 1 | HASH JOIN                   |                | 13   |
| 2   | NESTED LOOPS                |                |      |
| 3   | NESTED LOOPS                |                | 13   |
| 4   | STATISTICS COLLECTOR        |                |      |

| * 3 | TABLE ACCESS FULL | EMP  | 13     | 0      |

Predicate Information (identified by operation id):

\* 1 - access("EMP"."DEPTNO"="DEPT"."DEPTNO")  
\* 3 - filter("EMP"."SAL">1000)

REPLAY Note:

- Replay used dynamic sampling
- Replay forced Dynamic plan

## 168.4.22 REPORT\_SQL Function

Generates a diagnostic report in HTML format for a specific SQL statement.

### Syntax

```
DBMS_SQLDIAG.REPORT_SQL (
    sql_id      IN  VARCHAR2,
    directory   IN  VARCHAR2,
    level       IN  VARCHAR2
)
RETURN CLOB;
```

### Parameters

**Table 168-31 DBMS\_SQLDIAG.REPORT\_SQL Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id    | ID of the SQL statement.                                                                                                                                                                                                                                                                                                             |
| directory | Directory object where the report is written. By default, this parameter is NULL and the report is returned as a CLOB and not written to disk.                                                                                                                                                                                       |
| level     | Three options: <ul style="list-style-type: none"> <li>BASIC – A basic report covering minimal report detail.</li> <li>TYPICAL – A standard (default) report which contains the basic information plus other, more advanced, report sections.</li> <li>ALL – A complete report containing all possible report information.</li> </ul> |

### Usage Notes

By default, the `level` parameter is NULL and the report is returned as a CLOB and not written to disk.

If a directory name is specified for the `DIRECTORY` argument, the file name will be created in the following format: `SQLR_<SQL_ID>_<YYYYMMDDHH24MI>.html`, where `<SQL_ID>` represents the

SQL identifier provided as the `SQL_ID` argument and `<YYYYMMDDHH24MI>` represents the timestamp at which the file was created.

#### Example 168-1

In this example, `SQL_ID 'gtckcpmp3ry7'` is passed in, the directory is the standard Data Pump directory, and `ALL` detail is returned in the report.

```
declare my_report clob;

begin
    my_report := dbms_sqldiag.report_sql('gtckcpmp3ry7',
    directory=>'DATA_PUMP_DIR', level=>'ALL');
end;
/
```

## 168.4.23 REPORT\_DIAGNOSIS\_TASK Function

This function reports on a diagnostic task. It returns a `CLOB` containing the desired report.

### Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
    taskname          IN   VARCHAR2,
    type              IN   VARCHAR2  := TYPE_TEXT,
    level             IN   VARCHAR2  := LEVEL_TYPICAL,
    section           IN   VARCHAR2  := SECTION_ALL,
    object_id         IN   NUMBER    := NULL,
    result_limit      IN   NUMBER    := NULL,
    owner_name        IN   VARCHAR2  := NULL)
RETURN CLOB;
```

### Parameters

**Table 168-32** REPORT\_DIAGNOSIS\_TASK Function Parameters

| Parameter    | Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| taskname     | Name of task to report                                                                                                                   |
| type         | Type of the report. Possible values are: TEXT, HTML, XML (see <a href="#">Table 168-4</a> ).                                             |
| level        | Format of the recommendations. Possible values are TYPICAL, BASIC, ALL ( <a href="#">Table 168-5</a> ).                                  |
| section      | Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL ( <a href="#">Table 168-6</a> ). |
| object_id    | Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).                                  |
| result_limit | Number of statements in a STS for which the report is generated                                                                          |
| owner_name   | Name of the task execution to use. If <code>NULL</code> , the report will be generated for the last task execution.                      |

## 168.4.24 RESET\_DIAGNOSIS\_TASK Procedure

This procedure resets a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname          IN   VARCHAR2);
```

### Parameters

**Table 168-33** RESET\_DIAGNOSIS\_TASK Procedure Parameters

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.25 RESUME\_DIAGNOSIS\_TASK Procedure

This procedure resumes a diagnostic path.

### Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
    taskname          IN   VARCHAR2);
```

### Parameters

**Table 168-34** RESUME\_DIAGNOSIS\_TASK Procedure Parameters

| Parameter | Description  |
|-----------|--------------|
| taskname  | Name of task |

## 168.4.26 SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type `VARCHAR2`.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- `MODE`: diag scope (comprehensive, limited)
- `_SQLDIAG_FINDING_MODE`: findings in the report (see "[Table 168-8](#)" for possible values)

### Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (  
    taskname          IN   VARCHAR2,  
    parameter         IN   VARCHAR2,    value          IN   NUMBER);
```

## Parameters

**Table 168-35 SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| taskname  | Identifier of the task to execute    |
| parameter | Name of the parameter to set         |
| value     | New value of the specified parameter |

## 168.4.27 SQL\_DIAGNOSE\_AND\_REPAIR Function

Diagnoses a given SQL statement for a given SQL ID for the given problem type. This function creates an incident, populate incident metadata with required information like, SQL ID, SQL text, compilation environment, and so on. It also creates a diagnostic task, executes it and accepts SQL PATCH recommendation for a given SQL ID.

### Syntax

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_text          IN    CLOB,
    bind_list         IN    sql_binds := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER    := TIME_LIMIT_DEFAULT,
    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN    VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    sql_id            IN    VARCHAR2,
    plan_hash_value   IN    NUMBER    := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER    := TIME_LIMIT_DEFAULT,
    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN    VARCHAR2 := YES)
RETURN NUMBER;
```

```
DBMS_SQLDIAG.SQL_DIAGNOSE_AND_REPAIR (
    incident_id       IN    VARCHAR2,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER    := TIME_LIMIT_DEFAULT,
    problem_type      IN    NUMBER    := PROBLEM_TYPE_PERFORMANCE,
    auto_apply_patch  IN    VARCHAR2 := YES)
RETURN NUMBER;
```

## Parameters

**Table 168-36 SQL\_DIAGNOSE\_AND\_REPAIR Function Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| sql_text  | Text of the SQL statement. |
| sql_id    | SQL ID of the SQL query.   |

**Table 168-36 (Cont.) SQL\_DIAGNOSE\_AND\_REPAIR Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_hash_value  | The plan to be used for diagnosis. The default value is NULL.                                                                                                                                                                                                                                                                                                                                                                                             |
| bind_list        | Binds to be used for diagnosis. The default value is NULL.                                                                                                                                                                                                                                                                                                                                                                                                |
| scope            | The scope of diagnostic advisor.<br>Possible values are: <ul style="list-style-type: none"> <li>SCOPE_LIMITED—only index and plan analyze are invoked for a given SQL.</li> <li>SCOPE_COMPREHENSIVE—besides index and plan analyze, auto-tune is called first to tune the statement.</li> </ul> The default value is SCOPE_COMPREHENSIVE.                                                                                                                 |
| time_limit       | Time limit for diagnostic task. The default value is TIME_LIMIT_DEFAULT.                                                                                                                                                                                                                                                                                                                                                                                  |
| problem_type     | Problem type that is being diagnosed. The following problem type are supported: <ul style="list-style-type: none"> <li>PROBLEM_TYPE_PERFORMANCE—performance problem.</li> <li>PROBLEM_TYPE_WRONG_RESULTS— incorrect results.</li> <li>PROBLEM_TYPE_COMPILATION_ERROR—crash during compilation of the statement.</li> <li>PROBLEM_TYPE_EXECUTION_ERROR— crash during execution of the statement.</li> </ul> The default value is PROBLEM_TYPE_PERFORMANCE. |
| auto_apply_patch | A value that decides if the recommended SQL patch needs to be accepted. Possible values are: <ul style="list-style-type: none"> <li>YES—accepts the recommended SQL patch.</li> <li>NO—does not accepts recommended SQL patch automatically.</li> </ul> User need to manually accept the SQL patch.<br>The default value is YES.                                                                                                                          |

## 168.4.28 UNPACK\_STGTAB\_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK\_STGTAB\_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT\_SQL\_PATCH Function & Procedure).

### Syntax

```
DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (
  patch_name      IN  VARCHAR2 := '%',
  patch_category  IN  VARCHAR2 := '%',
  replace         IN  BOOLEAN,
```

```
staging_table_name    IN  VARCHAR2,  
staging_schema_owner  IN  VARCHAR2 := NULL);
```

## Parameters

**Table 168-37 UPPACK\_STGTAB\_SQLPATCH Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| patch_name           | Name of patch to unpack (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                   |
| patch_category       | Category from which to unpack patches (% wildcards acceptable, case-insensitive)                                                                                                                                                                                   |
| replace              | Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists. |
| staging_table_name   | (Mandatory) Name of the table to use (case-sensitive)                                                                                                                                                                                                              |
| staging_schema_owner | Schema where the table resides, or NULL for current schema (case-sensitive)                                                                                                                                                                                        |

## Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

## Related Topics

- [PACK\\_STGTAB\\_SQLPATCH Procedure](#)  
This procedure packs SQL patches into the staging table created by a call to the CREATE\_STGTAB\_SQLPATCH Procedure.
- [ACCEPT\\_SQL\\_PATCH Function & Procedure](#)  
This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

# DBMS\_SQLPA

The DBMS\_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_SQLPA Subprograms](#)

## 169.1 DBMS\_SQLPA Overview

The DBMS\_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE\\_ANALYSIS\\_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.s
2. The [EXECUTE\\_ANALYSIS\\_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT\\_ANALYSIS\\_TASK Function](#) displays the results of an analysis task.

## 169.2 DBMS\_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX\_ANALYSIS\_TASK) require privilege ADVISOR.

## 169.3 Summary of DBMS\_SQLPA Subprograms

This table lists the DBMS\_SQLPA subprograms and briefly describes them.

**Table 169-1 DBMS\_SQLPA Package Subprograms**

| Subprogram                                     | Description                                                                 |
|------------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">CANCEL_ANALYSIS_TASK Procedure</a> | Cancels the currently executing task analysis of one or more SQL statements |
| <a href="#">CREATE_ANALYSIS_TASK Functions</a> | Creates an advisor task to process and analyze one or more SQL statements   |
| <a href="#">DROP_ANALYSIS_TASK Procedure</a>   | Drops a SQL analysis task                                                   |

**Table 169-1 (Cont.) DBMS\_SQLPA Package Subprograms**

| Subprogram                                                     | Description                                                                                  |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a> | Executes a previously created analysis task                                                  |
| <a href="#">INTERRUPT_ANALYSIS_TASK Procedure</a>              | Interrupts the currently executing analysis task                                             |
| <a href="#">REPORT_ANALYSIS_TASK Function</a>                  | Displays the results of an analysis task                                                     |
| <a href="#">RESET_ANALYSIS_TASK Procedure</a>                  | Resets the currently executing analysis task to its initial state                            |
| <a href="#">RESUME_ANALYSIS_TASK Procedure</a>                 | Resumes a previously interrupted analysis task that was created to process a SQL tuning set. |
| <a href="#">SET_ANALYSIS_TASK_PARAMETER Procedures</a>         | Sets the SQL analysis task parameter value                                                   |
| <a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a>      | Sets the SQL analysis task parameter default value                                           |

## 169.3.1 CANCEL\_ANALYSIS\_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

### Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 169-2 CANCEL\_ANALYSIS\_TASK Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| task_name | Name of the task to cancel |

### Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

## 169.3.2 CREATE\_ANALYSIS\_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

## Syntax

**SQL text format.** This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text      IN CLOB,
  bind_list     IN sql_binds := NULL,
  parsing_schema IN VARCHAR2 := NULL,
  task_name     IN VARCHAR2 := NULL,
  description   IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

**SQL ID format.** This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id        IN VARCHAR2,
  plan_hash_value IN NUMBER := NULL,
  task_name     IN VARCHAR2 := NULL,
  con_name      IN VARCHAR2 DEFAULT,
  description   IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

**Workload Repository format.** This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  dbid          IN NUMBER      DEFAULT,
  begin_snap    IN NUMBER,
  end_snap      IN NUMBER,
  sql_id        IN VARCHAR2,
  plan_hash_value IN NUMBER := NULL,
  task_name     IN VARCHAR2 := NULL,
  description   IN VARCHAR2 := NULL)
  con_name      IN VARCHAR2 DEFAULT,
RETURN VARCHAR2;
```

**SQLSET format.** This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name   IN VARCHAR2,
  basic_filter   IN VARCHAR2 := NULL,
  con_name      IN VARCHAR2 DEFAULT,
  order_by      IN VARCHAR2 := NULL,
  top_sql       IN VARCHAR2 := NULL,
  task_name     IN VARCHAR2 := NULL,
  description   IN VARCHAR2 := NULL,
  sqlset_owner  IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 169-3** *CREATE\_ANALYSIS\_TASK Function Parameters*

| Parameter | Description             |
|-----------|-------------------------|
| sql_text  | Text of a SQL statement |
| bind_list | A set of bind values    |

**Table 169-3 (Cont.) CREATE\_ANALYSIS\_TASK Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parsing_schema  | Name of the schema where the statement can be compiled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| task_name       | Optional analysis task name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| dbid            | The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| con_name        | <p>Container for the SPA task. The semantics depend on the function format:</p> <p>For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis.</p> <p>For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for using with SPA. SPA will analyze the statement in this container. If null, then the database uses the current PDB for SPA analysis.</p> <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> <li>• In a non-CDB, this parameter is ignored.</li> <li>• In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, error occurs.</li> <li>• In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, error occurs.</li> </ul> |
| description     | Description of the SQL analysis task to a maximum of 256 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| sql_id          | Identifier of a SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| plan_hash_value | Hash value of the SQL execution plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| begin_snap      | Begin snapshot identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| order_by        | Order-by clause on the selected SQL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| top_sql         | Top N SQL after filtering and ranking                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| sqlset_owner    | The owner of the SQL tuning set, or NULL for the current schema owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

### Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id = t.time_id
and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
```

```

        sql_id          => 'aylm3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'aylm3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name  => 'my_workload', -
    order_by    => 'BUFFER_GETS', -
    description  => 'process workload ordered by buffer gets');

```

### 169.3.3 DROP\_ANALYSIS\_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

#### Syntax

```

DBMS_SQLPA.DROP_ANALYSIS_TASK(
    task_name          IN VARCHAR2);

```

#### Parameters

**Table 169-4 DROP\_ANALYSIS\_TASK Procedure Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| task_name | The name of the analysis task to drop |

### 169.3.4 EXECUTE\_ANALYSIS\_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

#### Syntax

```

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2           := 'test execute',
    execution_name     IN VARCHAR2           := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2           := NULL)
RETURN VARCHAR2;

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2           := 'test execute',
    execution_name     IN VARCHAR2           := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2           := NULL);

```

## Parameters

**Table 169-5 EXECUTE\_ANALYSIS\_TASK Function & Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Identifier of the task to execute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| execution_type   | Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> <li>[TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default.</li> <li>EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task.</li> <li>COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type <code>EXPLAIN_PLAN</code> or <code>TEST_EXECUTE</code> already exist in the task</li> <li>CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.</li> </ul> |
| execution_name   | A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the <a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| execution_desc   | A 256-length string describing the execution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

## Examples

### 1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name => 'my_sts');
```

### 2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
    task_name => :tname,
```

```
execution_type => 'test execute',  
execution_name => 'before_change');
```

3. Make change

...

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name      => :tname, -  
    execution_type  => 'test execute',  
    execution_name  => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(  
    :tname, 'comparison_metric', 'buffer_gets');  
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name      => :tname, -  
    execution_type  => 'compare performance', -  
    execution_name  => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(  
    task_name      => :tname, -  
    execution_type  => 'compare performance',  
    execution_params => dbms_advisor.arglist(  
        'execution_name1',  
        'before_change',  
        'execution_name2',  
        'after_change',  
        'comparison_metric',  
        'buffer_gets'));
```

# 169.3.5 INTERRUPT\_ANALYSIS\_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

**Syntax**

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(  
    task_name      IN VARCHAR2);
```

**Parameters**

**Table 169-6** INTERRUPT\_ANALYSIS\_TASK Procedure Parameters

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| task_name | Identifier of the analysis task to interrupt |

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

169.3.6 REPORT\_ANALYSIS\_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(  
    task_name      IN   VARCHAR2,  
    type           IN   VARCHAR2      := 'TEXT',  
    level          IN   VARCHAR2      := 'TYPICAL',  
    section        IN   VARCHAR2      := 'SUMMARY',  
    object_id      IN   NUMBER        := NULL,  
    top_sql        IN   NUMBER        := 100,  
    execution_name IN   VARCHAR2      := NULL,  
    task_owner     IN   VARCHAR2      := NULL,  
    order_by       IN   VARCHAR2      := NULL)  
RETURN CLOB;
```

Parameters

Table 169-7 REPORT\_ANALYSIS\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Name of the task to report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| type           | Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| level          | Level of detail in the report: <ul style="list-style-type: none"><li>ALL - details of all SQL</li><li>BASIC - currently the same as typical</li><li>CHANGED - only SQL with changed performance</li><li>CHANGED_PLANS - only SQL with plan changes</li><li>ERRORS - SQL with errors only</li><li>IMPROVED - only improved SQL</li><li>REGRESSED - only regressed SQL</li><li>TIMEOUT - only SQL which timed-out during execution</li><li>TYPICAL (default) - show information about every statement analyzed, including changing and errors</li><li>UNCHANGED - only SQL with unchanged performance</li><li>UNCHANGED_PLANS - only SQL with unchanged plans</li><li>UNSUPPORTED - only SQL not supported by SPAs</li></ul> |
| section        | Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"><li>SUMMARY (default) - workload summary only</li><li>ALL - summary and details on SQL</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| object_id      | Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| top_sql        | Number of SQL statements in a STS for which the report is generated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| execution_name | Name of the task execution to use. If NULL, the report will be generated for the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 169-7 (Cont.) REPORT\_ANALYSIS\_TASK Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_owner | Owner of the relevant analysis task. Defaults to the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                         |
| order_by   | How to sort SQL statements in the report (summary and body).<br>Possible values: <ul style="list-style-type: none"><li>CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric</li><li>NULL (default) - order SQL statement by impact on workload</li><li>SQL_IMPACT - order SQL statement by change impact on SQL</li><li>WORKLOAD_IMPACT - same as NULL</li><li>METRIC_DELTA - same as CHANGE_DIFF</li></ul> |

### Return Values

A CLOB containing the desired report.

### Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

### Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5) from dual;
```

## 169.3.7 RESET\_ANALYSIS\_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

### Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
    task_name          IN VARCHAR2);
```

## Parameters

**Table 169-8 RESET\_ANALYSIS\_TASK Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| task_name | Identifier of the analysis task to reset |

## Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

## 169.3.8 RESUME\_ANALYSIS\_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

## Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name      IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL);
```

## Parameters

**Table 169-9 RESUME\_ANALYSIS\_TASK Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name    | Identifier of the analysis task to resume                                                                                                                                                                                                                         |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter <code>basic_filter</code> ) that was specified when calling the <a href="#">CREATE_ANALYSIS_TASK Functions</a> . |

## Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

## Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

## 169.3.9 SET\_ANALYSIS\_TASK\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

### Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(  
    task_name          IN VARCHAR2,  
    parameter          IN VARCHAR2,  
    value              IN VARCHAR2,  
    test_execute_dop   IN NUMBER DEFAULT 0,  
    compare_resultset  IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(  
    task_name          IN VARCHAR2,  
    parameter          IN VARCHAR2,  
    value              IN NUMBER,  
    test_execute_dop   IN NUMBER DEFAULT 0,  
    compare_resultset  IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 169-10 SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Identifier of the task to execute                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| parameter | <p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"><li>• <code>APPLY_CAPTURED_COMPILEENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li><li>• <code>BASIC_FILTER</code>: basic filter for SQL tuning set</li><li>• <code>CELL_SIMULATION_ENABLED</code>: for more details, see the helper script <code>tcellsim.sql</code> in the <code>ADMIN</code> directory.</li><li>• <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</li><li>• <code>DATABASE_LINK</code>: can be set to the global name of a <code>PUBLIC</code> database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li><li>• <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted</li><li>• <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li></ul> |

**Table 169-10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter (contd.) | <ul style="list-style-type: none"> <li>• <b>DISABLE_MULTI_EXEC:</b> SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to <b>TRUE</b> to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.</li> <li>• <b>EXECUTE_TRIGGERS:</b> Set this parameter to <b>TRUE</b> to execute all statement-level triggers in the <b>FULLDML</b> mode. If the parameter is set to <b>FALSE</b>, then the triggers will not be executed even in <b>FULLDML</b> mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is <b>FALSE</b>.</li> <li>• <b>EXECUTION_DAYS_TO_EXPIRE:</b> number of days until the tasks's executions will be deleted (without deleting the task)</li> <li>• <b>EXECUTE_FULLDML:</b> <b>TRUE</b> to execute DML statement fully, including acquiring row locks and modifying rows; <b>FALSE</b> (default) to execute only the query part of the DML without modifying data. When <b>TRUE</b>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li>• <b>EXECUTION_NAME1:</b> name of the first task execution to analyze</li> <li>• <b>EXECUTION_NAME2:</b> name of the second task execution to analyze</li> <li>• <b>LOCAL_TIME_LIMIT:</b> per-statement time out (seconds)</li> <li>• <b>METRIC_DELTA_THRESHOLD:</b> threshold of the difference between the SQL performance metric before and after the change. The default value is zero.</li> <li>• <b>NUM_ROWS_TO_FETCH:</b> specifies the number of rows to be fetched for an SQL query. You can use one of the following values: <ul style="list-style-type: none"> <li>– <b>ALL_ROWS:</b> Fetches all the rows for an SQL query</li> <li>– <b>AVERAGE:</b> Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS</li> <li>– <b>AUTO:</b> Number of result rows is determined using the value of <b>optimizer_mode</b> parameter of the optimizer environment captured in the STS. If the value of <b>optimizer_mode</b> is <b>ALL_ROWS</b>, then all result rows will be fetched. If its value is <b>FIRST_ROWS_n</b>, then <b>n</b> result rows will be fetched by the SPA.</li> <li>– A valid number: Fetches the exact number of rows specified by in the SQL query</li> </ul> <p>The default value is <b>ALL_ROWS</b>.</p> </li> <li>• <b>PLAN_FILTER:</b> plan filter for SQL tuning set (see <b>SELECT_SQLSET</b> for possible values)</li> <li>• <b>PLAN_LINES_COMPARISON:</b> <ul style="list-style-type: none"> <li>- <b>ALWAYS</b> --line by line comparison of plans in all scenarios.- <b>AUTO</b> - Line by Line comparison of plans only if <b>phv2</b> is not available and <b>phv1</b> is different- <b>NONE</b> (default) - line by line comparison of plans only if <b>phv</b> is unknown</li> </ul> </li> <li>• <b>RANK_MEASURE1:</b> first ranking measure for SQL tuning set</li> <li>• <b>RANK_MEASURE2:</b> second possible ranking measure for SQL tuning set</li> <li>• <b>RANK_MEASURE3:</b> third possible ranking measure for SQL tuning set</li> </ul> |

**Table 169-10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <ul style="list-style-type: none"> <li>REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values: <ul style="list-style-type: none"> <li>CURRENT_SYSDATE: SYSDATE calls return the current date.</li> <li>SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS</li> </ul> The default value is CURRENT_SYSDATE.</li> <li>RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li>SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</li> <li>SQL_LIMIT: maximum number of SQL statements to process</li> <li>SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li>SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA.</li> <li>SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME.</li> <li>TIME_LIMIT: global time out (seconds)</li> </ul> |
| parameter (contd.) | <ul style="list-style-type: none"> <li>WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</li> <li>CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| value              | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| test_execute_dop   | <p>Specifies the requested level of concurrency with which a SPA task should be executed.</p> <p>Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| compare_resultset  | <p>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</p> <ul style="list-style-type: none"> <li>If set to TRUE the result set comparison will be performed</li> <li>If set to FALSE result set comparison will not be performed.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the test\_execute\_dop parameter. This parameter applies only to test-execute or explain plan type of trials that process a SQL Tuning set.

## Examples

To request two concurrent processes to execute the SPA task:

```
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```
exec  
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```
exec  
dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

## 169.3.10 SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

### Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(  
    parameter    IN  VARCHAR2,  
    value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(  
    parameter    IN  VARCHAR2,  
    value        IN  NUMBER);
```

## Parameters

**Table 169-11 SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedure Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameter          | <p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> <li>• <code>APPLY_CAPTURED_COMPILEENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>• <code>BASIC_FILTER</code>: basic filter for SQL tuning set</li> <li>• <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</li> <li>• <code>DATABASE_LINK</code>: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li> <li>• <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted</li> <li>• <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li> <li>• <code>EXECUTE_FULLDML</code>: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li>• <code>EXECUTION_DAYS_TO_EXPIRE</code>: number of days until the task's executions will be deleted (without deleting the task)</li> <li>• <code>EXECUTION_NAME1</code>: name of the first task execution to analyze</li> <li>• <code>EXECUTION_NAME2</code>: name of the second task execution to analyze</li> <li>• <code>LOCAL_TIME_LIMIT</code>: per-statement time out (seconds)</li> </ul> |
| parameter (contd.) | <ul style="list-style-type: none"> <li>• <code>PLAN_FILTER</code>: plan filter for SQL tuning set (see <code>SELECT_SQLSET</code> for possible values)</li> <li>• <code>RANK_MEASURE1</code>: first ranking measure for SQL tuning set</li> <li>• <code>RANK_MEASURE2</code>: second possible ranking measure for SQL tuning set</li> <li>• <code>RANK_MEASURE3</code>: third possible ranking measure for SQL tuning set</li> <li>• <code>RESUME_FILTER</code>: a extra filter for SQL tuning sets besides <code>BASIC_FILTER</code></li> <li>• <code>SQL_IMPACT_THRESHOLD</code>: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</li> <li>• <code>SQL_LIMIT</code>: maximum number of SQL statements to process</li> <li>• <code>SQL_PERCENTAGE</code>: percentage filter of SQL tuning set statements</li> <li>• <code>TIME_LIMIT</code>: global time out (seconds)</li> <li>• <code>WORKLOAD_IMPACT_THRESHOLD</code>: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter | Description                          |
|-----------|--------------------------------------|
| value     | New value of the specified parameter |

# DBMS\_SQLQ

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

This chapter contains the following topics:

- [DBMS\\_SQLQ Overview](#)
- [Summary of DBMS\\_SQLQ Subprograms](#)

## 170.1 DBMS\_SQLQ Overview

The `DBMS_SQLQ` package provides the interface for configuring quarantine thresholds for execution plans of SQL statements. If any of the Resource Manager thresholds is equal to or less than the quarantine threshold specified in a SQL statement's quarantine configuration, then the SQL statement is not allowed to run, if it uses the execution plan specified in its quarantine configuration.

You can use the `DBMS_SQLQ` package subprograms to:

- create quarantine configurations for execution plans of SQL statements and specify quarantine thresholds for their resource consumption
- query quarantine thresholds specified in quarantine configurations
- delete quarantine configurations
- transfer quarantine configurations from one database to another

## 170.2 Summary of DBMS\_SQLQ Subprograms

This table lists the `DBMS_SQLQ` subprograms and briefly describes them.

**Table 170-1 DBMS\_SQLQ Package Subprograms**

| Procedure                                              | Description                                                                                           |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_QUARANTINE Procedure</a>             | Specifies a quarantine threshold in a quarantine configuration for execution plans of a SQL statement |
| <a href="#">CREATE_QUARANTINE_BY_SQL_ID Function</a>   | Creates a quarantine configuration for execution plans of a SQL statement using SQL ID                |
| <a href="#">CREATE_QUARANTINE_BY_SQL_TEXT Function</a> | Creates a quarantine configuration for execution plans of a SQL statement using SQL text              |
| <a href="#">CREATE_STGTAB_QUARANTINE Procedure</a>     | Creates a staging table to store quarantine configurations                                            |
| <a href="#">DROP_QUARANTINE Procedure</a>              | Deletes a quarantine configuration                                                                    |

**Table 170-1 (Cont.) DBMS\_SQLQ Package Subprograms**

| Procedure                                           | Description                                                                          |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">GET_PARAM_VALUE_QUARANTINE Function</a> | Returns the value for a quarantine threshold specified in a quarantine configuration |
| <a href="#">PACK_STGTAB_QUARANTINE Function</a>     | Adds one or more quarantine configurations to a staging table                        |
| <a href="#">UNPACK_STGTAB_QUARANTINE Function</a>   | Creates quarantine configurations in a database from a staging table                 |

## 170.2.1 ALTER\_QUARANTINE Procedure

This procedure specifies a quarantine threshold for a resource in a quarantine configuration for execution plans of a SQL statement.

### Syntax

```
DBMS_SQLQ.ALTER_QUARANTINE (
    quarantine_name    IN VARCHAR2,
    parameter_name     IN VARCHAR2,
    parameter_value    IN VARCHAR2);
```

### Parameters

**Table 170-2 ALTER\_QUARANTINE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quarantine_name | Name of the quarantine configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| parameter_name  | <p>Name of the resource for which quarantine threshold needs to be specified. You can specify any one of the following values:</p> <ul style="list-style-type: none"> <li>CPU_TIME: CPU time</li> <li>ELAPSED_TIME: Elapsed time</li> <li>IO_MEGABYTES: I/O in megabytes</li> <li>IO_REQUESTS: Number of physical I/O requests</li> <li>IO_LOGICAL: Number of logical I/O requests</li> <li>ENABLED: Flag to enable or disable the quarantine configuration. Specify YES to enable it and NO to disable it. The default value is YES.</li> <li>AUTOPURGE: Flag to enable or disable automatic purging of the quarantine configuration. If it is set to YES, the quarantine configuration is automatically purged after 53 weeks, if not used. If it is set to NO, the quarantine configuration is never purged. The default value is YES.</li> </ul> |
| parameter_value | Quarantine threshold for the resource specified in parameter_name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Examples

In the following example, the quarantine threshold specified for CPU time is 5 seconds and elapsed time is 10 seconds for the quarantine configuration  
SQL\_QUARANTINE\_3z0mwuq3aqsm8cfe7a0e4.

```
BEGIN

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'CPU_TIME',
    PARAMETER_VALUE => '5');

  DBMS_SQLQ.ALTER_QUARANTINE (
    QUARANTINE_NAME => 'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
    PARAMETER_NAME  => 'ELAPSED_TIME',
    PARAMETER_VALUE => '10');

END;
/
```

When the SQL statement is executed using the execution plan specified in the quarantine configuration, and if the Resource Manager threshold for CPU time is 5 seconds or less, or elapsed time is 10 seconds or less, then the SQL statement is not allowed to run.

170.2.2 CREATE\_QUARANTINE\_BY\_SQL\_ID Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL ID.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 170-3 CREATE\_QUARANTINE\_BY\_SQL\_ID Function Parameters

| Parameter       | Description                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | SQL ID of the SQL statement.                                                                                                                                                                |
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL.<br><br>When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

Return Value

Name of the quarantine configuration.

Examples

The following example creates a quarantine configuration for the SQL statement having the SQL ID of 8vu7s907prbgr. The quarantine configuration applies to all the execution plans of the SQL statement.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID => '8vu7s907prbgr');
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL ID of 8vu7s907prbgr.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_ID(SQL_ID => '8vu7s907prbgr',
    PLAN_HASH_VALUE => '3488063716');
END;
/
```

170.2.3 CREATE\_QUARANTINE\_BY\_SQL\_TEXT Function

This function creates a quarantine configuration for execution plans of a SQL statement based on SQL text.

Syntax

```
DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT (
    sql_text          IN CLOB,
    plan_hash_value   IN NUMBER DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 170-4 CREATE\_QUARANTINE\_BY\_SQL\_TEXT Function Parameters

| Parameter       | Description                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text        | SQL statement.                                                                                                                                                                              |
| plan_hash_value | Hash value of the execution plan of the SQL statement. Default value is NULL.<br><br>When it is NULL, the quarantine configuration applies to all the execution plans of the SQL statement. |

Return Value

Name of the quarantine configuration.

## Examples

The following example creates a quarantine configuration that applies to all the execution plans of the SQL statement 'select count(\*) from emp'.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'));
END;
/
```

The following example creates a quarantine configuration for the execution plan having the hash value of 3488063716 for the SQL statement having the SQL text of 'select count(\*) from emp'.

```
DECLARE
    quarantine_config VARCHAR2(30);
BEGIN
    quarantine_config := DBMS_SQLQ.CREATE_QUARANTINE_BY_SQL_TEXT(SQL_TEXT =>
to_clob('select count(*) from emp'), PLAN_HASH_VALUE => '3488063716');
END;
/
```

## 170.2.4 CREATE\_STGTAB\_QUARANTINE Procedure

This procedure creates a staging table to store the quarantine configurations, so that the staging table can be exported from the current database and imported into another database, thus enabling the quarantine configurations to be used across databases.

### Syntax

```
DBMS_SQLQ.CREATE_STGTAB_QUARANTINE (
    staging_table_name    IN VARCHAR2,
    staging_table_owner   IN VARCHAR2 DEFAULT NULL,
    tablespace_name      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 170-5 CREATE\_STGTAB\_QUARANTINE Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table.                                                                                                                                                                      |
| staging_table_owner | Name of the schema owner of the staging table.<br>Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner.                |
| tablespace_name     | Name of the tablespace in which the staging table needs to be created. Default value is <code>NULL</code> , which means the staging table is created in the default tablespace of the database. |

Examples

The following example creates the staging table `TBL_STG_QUARANTINE` in the default tablespace of the database and sets its table owner to the database user executing this procedure.

```
BEGIN
  DBMS_SQLQ.CREATE_STGTAB_QUARANTINE(STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

170.2.5 DROP\_QUARANTINE Procedure

This procedure deletes a quarantine configuration.

Syntax

```
DBMS_SQLQ.DROP_QUARANTINE(quarantine_name IN VARCHAR2);
```

Parameters

Table 170-6 DROP\_QUARANTINE Procedure Parameters

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| quarantine_name | Name of the quarantine configuration to delete. |

Examples

The following example deletes the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
BEGIN
  DBMS_SQLQ.DROP_QUARANTINE('SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4');
END;
/
```

170.2.6 GET\_PARAM\_VALUE\_QUARANTINE Function

This function returns the quarantine threshold for a resource specified in a quarantine configuration.

Syntax

```
DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE (
  quarantine_name IN VARCHAR2,
  parameter_name  IN VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 170-7 GET\_PARAM\_VALUE\_QUARANTINE Function Parameters**

| Parameter       | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| quarantine_name | Name of the quarantine configuration.                              |
| parameter_name  | Resource for which the quarantine threshold needs to be retrieved. |

## Return Value

Returns the quarantine threshold for a resource specified in a quarantine configuration.

## Examples

The following example returns the quarantine threshold for CPU time specified in the quarantine configuration having the name `SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4`.

```
DECLARE
    quarantine_config_setting_value VARCHAR2(30);
BEGIN
    quarantine_config_setting_value := DBMS_SQLQ.GET_PARAM_VALUE_QUARANTINE(
        QUARANTINE_NAME =>
        'SQL_QUARANTINE_3z0mwuq3aqsm8cfe7a0e4',
        PARAMETER_NAME   => 'CPU_TIME');
END;
/
```

## 170.2.7 PACK\_STGTAB\_QUARANTINE Function

This function adds one or more quarantine configurations into a staging table.

## Syntax

```
DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
    staging_table_name    IN VARCHAR2,
    staging_table_owner   IN VARCHAR2 DEFAULT NULL,
    name                  IN VARCHAR2 DEFAULT '%',
    sql_text              IN VARCHAR2 DEFAULT '%',
    enabled               IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

**Table 170-8 PACK\_STGTAB\_QUARANTINE Function Parameters**

| Parameter           | Description                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table in which the quarantine configurations need to be added.                                                                                            |
| staging_table_owner | Name of the schema owner of the staging table. Default value is <code>NULL</code> , which means the database user executing this procedure is set as the staging table owner. |

**Table 170-8 (Cont.) PACK\_STGTAB\_QUARANTINE Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                               |
| sql_text  | SQL statement text. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                                                 |
| enabled   | Flag indicating whether the quarantine configuration should be enabled or disabled. If it is set to YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default. |

**Return Value**

Number of quarantine configurations added to the staging table.

**Examples**

The following example adds all the quarantine configurations having the names starting with `SQL_QUARANTINE_` into the staging table `TBL_STG_QUARANTINE`.

```
DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.PACK_STGTAB_QUARANTINE (
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE',
        NAME => 'SQL_QUARANTINE_%');
END;
/
```

## 170.2.8 UNPACK\_STGTAB\_QUARANTINE Function

This function creates quarantine configurations in a database from a staging table.

**Syntax**

```
DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE (
    staging_table_name      IN VARCHAR2,
    staging_table_owner     IN VARCHAR2 DEFAULT NULL,
    name                   IN VARCHAR2 DEFAULT '%',
    sql_text               IN VARCHAR2 DEFAULT '%',
    enabled                IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 170-9 UNPACK\_STGTAB\_QUARANTINE Function Parameters

| Parameter           | Description                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| staging_table_name  | Name of the staging table from which the quarantine configurations need to be created in the database.                                                                                                                                                              |
| staging_table_owner | Name of the schema owner of the staging table. Default value is NULL, which means the database user executing this procedure is set as the staging table owner.                                                                                                     |
| name                | Name of the quarantine configuration. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                               |
| sql_text            | SQL statement text. Its value is case-sensitive and it accepts wildcard characters.                                                                                                                                                                                 |
| enabled             | Flag indicating whether the quarantine configuration should be enabled or disabled. If its value is YES, then the quarantine configuration is enabled, else it is disabled. Default value is NULL, which means the quarantine configuration is disabled by default. |

Return Value

Number of quarantine configurations created in the database from the staging table.

Examples

The following example creates the quarantine configurations in the database from all the quarantine configurations stored in the staging table TBL\_STG\_QUARANTINE.

```
DECLARE
    quarantine_configs NUMBER;
BEGIN
    quarantine_configs := DBMS_SQLQ.UNPACK_STGTAB_QUARANTINE(
        STAGING_TABLE_NAME => 'TBL_STG_QUARANTINE');
END;
/
```

# DBMS\_SQLSET

The `DBMS_SQLSET` package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in `DBMS_SQLTUNE`. The difference is that `DBMS_SQLSET` does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- [DBMS\\_SQLSET Overview](#)
- [DBMS\\_SQLSET Security Model](#)
- [DBMS\\_SQLSET Data Structures](#)
- [Summary of DBMS\\_SQLSET Subprograms](#)

## 171.1 DBMS\_SQLSET Overview

Use this package to manage SQL tuning sets.

**Note:**

All `DBMS_SQLSET` subprograms have equivalents in the `DBMS_SQLTUNE` package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT\\_CURSOR\\_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT\\_WORKLOAD\\_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT\\_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT\\_SQLPA\\_TASK Function](#)
- SQL Trace files using the [SELECT\\_SQL\\_TRACE Function](#)
- A user-defined workload

The complete group of subprograms listed in [Summary of DBMS\\_SQLSET Subprograms](#) facilitates this functionality. As examples:

- The [CREATE\\_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD\\_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.
- The [CAPTURE\\_CURSOR\\_CACHE Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

## 171.2 DBMS\_SQLSET Security Model

This package is available to `PUBLIC` and performs its own security checking.

SQL tuning set subprograms require either the `ADMINISTER SQL TUNING SET` or the `ADMINISTER ANY SQL TUNING SET` privilege. Users having the `ADMINISTER SQL TUNING SET` privilege can only create and modify a SQL tuning set that they own. The `ADMINISTER ANY SQL TUNING SET` privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use [CREATE\\_SQLSET Procedure and Function](#) to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the `ADMINISTER SQL TUNING SET` privilege to manipulate the SQL tuning set.

## 171.3 DBMS\_SQLSET Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

### Object Types

- [SQLSET\\_ROW Object Type](#)

### 171.3.1 SQLSET\_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by `(sql_id, plan_hash_value)`. Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

### Syntax

```
CREATE TYPE sqlset_row AS object (  
    sql_id                VARCHAR(13),  
    force_matching_signature NUMBER,  
    sql_text              CLOB,  
    object_list           sql_objects,  
    bind_data             RAW(2000),  
    parsing_schema_name   VARCHAR2(30),
```

|                      |                      |
|----------------------|----------------------|
| module               | VARCHAR2(48),        |
| action               | VARCHAR2(32),        |
| elapsed_time         | NUMBER,              |
| cpu_time             | NUMBER,              |
| buffer_gets          | NUMBER,              |
| disk_reads           | NUMBER,              |
| direct_writes        | NUMBER,              |
| rows_processed       | NUMBER,              |
| fetches              | NUMBER,              |
| executions           | NUMBER,              |
| end_of_fetch_count   | NUMBER,              |
| optimizer_cost       | NUMBER,              |
| optimizer_env        | RAW(2000),           |
| priority             | NUMBER,              |
| command_type         | NUMBER,              |
| first_load_time      | VARCHAR2(19),        |
| stat_period          | NUMBER,              |
| active_stat_period   | NUMBER,              |
| other                | CLOB,                |
| plan_hash_value      | NUMBER,              |
| sql_plan             | sql_plan_table_type, |
| bind_list            | sql_binds,           |
| con_dbid             | NUMBER,              |
| last_exec_start_time | VARCHAR2(19))        |

## Attributes

**Table 171-1 SQLSET\_ROW Attributes**

| Attribute                  | Description                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id                     | Unique SQL ID.                                                                                                                                                       |
| forcing_matching_signature | Signature with literals, case, and whitespace removed.                                                                                                               |
| sql_text                   | Full text for the SQL statement.                                                                                                                                     |
| object_list                | Currently not implemented.                                                                                                                                           |
| bind_data                  | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive. |
| parsing_schema_name        | Schema where the SQL is parsed.                                                                                                                                      |
| module                     | Last application module for the SQL.                                                                                                                                 |
| action                     | Last application action for the SQL.                                                                                                                                 |
| elapsed_time               | Sum total elapsed time for this SQL statement.                                                                                                                       |
| cpu_time                   | Sum total CPU time for this SQL statement.                                                                                                                           |
| buffer_gets                | Sum total number of buffer gets.                                                                                                                                     |
| disk_reads                 | Sum total number of disk reads.                                                                                                                                      |
| direct_writes              | Sum total number of direct path writes.                                                                                                                              |
| rows_processed             | Sum total number of rows processed by this SQL.                                                                                                                      |
| fetches                    | Sum total number of fetches.                                                                                                                                         |
| executions                 | Total executions of this SQL statement.                                                                                                                              |

**Table 171-1 (Cont.) SQLSET\_ROW Attributes**

| Attribute            | Description                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| end_of_fetch_count   | Number of times the SQL statement was fully executed with all of its rows fetched.                                                                                                                                |
| optimizer_cost       | Optimizer cost for this SQL.                                                                                                                                                                                      |
| optimizer_env        | Optimizer environment for this SQL statement.                                                                                                                                                                     |
| priority             | User-defined priority (1,2,3).                                                                                                                                                                                    |
| command_type         | Statement type, such as INSERT or SELECT.                                                                                                                                                                         |
| first_load_time      | Load time of the parent cursor.                                                                                                                                                                                   |
| stat_period          | Period of time (seconds) when the statistics of this SQL statement were collected.                                                                                                                                |
| active_stat_period   | Effective period of time (in seconds) during which the SQL statement was active.                                                                                                                                  |
| other                | Other column for user-defined attributes.                                                                                                                                                                         |
| plan_hash_value      | Plan hash value of the plan.                                                                                                                                                                                      |
| sql_plan             | Execution plan for the SQL statement.                                                                                                                                                                             |
| bind_list            | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive. |
| con_dbid             | DBID of the PDB or CDB root.                                                                                                                                                                                      |
| last_exec_start_time | Most recent execution start time of this SQL statement.                                                                                                                                                           |

## 171.4 Summary of DBMS\_SQLSET Subprograms

This table lists the DBMS\_SQLSET subprograms and briefly describes them.

**Table 171-2 DBMS\_SQLSET Package Subprograms**

| Subprogram                                           | Description                                                                                        |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">ADD_REFERENCE Function</a>               | This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client. |
| <a href="#">CAPTURE_CURSOR_CACHE Procedure</a>       | This procedure captures a workload from the shared SQL area into a SQL tuning set.                 |
| <a href="#">CREATE_SQLSET Procedure and Function</a> | This procedure or function creates a SQL tuning set object in the database.                        |
| <a href="#">CREATE_STGTAB Procedure</a>              | This procedure creates a staging table through which SQL tuning sets are imported and exported.    |
| <a href="#">DELETE_SQLSET Procedure</a>              | This procedure deletes a set of SQL statements from a SQL tuning set.                              |
| <a href="#">DROP_SQLSET Procedure</a>                | This procedure drops a SQL tuning set if it is not active.                                         |

**Table 171-2 (Cont.) DBMS\_SQLSET Package Subprograms**

| Subprogram                                          | Description                                                                                                                                                                                          |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LOAD_SQLSET Procedure</a>               | This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements. |
| <a href="#">PACK_STGTAB Procedure</a>               | This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the <a href="#">CREATE_STGTAB</a> procedure.                                   |
| <a href="#">REMAP_STGTAB Procedure</a>              | This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.                                                                      |
| <a href="#">REMOVE_REFERENCE Procedure</a>          | This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.                                                                                                     |
| <a href="#">SELECT_CURSOR_CACHE Function</a>        | This function collects SQL statements from the workload repository.                                                                                                                                  |
| <a href="#">SELECT_SQL_TRACE Function</a>           | This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code> .                                                  |
| <a href="#">SELECT_SQLPA_TASK Function</a>          | This function collects SQL statements from a SQL Performance Analyzer comparison task.                                                                                                               |
| <a href="#">SELECT_SQLSET Function</a>              | This is a table function that reads the contents of a SQL tuning set.                                                                                                                                |
| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a> | This function collects SQL statements from the workload repository.                                                                                                                                  |
| <a href="#">UNPACK_STGTAB Procedure</a>             | This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.                                      |
| <a href="#">UPDATE_SQLSET Procedures</a>            | This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.                                                                                                            |

## 171.4.1 ADD\_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

### Syntax

```
DBMS_SQLSET.ADD_REFERENCE (
    sqlset_name IN VARCHAR2,
    description IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 :=NULL)
RETURN NUMBER;
```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

**Table 171-3 ADD\_SQLSET\_REFERENCE and ADD\_REFERENCE Function Parameters**

| Parameter    | Description                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                       |
| description  | Provides an optional description of the usage of SQL tuning set.<br>The description is truncated if longer than 256 characters. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                |

### Return Values

The identifier of the added reference.

### Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

### Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```
VARIABLE b_rid NUMBER;  
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload',  
description => 'my sts ref');
```

## 171.4.2 CAPTURE\_CURSOR\_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

### Syntax

```
DBMS_SQLSET.CAPTURE_CURSOR_CACHE (  
    sqlset_name          IN VARCHAR2,  
    time_limit           IN POSITIVE := 1800,  
    repeat_interval      IN POSITIVE := 300,  
    capture_option       IN VARCHAR2 := 'MERGE',  
    capture_mode         IN NUMBER   := MODE_REPLACE_OLD_STATS,  
    basic_filter         IN VARCHAR2 := NULL,  
    sqlset_owner         IN VARCHAR2 := NULL,  
    recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

## Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

**Table 171-4 CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>     | Specifies the SQL tuning set name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>time_limit</code>      | Defines the total amount of time, in seconds, to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>repeat_interval</code> | Defines the amount of time, in seconds, to pause between sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>capture_option</code>  | Specifies whether to insert new statements, update existing statements, or both.<br>Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .                                                                                                                                                                                                                                                                                                                                                 |
| <code>capture_mode</code>    | Specifies the capture mode ( <code>UPDATE</code> and <code>MERGE</code> capture options). Possible values: <ul style="list-style-type: none"> <li><code>MODE_REPLACE_OLD_STATS</code> — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</li> <li><code>MODE_ACCUMULATE_STATS</code> — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</li> </ul> |
| <code>basic_filter</code>    | Defines a filter to apply to the shared SQL area for each sample.<br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .                                                                                                                                                                                                                                                                            |
| <code>sqlset_owner</code>    | Specifies the owner of the SQL tuning set or <code>NULL</code> for current schema owner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>recursive_sql</code>   | Defines a filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE ( -
                                     sqlset_name      => 'my_workload', -
                                     time_limit        => 30, -
                                     repeat_interval    => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_mode     =>
DBMS_SQLSET.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_option   => 'INSERT');
```

## 171.4.3 CREATE\_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

### Syntax

```
DBMS_SQLSET.CREATE_SQLSET (
    sqlset_name IN VARCHAR2,
    description IN VARCHAR2 := NULL
    sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLSET.CREATE_SQLSET (
    sqlset_name IN VARCHAR2 := NULL,
    description IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 171-5 CREATE\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |
| description  | Provides an optional description of the SQL tuning set.                                                                                                                             |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                    |

## Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.

## Examples

```
EXEC DBMS_SQLSET.CREATE_SQLSET(-
    sqlset_name => 'my_workload', -
    description => 'complete application workload');
```

## 171.4.4 CREATE\_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

## Syntax

```
DBMS_SQLSET.CREATE_STGTAB (
    table_name          IN VARCHAR2,
    schema_name         IN VARCHAR2 := NULL,
    tablespace_name     IN VARCHAR2 := NULL,
    db_version          IN NUMBER   := NULL);
```

## Parameters

**Table 171-6 CREATE\_STGTAB\_SQLSET and CREATE\_STGTAB Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | Specifies the of the table to create. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| schema_name     | Defines the schema in which to create the table, or <b>NULL</b> for the current schema. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| tablespace_name | Specifies the tablespace in which to store the staging table, or <b>NULL</b> for the default tablespace of the current user. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| db_version      | <p>Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values:</p> <ul style="list-style-type: none"><li>• <b>NULL (default)</b> — Specifies the current database version.</li><li>• <b>STS_STGTAB_10_2_VERSION</b> — Specifies the 10.2 database version.</li><li>• <b>STS_STGTAB_11_1_VERSION</b> — Specifies the 11.1 database version.</li><li>• <b>STS_STGTAB_11_2_VERSION</b> — Specifies the 11.2 database version.</li><li>• <b>STS_STGTAB_12_1_VERSION</b> — Specifies the 12.1 database version.</li><li>• <b>STS_STGTAB_12_2_VERSION</b> — Specifies the 12.2 database version.</li></ul> |

## Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

```
EXEC DBMS_SQLSET.CREATE_STGTAB(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

```
BEGIN
  DBMS_SQLSET.CREATE_STGTAB(
    table_name => 'STGTAB_SQLSET_121'
  ,   db_version => DBMS_SQLSET.STS_STGTAB_12_1_VERSION );
END;
```

## 171.4.5 DELETE\_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

### Syntax

```
DBMS_SQLSET.DELETE_SQLSET (
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

### Parameters

**Table 171-7** DELETE\_SQLSET Procedure Parameters

| Parameter    | Description                                                                                                                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                                                                                                   |
| basic_filter | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner.                                                                                                                                |

### Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```

## 171.4.6 DROP\_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

### Syntax

```
DBMS_SQLSET.DROP_SQLSET (
  sqlset_name   IN  VARCHAR2,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

## Parameters

**Table 171-8 DROP\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                    |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

## Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

## Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');
```

## 171.4.7 LOAD\_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

## Syntax

```
DBMS_SQLSET.LOAD_SQLSET (  
    sqlset_name      IN  VARCHAR2,  
    populate_cursor  IN  sqlset_cursor,  
    load_option       IN  VARCHAR2 := 'INSERT',  
    update_option     IN  VARCHAR2 := 'REPLACE',  
    update_condition IN  VARCHAR2 := NULL,  
    update_attributes IN  VARCHAR2 := NULL,  
    ignore_null       IN  BOOLEAN  := TRUE,  
    commit_rows       IN  POSITIVE := NULL,  
    sqlset_owner      IN  VARCHAR2 := NULL);
```

## Parameters

**Table 171-9 LOAD\_SQLSET Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the name of SQL tuning set to be loaded.                                                                                                                                                                                                                                                                                                                       |
| populate_cursor | Specifies the cursor reference to the SQL tuning set to be loaded.                                                                                                                                                                                                                                                                                                       |
| load_option     | Specifies which statements are loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"><li>• INSERT (default) — Adds only new statements.</li><li>• UPDATE — Updates existing the SQL statements and ignores any new statements.</li><li>• MERGE — Inserts new statements and updates the information of the existing ones.</li></ul> |

**Table 171-9 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| update_option     | <p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are:</p> <ul style="list-style-type: none"> <li>REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on.</li> <li>ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</li> </ul>                                                                                                                                                                           |
| update_condition  | <p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> <li>OLD — Refers to statement attributes from the SQL tuning set (destination).</li> <li>NEW — Refers to statement attributes from the input statements (source).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| update_attributes | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action.</li> <li>BASIC — Specifies statistics and binds only.</li> <li>TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list.</li> <li>ALL — Specifies all attributes, including the execution context attributes such as module and action.</li> <li>List of comma separated attribute names to update: <ul style="list-style-type: none"> <li>EXECUTION_CONTEXT</li> <li>EXECUTION_STATISTICS</li> <li>SQL_BINDS</li> <li>SQL_PLAN</li> <li>SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)</li> </ul> </li> </ul> |
| ignore_null       | <p>Specifies whether to update attributes when the new value is NULL.</p> <p>If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| commit_rows       | <p>Specifies whether to commit statements after DML.</p> <p>If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation.</p> <p>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 171-9 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter                 | Description                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------|
| <code>sqlset_owner</code> | Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner). |

**Exceptions**

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

**Usage Notes**

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

**Examples**

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to `SYS` schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur);

END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>
''SYS'',
                                                NULL, NULL,NULL,NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          load_option      => 'MERGE',
                          update_option    => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that `'INSERT'` is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;

  DBMS_SQLSET.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          load_option      => 'UPDATE');
END;
/
```

## 171.4.8 PACK\_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the `sys` schema to a staging table created by the `CREATE_STGTAB` procedure.

### Syntax

```
DBMS_SQLSET.PACK_STGTAB (  
    sqlset_name          IN VARCHAR2,  
    sqlset_owner          IN VARCHAR2 := NULL,  
    staging_table_name    IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL,  
    db_version            IN NUMBER   := NULL);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.PACK_STGTAB_SQLSET` and `DBMS_SQLSET.PACK_STGTAB` procedures.

**Table 171-10** `PACK_STGTAB_SQLSET` and `PACK_STGTAB` Procedure Parameters

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>          | Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>sqlset_owner</code>         | Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>staging_table_name</code>   | Specifies the name of the table to use. The value is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>staging_schema_owner</code> | Specifies the schema where the table resides, or <code>NULL</code> for the current schema. The value is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>db_version</code>           | Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values: <ul style="list-style-type: none"><li><code>NULL</code> (default) — Specifies the current database version.</li><li><code>STS_STGTAB_10_2_VERSION</code> — Specifies the 10.2 database version.</li><li><code>STS_STGTAB_11_1_VERSION</code> — Specifies the 11.1 database version.</li><li><code>STS_STGTAB_11_2_VERSION</code> — Specifies the 11.2 database version.</li></ul> |

### Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a `COMMIT` after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

## Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   sqlset_owner   => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'my_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name      => 'workload_subset'
  ,   staging_table_name => 'STGTAB_SQLSET'
  ,   db_version      => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

## 171.4.9 REMAP\_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

### Syntax

```
DBMS_SQLSET.REMAP_STGTAB (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner     IN VARCHAR2 := NULL,
    new_sqlset_name      IN VARCHAR2 := NULL,
    new_sqlset_owner     IN VARCHAR2 := NULL,
    staging_table_name   IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid         IN NUMBER   := NULL,
    new_con_dbid         IN NUMBER   := NULL);
);
```

### Parameters

The parameters are identical for the DBMS\_SQLTUNE.REMAP\_STGTAB\_SQLSET and DBMS\_SQLSET.REMAP\_SQLSET procedures.

**Table 171-11 REMAP\_STGTAB\_SQLSET and REMAP\_SQLSET Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old_sqlset_name      | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.                                                                                    |
| old_sqlset_owner     | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner                                                                                       |
| new_sqlset_name      | Specifies the new name for the tuning set, or NULL to keep the same tuning set name.                                                                                                                |
| new_sqlset_owner     | Specifies the new owner for the tuning set, or NULL to keep the same owner name.                                                                                                                    |
| staging_table_name   | Specifies the name of the table on which to perform the remap operation. The value is case sensitive.                                                                                               |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.                                                                                       |
| old_con_dbid         | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid         | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

### Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

## Examples

```
-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name =>
'my_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_name =>
'imp_workload'
    , staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name => 'imp_workload'
    , old_sqlset_owner => 'SH'
    , new_sqlset_owner => 'SYS'
    , staging_table_name => 'STGTAB_SQLSET');
END;
```

## 171.4.10 REMOVE\_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

### Syntax

```
DBMS_SQLSET.REMOVE_REFERENCE (
  sqlset_name   IN  VARCHAR2,
  reference_id  IN  NUMBER,
  sqlset_owner  IN  VARCHAR2 := NULL,
  force_remove  IN  NUMBER   := 0);
```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

**Table 171-12 REMOVE\_SQLSET\_REFERENCE and REMOVE\_REFERENCE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                     |
| reference_id | Specifies the identifier of the reference to remove.                                                                                                                                                                                                                                          |
| sqlset_owner | Specifies the owner of the SQL tuning set (or NULL for the current schema owner).                                                                                                                                                                                                             |
| force_remove | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0).<br><br>Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user. |

## Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', -
                                reference_id => :rid);
```

Use the `DBA_SQLSET_REFERENCES` view to find all references to a given SQL tuning set.

## 171.4.11 SELECT\_CURSOR\_CACHE Function

This function collects SQL statements from the shared SQL area.

### Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter     IN   VARCHAR2 := NULL,
  ranking_measure1  IN   VARCHAR2 := NULL,
  ranking_measure2  IN   VARCHAR2 := NULL,
  ranking_measure3  IN   VARCHAR2 := NULL,
  result_percentage IN   NUMBER    := 1,
  result_limit      IN   NUMBER    := NULL,
  attribute_list    IN   VARCHAR2 := 'TYPICAL',
  recursive_sql     IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 171-13 SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>basic_filter</code>       | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> .<br><br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| <code>object_filter</code>      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                             |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                         |
| <code>result_percentage</code>  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br><br>The value applies only if one ranking measure is supplied.                                                                                                                                                                                                                                        |
| <code>result_limit</code>       | Defines the top limit SQL from the filtered source ranked by the ranking measure.                                                                                                                                                                                                                                                                                                                    |

**Table 171-13 (Cont.) SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_list | <p>Specifies the list of SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default).</li> <li>BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>ALL — Specifies all attributes.</li> <li>Comma-separated list of attribute names.</li> </ul> <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> <li>EXECUTION_STATISTICS</li> <li>BIND_LIST</li> <li>OBJECT_LIST</li> <li>SQL_PLAN</li> <li>SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics</li> </ul> |
| recursive_sql  | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Return Values

This function returns a one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

### Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

### Example 171-1 Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```
SELECT SQL_ID, SQL_TEXT
FROM   TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

### Example 171-2 All Information About a Statement

The following query obtains all information about the SQL statement with the SQL ID 4rm4183czbs7j:

```
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id =
''4rm4183czbs7j''));
```

**Example 171-3 Multiple Plans for a SQL Statement**

A data source may store multiple plans for each SQL statement. The output of the `SELECT_CURSOR_CACHE` function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID `ay1m3ssvtrh24`:

```
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id = 'ay1m3ssvtrh24'))
ORDER BY sql_id, plan_hash_value;
```

**Example 171-4 Processing All Statements in the Shared SQL Area**

This example processes all statements in the shared SQL area:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

    -- Process each statement in cursor (or pass cursor to load_sqlset).

    CLOSE cur;
END;
/
```

**Example 171-5 Process Statements Not Parsed by SYS**

This example processes all statements not parsed in the `SYS` schema:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur for
        SELECT VALUE(p)
        FROM TABLE(
            DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <> 'SYS')) p;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
end;
/
```

**Example 171-6 All Statements from an Application Module and Action**

This example processes all statements from a specified application module and action:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
```

```
FROM TABLE (
  DBMS_SQLSET.SELECT_CURSOR_CACHE (
    'module = 'MY_APPLICATION' and action = 'MY_ACTION'')) p;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;/
```

### Example 171-7 All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/
```

### Example 171-8 Statements Parsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE (
      DBMS_SQLSET.SELECT_CURSOR_CACHE (
        'buffer_gets > 100 and parsing_schema_name = 'APPS''))p;

-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/
```

### Example 171-9 Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The SQL\_PLAN attribute of sqlset\_row is NULL.

```
-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
```

```

-- is NULL)
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => 'elapsed_time > 5000000',
            object_filter     => NULL,
            ranking_measure1  => NULL,
            ranking_measure2  => NULL,
            ranking_measure3  => NULL,
            result_percentage => 1,
            result_limit      => NULL,
            attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
            recursive_sql     => HAS_RECURSIVE_SQL)) p;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;/

```

#### Example 171-10 Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

```

DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            basic_filter      => NULL,
            object_filter     => NULL,
            ranking_measure_1 => 'ELAPSED_TIME',
            ranking_measure_2 => NULL,
            ranking_measure_3 => NULL,
            result_percentage => 1,
            result_limit      => 100,
            attribute_list    => 'TYPICAL',
            recursive_sql     => HAS_RECURSIVE_SQL))) p;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;
/

```

### Example 171-11 Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure_1 => 'BUFFER_GETS',
      ranking_measure_2 => NULL,
      ranking_measure_3 => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL))) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

## 171.4.12 SELECT\_SQL\_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

### Syntax

```
DBMS_SQLSET.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name          IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL,,
  select_mode        IN POSITIVE := SINGLE_EXECUTION,
  options            IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start      IN VARCHAR2 := NULL,
  pattern_end        IN VARCHAR2 := NULL,
  result_limit       IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 171-14 SELECT\_SQL\_TRACE Function Parameters**

| Parameter              | Description                                                                       |
|------------------------|-----------------------------------------------------------------------------------|
| <code>directory</code> | Defines the directory object containing the trace files. This field is mandatory. |

**Table 171-14 (Cont.) SELECT\_SQL\_TRACE Function Parameters**

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>file_name</code>           | Specifies all or part of the name of the trace files.<br>If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.                                                                                                                                               |
| <code>mapping_table_name</code>  | Specifies the mapping table name.<br>Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.                                                                                                                                                                           |
| <code>mapping_table_owner</code> | Specifies the mapping table owner.<br>If it is NULL, then the function uses the current user.                                                                                                                                                                                                                                                                        |
| <code>select_mode</code>         | Specifies the mode for selecting SQL from the trace.<br>Possible values are: <ul style="list-style-type: none"><li><code>SINGLE_EXECUTION</code> — Returns one execution of a SQL. This is the default.</li><li><code>ALL_EXECUTIONS</code> — Returns all executions.</li></ul>                                                                                      |
| <code>options</code>             | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"><li><code>LIMITED_COMMAND_TYPE</code> — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default.</li><li><code>ALL_COMMAND_TYPE</code> — Returns the SQL statements with all command types.</li></ul> |
| <code>pattern_start</code>       | Specifies the delimiting pattern of the trace file sections to consider.<br>CURRENTLY INOPERABLE.                                                                                                                                                                                                                                                                    |
| <code>pattern_end</code>         | Specifies the closing delimiting pattern of the trace file sections to process.<br>CURRENTLY INOPERABLE.                                                                                                                                                                                                                                                             |
| <code>result_limit</code>        | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.                                                                                                                                                                                                                                                                                           |

### Return Values

This function returns a `SQLSET_ROW` object.

### Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

### Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'
```

```
-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
  FROM dba_objects
  WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                           'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                           'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                           'LOB', 'OPERATOR', 'PACKAGE',
                           'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                           'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                           'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
  FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_SQL_TRACE(
        directory=>'SQL_TRACE_DIR',
        file_name=>'%trc',
        mapping_table_name=>'mapping')) p;
  DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

## 171.4.13 SELECT\_SQLPA\_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

### See Also:

*Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

### Syntax

```
DBMS_SQLSET.SELECT_SQLPA_TASK(
    task_name          IN VARCHAR2,
    task_owner         IN VARCHAR2 := NULL,
    execution_name     IN VARCHAR2 := NULL,
    level_filter       IN VARCHAR2 := 'REGRESSED',

### Parameters

**Table 171-15 SELECT\_SQLPA\_TASK Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>      | Specifies the name of the SQL Performance Analyzer task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>task_owner</code>     | Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>execution_name</code> | Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code> ) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>level_filter</code>   | Specifies which subset of SQL statements to include. Same format as <code>DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL</code> , with some possible strings removed. <ul style="list-style-type: none"> <li><code>IMPROVED</code> includes only improved SQL.</li> <li><code>REGRESSED</code> includes only regressed SQL (default).</li> <li><code>CHANGED</code> includes only SQL with changed performance.</li> <li><code>UNCHANGED</code> includes only SQL with unchanged performance.</li> <li><code>CHANGED_PLANS</code> includes only SQL with plan changes.</li> <li><code>UNCHANGED_PLANS</code> includes only SQL with unchanged plans.</li> <li><code>ERRORS</code> includes only SQL with errors only.</li> <li><code>MISSING_SQL</code> includes only missing SQL statements (across STS).</li> <li><code>NEW_SQL</code> includes only new SQL statements (across STS).</li> </ul> |
| <code>basic filter</code>   | Specifies the SQL predicate to filter the SQL in addition to the level filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>object_filter</code>  | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 171-15 (Cont.) SELECT\_SQLPA\_TASK Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_list | <p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>TYPICAL</b> — Returns <b>BASIC</b> plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</li> <li>• <b>BASIC</b> — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>• <b>ALL</b> — Returns all attributes.</li> <li>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <b>EXECUTION_STATISTICS</b>, <b>SQL_BINDS</b>, <b>SQL_PLAN_STATISTICS</b> (similar to <b>SQL_PLAN</b> + row source statistics).</li> </ul> |

### Return Values

This function returns a SQL tuning set object.

### Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

## 171.4.14 SELECT\_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

### Syntax

```
DBMS_SQLSET.SELECT_SQLSET (
  sqlset_name      IN   VARCHAR2,
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter     IN   VARCHAR2 := NULL,
  ranking_measure1  IN   VARCHAR2 := NULL,
  ranking_measure2  IN   VARCHAR2 := NULL,
  ranking_measure3  IN   VARCHAR2 := NULL,
  result_percentage IN   NUMBER   := 1,
  result_limit      IN   NUMBER   := NULL)
  attribute_list    IN   VARCHAR2 := 'TYPICAL',
  plan_filter       IN   VARCHAR2 := NULL,
  sqlset_owner      IN   VARCHAR2 := NULL,
  recursive_sql     IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 171-16 SELECT\_SQLSET Function Parameters**

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| sqlset_name | Specifies the name of the SQL tuning set to query. |

**Table 171-16 (Cont.) SELECT\_SQLSET Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>basic_filter</code>       | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>object_filter</code>      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>ranking_measure(n)</code> | Specifies an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>result_percentage</code>  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br><br>Note that this parameter applies only if one ranking measure is supplied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>result_limit</code>       | The top limit SQL from the filtered source, ranked by the ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>attribute_list</code>     | Defines the SQL statement attributes to return in the result.<br>The possible values are: <ul style="list-style-type: none"> <li><code>BASIC</code> — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.</li> <li><code>TYPICAL</code> — Returns <code>BASIC</code> plus the SQL plan, but without row source statistics and without the object reference list. This is the default.</li> <li><code>ALL</code> — Returns all attributes.</li> <li>Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes: <ul style="list-style-type: none"> <li><code>EXECUTION_STATISTICS</code></li> <li><code>SQL_BINDS</code></li> <li><code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics)</li> </ul> </li> </ul>                                                                                                                                                                                                                  |
| <code>plan_filter</code>        | Specifies the plan filter.<br><br>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are: <ul style="list-style-type: none"> <li><code>LAST_GENERATED</code> — Returns the plan with the most recent timestamp.</li> <li><code>FIRST_GENERATED</code> — Returns the plan with the least recent timestamp.</li> <li><code>LAST_LOADED</code> — Returns the plan with the most recent <code>FIRST_LOAD_TIME</code> statistical information.</li> <li><code>FIRST_LOADED</code> — Returns the plan with the least recent <code>FIRST_LOAD_TIME</code> statistical information.</li> <li><code>MAX_ELAPSED_TIME</code> — Returns the plan with the maximum elapsed time.</li> <li><code>MAX_BUFFER_GETS</code> — Returns the plan with the maximum buffer gets.</li> <li><code>MAX_DISK_READS</code> — Returns the plan with the maximum disk reads.</li> <li><code>MAX_DIRECT_WRITES</code> — Returns the plan with the maximum direct writes.</li> <li><code>MAX_OPTIMIZER_COST</code> — Returns the plan with the maximum optimizer cost value.</li> </ul> |
| <code>sqlset_owner</code>       | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>recursive_sql</code>      | Specifies that the filter must include recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> , which is the default) or exclude it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

## Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

## Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

## 171.4.15 SELECT\_WORKLOAD\_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

## Syntax

```
DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit     IN NUMBER   := NULL,
  attribute_list   IN VARCHAR2 := 'TYPICAL',
  recursive_sql    IN VARCHAR2 := HAS_RECURSIVE_SQL,
  dbid             IN NUMBER   := NULL)
RETURN sys.sqlset PIPELINED;

DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
  baseline_name   IN VARCHAR2,
```

```

basic_filter      IN VARCHAR2 := NULL,
object_filter     IN VARCHAR2 := NULL,
ranking_measure1  IN VARCHAR2 := NULL,
ranking_measure2  IN VARCHAR2 := NULL,
ranking_measure3  IN VARCHAR2 := NULL,
result_percentage IN NUMBER    := 1,
result_limit      IN NUMBER    := NULL,
attribute_list    IN VARCHAR2 := 'TYPICAL',
recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
dbid              IN NUMBER    := NULL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 171-17 SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| begin_snap         | Defines the beginning AWR snapshot (non-inclusive).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| end_snap           | Defines the ending AWR snapshot (inclusive).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| baseline_name      | Specifies the name of the AWR baseline period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| basic_filter       | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> .<br><br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .                                                                                                                                                                                                                                                                                                                                                                                          |
| object_filter      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ranking_measure(n) | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| result_percentage  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| result_limit       | Specifies the top limit SQL from the source according to the supplied ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| attribute_list     | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li><code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default.</li> <li><code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li><code>ALL</code> — Returns all attributes</li> <li>Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).</li> </ul> |
| recursive_sql      | Specifies the filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dbid               | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

## Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

## Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

## 171.4.16 UNPACK\_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

## Syntax

```
DBMS_SQLSET.UNPACK_STGTAB (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

## Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

**Table 171-18 UNPACK\_STGTAB\_SQLSET and UNPACK\_STGTAB Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code> | Specifies the name of the tuning set to unpack (not null).<br>Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |

**Table 171-18 (Cont.) UNPACK\_STGTAB\_SQLSET and UNPACK\_STGTAB Procedure Parameters**

| Parameter            | Description                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_owner         | Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.                                          |
| replace              | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists. |
| staging_table_name   | Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).     |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).                                                             |

### Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace           => FALSE, -
                               staging_table_name => 'STGTAB_SQLSET');
```

-- errors can arise during STS unpack when a STS in the staging table has the  
-- same name/owner as STS on the system. In this case, users should call  
-- remap\_stgtab\_sqlset to patch the staging table and with which to call  
unpack  
-- Replace set to TRUE.

```
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name      => '%', -
                               sqlset_owner     => '%', -
                               replace           => TRUE, -
                               staging_table_name => 'STGTAB_SQLSET');
```

## 171.4.17 UPDATE\_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

### Syntax

```
DBMS_SQLSET.UPDATE_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    plan_hash_value  IN  NUMBER := NULL,
    attribute_name   IN  VARCHAR2,
    attribute_value  IN  VARCHAR2 := NULL,
    sqlset_owner     IN  VARCHAR2 := NULL);
```

```
DBMS_SQLSET.UPDATE_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    plan_hash_value  IN  NUMBER := NULL,
    attribute_name   IN  VARCHAR2,
```

```
attribute_value IN NUMBER := NULL,  
sqlset_owner   IN VARCHAR2 := NULL);
```

## Parameters

**Table 171-19 UPDATE\_SQLSET Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                                                                                                    |
| sql_id          | Specifies the identifier of the SQL statement to be updated.                                                                                                                                                                                                                                                                                                                 |
| plan_hash value | Specifies the hash value of the execution plan for a SQL statement.<br>Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.                                                                                                                                                                    |
| attribute_name  | Specifies the name of the attribute to be modified.<br>You can update the text field for <code>MODULE</code> , <code>ACTION</code> , <code>PARSING_SCHEMA_NAME</code> , and <code>OTHER</code> . The only numerical field that you can update is <code>PRIORITY</code> .<br>If a statement has multiple plans, then the procedure changes the attribute value for all plans. |
| attribute_value | Specifies the new value of the attribute.                                                                                                                                                                                                                                                                                                                                    |

# DBMS\_SQLTUNE

The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [DBMS\\_SQLTUNE Overview](#)
- [DBMS\\_SQLTUNE Security Model](#)
- [DBMS\\_SQLTUNE Data Structures](#)
- [DBMS\\_SQLTUNE Subprogram Groups](#)
- [Summary of DBMS\\_SQLTUNE Subprograms](#)

**See Also:**

["DBMS\\_AUTO\\_SQLTUNE Overview"](#)

## 172.1 DBMS\_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS\\_SQLTUNE SQL Profile Subprograms](#)
- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#)

### SQL Tuning Advisor

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. [CREATE\\_TUNING\\_TASK Functions](#) creates a tuning task for tuning one or more SQL statements.
2. The [EXECUTE\\_TUNING\\_TASK Function and Procedure](#) executes a previously created tuning task.
3. The [REPORT\\_TUNING\\_TASK Function](#) displays the results of a tuning task.

4. You use the [SCRIPT\\_TUNING\\_TASK Function](#) to create a SQL\*Plus script which can then be executed to implement a set of Advisor recommendations

### SQL Profile Subprograms

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [DBMS\\_SQLTUNE SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT\\_SQL\\_PROFILE Procedure and Function](#) to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL profile with the [ALTER\\_SQL\\_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP\\_SQL\\_PROFILE Procedure](#).

### SQL Tuning Sets

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the [SELECT\\_CURSOR\\_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT\\_WORKLOAD\\_REPOSITORY Function](#)
- Other SQL tuning sets using the [SELECT\\_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT\\_SQLPA\\_TASK Function](#)
- SQL Trace files using the [SELECT\\_SQL\\_TRACE Function](#)
- A user-defined workload

The complete group of [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- The [CREATE\\_SQLSET Procedure and Function](#) creates a SQL tuning set object in the database.
- The [LOAD\\_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL.

- The [CAPTURE\\_CURSOR\\_CACHE\\_SQLSET Procedure](#) collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

**Note:**

When manipulating SQL tuning sets, you can use [DBMS\\_SQLSET](#) as an alternative to [DBMS\\_SQLTUNE](#).

## Import and Export of SQL Tuning Sets and SQL Profiles

Use [DBMS\\_SQLTUNE](#) subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the [CREATE\\_STGTAB\\_SQLPROF Procedure](#) or the [CREATE\\_STGTAB\\_SQLSET Procedure](#).
2. To populate the staging table with information from the source system, call the [PACK\\_STGTAB\\_SQLPROF Procedure](#) or [PACK\\_STGTAB\\_SQLSET Procedure](#).
3. Move the staging table to the destination system.
4. To re-create the object on the new system, call the [UNPACK\\_STGTAB\\_SQLPROF Procedure](#) or the [UNPACK\\_STGTAB\\_SQLSET Procedure](#).

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about programmatic flow

## Automatic Tuning Task Functions

The automated system task [SYS\\_AUTO\\_SQL\\_TUNING\\_TASK](#) is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the [DBMS\\_AUTO\\_SQLTUNE.REPORT\\_AUTO\\_TUNING\\_TASK](#) API.

**See Also:**

[DBMS\\_AUTO\\_SQLTUNE](#) for the list of subprograms that you can use to manage the automated SQL tuning task.

## Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views expose these statistics. In addition, `DBMS_SQLTUNE` provides the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions to report monitoring information.

### Note:

`DBMS_SQL_MONITOR` also contains the `REPORT_SQL_MONITOR` and `REPORT_SQL_MONITOR_LIST` functions.

## Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables `DBMS_SQLTUNE` to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the `database_link_to` parameter.

# 172.2 DBMS\_SQLTUNE Security Model

This package is available to `PUBLIC` and performs its own security checking.

Note the following:

- Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (`*_TUNING_TASK`) require the `ADVISOR` privilege.
- SQL tuning set subprograms (`*_SQLSET`) require either of the following privileges:
  - `ADMINISTER SQL TUNING SET`  
You can only create and modify a SQL tuning set that you own.
  - `ADMINISTER ANY SQL TUNING SET`  
You can operate on all SQL tuning sets, even those owned by other users.
- In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
  - `CREATE ANY SQL PROFILE`
  - `ALTER ANY SQL PROFILE`
  - `DROP ANY SQL PROFILE`

The preceding privileges have been deprecated in favor of `ADMINISTER SQL MANAGEMENT OBJECT`.

## 172.3 DBMS\_SQLTUNE Data Structures

The `SELECT_*` subprograms in the `DBMS_SQLTUNE` package return objects of the `SQLSET_ROW` type.

### Object Types

- [SQLSET\\_ROW Object Type](#)

### 172.3.1 SQLSET\_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of `SQLSET_ROW` objects. Each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_*` subprograms each model a data source as a collection of `SQLSET_ROW` objects, with each object uniquely identified by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

### Syntax

```
CREATE TYPE sqlset_row AS object (
    sql_id                VARCHAR(13),
    force_matching_signature NUMBER,
    sql_text              CLOB,
    object_list           sql_objects,
    bind_data             RAW(2000),
    parsing_schema_name   VARCHAR2(30),
    module                VARCHAR2(48),
    action                VARCHAR2(32),
    elapsed_time          NUMBER,
    cpu_time              NUMBER,
    buffer_gets           NUMBER,
    disk_reads            NUMBER,
    direct_writes         NUMBER,
    rows_processed        NUMBER,
    fetches               NUMBER,
    executions            NUMBER,
    end_of_fetch_count    NUMBER,
    optimizer_cost        NUMBER,
    optimizer_env         RAW(2000),
    priority              NUMBER,
    command_type          NUMBER,
    first_load_time       VARCHAR2(19),
    stat_period           NUMBER,
    active_stat_period    NUMBER,
    other                 CLOB,
    plan_hash_value       NUMBER,
    sql_plan              sql_plan_table_type,
    bind_list             sql_binds,
```

```

con_dbid          NUMBER,
last_exec_start_time  VARCHAR2(19))

```

## Attributes

**Table 172-1 SQLSET\_ROW Attributes**

| Attribute                  | Description                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id                     | Unique SQL ID.                                                                                                                                                                                                                  |
| forcing_matching_signature | Signature with literals, case, and whitespace removed.                                                                                                                                                                          |
| sql_text                   | Full text for the SQL statement.                                                                                                                                                                                                |
| object_list                | Currently not implemented.                                                                                                                                                                                                      |
| bind_data                  | Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for <code>bind_list</code> - they are mutually exclusive.                                                            |
| parsing_schema_name        | Schema where the SQL is parsed.                                                                                                                                                                                                 |
| module                     | Last application module for the SQL.                                                                                                                                                                                            |
| action                     | Last application action for the SQL.                                                                                                                                                                                            |
| elapsed_time               | Sum total elapsed time for this SQL statement.                                                                                                                                                                                  |
| cpu_time                   | Sum total CPU time for this SQL statement.                                                                                                                                                                                      |
| buffer_gets                | Sum total number of buffer gets.                                                                                                                                                                                                |
| disk_reads                 | Sum total number of disk reads.                                                                                                                                                                                                 |
| direct_writes              | Sum total number of direct path writes.                                                                                                                                                                                         |
| rows_processed             | Sum total number of rows processed by this SQL.                                                                                                                                                                                 |
| fetches                    | Sum total number of fetches.                                                                                                                                                                                                    |
| executions                 | Total executions of this SQL statement.                                                                                                                                                                                         |
| end_of_fetch_count         | Number of times the SQL statement was fully executed with all of its rows fetched.                                                                                                                                              |
| optimizer_cost             | Optimizer cost for this SQL.                                                                                                                                                                                                    |
| optimizer_env              | Optimizer environment for this SQL statement.                                                                                                                                                                                   |
| priority                   | User-defined priority (1,2,3).                                                                                                                                                                                                  |
| command_type               | Statement type, such as <code>INSERT</code> or <code>SELECT</code> .                                                                                                                                                            |
| first_load_time            | Load time of the parent cursor.                                                                                                                                                                                                 |
| stat_period                | Period of time (seconds) when the statistics of this SQL statement were collected.                                                                                                                                              |
| active_stat_period         | Effective period of time (in seconds) during which the SQL statement was active.                                                                                                                                                |
| other                      | Other column for user-defined attributes.                                                                                                                                                                                       |
| plan_hash_value            | Plan hash value of the plan.                                                                                                                                                                                                    |
| sql_plan                   | Execution plan for the SQL statement.                                                                                                                                                                                           |
| bind_list                  | List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for <code>bind_data</code> : they are mutually exclusive. |

**Table 172-1 (Cont.) SQLSET\_ROW Attributes**

| Attribute            | Description                                             |
|----------------------|---------------------------------------------------------|
| con_dbid             | DBID of the PDB or CDB root.                            |
| last_exec_start_time | Most recent execution start time of this SQL statement. |

## 172.4 DBMS\_SQLTUNE Subprogram Groups

DBMS\_SQLTUNE subprograms are grouped by function.

- [DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#)
- [DBMS\\_SQLTUNE SQL Profile Subprograms](#)
- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#)
- [DBMS\\_SQLTUNE Real-Time SQL Monitoring Subprograms](#)
- [DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#)

### 172.4.1 DBMS\_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

**Table 172-2 SQL Tuning Task Subprograms**

| Subprogram                                                   | Description                                                                                                   |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <a href="#">"CANCEL_TUNING_TASK Procedure"</a>               | Cancels the currently executing tuning task                                                                   |
| <a href="#">"CREATE_SQL_PLAN_BASELINE Procedure"</a>         | Creates a SQL plan baseline for an existing plan                                                              |
| <a href="#">"CREATE_TUNING_TASK Functions"</a>               | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor                        |
| <a href="#">"DROP_TUNING_TASK Procedure"</a>                 | Drops a SQL tuning task                                                                                       |
| <a href="#">"EXECUTE_TUNING_TASK Function and Procedure"</a> | Executes a previously created tuning task                                                                     |
| <a href="#">"IMPLEMENT_TUNING_TASK Procedure"</a>            | Implements a set of SQL profile recommendations made by SQL Tuning Advisor                                    |
| <a href="#">"INTERRUPT_TUNING_TASK Procedure"</a>            | Interrupts the currently executing tuning task                                                                |
| <a href="#">"REPORT_AUTO_TUNING_TASK Function"</a>           | Displays a report from the automatic tuning task, reporting on a range of executions                          |
| <a href="#">"REPORT_TUNING_TASK Function"</a>                | Displays the results of a tuning task                                                                         |
| <a href="#">"RESET_TUNING_TASK Procedure"</a>                | Resets the currently executing tuning task to its initial state                                               |
| <a href="#">"RESUME_TUNING_TASK Procedure"</a>               | Resumes a previously interrupted task that was created to process a SQL tuning set                            |
| <a href="#">"SCHEDULE_TUNING_TASK Function"</a>              | Creates a tuning task and schedules its execution as a scheduler job                                          |
| <a href="#">"SCRIPT_TUNING_TASK Function"</a>                | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations |

**Table 172-2 (Cont.) SQL Tuning Task Subprograms**

| Subprogram                                             | Description                                                            |
|--------------------------------------------------------|------------------------------------------------------------------------|
| <a href="#">"SET_TUNING_TASK_PARAMETER Procedures"</a> | Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER |

["Summary of DBMS\\_SQLTUNE Subprograms"](#) contains a complete listing of all subprograms in the package.

## 172.4.2 DBMS\_SQLTUNE SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

**Table 172-3 SQL Profile Subprograms**

| Subprogram                                                | Description                                                                                       |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <a href="#">ACCEPT_ALL_SQL_PROFILES Procedure</a>         | Accepts all SQL profiles recommended by a specific execution of a tuning task                     |
| <a href="#">ACCEPT_SQL_PROFILE Procedure and Function</a> | Creates a SQL profile for the specified tuning task                                               |
| <a href="#">ALTER_SQL_PROFILE Procedure</a>               | Alters specific attributes of an existing SQL profile object                                      |
| <a href="#">CREATE_STGTAB_SQLPROF Procedure</a>           | Creates the staging table used for copying SQL profiles from one system to another                |
| <a href="#">DROP_SQL_PROFILE Procedure</a>                | Drops the named SQL profile from the database                                                     |
| <a href="#">PACK_STGTAB_SQLPROF Procedure</a>             | Moves profile data out of the SYS schema into the staging table                                   |
| <a href="#">REMAP_STGTAB_SQLPROF Procedure</a>            | Changes the profile data values kept in the staging table prior to performing an unpack operation |
| <a href="#">SQLTEXT_TO_SIGNATURE Function</a>             | Returns a SQL text's signature                                                                    |
| <a href="#">UNPACK_STGTAB_SQLPROF Procedure</a>           | Uses the profile data stored in the staging table to create profiles on this system               |

["Summary of DBMS\\_SQLTUNE Subprograms"](#) contains a complete listing of all subprograms in the package.

## 172.4.3 DBMS\_SQLTUNE SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

**Table 172-4 SQL Tuning Set Subprograms**

| Subprogram                                                     | Description                                                                                                     |
|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_SQLSET_REFER<br/>ENCE Function</a>             | Adds a new reference to an existing SQL tuning set to indicate its use by a client                              |
| <a href="#">CAPTURE_CURSOR_C<br/>ACHE_SQLSET<br/>Procedure</a> | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set |
| <a href="#">CREATE_SQLSET<br/>Procedure and Function</a>       | Creates a SQL tuning set object in the database                                                                 |

**Table 172-4 (Cont.) SQL Tuning Set Subprograms**

| Subprogram                                          | Description                                                                                                                                      |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_STGTAB_SQLSET Procedure</a>      | Creates a staging table through which SQL Tuning Sets are imported and exported                                                                  |
| <a href="#">DELETE_SQLSET Procedure</a>             | Deletes a set of SQL statements from a SQL tuning set                                                                                            |
| <a href="#">DROP_SQLSET Procedure</a>               | Drops a SQL tuning set if it is not active                                                                                                       |
| <a href="#">LOAD_SQLSET Procedure</a>               | Populates the SQL tuning set with a set of selected SQL                                                                                          |
| <a href="#">PACK_STGTAB_SQLSET Procedure</a>        | Copies tuning sets out of the SYS schema into the staging table                                                                                  |
| <a href="#">REMAP_STGTAB_SQLSET Procedure</a>       | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system |
| <a href="#">REMOVE_SQLSET_REFERENCE Procedure</a>   | Deactivates a SQL tuning set to indicate it is no longer used by the client                                                                      |
| <a href="#">SELECT_CURSOR_CACHE Function</a>        | Collects SQL statements from the shared SQL area                                                                                                 |
| <a href="#">SELECT_SQL_TRACE Function</a>           | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>                    |
| <a href="#">SELECT_SQLPA_TASK Function</a>          | Collects SQL statements from a SQL performance analyzer comparison task                                                                          |
| <a href="#">SELECT_SQLSET Function</a>              | Collects SQL statements from an existing SQL tuning set                                                                                          |
| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a> | Collects SQL statements from the workload repository                                                                                             |
| <a href="#">UNPACK_STGTAB_SQLSET Procedure</a>      | Copies one or more SQL tuning sets from the staging table                                                                                        |
| <a href="#">UPDATE_SQLSET Procedures</a>            | Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set      |

The [Summary of DBMS\\_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

## 172.4.4 DBMS\_SQLTUNE Real-Time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

**Table 172-5 Real-Time SQL Monitoring Subprograms**

| Subprogram                                           | Description                                                                         |
|------------------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">REPORT_SQL_MONITOR Function</a>          | Reports on Real-Time SQL Monitoring                                                 |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a>     | Builds a report for all or a subset of statements monitored by Oracle Database      |
| <a href="#">REPORT_SQL_MONITOR_LIST_XML Function</a> | Builds an XML report for all or a subset of statements monitored by Oracle Database |

## 172.4.5 DBMS\_SQLTUNE SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the shared SQL area and automatic workload repository (AWR).

**Table 172-6 SQL Performance Reporting Subprograms**

| Subprogram                                       | Description                                                                                                                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_SQL_DETAIL Function</a>       | This function reports on a specific SQL ID.                                                                                                                                      |
| <a href="#">REPORT_SQL_MONITOR Function</a>      | This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.                      |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a> | This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics. |
| <a href="#">REPORT_TUNING_TASK Function</a>      | This function displays the results of a tuning task.                                                                                                                             |
| <a href="#">REPORT_TUNING_TASK_XML Function</a>  | This function displays an XML report of a tuning task.                                                                                                                           |

## 172.5 Summary of DBMS\_SQLTUNE Subprograms

This table lists the DBMS\_SQLTUNE subprograms and briefly describes them.

**Table 172-7 DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                                | Description                                                                                                     | Group                                                       |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <a href="#">ACCEPT_ALL_SQL_PROFILES Procedure</a>         | Accepts all SQL profiles recommended by a particular execution of a particular tuning task                      | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>        |
| <a href="#">ACCEPT_SQL_PROFILE Procedure and Function</a> | Creates a SQL profile for the specified tuning task                                                             | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>        |
| <a href="#">ADD_SQLSET_REFERENCE Function</a>             | Adds a new reference to an existing SQL tuning set to indicate its use by a client                              | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">ALTER_SQL_PROFILE Procedure</a>               | Alters specific attributes of an existing SQL profile object                                                    | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>        |
| <a href="#">CANCEL_TUNING_TASK Procedure</a>              | Cancels the currently executing tuning task                                                                     | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">CAPTURE_CURSOR_CACHE_SQLSET Procedure</a>     | Over a specified time interval incrementally captures a workload from the shared SQL area into a SQL tuning set | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |
| <a href="#">CREATE_SQL_PLAN_BASELINE Procedure</a>        | Creates a SQL plan baseline for an existing plan                                                                | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a> |
| <a href="#">CREATE_SQLSET Procedure and Function</a>      | Creates a SQL tuning set object in the database                                                                 | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>     |

**Table 172-7 (Cont.) DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                                 | Description                                                                                                                                      | Group                                                              |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">CREATE_STGTAB_SQLPROF Procedure</a>            | Creates the staging table used for copying SQL profiles from one system to another                                                               | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">CREATE_STGTAB_SQLSET Procedure</a>             | Creates a staging table through which SQL tuning sets are imported and exported                                                                  | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">CREATE_TUNING_TASK Functions</a>               | Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor                                                           | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">DELETE_SQLSET Procedure</a>                    | Deletes a set of SQL statements from a SQL tuning set                                                                                            | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">DROP_SQL_PROFILE Procedure</a>                 | Drops the named SQL profile from the database                                                                                                    | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">DROP_SQLSET Procedure</a>                      | Drops a SQL tuning set if it is not active                                                                                                       | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |

| <a href="#">EXECUTE_TUNING_TASK Function and Procedure</a> | Executes a previously created tuning task                                                                                                        | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">IMPLEMENT_TUNING_TASK Procedure</a>            | implements a set of SQL profile recommendations made by SQL Tuning Advisor                                                                       | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">INTERRUPT_TUNING_TASK Procedure</a>            | Interrupts the currently executing tuning task                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">LOAD_SQLSET Procedure</a>                      | Populates the SQL tuning set with a set of selected SQL                                                                                          | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">PACK_STGTAB_SQLPROF Procedure</a>              | Moves profile data out of the SYS schema into the staging table                                                                                  | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">PACK_STGTAB_SQLSET Procedure</a>               | Moves tuning sets out of the SYS schema into the staging table                                                                                   | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REMAP_STGTAB_SQLPROF Procedure</a>             | Changes the profile data values kept in the staging table prior to performing an unpack operation                                                | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>               |
| <a href="#">REMAP_STGTAB_SQLSET Procedure</a>              | Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REMOVE_SQLSET_REFERENCE Procedure</a>          | Deactivates a SQL tuning set to indicate it is no longer used by the client                                                                      | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REPORT_AUTO_TUNING_TASK Function</a>           | Displays a report from the automatic tuning task, reporting on a range of subtasks                                                               | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">REPORT_SQL_DETAIL Function</a>                 | Reports on a specific SQL ID                                                                                                                     | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |

**Table 172-7 (Cont.) DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                               | Group                                                              |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">REPORT_SQL_MONITOR Function</a>          | Builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution                              | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_SQL_MONITOR_LIST Function</a>     | Builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_SQL_MONITOR_LIST_XML Function</a> | Equivalent to the <a href="#">REPORT_SQL_MONITOR_LIST</a> function, except that it returns XMLType                                                                        | <a href="#">DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms</a>  |
| <a href="#">REPORT_TUNING_TASK Function</a>          | Displays the results of a tuning task                                                                                                                                     | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |
| <a href="#">REPORT_TUNING_TASK_XML Function</a>      | Displays an XML report of a tuning task                                                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Performance Reporting Subprograms</a> |
| <a href="#">RESET_TUNING_TASK Procedure</a>          | Resets the currently executing tuning task to its initial state                                                                                                           | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">RESUME_TUNING_TASK Procedure</a>         | Resumes a previously interrupted task that was created to process a SQL tuning set                                                                                        | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">SCHEDULE_TUNING_TASK Function</a>        | Creates a SQL tuning task and schedule its execution as a scheduler job                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">SCRIPT_TUNING_TASK Function</a>          | Creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations                                                             | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |
| <a href="#">SELECT_CURSOR_CACHE Function</a>         | Collects SQL statements from the shared SQL area                                                                                                                          | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">SELECT_SQL_TRACE Function</a>            | Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>                                             | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">SELECT_SQLPA_TASK Function</a>           | Collects SQL statements from a SQL Performance Analyzer comparison task                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">SELECT_SQLSET Function</a>               | Collects SQL statements from an existing SQL tuning set                                                                                                                   | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">SELECT_WORKLOAD_REPOSITORY Function</a>  | Collects SQL statements from the workload repository                                                                                                                      | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a>            |
| <a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> | Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER                                                                                                    | <a href="#">DBMS_SQLTUNE SQL Tuning Advisor Subprograms</a>        |

**Table 172-7 (Cont.) DBMS\_SQLTUNE Package Subprograms**

| Subprogram                                      | Description                                                                         | Group                                                   |
|-------------------------------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------|
| <a href="#">SQLTEXT_TO_SIGNATURE Function</a>   | Returns a SQL text's signature                                                      | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>    |
| <a href="#">UNPACK_STGTAB_SQLPROF Procedure</a> | Uses the profile data stored in the staging table to create profiles on this system | <a href="#">DBMS_SQLTUNE SQL Profile Subprograms</a>    |
| <a href="#">UNPACK_STGTAB_SQLSET Procedure</a>  | Moves one or more SQL tuning sets from the staging table                            | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a> |
| <a href="#">UPDATE_SQLSET Procedures</a>        | Updates selected fields for a SQL statement in a SQL tuning set                     | <a href="#">DBMS_SQLTUNE SQL Tuning Set Subprograms</a> |

## 172.5.1 ACCEPT\_ALL\_SQL\_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
    task_name          IN VARCHAR2,
    category           IN VARCHAR2 := NULL,
    replace            IN BOOLEAN  := FALSE,
    force_match        IN BOOLEAN  := FALSE,
    profile_type       IN VARCHAR2 := REGULAR_PROFILE,
    autotune_period    IN NUMBER   := NULL,
    execution_name     IN VARCHAR2 := NULL,
    task_owner         IN VARCHAR2 := NULL,
    description        IN VARCHAR2 := NULL,
    database_link_to   IN VARCHAR2 := NULL);
```

### Parameters

**Table 172-8 ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| task_name | The (mandatory) name of the SQL tuning task |

**Table 172-8 (Cont.) ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| category        | This is the category name which must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.                                               |
| replace         | If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/ category pair, even with <code>replace</code> set to <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                                                                       |
| force_match     | If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter.<br><br>If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter. |
| profile_type    | Options: <ul style="list-style-type: none"> <li><code>REGULAR_PROFILE</code> - profile without a change to parallel execution (Default, equivalent to <code>NULL</code>). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</li> <li><code>PX_PROFILE</code> - regular profile with a change to parallel execution</li> </ul>                                                                                                                                                          |
| autotune_period | The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows: <ul style="list-style-type: none"> <li>null or negative value (default) - all or full. The result includes all task executions.</li> <li>0 - result of the current or most recent task execution.</li> <li>1 - result for the most recent 24-hour period.</li> <li>7 - result for the most recent 7-day period.</li> </ul> The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.                |
| execution_name  | Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| task_owner      | Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| description     | A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 172-8 (Cont.) ACCEPT\_ALL\_SQL\_PROFILES Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Security Model

The `ADMINISTER SQL MANAGEMENT OBJECT` privilege is required. The `CREATE ANY SQL PROFILE` privilege is deprecated.

## 172.5.2 ACCEPT\_SQL\_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

### Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (  
  task_name      IN  VARCHAR2,  
  object_id      IN  NUMBER   := NULL,  
  name           IN  VARCHAR2 := NULL,  
  description    IN  VARCHAR2 := NULL,  
  category       IN  VARCHAR2 := NULL);  
task_owner      IN  VARCHAR2 := NULL,  
replace         IN  BOOLEAN   := FALSE,
```

```

force_match IN BOOLEAN      := FALSE,
profile_type IN VARCHAR2    := REGULAR_PROFILE);

DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER      := NULL,
  name           IN  VARCHAR2    := NULL,
  description     IN  VARCHAR2    := NULL,
  category       IN  VARCHAR2    := NULL;
  task_owner     IN  VARCHAR2    := NULL,
  replace        IN  BOOLEAN      := FALSE,
  force_match    IN  BOOLEAN      := FALSE,
  profile_type   IN  VARCHAR2    := REGULAR_PROFILE,
  database_link_to IN  VARCHAR2    := NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 172-9 ACCEPT\_SQL\_PROFILE Procedure and Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name   | The (mandatory) name of the SQL tuning task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| object_id   | The identifier of the advisor framework object representing the SQL statement associated with the tuning task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| name        | The name of the SQL profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL profile.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| description | A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| category    | The category name. This name must match the value of the <code>SQLTUNE_CATEGORY</code> parameter in a session for the session to use this SQL profile. It defaults to the value "DEFAULT". This is also the default of the <code>SQLTUNE_CATEGORY</code> parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An <code>ACCEPT_SQL_PROFILE</code> fails if this combination is duplicated.                                                        |
| task_owner  | Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| replace     | If the profile already exists, it is replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/ category pair, even with <code>replace</code> set to <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                                                                             |
| force_match | <p>If <code>TRUE</code> this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>cursor_sharing</code> parameter.</p> <p>If <code>FALSE</code>, literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>cursor_sharing</code> parameter.</p> |

**Table 172-9 (Cont.) ACCEPT\_SQL\_PROFILE Procedure and Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| profile_type     | Options: <ul style="list-style-type: none"> <li>REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</li> <li>PX_PROFILE - regular profile with a change to parallel execution</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Return Values

The name of the SQL profile.

### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

### Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
```

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name => :stmt_task, -
    category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
                                         force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
    sqlset_name  => 'my_workload', -
    rank1       => 'ELAPSED_TIME', -
    time_limit   => 3600,          -
    description  => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
    task_name  => :sts_task, -
    object_id  => 5);
```

## 172.5.3 ADD\_SQLSET\_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

**Table 172-10** ADD\_SQLSET\_REFERENCE and ADD\_REFERENCE Function Parameters

| Parameter    | Description                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                                                                       |
| description  | Provides an optional description of the usage of SQL tuning set.<br>The description is truncated if longer than 256 characters. |
| sqlset_owner | Specifies the owner of the SQL tuning set, or <code>NULL</code> for the current schema owner.                                   |

### Return Values

The identifier of the added reference.

### Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    description => 'my sts reference');
```

You can use the `DBA_SQLSET_REFERENCES` view to find all references on a given SQL tuning set.

## 172.5.4 ALTER\_SQL\_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- **STATUS** can be set to **ENABLED** or **DISABLED**.
- **NAME** can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- **DESCRIPTION** can be set to any string of size no more than 500 characters.
- **CATEGORY** can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

**See Also:**

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name             IN  VARCHAR2,  
    attribute_name    IN  VARCHAR2,  
    value             IN  VARCHAR2);
```

### Parameters

**Table 172-11 ALTER\_SQL\_PROFILE Procedure Parameters**

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| name           | The (mandatory) name of the existing SQL profile to alter                              |
| attribute_name | The (mandatory) attribute name to alter (case insensitive) using valid attribute names |
| value          | The (mandatory) new value of the attribute using valid attribute values                |

### Usage Notes

Requires the **ALTER ANY SQL PROFILE** privilege.

### Examples

```
-- Disable a profile, so it is not be used by any sessions.  
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -  
                                       attribute_name => 'STATUS', -  
                                       value           => 'DISABLED');  
  
-- Enable it back:  
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -  
                                       attribute_name => 'STATUS', -
```

```
value => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name      => :pname, -
                                     attribute_name => 'CATEGORY', -
                                     value      => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name      => :pname, -
                                     attribute_name => 'CATEGORY', -
                                     value      => 'DEFAULT');
```

## 172.5.5 CANCEL\_TUNING\_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK (
  task_name      IN VARCHAR2);
```

### Parameters

**Table 172-12 CANCEL\_TUNING\_TASK Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| task_name | Specifies the name of the task to cancel |

### Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

## 172.5.6 CAPTURE\_CURSOR\_CACHE\_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (  
    sqlset_name          IN VARCHAR2,  
    time_limit           IN POSITIVE := 1800,  
    repeat_interval      IN POSITIVE := 300,  
    capture_option       IN VARCHAR2 := 'MERGE',  
    capture_mode         IN NUMBER   := MODE_REPLACE_OLD_STATS,  
    basic_filter         IN VARCHAR2 := NULL,  
    sqlset_owner         IN VARCHAR2 := NULL,  
    recursive_sql       IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

### Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

**Table 172-13 CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the SQL tuning set name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| time_limit      | Defines the total amount of time, in seconds, to execute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| repeat_interval | Defines the amount of time, in seconds, to pause between sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| capture_option  | Specifies whether to insert new statements, update existing statements, or both.<br><br>Values are <code>INSERT</code> , <code>UPDATE</code> , or <code>MERGE</code> . The values are the same as for <code>load_option</code> in <code>load_sqlset</code> .                                                                                                                                                                                                                                                                                                                                          |
| capture_mode    | Specifies the capture mode ( <code>UPDATE</code> and <code>MERGE</code> capture options). Possible values: <ul style="list-style-type: none"><li><code>MODE_REPLACE_OLD_STATS</code> — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</li><li><code>MODE_ACCUMULATE_STATS</code> — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</li></ul> |

**Table 172-13 (Cont.) CAPTURE\_CURSOR\_CACHE\_SQLSET and CAPTURE\_CURSOR\_CACHE Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>basic_filter</code>  | Defines a filter to apply to the shared SQL area for each sample.<br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| <code>sqlset_owner</code>  | Specifies the owner of the SQL tuning set or <code>NULL</code> for current schema owner                                                                                                                                                                                                                                       |
| <code>recursive_sql</code> | Defines a filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                       |

### Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                sqlset_name      => 'my_workload', -
                                time_limit        => 30, -
                                repeat_interval   => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                sqlset_name      => 'my_workload', -
                                time_limit        => 30, -
                                repeat_interval   => 5, -
                                capture_mode      =>
dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                sqlset_name      => 'my_workload', -
                                time_limit        => 30, -
                                repeat_interval   => 5, -
                                capture_option    => 'INSERT');
```

## 172.5.7 CREATE\_SQL\_PLAN\_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (  
    task_name           IN VARCHAR2,  
    object_id           IN NUMBER    := NULL,  
    plan_hash_value     IN NUMBER,  
    owner_name          IN VARCHAR2  := NULL,  
    database_link_to    IN VARCHAR2  := NULL);
```

### Parameters

**Table 172-14** CREATE\_SQL\_PLAN\_BASELINE Procedure Parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Name of the task for which to get a script                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| object_id        | Object ID to which the SQL corresponds                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| plan_hash_value  | Plan to create plan baseline                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| owner_name       | Owner of the relevant tuning task. Defaults to the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF<br/>IDENTIFIED BY password USING 'inst1';</pre> |

## 172.5.8 CREATE\_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

### Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL  
    sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (  
    sqlset_name IN VARCHAR2 := NULL,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 172-15 CREATE\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name. |
| description  | Provides an optional description of the SQL tuning set.                                                                                                                             |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                    |

### Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-  
    sqlset_name => 'my_workload', -  
    description => 'complete application workload');
```

## 172.5.9 CREATE\_STGTAB\_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (  
    table_name          IN VARCHAR2,  
    schema_name         IN VARCHAR2 := NULL,  
    tablespace_name     IN VARCHAR2 := NULL);
```

## Parameters

**Table 172-16 CREATE\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter       | Description                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | The name of the table to create (case-insensitive unless double quoted).                                                                          |
| schema_name     | The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted).                                        |
| tablespace_name | The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted). |

## Usage Notes

- Call this procedure once before issuing a call to the [PACK\\_STGTAB\\_SQLPROF Procedure](#).
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.

## Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

## 172.5.10 CREATE\_STGTAB\_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (  
    table_name          IN VARCHAR2,  
    schema_name         IN VARCHAR2 := NULL,  
    tablespace_name     IN VARCHAR2 := NULL,  
    db_version          IN NUMBER   := NULL);
```

## Parameters

**Table 172-17 CREATE\_STGTAB\_SQLSET and CREATE\_STGTAB Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name      | Specifies the of the table to create. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| schema_name     | Defines the schema in which to create the table, or NULL for the current schema. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| tablespace_name | Specifies the tablespace in which to store the staging table, or NULL for the default tablespace of the current user. The name is case sensitive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| db_version      | <p>Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use one of the following values:</p> <ul style="list-style-type: none"><li>• NULL (default) — Specifies the current database version.</li><li>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</li><li>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</li><li>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</li><li>• STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version.</li><li>• STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.</li></ul> |

## Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.

## Usage Notes

- Call this procedure once before packing the SQL set.
- To have different tuning sets in different staging tables, you can call this procedure multiple times.
- This is a DDL operation, so it does not occur within a transaction.
- The staging table contains nested table columns and indexes, so it should not be renamed.

## Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

```
BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET'
  ,   db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;
```

## 172.5.11 CREATE\_TUNING\_TASK Functions

This function creates a SQL Tuning Advisor task.

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the shared SQL area given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

### Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
    sql_text          IN CLOB,  
    bind_list         IN sql_binds := NULL,  
    user_name         IN VARCHAR2 := NULL,  
    scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
    time_limit        IN NUMBER   := TIME_LIMIT_DEFAULT,  
    task_name         IN VARCHAR2 := NULL,  
    description       IN VARCHAR2 := NULL,  
    con_name          IN VARCHAR2 := NULL,  
    database_link_to  IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
    sql_id           IN VARCHAR2,  
    plan_hash_value  IN NUMBER   := NULL,  
    scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
    time_limit      IN NUMBER   := TIME_LIMIT_DEFAULT,  
    task_name       IN VARCHAR2 := NULL,  
    description     IN VARCHAR2 := NULL,  
    con_name        IN VARCHAR2 := NULL,  
    database_link_to IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

#### AWR format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER      := NULL,
  scope           IN VARCHAR2   := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER     := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2   := NULL,
  description     IN VARCHAR2   := NULL,
  con_name        IN VARCHAR2   := NULL,
  dbid            IN NUMBER     := NULL,
  database_link_to IN VARCHAR2   := NULL)
RETURN VARCHAR2;
```

#### SQL tuning set format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter    IN VARCHAR2 := NULL,
  rank1            IN VARCHAR2 := NULL,
  rank2            IN VARCHAR2 := NULL,
  rank3            IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := NULL,
  result_limit     IN NUMBER   := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL,
  plan_filter      IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner     IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

#### SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK (
  spa_task_name    IN VARCHAR2,
  spa_task_owner   IN VARCHAR2 := NULL,
  spa_compare_exec IN VARCHAR2 := NULL,
  basic_filter     IN VARCHAR2 := NULL,
  time_limit       IN NUMBER   := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

## Parameters

**Table 172-18** *CREATE\_TUNING\_TASK Function Parameters*

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_text          | Specifies the text of a SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| begin_snap        | Specifies the begin snapshot identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| end_snap          | Specifies the end snapshot identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| sql_id            | Specifies the identifier of a SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| bind_list         | Defines an ordered list of bind values in ANYDATA type.<br><b>NOTE:</b> This parameter is not supported on a standby database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| plan_hash_value   | Specifies the hash value of the SQL execution plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| sqlset_name       | Specifies the SQL tuning set name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| basic_filter      | Specifies the predicate used to filter the SQL from the SQL tuning set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| object_filter     | Specifies the object filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| rank(i)           | Specifies an ORDER BY clause on the selected SQL statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| result_percentage | Specifies the percentage on the sum of a ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| result_limit      | Specifies the top L(imit) SQL from the filtered or ranked SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| user_name         | Specifies the user name for whom the statement is to be tuned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| scope             | Specifies the tuning scope: <ul style="list-style-type: none"> <li>LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated.</li> <li>COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| time_limit        | Specifies the maximum duration in seconds for the tuning session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| task_name         | Specifies an optional tuning task name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| description       | Provides a description of the SQL tuning session, up to a maximum of 256 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| plan_filter       | Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> <li>LAST_GENERATED: most recent timestamp</li> <li>FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED</li> <li>LAST_LOADED: most recent first_load_time statistics information</li> <li>FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED</li> <li>MAX_ELAPSED_TIME: maximum elapsed time</li> <li>MAX_BUFFER_GETS: maximum buffer gets</li> <li>MAX_DISK_READS: maximum disk reads</li> <li>MAX_DIRECT_WRITES: maximum direct writes</li> <li>MAX_OPTIMIZER_COST: maximum optimizer cost</li> </ul> |
| sqlset_owner      | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 172-18 (Cont.) CREATE\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| spa_task_name    | Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| spa_task_owner   | Specifies the owner of specified SQL Performance Analyzer task or <code>NULL</code> for current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| spa_compare_exec | Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If <code>NULL</code> , then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type <code>COMPARE PERFORMANCE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| dbid             | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the current database DBID is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| con_name         | <p>Specifies the container for the tuning task. The semantics depend on the function format:</p> <ul style="list-style-type: none"> <li>For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container.</li> <li>For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container.</li> <li>For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container.</li> </ul> <p>The following statements are true of all function formats:</p> <ul style="list-style-type: none"> <li>In a non-CDB, this parameter is ignored.</li> <li>In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs.</li> <li>In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.</li> </ul> |
| database_link_to | <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

## Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

### Example 172-1 Examples

The following examples assume the following variable definitions:

```
VARIABLE stmt_task      VARCHAR2(64);
VARIABLE sts_task       VARCHAR2(64);
VARIABLE spa_tune_task  VARCHAR2(64);
```

### Example 172-2 Create Tuning Task with SQL Text Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE s.time_id =
t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

### Example 172-3 Create Tuning Task with SQL ID Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3ssvtrh24');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3ssvtrh24',
-
    scope => 'LIMITED');

EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3ssvtrh24',
-
    time_limit => 600);
```

### Example 172-4 Create Tuning Task with AWR Snapshot Format

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
    end_snap => 2, sql_id => 'aylm3ssvtrh24');
```

### Example 172-5 Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and also sets a time limit of one hour. The default ranking measure is elapsed time.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sqlset_name  => 'my_workload', -
    rank1        => 'BUFFER_GETS', -
    time_limit   => 3600, -
    description  => 'tune my workload ordered by buffer gets');
```

### Example 172-6 Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from the compare performance execution of the SQL Performance Analyzer task named `task_123`.

```
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    spa_task_name      => 'task_123',
    spa_task_owner     => 'SCOTT',
    spa_compare_exec   => 'exec1');
```

### Example 172-7 Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task uses the `lnk_to_primary` database link to write data to the primary database, which is open read/write.

```
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ coll FROM table1 t WHERE coll=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query, -
    task_name => :tname, database_link_to => 'lnk_to_primary');
```

## 172.5.12 DELETE\_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

### Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
    sqlset_name  IN  VARCHAR2,
    basic_filter IN  VARCHAR2 := NULL,
    sqlset_owner IN  VARCHAR2 := NULL);
```

### Parameters

**Table 172-19 DELETE\_SQLSET Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>  | Specifies the name of the SQL tuning set.                                                                                                                                                                   |
| <code>basic_filter</code> | Specifies the SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the SQL tuning set. |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set, or NULL for current schema owner.                                                                                                                                |

### Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
```

```
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -  
                                basic_filter => 'elapsed_time < 1000000');
```

## 172.5.13 DROP\_SQL\_PROFILE Procedure

This procedure drops the named SQL profile from the database.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (  
    name          IN  VARCHAR2,  
    ignore        IN  BOOLEAN  := FALSE);
```

### Parameters

**Table 172-20 DROP\_SQL\_PROFILE Procedure Parameters**

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| name      | The (mandatory) name of SQL profile to be dropped. The name is case sensitive. |
| ignore    | Ignores errors due to object not existing                                      |

### Usage Notes

Requires the `DROP ANY SQL PROFILE` privilege.

### Examples

```
-- Drop the profile:  
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

## 172.5.14 DROP\_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name    IN  VARCHAR2,  
    sqlset_owner   IN  VARCHAR2 := NULL);
```

## Parameters

**Table 172-21 DROP\_SQLSET Procedure Parameters**

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| sqlset_name  | Specifies the name of the SQL tuning set.                                    |
| sqlset_owner | Specifies the owner of the SQL tuning set, or NULL for current schema owner. |

## Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

## Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

## 172.5.15 DROP\_TUNING\_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK (  
    task_name      IN  VARCHAR2);
```

## Parameters

**Table 172-22 DROP\_TUNING\_TASK Procedure Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| task_name | Specifies name of the tuning task to drop. |

## 172.5.16 EXECUTE\_TUNING\_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name      IN VARCHAR2                := NULL,
    execution_params    IN dbms_advisor.argList     := NULL,
    execution_desc      IN VARCHAR2                := NULL,
    database_link_to    IN VARCHAR2                := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name      IN VARCHAR2                := NULL,
    execution_params    IN dbms_advisor.argList     := NULL,
    execution_desc      IN VARCHAR2                := NULL,
    database_link_to    IN VARCHAR2                := NULL);
```

### Parameters

**Table 172-23 EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Name of the tuning task to execute.                                                                                                                                                                                                                                                            |
| execution_name   | A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.                                                                                                                                                                        |
| execution_params | List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the <a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> ). |
| execution_desc   | A 256-length string describing the execution.                                                                                                                                                                                                                                                  |

**Table 172-23 (Cont.) EXECUTE\_TUNING\_TASK Function & Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Usage Notes

A tuning task can be executed multiples times without having to reset it.

### Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

## 172.5.17 IMPLEMENT\_TUNING\_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing `IMPLEMENT_TUNING_TASK` is equivalent to executing the [SCRIPT\\_TUNING\\_TASK Function](#) and then running the script.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(  
    task_name          IN  VARCHAR2,  
    rec_type           IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,  
    owner_name         IN  VARCHAR2 := NULL,  
    execution_name     IN  VARCHAR2 := NULL,  
    database_link_to   IN  VARCHAR2 := NULL);
```

## Parameters

**Table 172-24 IMPLEMENT\_TUNING\_TASK Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>        | Name of the tuning task for which to implement recommendations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>rec_type</code>         | Filter the types of recommendations to implement. Only 'PROFILES' is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>owner_name</code>       | Owner of the relevant tuning task or <code>NULL</code> for the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>execution_name</code>   | Name of the task execution to use. If <code>NULL</code> , then the procedure implements recommendations from the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>database_link_to</code> | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

## 172.5.18 INTERRUPT\_TUNING\_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (
  task_name          IN VARCHAR2);
```

## Parameters

**Table 172-25 INTERRUPT\_TUNING\_TASK Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| task_name | Name of the tuning task to interrupt |

## Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

## 172.5.19 LOAD\_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
  sqlset_name      IN  VARCHAR2,
  populate_cursor  IN  sqlset_cursor,
  load_option      IN  VARCHAR2 := 'INSERT',
  update_option    IN  VARCHAR2 := 'REPLACE',
  update_condition IN  VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN  BOOLEAN  := TRUE,
  commit_rows     IN  POSITIVE  := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

## Parameters

**Table 172-26 LOAD\_SQLSET Procedure Parameters**

| Parameter       | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| sqlset_name     | Specifies the name of SQL tuning set to be loaded.                 |
| populate_cursor | Specifies the cursor reference to the SQL tuning set to be loaded. |

**Table 172-26 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| load_option       | <p>Specifies which statements are loaded into the SQL tuning set. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>INSERT</b> (default) — Adds only new statements.</li> <li>• <b>UPDATE</b> — Updates existing the SQL statements and ignores any new statements.</li> <li>• <b>MERGE</b> — Inserts new statements and updates the information of the existing ones.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| update_option     | <p>Specifies how existing SQL statements are updated.</p> <p>This parameter is considered only if <code>load_option</code> is specified with <b>UPDATE</b> or <b>MERGE</b> as an option. The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>REPLACE</b> (default) — Updates the statement using the new statistics, bind list, object list, and so on.</li> <li>• <b>ACCUMULATE</b> — Combines attributes when possible (for example, statistics such as <code>elapsed_time</code>), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: <code>elapsed_time</code>, <code>buffer_gets</code>, <code>direct_writes</code>, <code>disk_reads</code>, <code>row_processed</code>, <code>fetches</code>, <code>executions</code>, <code>end_of_fetch_count</code>, <code>stat_period</code> and <code>active_stat_period</code>.</li> </ul>                                                                                                                           |
| update_condition  | <p>Specifies when to perform the update.</p> <p>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</p> <ul style="list-style-type: none"> <li>• <b>OLD</b> — Refers to statement attributes from the SQL tuning set (destination).</li> <li>• <b>NEW</b> — Refers to statement attributes from the input statements (source).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| update_attributes | <p>Specifies the list of SQL statement attributes to update during a merge or update.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> <li>• <b>NULL</b> (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to <b>ALL</b> without execution contexts such as module and action.</li> <li>• <b>BASIC</b> — Specifies statistics and binds only.</li> <li>• <b>TYPICAL</b> — Specifies <b>BASIC</b> with SQL plans (without row source statistics) and without an object reference list.</li> <li>• <b>ALL</b> — Specifies all attributes, including the execution context attributes such as module and action.</li> <li>• List of comma separated attribute names to update: <ul style="list-style-type: none"> <li>– <code>EXECUTION_CONTEXT</code></li> <li>– <code>EXECUTION_STATISTICS</code></li> <li>– <code>SQL_BINDS</code></li> <li>– <code>SQL_PLAN</code></li> <li>– <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> with added row source statistics)</li> </ul> </li> </ul> |
| ignore_null       | <p>Specifies whether to update attributes when the new value is <b>NULL</b>.</p> <p>If <b>TRUE</b>, then the procedure does not update an attribute when the new value is <b>NULL</b>. That is, do not override with <b>NULL</b> values unless intentional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 172-26 (Cont.) LOAD\_SQLSET Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>commit_rows</code>  | Specifies whether to commit statements after DML.<br>If a value is provided, then the load commits after each specified number of statements is inserted. If <code>NULL</code> is provided, then the load commits only once, at the end of the operation.<br>Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the <code>DBA_SQLSET</code> views. The <code>STATEMENT_COUNT</code> value increases as new SQL statements are loaded. |
| <code>sqlset_owner</code> | Defines the owner of the SQL tuning set, or the current schema owner (or <code>NULL</code> for the current owner).                                                                                                                                                                                                                                                                                                                                                                               |

**Exceptions**

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

**Usage Notes**

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

**Examples**

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to `SYS` schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
    cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(
            DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
                'parsing_schema_name <> 'SYS' AND elapsed_time > 5000000',
                NULL, NULL, NULL, NULL, 1, NULL,
                'ALL')) P;

    DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <>
''SYS'',
                                                NULL, NULL,NULL,NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name      => 'my_workload',
                          populate_cursor => cur,
                          Using DBMS_SQLTUNE
                          load_option => 'MERGE',
                          update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor =>
cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;
```

```
DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name    => 'my_workload',
                        populate_cursor => cur,
                        load_option     => 'UPDATE');

END;
/
```

## 172.5.20 PACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data from the `SYS.` schema into the staging table.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
    profile_name          IN VARCHAR2 := '%',
    profile_category      IN VARCHAR2 := 'DEFAULT',
    staging_table_name     IN VARCHAR2,
    staging_schema_owner  IN VARCHAR2 := NULL);
```

### Parameters

**Table 172-27** PACK\_STGTAB\_SQLPROF Procedure Parameters

| Parameter                         | Description                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <code>profile_name</code>         | The name of the profile to pack (% wildcards acceptable, case-sensitive)                                            |
| <code>profile_category</code>     | The category to pack profiles from (% wildcards acceptable, case-sensitive)                                         |
| <code>staging_table_name</code>   | The name of the table to use (case-insensitive unless double quoted). Required.                                     |
| <code>staging_schema_owner</code> | The schema where the table resides, or <code>NULL</code> for current schema (case-insensitive unless double quoted) |

### Security Model

This procedure requires `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table.

### Usage Notes

This function issues a `COMMIT` after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

## Examples

Put only those profiles in the `DEFAULT` category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name =>
'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
staging_table_name => 'PROFILE_STGTAB');
```

## 172.5.21 PACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the `SYS` schema to a staging table created by the `CREATE_STGTAB_SQLSET` procedure.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version           IN NUMBER   := NULL);
```

## Examples

Put all SQL tuning sets on the database in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
  ,   sqlset_owner   => '%'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => '%'
```

```
, staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'my_workload'
    , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
    , staging_table_name => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 1 (11.2):

```
BEGIN
  DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
    sqlset_name      => 'workload_subset'
    , staging_table_name => 'STGTAB_SQLSET'
    , db_version      => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;
```

## 172.5.22 REMAP\_STGTAB\_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

## Parameters

**Table 172-28 REMAP\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter            | Description                                                                               |
|----------------------|-------------------------------------------------------------------------------------------|
| old_profile_name     | The name of the profile to target for a remap operation (case-sensitive)                  |
| new_profile_name     | The new name of the profile, or NULL to remain the same (case-sensitive)                  |
| new_profile_category | The new category for the profile, or NULL to remain the same (case-sensitive)             |
| staging_table_name   | The name of the table on which to perform the remap operation (case-sensitive). Required. |
| staging_schema_owner | The schema where the table resides, or NULL for current schema (case-sensitive)           |

## Security Model

This procedure requires the `UPDATE` privilege on the staging table.

## Examples

Change the name of a profile before we unpack, to avoid conflicts

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_name => 'IMP' || :pname
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(
    old_profile_name => :pname
  ,   new_profile_category => 'TEST'
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

## 172.5.23 REMAP\_STGTAB\_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

## Syntax

```

DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
    old_sqlset_name      IN VARCHAR2,
    old_sqlset_owner     IN VARCHAR2 := NULL,
    new_sqlset_name      IN VARCHAR2 := NULL,
    new_sqlset_owner     IN VARCHAR2 := NULL,
    staging_table_name   IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL,
    old_con_dbid         IN NUMBER   := NULL,
    new_con_dbid         IN NUMBER   := NULL);

```

## Parameters

The parameters are identical for the DBMS\_SQLTUNE.REMAP\_STGTAB\_SQLSET and DBMS\_SQLSET.REMAP\_SQLSET procedures.

**Table 172-29 REMAP\_STGTAB\_SQLSET and REMAP\_SQLSET Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| old_sqlset_name      | Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.                                                                                    |
| old_sqlset_owner     | Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner                                                                                       |
| new_sqlset_name      | Specifies the new name for the tuning set, or NULL to keep the same tuning set name.                                                                                                                |
| new_sqlset_owner     | Specifies the new owner for the tuning set, or NULL to keep the same owner name.                                                                                                                    |
| staging_table_name   | Specifies the name of the table on which to perform the remap operation. The value is case sensitive.                                                                                               |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.                                                                                       |
| old_con_dbid         | Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |
| new_con_dbid         | Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed. |

## Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

## Examples

```

-- Change the name of an STS in the staging table before unpacking it.
BEGIN
    DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
        old_sqlset_name =>

```

```

'my_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_name    =>
'imp_workload'
  ,   staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before unpacking it.
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
  old_sqlset_name   => 'imp_workload'
  ,   old_sqlset_owner   => 'SH'
  ,   new_sqlset_owner   => 'SYS'
  ,   staging_table_name => 'STGTAB_SQLSET');
END;

```

## 172.5.24 REMOVE\_SQLSET\_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
  sqlset_name   IN  VARCHAR2,
  reference_id  IN  NUMBER,
  sqlset_owner  IN  VARCHAR2 := NULL,
  force_remove  IN  NUMBER   := 0);

```

### Parameters

The parameters are identical for the `DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE` and `DBMS_SQLSET.REMOVE_REFERENCE` procedures.

**Table 172-30 REMOVE\_SQLSET\_REFERENCE and REMOVE\_REFERENCE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sqlset_name</code>  | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                                  |
| <code>reference_id</code> | Specifies the identifier of the reference to remove.                                                                                                                                                                                                                                                       |
| <code>sqlset_owner</code> | Specifies the owner of the SQL tuning set (or <code>NULL</code> for the current schema owner).                                                                                                                                                                                                             |
| <code>force_remove</code> | Specifies whether references can be removed for other users (1) or whether they cannot be removed (0).<br><br>Setting this parameter to 1 only takes effect when the user has the <code>ADMINISTER ANY SQL TUNING SET</code> privilege. Otherwise, the database only removes references owned by the user. |

## Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to `my_workload`:

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
    sqlset_name    => 'my_workload', -
    reference_id   => :rid,
    sqlset_owner   => NULL,
    force_remove   => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

## 172.5.25 REPORT\_AUTO\_TUNING\_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the [REPORT\\_TUNING\\_TASK Function](#) reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

### See Also:

- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT\\_AUTO\\_TUNING\\_TASK Function](#)

## Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec      IN VARCHAR2  := NULL,
    end_exec        IN VARCHAR2  := NULL,
    type            IN VARCHAR2  := TYPE_TEXT,
    level           IN VARCHAR2  := LEVEL_TYPICAL,
    section         IN VARCHAR2  := SECTION_ALL,
    object_id       IN NUMBER    := NULL,
    result_limit    IN NUMBER    := NULL)
RETURN CLOB;
```

## Parameters

**Table 172-31** REPORT\_AUTO\_TUNING\_TASK Function Parameters

| Parameter               | Description                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>begin_exec</code> | Specifies the name of the execution from which to begin the report. <code>NULL</code> retrieves a report on the most recent run. |
| <code>end_exec</code>   | Specifies the name of the execution at which to end the report. <code>NULL</code> retrieves a report on the most recent run.     |

**Table 172-31 (Cont.) REPORT\_AUTO\_TUNING\_TASK Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type         | Specifies the type of the report to produce. Possible values are <code>TYPE_TEXT</code> which produces a text report                                                                                                                                                                                                                                                                                                                                                         |
| level        | Specifies the level of detail in the report: <ul style="list-style-type: none"> <li><code>LEVEL_BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor.</li> <li><code>LEVEL_TYPICAL</code>: show information about every statement analyzed, including requests not implemented.</li> <li><code>LEVEL_ALL</code>: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>              |
| section      | Limits the report to a single section ( <code>ALL</code> for all sections): <ul style="list-style-type: none"> <li><code>SECTION_SUMMARY</code> - summary information</li> <li><code>SECTION_FINDINGS</code> - tuning findings</li> <li><code>SECTION_PLAN</code> - explain plans</li> <li><code>SECTION_INFORMATION</code> - general information</li> <li><code>SECTION_ERROR</code> - statements with errors</li> <li><code>SECTION_ALL</code> - all statements</li> </ul> |
| object_id    | Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify <code>NULL</code> for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                                                                  |
| result_limit | Specifies the maximum number of SQL statements to show in the report.                                                                                                                                                                                                                                                                                                                                                                                                        |

#### Return Values

A CLOB containing the desired report.

## 172.5.26 REPORT\_SQL\_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the `V$` views and AWR.

#### See Also:

[DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

#### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL (
  sql_id          IN  VARCHAR2  DEFAULT NULL,
  sql_plan_hash_value IN  NUMBER  DEFAULT NULL,
  start_time      IN  DATE       DEFAULT NULL,
  duration        IN  NUMBER     DEFAULT NULL,
  inst_id         IN  NUMBER     DEFAULT NULL,
  dbid            IN  NUMBER     DEFAULT NULL,
  event_detail    IN  VARCHAR2   DEFAULT 'YES',
  bucket_max_count IN  NUMBER    DEFAULT 128,
```

```

        bucket_interval      IN  NUMBER      DEFAULT NULL,
        top_n                IN  NUMBER      DEFAULT 10,
        report_level         IN  VARCHAR2    DEFAULT 'TYPICAL',
        type                 IN  VARCHAR2    DEFAULT 'ACTIVE',
        data_source          IN  VARCHAR2    DEFAULT 'AUTO',
        end_time              IN  DATE        DEFAULT NULL,
        duration_stats       IN  NUMBER      DEFAULT NULL,
        con_name              IN  VARCHAR2    DEFAULT NULL)
RETURN CLOB;

```

## Parameters

**Table 172-32 REPORT\_SQL\_DETAIL Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id              | SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.                                                                                      |
| sql_plan_hash_value | Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.                                                                                                                 |
| start_time          | If specified, shows SQL activity (from GV\$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time. |
| duration            | Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.                                                                                                                                                                           |
| inst_id             | Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.                                                                                                                                                  |
| dbid                | DBID from which to get SQL details. If NULL, uses current DBID.                                                                                                                                                                                                     |
| event_detail        | When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class,event_name).                                                                                                                                   |
| bucket_max_count    | If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.                                                                                                                               |
| bucket_interval     | If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.                                                                                                                              |
| top_n               | Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.                                                                                                                             |

**Table 172-32 (Cont.) REPORT\_SQL\_DETAIL Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report_level | <p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default</li> <li>'SPM' - Show existing plan baselines for a SQL statement; OFF by default</li> <li>'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default.</li> <li>'STATS' - Show SQL execution statistics per plan from GV\$SQLAREA_PLAN_HASH; ON by default</li> <li>'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default</li> <li>'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</li> <li>'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default</li> <li>'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default</li> <li>'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default</li> <li>'XPLAN' - Show execution plans; ON by default</li> <li>'BINDS' - show captured bind data; ON by default</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>-SQL_TEXT - No SQL text in report</li> <li>+SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>-SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>+SQL_FULLTEXT - Show full SQL text (default value)</li> </ul> <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>NONE - minimum possible</li> <li>BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM</li> <li>TYPICAL - SQL_FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN+MONITOR</li> <li>ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p> |
| type         | Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| data_source  | <p>Determines the data source of SQL data based on one of the following values:</p> <ul style="list-style-type: none"> <li>MEMORY: The data source is GV\$ view</li> <li>DISK: The data source is DBA_HIST_* view</li> <li>AUTO: Automatically determines the data source based on the time frame (default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| end_time     | If specified, shows SQL activity from start_time to end_time. If NULL (default), shows SQL activity for systimestamp.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 172-32 (Cont.) REPORT\_SQL\_DETAIL Function Parameters**

| Parameter                   | Description                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>duration_stats</code> | Duration of additional SQL execution statistics from AWR (in hours), for the report. If <code>NULL</code> (default), then the duration of 24 hours is considered. |
| <code>con_name</code>       | Name of the multitenant container database (CDB).                                                                                                                 |

**Security Model**

The invoker needs the `EXECUTE` privilege on the [DBMS\\_XPLAN](#) package.

**Return Values**

A `CLOB` containing the desired report.

**Usage Notes**

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the `SELECT` or `READ` privilege on the following views:
  - `V$SESSION`
  - `DBA_ADVISOR_FINDINGS`
  - `V$DATABASE`
  - `GV$ASH_INFO`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SQLAREA_PLAN_HASH`
  - `GV$SQL`
  - `DBA_HIST_SNAPSHOT`
  - `DBA_HIST_WR_CONTROL`
  - `DBA_HIST_ACTIVE_SESS_HISTORY`
  - `DBA_HIST_SQLSTAT`
  - `DBA_HIST_SQL_BIND_METADATA`
  - `DBA_HIST_SQLTEXT`
  - `DBA_SQL_PLAN_BASELINES`
  - `DBA_SQL_PROFILES`
  - `DBA_ADVISOR_TASKS`
  - `DBA_SERVICES`
  - `DBA_USERS`
  - `DBA_OBJECTS`

## 172.5.27 REPORT\_SQL\_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

### See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.REPORT_SQL_MONITOR (
  sql_id                IN VARCHAR2  DEFAULT NULL,
  dbop_name              IN VARCHAR2  DEFAULT NULL,
  dbop_exec_id           IN NUMBER     DEFAULT NULL,
  session_id             IN NUMBER     DEFAULT NULL,
  session_serial         IN NUMBER     DEFAULT NULL,
  sql_exec_start         IN DATE        DEFAULT NULL,
  sql_exec_id            IN NUMBER     DEFAULT NULL,
  inst_id                IN NUMBER     DEFAULT NULL,
  start_time_filter      IN DATE        DEFAULT NULL,
  end_time_filter        IN DATE        DEFAULT NULL,
  instance_id_filter     IN NUMBER     DEFAULT NULL,
  parallel_filter        IN VARCHAR2   DEFAULT NULL,
  plan_line_filter       IN NUMBER     DEFAULT NULL,
  event_detail           IN VARCHAR2   DEFAULT 'YES',
  bucket_max_count       IN NUMBER     DEFAULT 128,
  bucket_interval        IN NUMBER     DEFAULT NULL,
  base_path              IN VARCHAR2   DEFAULT NULL,
  last_refresh_time      IN DATE        DEFAULT NULL,
  report_level           IN VARCHAR2   DEFAULT 'TYPICAL',
  type                   IN VARCHAR2   DEFAULT 'TEXT',
  sql_plan_hash_value    IN NUMBER     DEFAULT NULL,
  con_name               IN VARCHAR2   DEFAULT NULL,
  report_id              IN NUMBER     DEFAULT NULL)
RETURN CLOB;

```

### Parameters

**Table 172-33** REPORT\_SQL\_MONITOR Function Parameters

| Parameter    | Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id       | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle. |
| dbop_name    | DBOP_NAME for which monitoring information of the composite database operation is displayed.                                             |
| dbop_exec_id | Execution ID for the composite database operation for which monitoring information is displayed.                                         |

**Table 172-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>session_id</code>         | If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use <code>USERENV('SID')</code> for current session.                                                                                                                                                                                                                                |
| <code>session_serial</code>     | In addition to the <code>session_id</code> parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when <code>session_id</code> is NULL.                                                                                                                                                                                   |
| <code>sql_exec_start</code>     | This parameter, along with <code>sql_exec_id</code> , is only applicable when <code>sql_id</code> is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by <code>sql_id</code> , assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL <code>sql_id</code> is shown.    |
| <code>sql_exec_id</code>        | This parameter, along with <code>sql_exec_start</code> , is only applicable when <code>sql_id</code> is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by <code>sql_id</code> , assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL <code>sql_id</code> is shown. |
| <code>inst_id</code>            | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.                                                                                                                                                                                                                                                                     |
| <code>start_time_filter</code>  | If not NULL, the report considers only the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code> ) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.                                                                                                                                                                  |
| <code>end_time_filter</code>    | If not NULL, the report shows only the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code> ) collected before the date <code>end_time_filter</code> . If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.                                                                                                |
| <code>instance_id_filter</code> | Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.                                                                                           |

**Table 172-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parallel_filter   | <p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> <li>• NULL to target all processes</li> <li>• [qc][servers(&lt;svr_grp&gt;[,] &lt;svr_set&gt;[,] &lt;srv_num&gt;)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider.</li> </ul> <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> <li>• qc: targets only the query coordinator</li> <li>• servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.</li> <li>• servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)</li> <li>• servers(1,1): consider only group 1, set 1</li> <li>• servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process</li> <li>• qc servers(1,2,4): same as above by also including the query coordinator</li> </ul> |
| event_detail      | <p>When value is 'YES' (the default), reported activity from GV\$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| bucket_max_count  | <p>If specified, this should be the maximum number of histogram buckets created in the report</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| bucket_interval   | <p>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| base_path         | <p>URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| last_refresh_time | <p>If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:</p> <ul style="list-style-type: none"> <li>• SQL text is not returned when this option is specified</li> <li>• activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 172-33 (Cont.) REPORT\_SQL\_MONITOR Function Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| report_level          | <p>Level of detail for the report: 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'.</p> <p>In addition, individual report sections can also be enabled or disabled by using a +/- <i>section_name</i>. Several sections are defined:</p> <ul style="list-style-type: none"> <li>'XPLAN' - Show explain plan; ON by default</li> <li>'PLAN' - Show plan monitoring statistics; ON by default</li> <li>'SESSIONS' - Show session details. Applies only to parallel queries; ON by default</li> <li>'INSTANCE' - Show instance details. Applies only to parallel and cross instance; ON by default</li> <li>'PARALLEL' - An umbrella parameter for specifying sessions+instance details</li> <li>'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default</li> <li>'BINDS' - Show bind information when available; ON by default</li> <li>'METRICS' - Show metric data (CPU, I/Os, ...) over time; ON by default</li> <li>'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default</li> <li>'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default</li> <li>'OTHER' - Other info; ON by default</li> </ul> <p>In addition, SQL text can be specified at different levels:</p> <ul style="list-style-type: none"> <li>SQL_TEXT - No SQL text in report</li> <li>+SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV\$SQL_MONITOR</li> <li>-SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</li> <li>+SQL_FULLTEXT - Show full SQL text (default value)</li> </ul> |
| report_level (contd.) | <p>The meanings of the three top-level report levels are:</p> <ul style="list-style-type: none"> <li>NONE - minimum possible</li> <li>+BASIC - SQL_TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_HISTOGRAM-PLAN_HISTOGRAM-METRICS</li> <li>TYPICAL - everything but PLAN_HISTOGRAM</li> <li>ALL - everything</li> </ul> <p>Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| type                  | Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| sql_plan_hash_value   | Target only those SQL executions with the specified plan_hash_value. Default is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| con_name              | Name of the multitenant container database (CDB).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| report_id             | ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Return Values

A CLOB containing the desired report.

## Usage Notes

- The target SQL statement for this report can be:
  - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
  - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id =>` for the current session or `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
  - The most recent execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key (`sql_id`, `sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`
- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram.

By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because  $600/8 = 74$ , which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.
- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.

## 172.5.28 REPORT\_SQL\_MONITOR\_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the [REPORT\\_SQL\\_MONITOR Function](#) to get detailed monitoring information for a single SQL statement.

### See Also:

[Real-Time SQL Monitoring](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(

### Parameters

**Table 172-34** REPORT\_SQL\_MONITOR\_LIST Function Parameters

| Parameter      | Description                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id         | SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.                                                        |
| session_id     | If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.                        |
| session_serial | In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL. |

**Table 172-34 (Cont.) REPORT\_SQL\_MONITOR\_LIST Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inst_id            | Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| active_since_date  | If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.                                                                                                                                                                                                                                                                                                                                           |
| active_since_sec   | Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.                                                                                                                                                                                                                                                                                                                                                                                                               |
| active_before_date | If not NULL (default), returns only monitored statements that have been active before the specified date and time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| last_refresh_time  | If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics. |
| dbop_name          | DB operation name. Specify NULL to display all the monitored DB operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| monitor_type       | Type of the SQL Monitor operation. Specify one of the following values: <ul style="list-style-type: none"> <li>• MONITOR_TYPE_SQL - Returns only SQL statements</li> <li>• MONITOR_TYPE_DBOP - Returns only database operations</li> <li>• MONITOR_TYPE_ALL - Returns SQL statements as well as database operations</li> </ul>                                                                                                                                                                                                                                                             |
| max_sqltext_length | Maximum length of the SQL text. Default is NULL (no limit).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| top_n_count        | Limits the number of top-N SQL statements that need to be included in the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| top_n_rankby       | Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values: <ul style="list-style-type: none"> <li>• LAST_ACTIVE_TIME - Last active date and time (top N most recent)</li> <li>• DURATION - Total duration of execution</li> <li>• DB_TIME - DB time used</li> <li>• CPU_TIME - CPU time used</li> <li>• IO_REQUESTS - Number of I/O requests</li> <li>• IO_BYTES - Number of I/O bytes</li> </ul>                                                            |
| report_level       | Level of detail for the report. The level is one of the following: <ul style="list-style-type: none"> <li>• BASIC - SQL text up to 200 characters</li> <li>• TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters</li> <li>• ALL - currently the same as TYPICAL</li> </ul>                                                                                                                                                                                                                                 |
| auto_refresh       | Currently non-operational, reserved for future use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| base_path          | URL path for flex HTML resources because flex HTML format is required to access external files (java scripts and the flash SWF file itself).                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 172-34 (Cont.) REPORT\_SQL\_MONITOR\_LIST Function Parameters**

| Parameter          | Description                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| type               | Report format: TEXT (default), HTML, or XML.                                                                   |
| con_name           | Name of the multitenant container database (CDB)                                                               |
| top_n_detail_count | Limits the number of top-N SQL statements for which the SQL monitor details need to be included in the report. |

**Return Values**

A report for the list of SQL statements that have been monitored. The report type is text, XML, or HTML.

**Usage Notes**

You must have the privilege to access the following fixed views: `GV$SQL_MONITOR` and `GV$SQL`.

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about SQL real-time monitoring.

## 172.5.29 REPORT\_TUNING\_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

**See Also:**

[DBMS\\_SQLTUNE SQL Performance Reporting Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(  
    task_name      IN    VARCHAR2,  
    type           IN    VARCHAR2    := 'TEXT',  
    level          IN    VARCHAR2    := 'TYPICAL',  
    section        IN    VARCHAR2    := ALL,  
    object_id      IN    NUMBER       := NULL,  
    result_limit   IN    NUMBER       := NULL,  
    owner_name     IN    VARCHAR2    := NULL,  
    execution_name IN    VARCHAR2    := NULL,  
    database_link_to IN  VARCHAR2    := NULL)  
RETURN CLOB;
```

## Parameters

**Table 172-35 REPORT\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name        | Name of the tuning task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| type             | Type of the report to produce. Possible values are <code>TEXT</code> which produces a text report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| level            | Level of detail in the report: <ul style="list-style-type: none"> <li><code>BASIC</code>: simple version of the report. Just show info about the actions taken by the advisor.</li> <li><code>TYPICAL</code>: show information about every statement analyzed, including requests not implemented.</li> <li><code>ALL</code>: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| section          | Section of the report to include.<br>You can limit the report to any of the following single sections ( <code>ALL</code> for all sections): <ul style="list-style-type: none"> <li><code>SUMMARY</code> - Summary information</li> <li><code>FINDINGS</code> - Tuning findings</li> <li><code>PLAN</code> - Explain plans</li> <li><code>INFORMATION</code> - General information</li> <li><code>ERROR</code> - Statements with errors</li> <li><code>ALL</code> - All statements</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| object_id        | Advisor framework object ID that represents a single statement to restrict reporting to. <code>NULL</code> for all statements. Only valid for reports that target a single execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| result_limit     | Maximum number of SQL statements to show in the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| owner_name       | Owner of the relevant tuning task. The default is the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| execution_name   | Name of the task execution to use. If <code>NULL</code> , then the function generates the report for the last task execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| database_link_to | Name of a database link that exists on a standby database.<br>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.<br>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.<br>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code> . The following sample statement creates a link named <code>lnk_to_pri</code> :<br><br><pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Return Values

A CLOB containing the desired report.

### Examples

```
-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM   DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL',
'SUMMARY')
FROM   DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT',
'TYPICAL','FINDINGS', 5)
FROM   DUAL;
```

## 172.5.30 REPORT\_TUNING\_TASK\_XML Function

This function displays an XML report of a tuning task.

### Parameters

**Table 172-36** REPORT\_TUNING\_TASK\_XML Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| task_name | Name of the tuning task. |

**Table 172-36 (Cont.) REPORT\_TUNING\_TASK\_XML Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | <p>Level of detail in the report:</p> <ul style="list-style-type: none"> <li>BASIC: simple version of the report. Just show info about the actions taken by the advisor.</li> <li>TYPICAL: show information about every statement analyzed, including requests not implemented.</li> <li>ALL: highly detailed report level, also provides annotations about statements skipped over.</li> </ul>                                                                                                                                                                                                                     |
| section         | <p>Section of the report to include.</p> <p>You can limit the report to any of the following single sections (ALL for all sections):</p> <ul style="list-style-type: none"> <li>SUMMARY - Summary information</li> <li>ALL - All statements</li> </ul>                                                                                                                                                                                                                                                                                                                                                              |
| object_id       | <p>Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| result_limit    | <p>The number of statements in a SQL tuning set or snapshot range for which the report is generated. The default is 160 (20 statements * 8 categories). The categories are as follows:</p> <ul style="list-style-type: none"> <li>Profile</li> <li>Index</li> <li>Restructure SQL</li> <li>Alternate plan</li> <li>Statistics</li> <li>Errors</li> <li>Information</li> <li>No findings</li> </ul>                                                                                                                                                                                                                  |
| owner_name      | <p>Owner of the relevant tuning task. The default is the current schema owner.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| execution_name  | <p>Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| autotune_period | <p>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</p> <ul style="list-style-type: none"> <li>Null or negative value (default) — All or full. The result includes all task executions.</li> <li>0 — Result of the current or most recent task execution.</li> <li>1 — Result for the most recent 24-hour period.</li> <li>7 — Result for the most recent 7-day period.</li> </ul> <p>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</p> |
| report_tag      | <p>The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Return Values

A CLOB containing the desired report.

## 172.5.31 RESET\_TUNING\_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 172-37** RESET\_TUNING\_TASK Procedure Parameters

| Parameter | Description                          |
|-----------|--------------------------------------|
| task_name | The name of the tuning task to reset |

### Examples

```
-- reset and re-execute a task  
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);  
  
-- re-execute the task  
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

## 172.5.32 RESUME\_TUNING\_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(  
    task_name          IN VARCHAR2,  
    basic_filter        IN VARCHAR2 := NULL);
```

## Parameters

**Table 172-38 RESUME\_TUNING\_TASK Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name    | The name of the tuning task to resume.                                                                                                                                                                               |
| basic_filter | A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the parameter <code>basic_filteri</code> when calling <a href="#">CREATE_TUNING_TASK Functions</a> . |

## Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

## Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

## 172.5.33 SCHEDULE\_TUNING\_TASK Function

This function creates a tuning task for a single SQL statement and schedules a `DBMS_SCHEDULER` job to execute the tuning task. One form of the function finds the information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

## Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER           := NULL,
  start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
  scope          IN VARCHAR2           := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER             := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2           := NULL,
  description     IN VARCHAR2           := NULL,
```

```

    con_name      IN VARCHAR2                := NULL)
RETURN VARCHAR2;

```

#### AWR Format:

```

DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER                := NULL,
    start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
    scope           IN VARCHAR2              := SCOPE_COMPREHENSIVE,
    time_limit      IN NUMBER                := TIME_LIMIT_DEFAULT,
    task_name       IN VARCHAR2              := NULL,
    description     IN VARCHAR2              := NULL,
    con_name        IN VARCHAR2              := NULL,
    dbid            IN NUMBER                := NULL)
RETURN VARCHAR2;

```

#### Parameters

**Table 172-39 SCHEDULE\_TUNING\_TASK Function Parameters**

| Parameter       | Description                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| begin_snap      | The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included. |
| end_snap        | The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.           |
| sql_id          | The SQL ID of the statement to be tuned.                                                                                         |
| plan_hash_value | The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.          |
| start_date      | The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.                    |
| scope           | The scope of the tuning job: limited, or comprehensive.                                                                          |
| time_limit      | The maximum duration in seconds for the SQL tuning session.                                                                      |
| task_name       | Optional SQL tuning task name.                                                                                                   |
| description     | Description of the SQL tuning session. The description can contain a maximum of 256 characters.                                  |
| con_name        | The container from which SQL Tuning Advisor accesses the SQL statement information.                                              |
| dbid            | DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.                                        |

#### Security Model

The caller must possess the `CREATE JOB` privilege for the job.

#### Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

### Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:  
`sqltune_job_taskid_orahash(systimestamp)`.

## 172.5.34 SCRIPT\_TUNING\_TASK Function

This function creates a SQL\*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL,
  database_link_to   IN VARCHAR2  := NULL)
RETURN CLOB;
```

### Parameters

**Table 172-40** SCRIPT\_TUNING\_TASK Function Parameters

| Parameter                   | Description                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>      | Name of the tuning task for which to apply a script.                                                                                                                                                                                                                    |
| <code>rec_type</code>       | Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL: 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES, STATISTICS'. |
| <code>object_id</code>      | Optionally filters by a single object ID.                                                                                                                                                                                                                               |
| <code>result_limit</code>   | Optionally shows commands for only top <i>n</i> SQL (ordered by <code>object_id</code> and ignored if an <code>object_id</code> is also specified).                                                                                                                     |
| <code>owner_name</code>     | Owner of the relevant tuning task. Defaults to the current schema owner.                                                                                                                                                                                                |
| <code>excutio_n_name</code> | Name of the task execution to use. If NULL, the script is generated for the last task execution.                                                                                                                                                                        |

**Table 172-40 (Cont.) SCRIPT\_TUNING\_TASK Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use <code>DBMS_SQLTUNE</code> to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute <code>REPORT_TUNING_TASK</code> locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The <code>database_link_to</code> parameter must specify a private database link. This link must be owned by <code>SYS</code> and accessed by the default privileged user <code>SYS\$UMF</code>. The following sample statement creates a link named <code>lnk_to_pri</code>:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

### Return Values

Returns a script in the form of a CLOB.

### Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to `DBMS_ADVISOR.CREATE_FILE` to put it into a file.

### Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;

-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

## 172.5.35 SELECT\_CURSOR\_CACHE Function

This function collects SQL statements from the shared SQL area.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN   VARCHAR2 := NULL,
  object_filter     IN   VARCHAR2 := NULL,
  ranking_measure1  IN   VARCHAR2 := NULL,
  ranking_measure2  IN   VARCHAR2 := NULL,
  ranking_measure3  IN   VARCHAR2 := NULL,
  result_percentage IN   NUMBER    := 1,
  result_limit      IN   NUMBER    := NULL,
  attribute_list    IN   VARCHAR2 := NULL,
  recursive_sql     IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 172-41 SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>basic_filter</code>       | Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the <code>SQLSET_ROW</code> .<br><br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of the type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> . |
| <code>object_filter</code>      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                             |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                         |
| <code>result_percentage</code>  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br><br>The value applies only if one ranking measure is supplied.                                                                                                                                                                                                                                        |
| <code>result_limit</code>       | Defines the top limit SQL from the filtered source ranked by the ranking measure.                                                                                                                                                                                                                                                                                                                    |

**Table 172-41 (Cont.) SELECT\_CURSOR\_CACHE Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| attribute_list | <p>Specifies the list of SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default).</li> <li>BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li> <li>ALL — Specifies all attributes.</li> <li>Comma-separated list of attribute names.</li> </ul> <p>This values returns only a subset of SQL attributes:</p> <ul style="list-style-type: none"> <li>EXECUTION_STATISTICS</li> <li>BIND_LIST</li> <li>OBJECT_LIST</li> <li>SQL_PLAN</li> <li>SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics</li> </ul> |
| recursive_sql  | <p>Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Return Values**

This function returns a one SQLSET\_ROW per SQL\_ID or PLAN\_HASH\_VALUE pair found in each data source.

**Usage Notes**

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

**Examples**

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''aylm3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
```

```
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT value(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur for
        SELECT VALUE(P)
        FROM table(
            DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> 'SYS')) P;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
end;/

-- All statements from a particular module/action.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(
            DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
                'module = 'MY_APPLICATION' and action = 'MY_ACTION')) P;

    -- Process each statement (or pass cursor to load_sqlset)

    CLOSE cur;
END;/

-- all statements that ran for at least five seconds
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

    -- Process each statement (or pass cursor to load_sqlset)
```

```
CLOSE cur;
end;/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR

                                                    'BUFFER_GETS', NULL, NULL,
                                                    .9)) P;

    -- Process each statement (or pass cursor to load_sqlset).

    CLOSE cur;
END;
/

```

## 172.5.36 SELECT\_SQL\_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```

DBMS_SQLTUNE.SELECT_SQL_TRACE (
    directory          IN VARCHAR2,
    file_name          IN VARCHAR2 := NULL,
    mapping_table_name IN VARCHAR2 := NULL,
    mapping_table_owner IN VARCHAR2 := NULL,
    select_mode         IN POSITIVE := SINGLE_EXECUTION,
    options             IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
    pattern_start       IN VARCHAR2 := NULL,
    pattern_end         IN VARCHAR2 := NULL,
    result_limit        IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

```

## Parameters

**Table 172-42 SELECT\_SQL\_TRACE Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| directory           | Defines the directory object containing the trace files. This field is mandatory.                                                                                                                                                                                                                                                             |
| file_name           | Specifies all or part of the name of the trace files.<br>If NULL, then the function uses the current or most recent file in the specified location or path. '%' wildcards are supported for matching trace file names.                                                                                                                        |
| mapping_table_name  | Specifies the mapping table name.<br>Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.                                                                                                                                                    |
| mapping_table_owner | Specifies the mapping table owner.<br>If it is NULL, then the function uses the current user.                                                                                                                                                                                                                                                 |
| select_mode         | Specifies the mode for selecting SQL from the trace.<br>Possible values are: <ul style="list-style-type: none"> <li>SINGLE_EXECUTION — Returns one execution of a SQL. This is the default.</li> <li>ALL_EXECUTIONS — Returns all executions.</li> </ul>                                                                                      |
| options             | Specifies which types of SQL statements are returned. <ul style="list-style-type: none"> <li>LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default.</li> <li>ALL_COMMAND_TYPE — Returns the SQL statements with all command types.</li> </ul> |
| pattern_start       | Specifies the delimiting pattern of the trace file sections to consider.<br>CURRENTLY INOPERABLE.                                                                                                                                                                                                                                             |
| pattern_end         | Specifies the closing delimiting pattern of the trace file sections to process.<br>CURRENTLY INOPERABLE.                                                                                                                                                                                                                                      |
| result_limit        | Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.                                                                                                                                                                                                                                                                    |

## Return Values

This function returns a `SQLSET_ROW` object.

## Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with `SELECT` privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the `PATH_PREFIX` clause of the `CREATE PLUGGABLE DATABASE` statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

## Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
FROM dba_objects
WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                          'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                          'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                          'LOB', 'OPERATOR', 'PACKAGE',
                          'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                          'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                          'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
  FROM TABLE(
    DBMS_SQLTUNE.SELECT_SQL_TRACE(
      directory=>'SQL_TRACE_DIR',
      file_name=>'%trc',
      mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/
```

## 172.5.37 SELECT\_SQLPA\_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

#### See Also:

- [DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- *Oracle Database Testing Guide* for a `SELECT_SQLPA_TASK` example

### Syntax

```
DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name          IN VARCHAR2,
    task_owner         IN VARCHAR2 := NULL,
    execution_name      IN VARCHAR2 := NULL,
    level_filter        IN VARCHAR2 := 'REGRESSED',
    basic_filter        IN VARCHAR2 := NULL,
    object_filter       IN VARCHAR2 := NULL,
    attribute_list      IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 172-43 SELECT\_SQLPA\_TASK Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>      | Specifies the name of the SQL Performance Analyzer task.                                                                                                                                                                                                   |
| <code>task_owner</code>     | Specifies the owner of the SQL Performance Analyzer task. If <code>NULL</code> , then assume the current user.                                                                                                                                             |
| <code>execution_name</code> | Specifies the name of the SQL Performance Analyzer task execution (type <code>COMPARE PERFORMANCE</code> ) from which the provided filters will be applied. If <code>NULL</code> , then assume the most recent <code>COMPARE PERFORMANCE</code> execution. |

**Table 172-43 (Cont.) SELECT\_SQLPA\_TASK Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>level_filter</code>   | <p>Specifies which subset of SQL statements to include. Same format as <code>DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL</code>, with some possible strings removed.</p> <ul style="list-style-type: none"><li>• <code>IMPROVED</code> includes only improved SQL.</li><li>• <code>REGRESSED</code> includes only regressed SQL (default).</li><li>• <code>CHANGED</code> includes only SQL with changed performance.</li><li>• <code>UNCHANGED</code> includes only SQL with unchanged performance.</li><li>• <code>CHANGED_PLANS</code> includes only SQL with plan changes.</li><li>• <code>UNCHANGED_PLANS</code> includes only SQL with unchanged plans.</li><li>• <code>ERRORS</code> includes only SQL with errors only.</li><li>• <code>MISSING_SQL</code> includes only missing SQL statements (across STS).</li><li>• <code>NEW_SQL</code> includes only new SQL statements (across STS).</li></ul> |
| <code>basic_filter</code>   | Specifies the SQL predicate to filter the SQL in addition to the level filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>object_filter</code>  | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>attribute_list</code> | <p>Defines the SQL statement attributes to return in the result.</p> <p>Possible values are:</p> <ul style="list-style-type: none"><li>• <code>TYPICAL</code> — Returns <code>BASIC</code> plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</li><li>• <code>BASIC</code> — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</li><li>• <code>ALL</code> — Returns all attributes.</li><li>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> + row source statistics).</li></ul>                                                                                            |

### Return Values

This function returns a SQL tuning set object.

### Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

## 172.5.38 SELECT\_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

## Parameters

**Table 172-44 SELECT\_SQLSET Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name        | Specifies the name of the SQL tuning set to query.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| basic_filter       | Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the <code>SQLSET_ROW</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| object_filter      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ranking_measure(n) | Specifies an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| result_percentage  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure.<br>Note that this parameter applies only if one ranking measure is supplied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| result_limit       | The top limit SQL from the filtered source, ranked by the ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| attribute_list     | Defines the SQL statement attributes to return in the result.<br>The possible values are: <ul style="list-style-type: none"> <li>BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.</li> <li>TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default.</li> <li>ALL — Returns all attributes.</li> <li>Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes:               <ul style="list-style-type: none"> <li>EXECUTION_STATISTICS</li> <li>SQL_BINDS</li> <li>SQL_PLAN_STATISTICS (similar to <code>SQL_PLAN</code> plus row source statistics)</li> </ul> </li> </ul> |

**Table 172-44 (Cont.) SELECT\_SQLSET Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plan_filter   | <p>Specifies the plan filter.</p> <p>This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:</p> <ul style="list-style-type: none"> <li>LAST_GENERATED — Returns the plan with the most recent timestamp.</li> <li>FIRST_GENERATED — Returns the plan with the least recent timestamp.</li> <li>LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information.</li> <li>FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information.</li> <li>MAX_ELAPSED_TIME — Returns the plan with the maximum elapsed time.</li> <li>MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets.</li> <li>MAX_DISK_READS — Returns the plan with the maximum disk reads.</li> <li>MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes.</li> <li>MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value.</li> </ul> |
| sqlset_owner  | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| recursive_sql | Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Return Values**

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

**Usage Notes**

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

**Examples**

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

## 172.5.39 SELECT\_WORKLOAD\_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

### Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    basic_filter     IN VARCHAR2 := NULL,
    object_filter    IN VARCHAR2 := NULL,
    ranking_measure1 IN VARCHAR2 := NULL,
    ranking_measure2 IN VARCHAR2 := NULL,
    ranking_measure3 IN VARCHAR2 := NULL,
    result_percentage IN NUMBER   := 1,
    result_limit     IN NUMBER   := NULL,
    attribute_list    IN VARCHAR2 := NULL,
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid             IN NUMBER   := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
    baseline_name    IN VARCHAR2,
    basic_filter     IN VARCHAR2 := NULL,
    object_filter    IN VARCHAR2 := NULL,
    ranking_measure1 IN VARCHAR2 := NULL,
    ranking_measure2 IN VARCHAR2 := NULL,
    ranking_measure3 IN VARCHAR2 := NULL,
    result_percentage IN NUMBER   := 1,
    result_limit     IN NUMBER   := NULL,
    attribute_list    IN VARCHAR2 := NULL,
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid             IN NUMBER   := NULL)
RETURN sys.sqlset PIPELINED;
```

### Parameters

**Table 172-45 SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter                  | Description                                         |
|----------------------------|-----------------------------------------------------|
| <code>begin_snap</code>    | Defines the beginning AWR snapshot (non-inclusive). |
| <code>end_snap</code>      | Defines the ending AWR snapshot (inclusive).        |
| <code>baseline_name</code> | Specifies the name of the AWR baseline period.      |

**Table 172-45 (Cont.) SELECT\_WORKLOAD\_REPOSITORY Function Parameters**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>basic_filter</code>       | Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the <code>SQLSET_ROW</code> .<br><br>If <code>basic_filter</code> is not set by the caller, then the subprogram captures only statements of type <code>CREATE TABLE</code> , <code>INSERT</code> , <code>SELECT</code> , <code>UPDATE</code> , <code>DELETE</code> , and <code>MERGE</code> .                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>object_filter</code>      | Currently not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>ranking_measure(n)</code> | Defines an <code>ORDER BY</code> clause on the selected SQL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>result_percentage</code>  | Specifies a filter that picks the top <i>n</i> % according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>result_limit</code>       | Specifies the top limit SQL from the source according to the supplied ranking measure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>attribute_list</code>     | Specifies the SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> <li><code>TYPICAL</code> — Returns <code>BASIC</code> plus SQL plan (without row source statistics) and without object reference list. This is the default.</li> <li><code>BASIC</code> — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</li> <li><code>ALL</code> — Returns all attributes</li> <li>Comma-separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS</code>, <code>SQL_BINDS</code>, <code>SQL_PLAN_STATISTICS</code> (similar to <code>SQL_PLAN</code> plus row source statistics).</li> </ul> |
| <code>recursive_sql</code>      | Specifies the filter that includes recursive SQL in the SQL tuning set ( <code>HAS_RECURSIVE_SQL</code> ) or excludes it ( <code>NO_RECURSIVE_SQL</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>dbid</code>               | Specifies the DBID for imported or PDB-level AWR data. If <code>NULL</code> , then the function uses the current database DBID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Return Values

This function returns one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

### Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

### Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
      FROM table(dbms_sqltune.select_workload_repository(1,2)) P;
```

```
-- Process each statement (or pass cursor to load_sqlset)

CLOSE cur;
END;
/
```

## 172.5.40 SET\_TUNING\_TASK\_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  VARCHAR2,
    database_link_to   IN  VARCHAR2);

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (
    task_name          IN  VARCHAR2,
    parameter          IN  VARCHAR2,
    value              IN  NUMBER,
    database_link_to   IN  VARCHAR2);
);
```

### Parameters

**Table 172-46 SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| task_name | Identifier of the task to execute |

**Table 172-46 (Cont.) SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| value     | New value of the specified parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 172-46 (Cont.) SET\_TUNING\_TASK\_PARAMETER Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| database_link_to | <p>Name of a database link that exists on a standby database.</p> <p>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</p> <p>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</p> <p>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS\$UMF. The following sample statement creates a link named lnk_to_pri:</p> <pre>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS\$UMF IDENTIFIED BY password USING 'inst1';</pre> |

#### Usage Notes

When setting automatic tuning task parameters, use the [SET\\_AUTO\\_TUNING\\_TASK\\_PARAMETER Procedures](#) in the [DBMS\\_AUTO\\_SQLTUNE](#) package.

## 172.5.41 SQLTEXT\_TO\_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in dba\_sql\_profiles.

#### See Also:

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

#### Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text      IN CLOB,
  force_match IN BOOLEAN := FALSE)
RETURN NUMBER;
```

#### Parameters

**Table 172-47 SQLTEXT\_TO\_SIGNATURE Function Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| sql_text  | SQL text whose signature is required. Required. |

**Table 172-47 (Cont.) SQLTEXT\_TO\_SIGNATURE Function Parameters**

| Parameter   | Description                                                                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force_match | If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed |

**Return Values**

This function returns the signature of the specified SQL text.

## 172.5.42 UNPACK\_STGTAB\_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

**See Also:**

[DBMS\\_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

**Syntax**

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (  
    profile_name          IN VARCHAR2 := '%',  
    profile_category      IN VARCHAR2 := 'DEFAULT',  
    replace               IN BOOLEAN,  
    staging_table_name     IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL);
```

**Parameters****Table 172-48 UNPACK\_STGTAB\_SQLPROF Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| profile_name         | The name of the profile to unpack (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                            |
| profile_category     | The category from which to unpack profiles (% wildcards acceptable, case-sensitive)                                                                                                                                                                                                   |
| replace              | The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists |
| staging_table_name   | The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.                                                                                                                                                                      |
| staging_schema_owner | The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)                                                                                                                                                                                |

### Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

### Examples

```
-- Unpack all profiles stored in a staging table.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace          => FALSE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;

-- If there is a failure during the unpack operation, you can find the profile
-- that caused the error and perform a remap_stgtab_sqlprof operation
-- targeting it.
-- You can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced.
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace          => TRUE
  ,   staging_table_name => 'PROFILE_STGTAB');
END;
```

## 172.5.43 UNPACK\_STGTAB\_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

### See Also:

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

**Table 172-49 UNPACK\_STGTAB\_SQLSET and UNPACK\_STGTAB Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name          | Specifies the name of the tuning set to unpack (not null).<br>Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table. |
| sqlset_owner         | Specifies the name of tuning set owner, or NULL for the current schema owner.<br>Wildcard characters (%) are supported.                                                                                                       |
| replace              | Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.                                                                 |
| staging_table_name   | Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).                                                                     |
| staging_schema_owner | Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).                                                                                                                             |

**Examples**

```
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner      => '%', -
                                       replace            => FALSE, -
                                       staging_table_name =>
'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system. In this case, users should call
-- remap_stgtab_sqlset to patch the staging table and with which to call
unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner      => '%', -
                                       replace            => TRUE, -
                                       staging_table_name =>
'STGTAB_SQLSET');
```

## 172.5.44 UPDATE\_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

**See Also:**

[DBMS\\_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  NUMBER := NULL);
```

## Parameters

**Table 172-50 UPDATE\_SQLSET Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name     | Specifies the name of the SQL tuning set.                                                                                                                                                                                                                                                              |
| sql_id          | Specifies the identifier of the SQL statement to be updated.                                                                                                                                                                                                                                           |
| plan_hash value | Specifies the hash value of the execution plan for a SQL statement.<br>Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.                                                                                              |
| attribute_name  | Specifies the name of the attribute to be modified.<br>You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY.<br>If a statement has multiple plans, then the procedure changes the attribute value for all plans. |
| attribute_value | Specifies the new value of the attribute.                                                                                                                                                                                                                                                              |

# DBMS\_STAT\_FUNCS

The DBMS\_STAT\_FUNCS package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS\\_STAT\\_FUNCS Subprograms](#)

## 173.1 Summary of DBMS\_STAT\_FUNCS Subprograms

This table lists and briefly describes the DBMS\_STAT\_FUNCS subprograms.

**Table 173-1 DBMS\_STAT\_FUNCS Package Subprograms**

| Subprogram                                     | Description                                                        |
|------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">EXPONENTIAL_DIST_FIT Procedure</a> | Tests how well a sample of values fits an exponential distribution |
| <a href="#">NORMAL_DIST_FIT Procedure</a>      | Tests how well a sample of values fits a normal distribution       |
| <a href="#">POISSON_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a Poisson distribution      |
| <a href="#">SUMMARY Procedure</a>              | Summarizes a numerical column of a table                           |
| <a href="#">UNIFORM_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a uniform distribution      |
| <a href="#">WEIBULL_DIST_FIT Procedure</a>     | Tests how well a sample of values fits a Weibull distribution      |

### 173.1.1 EXPONENTIAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

#### Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
  ownername      IN   VARCHAR2,
  tablename      IN   VARCHAR2,
  columnname     IN   VARCHAR2,
  test_type      IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda         IN   NUMBER,
  mu             IN   NUMBER,
  sig            OUT  NUMBER);
```

#### Parameters

**Table 173-2 EXPONENTIAL\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                            |
|------------|--------------------------------------------------------|
| ownername  | The schema where the table resides.                    |
| tablename  | The table where the column resides.                    |
| columnname | The column of the table against which to run the test. |

**Table 173-2 (Cont.) EXPONENTIAL\_DIST\_FIT Procedure Parameters**

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| test_type | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                               |
| lambda    | The scale parameter.                                                                                                                                                                              |
| mu        | The location parameter.                                                                                                                                                                           |
| sig       | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match. |

## 173.1.2 NORMAL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

### Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (  
  ownername      IN   VARCHAR2,  
  tablename      IN   VARCHAR2,  
  columnname     IN   VARCHAR2,  
  test_type      IN   VARCHAR2 DEFAULT 'SHAPIRO_WILKS',  
  mean           IN   NUMBER,  
  stdev          IN   NUMBER,  
  sig            OUT  NUMBER);
```

### Parameters

**Table 173-3 NORMAL\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                          |
| tablename  | The table where the column resides.                                                                                                                                                          |
| columnname | The column of the table against which to run the test.                                                                                                                                       |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.                                                                                         |
| mean       | The mean of the distribution against which to compare.                                                                                                                                       |
| stdev      | The standard deviation of the distribution against which to compare.                                                                                                                         |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match. |

## 173.1.3 POISSON\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

### Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (  
  ownername      IN   VARCHAR2,
```

```
tablename    IN    VARCHAR2,  
columnname   IN    VARCHAR2,  
test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
lambda       IN    NUMBER,  
sig          OUT   NUMBER);
```

### Parameters

**Table 173-4 POISSON\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                           |
| tablename  | The table where the column resides.                                                                                                                                                           |
| columnname | The column of the table against which to run the test.                                                                                                                                        |
| test_type  | The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                                          |
| lambda     | The lambda parameter is the shape parameter.                                                                                                                                                  |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match. |

## 173.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

### Syntax

```
DBMS_STAT_FUNCS.SUMMARY (  
  ownername    IN    VARCHAR2,  
  tablename     IN    VARCHAR2,  
  columnname    IN    VARCHAR2,  
  sigma_value   IN    NUMBER DEFAULT 3,  
  s            OUT   SummaryType);
```

### Parameters

**Table 173-5 SUMMARY Procedure Parameters**

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| ownername   | The schema where the table resides.                                |
| tablename   | The table where the column resides.                                |
| columnname  | The column of the table to be summarized.                          |
| sigma_value | The number of sigmas for the set of extreme values, defaults to 3. |
| s           | The Record containing summary information about given column.      |

### Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;  
TYPE num_table IS TABLE of NUMBER;
```

```
TYPE summaryType IS RECORD (  
    count          NUMBER,  
    min            NUMBER,  
    max            NUMBER,  
    range          NUMBER,  
    mean           NUMBER,  
    cmode          num_table,  
    variance       NUMBER,  
    stddev        NUMBER,  
    quantile_5     NUMBER,  
    quantile_25    NUMBER,  
    median         NUMBER,  
    quantile_75    NUMBER,  
    quantile_95    NUMBER,  
    plus_x_sigma   NUMBER,  
    minus_x_sigma  NUMBER,  
    extreme_values num_table,  
    top_5_values   n_arr,  
    bottom_5_values n_arr);
```

### 173.1.5 UNIFORM\_DIST\_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

#### Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (  
    ownername      IN   VARCHAR2,  
    tablename      IN   VARCHAR2,  
    columnname     IN   VARCHAR2,  
    var_type       IN   VARCHAR2 DEFAULT 'CONTINUOUS',  
    test_type      IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    paramA         IN   NUMBER,  
    paramB         IN   NUMBER,  
    sig            OUT  NUMBER);
```

#### Parameters

**Table 173-6 UNIFORM\_DIST\_FIT Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                           |
| tablename  | The table where the column resides.                                                                                                                                                           |
| columnname | The column of the table against which to run the test.                                                                                                                                        |
| var_type   | The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'                                                                                                                            |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                           |
| paramA     | Parameter A estimated from the sample (the location parameter).                                                                                                                               |
| paramB     | Parameter B estimated from the sample (the scale parameter).                                                                                                                                  |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match. |

# 173.1.6 WEIBULL\_DIST\_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

## Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (  
    ownername      IN    VARCHAR2,  
    tablename      IN    VARCHAR2,  
    columnname     IN    VARCHAR2,  
    test_type      IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    alpha          IN    NUMBER,  
    mu             IN    NUMBER,  
    beta           IN    NUMBER,  
    sig            OUT   NUMBER);
```

## Parameters

Table 173-7 WEIBULL\_DIST\_FIT Procedure Parameters

| Parameter  | Description                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownername  | The schema where the table resides.                                                                                                                                                           |
| tablename  | The table where the column resides.                                                                                                                                                           |
| columnname | The column of the table against which to run the test.                                                                                                                                        |
| test_type  | The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.                                                                                                           |
| alpha      | The scale parameter.                                                                                                                                                                          |
| mu         | The location parameter.                                                                                                                                                                       |
| beta       | The slope/shape parameter.                                                                                                                                                                    |
| sig        | The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match. |

# DBMS\_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the `DBMS_STATS` package. However, `DBMS_STATS` cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

- [DBMS\\_STATS Overview](#)
- [DBMS\\_STATS Deprecated Subprograms](#)
- [DBMS\\_STATS Types](#)
- [DBMS\\_STATS Constants](#)
- [DBMS\\_STATS Operational Notes](#)
- [DBMS\\_STATS Data Structures](#)
- [Summary of DBMS\\_STATS Subprograms](#)

## See Also:

- *Oracle Database SQL Tuning Guide*
- *Oracle Database Administrator's Guide*

## 174.1 DBMS\_STATS Overview

To improve performance, the database enables you to collect optimizer statistics.

## Note:

By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the `DELETE_COLUMN_STATS` procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only optimizer statistics stored in the data dictionary have an effect on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel.

Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations. The advisor task runs automatically in the maintenance window. However, you can also run the job on demand.

**See Also:**

*Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics

## 174.2 DBMS\_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- [GET\\_PARAM Function](#)  
Instead, use [GET\\_PREFS Function](#)
- [SET\\_PARAM Procedure](#)  
Instead, use [SET\\_GLOBAL\\_PREFS Procedure](#)
- [RESET\\_PARAM\\_DEFAULTS Procedure](#)  
Instead use [RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#)

The following subprogram is deprecated with Oracle Database 12c and later:

- `GENERATE_STATS`

This procedure is replaced by the `GATHER_INDEX_STAT` procedure.

**See Also:**

["GATHER\\_INDEX\\_STATS Procedure"](#)

## 174.3 DBMS\_STATS Types

### Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```
TYPE numarray IS VARRAY(2050) OF NUMBER;  
TYPE datearray IS VARRAY(2050) OF DATE;  
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);  
TYPE rawarray IS VARRAY(2050) OF RAW(2000);  
TYPE fltarray IS VARRAY(2050) OF BINARY_FLOAT;  
TYPE dblarray IS VARRAY(2050) OF BINARY_DOUBLE;
```

### Stale Tables

Types for listing stale tables include the following:

```

TYPE ObjectElem IS RECORD (
    ownname      VARCHAR2(30),      -- owner
    objtype      VARCHAR2(6),      -- 'TABLE' or 'INDEX'
    objname      VARCHAR2(30),      -- table/index
    partname     VARCHAR2(30),      -- partition
    subpartname  VARCHAR2(30));    -- subpartition
TYPE ObjectTab IS TABLE OF ObjectElem;

```

### Statistics Difference Reports

Use the following type to displays a statistics difference report:

```

TYPE DiffRepElem IS RECORD (
    report      CLOB,              -- stats difference report
    maxdiffpct  NUMBER);          -- max stats difference (percentage)
TYPE DiffRepTab IS TABLE OF DiffRepElem;

```

### Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```

TYPE ObjectElem IS RECORD (
    ownname      dbms_quoted_id, -- owner
    objtype      VARCHAR2(6),    -- 'TABLE' or 'INDEX'
    objname      dbms_quoted_id, -- table/index
    partname     dbms_quoted_id, -- partition
    subpartname  dbms_quoted_id -- subpartition
);
TYPE ObjectTab IS TABLE OF ObjectElem;

```

#### Note:

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed

The following type represents an operation:

```

TYPE StatsAdvOpr IS RECORD (
    name  VARCHAR2(64), -- name of the operation
    param VARCHAR2(4000)
); -- XML containing parameters and their values
TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;

```

The following type represents a filter list:

```

TYPE StatsAdvFilter IS RECORD (
    rulename VARCHAR2(64), -- rule name
    objlist  ObjectTab,    -- object filter list
    oprlist  StatsAdvOprTab, -- operation filter list
    include  BOOLEAN);     -- include/exclude elements in the list
TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;

```

## 174.4 DBMS\_STATS Constants

The `DBMS_STATS` package defines several constants to use specifying parameter values.

**Table 174-1 DBMS\_STATS Constants**

| Name                          | Type                     | Description                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ADD_GLOBAL_PREFS</code> | NUMBER                   | Copies global preferences                                                                                                                                                                                                                                        |
| <code>AUTO_CASCADE</code>     | BOOLEAN                  | Lets Oracle decide whether to collect statistics for indexes or not                                                                                                                                                                                              |
| <code>AUTO_DEGREE</code>      | NUMBER                   | Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters                                                                                                                                           |
| <code>AUTO_INVALIDATE</code>  | BOOLEAN                  | Lets Oracle decide when to invalidate dependent cursors                                                                                                                                                                                                          |
| <code>AUTO_SAMPLE_SIZE</code> | NUMBER                   | Indicates that auto-sample size algorithms should be used                                                                                                                                                                                                        |
| <code>PURGE_ALL</code>        | TIMESTAMP WITH TIME ZONE | A flag that can be passed to the <a href="#">PURGE_STATS Procedure</a> and unconditionally deletes all the history statistics. The deletion uses <code>TRUNCATE</code> statements on the various dictionary statistics tables holding the history of statistics. |
| <code>RECLAIM_SYNOPSIS</code> | TIMESTAMP WITH TIME ZONE | A constant used for reclaiming synopsis table space.                                                                                                                                                                                                             |

## 174.5 DBMS\_STATS Operational Notes

Observe these operational notes when using the `DBMS_STATS` package.

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)
- [Extended Statistics](#)
- [Optimizer Statistics Advisor](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET\\_DATABASE\\_PREFS Procedure](#), [SET\\_GLOBAL\\_PREFS Procedure](#), [SET\\_SCHEMA\\_PREFS Procedure](#) and [SET\\_TABLE\\_PREFS Procedure](#).

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a `force` parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

### Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER\\_DATABASE\\_STATS Procedures](#)
- [GATHER\\_DICTIONARY\\_STATS Procedure](#)
- [GATHER\\_FIXED\\_OBJECTS\\_STATS Procedure](#)
- [GATHER\\_INDEX\\_STATS Procedure](#)
- [GATHER\\_SCHEMA\\_STATS Procedures](#)
- [GATHER\\_SYSTEM\\_STATS Procedure](#)
- [GATHER\\_TABLE\\_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE\\_STATS Procedure](#)

### Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

- [PREPARE\\_COLUMN\\_VALUES Procedures](#)
- [PREPARE\\_COLUMN\\_VALUES\\_NVARCHAR Procedure](#)

[PREPARE\\_COLUMN\\_VALUES\\_ROWID Procedure](#)[SEED\\_COL\\_USAGE Procedure](#)[SET\\_INDEX\\_STATS Procedures](#)[SET\\_SYSTEM\\_STATS Procedure](#)[SET\\_TABLE\\_STATS Procedure](#)[GET\\_COLUMN\\_STATS Procedures](#)[GET\\_INDEX\\_STATS Procedures](#)[GET\\_SYSTEM\\_STATS Procedure](#)[GET\\_TABLE\\_STATS Procedure](#)

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

### Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE\\_COLUMN\\_STATS Procedure](#)[DELETE\\_DATABASE\\_STATS Procedure](#)[DELETE\\_DICTIONARY\\_STATS Procedure](#)[DELETE\\_FIXED\\_OBJECTS\\_STATS Procedure](#)[DELETE\\_INDEX\\_STATS Procedure](#)[DELETE\\_SCHEMA\\_STATS Procedure](#)[DELETE\\_SYSTEM\\_STATS Procedure](#)[DELETE\\_TABLE\\_STATS Procedure](#)

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are `'OBJECT_STATS'` (table statistics, column statistics and index statistics) and `'SYNOPSIS'` (auxiliary statistics created when statistics are incrementally maintained). The default is `'OBJECT_STATS, SYNOPSIS'`.

### Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE\\_STAT\\_TABLE Procedure](#)[DROP\\_STAT\\_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (`EXPORT_*`)

- from a user statistics table to the dictionary (IMPORT\_\*)

[EXPORT\\_COLUMN\\_STATS Procedure](#)  
[EXPORT\\_DATABASE\\_STATS Procedure](#)  
[EXPORT\\_DICTIONARY\\_STATS Procedure](#)  
[EXPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[EXPORT\\_INDEX\\_STATS Procedure](#)  
[EXPORT\\_SCHEMA\\_STATS Procedure](#)  
[EXPORT\\_SYSTEM\\_STATS Procedure](#)  
[EXPORT\\_TABLE\\_STATS Procedure](#)  
  
[IMPORT\\_COLUMN\\_STATS Procedure](#)  
[IMPORT\\_DATABASE\\_STATS Procedure](#)  
[IMPORT\\_DICTIONARY\\_STATS Procedure](#)  
[IMPORT\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[IMPORT\\_INDEX\\_STATS Procedure](#)  
[IMPORT\\_SCHEMA\\_STATS Procedure](#)  
[IMPORT\\_SYSTEM\\_STATS Procedure](#)  
[IMPORT\\_TABLE\\_STATS Procedure](#)

**Note:**

Oracle does not support export or import of statistics across databases of different character sets.

### Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK\\_PARTITION\\_STATS Procedure](#)  
[LOCK\\_SCHEMA\\_STATS Procedure](#)  
[LOCK\\_TABLE\\_STATS Procedure](#)  
  
[UNLOCK\\_PARTITION\\_STATS Procedure](#)  
[UNLOCK\\_SCHEMA\\_STATS Procedure](#)  
[UNLOCK\\_TABLE\\_STATS Procedure](#)

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

### Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#)  
[RESTORE\\_DATABASE\\_STATS Procedure](#)  
[RESTORE\\_DICTIONARY\\_STATS Procedure](#)  
[RESTORE\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
[RESTORE\\_SCHEMA\\_STATS Procedure](#)  
[RESTORE\\_SYSTEM\\_STATS Procedure](#)

### RESTORE\_TABLE\_STATS Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER\\_STATS\\_HISTORY\\_RETENTION Procedure](#).

The other DBMS\_STATS procedures related to restoring statistics are:

- [PURGE\\_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET\\_STATS\\_HISTORY\\_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET\\_STATS\\_HISTORY\\_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE\_\* operations are not supported for user defined statistics.

### User-Defined Statistics

The DBMS\_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET\\_INDEX\\_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

SET\_\* and GET\_\* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.

EXPORT\_\*, IMPORT\_\* and RESTORE\_\* operations are not supported for user defined statistics.

### Pending Statistics

The package gathers statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET\*PREFS procedures. The default value for PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_pending_statistics` is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT\\_PENDING\\_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to TRUE in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the [PUBLISH\\_PENDING\\_STATS Procedure](#) if the performance is acceptable, or delete the pending statistics using [DELETE\\_PENDING\\_STATS Procedure](#) if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE\\_PENDING\\_STATS Procedure](#)
- [EXPORT\\_PENDING\\_STATS Procedure](#)
- [PUBLISH\\_PENDING\\_STATS Procedure](#)

### Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

### Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group (`c1, c2`), the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

- [CREATE\\_EXTENDED\\_STATS Function](#)
- [DROP\\_EXTENDED\\_STATS Procedure](#)
- [SHOW\\_EXTENDED\\_STATS\\_NAME Function](#)
- [REPORT\\_COL\\_USAGE Function](#)
- [SEED\\_COL\\_USAGE Procedure](#)
- [RESET\\_COL\\_USAGE Procedure](#)

### Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in `DBA_ADVISOR_RECOMMENDATIONS`.

The advisor organizes rules into the following classes:

- **System**  
This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value `SYSTEM` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Operation**  
This class checks whether statistics collection uses the defaults, test statistics are created using the `SET_*_STATS` procedures, and so on. Rules in this class have the value `OPERATION` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.
- **Object**  
This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value `OBJECT` in `V$STATS_ADVISOR_RULES.RULE_TYPE`.

All Optimizer Statistics Advisor subprograms require the `ADVISOR` privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the `ANALYZE ANY DICTIONARY` privilege creates a task `t1`, and if a DBA then executes this task, then the task execution checks for `SYS` objects. Another example is a task that is executed by `user1`, interrupted, and then resumed by `user2`. In this case, the checks of the resumed execution are based on the privilege of `user2` rather than `user1`.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- [CANCEL\\_ADVISOR\\_TASK Procedure](#)
- [CONFIGURE\\_ADVISOR\\_FILTER Function](#)
- [CONFIGURE\\_ADVISOR\\_OBJ\\_FILTER Function](#)
- [CONFIGURE\\_ADVISOR\\_OPR\\_FILTER Functions](#)
- [CONFIGURE\\_ADVISOR\\_RULE\\_FILTER Function](#)
- [CREATE\\_ADVISOR\\_TASK Function](#)
- [DROP\\_ADVISOR\\_TASK Procedure](#)
- [EXECUTE\\_ADVISOR\\_TASK Function](#)
- [GET\\_ADVISOR\\_OPR\\_FILTER Procedure](#)
- [GET\\_ADVISOR\\_RECS Function](#)
- [IMPLEMENT\\_ADVISOR\\_TASK Function](#)
- [INTERRUPT\\_ADVISOR\\_TASK Procedure](#)
- [REPORT\\_ADVISOR\\_TASK Function](#)
- [RESET\\_ADVISOR\\_TASK Procedure](#)
- [RESUME\\_ADVISOR\\_TASK Procedure](#)
- [SCRIPT\\_ADVISOR\\_TASK Function](#)
- [SET\\_ADVISOR\\_TASK\\_PARAMETER Procedure](#)

## 174.6 DBMS\_STATS Data Structures

The DBMS\_STATS package defines a RECORD type.

### RECORD Types

- [STAT\\_REC Record Type](#)

### 174.6.1 DBMS\_STATS STAT\_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

#### Syntax

```
TYPE STATREC IS RECORD (  
    epc      NUMBER,  
    minval   RAW(2000),  
    maxval   RAW(2000),  
    bkvals   NUMARRAY,  
    novals   NUMARRAY,  
    chvals   CHARARRAY,  
    eavals   RAWARRAY,  
    rpcnts   NUMARRAY,  
    eavs     NUMBER);
```

#### Fields of the Record type COMPARISON\_TYPE (STAT\_REC Attributes)

**Table 174-2** STAT\_REC Attributes

| Field  | Description                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| epc    | Number of buckets in histogram                                                                                                                                                            |
| minval | Minimum value                                                                                                                                                                             |
| maxval | Maximum value                                                                                                                                                                             |
| bkvals | Array of bucket numbers                                                                                                                                                                   |
| novals | Array of normalized end point values                                                                                                                                                      |
| chvals | Array of dumped end point values                                                                                                                                                          |
| eavals | Array of end point actual values                                                                                                                                                          |
| rpcnts | Array of end point value frequencies                                                                                                                                                      |
| eavs   | A number indicating whether actual end point values are needed in the histogram. If using the <a href="#">PREPARE_COLUMN_VALUES Procedures</a> , this field will be automatically filled. |

## 174.7 Summary of DBMS\_STATS Subprograms

This table lists the DBMS\_STATS subprograms and briefly describes them.

**Table 174-3 DBMS\_STATS Package Subprograms**

| Subprogram                                                  | Description                                                                                                                               |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ALTER_STATS_HISTORY_RETENTION Procedure</a>     | Changes the statistics history retention value                                                                                            |
| <a href="#">CANCEL_ADVISOR_TASK Procedure</a>               | Cancels an Optimizer Statistics Advisor execution                                                                                         |
| <a href="#">CONFIGURE_ADVISOR_FILTER Function</a>           | Configures the filter list for an Optimizer Statistics Advisor task                                                                       |
| <a href="#">CONFIGURE_ADVISOR_OBJECT_FILTER Function</a>    | Configures an object filter for an Optimizer Statistics Advisor task                                                                      |
| <a href="#">CONFIGURE_ADVISOR_OPERATOR_FILTER Functions</a> | Configures an operation filter for an Optimizer Statistics Advisor task                                                                   |
| <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a>      | Configures a rule filter for an Optimizer Statistics Advisor task                                                                         |
| <a href="#">CREATE_ADVISOR_TASK Function</a>                | Creates an advisor task for the Optimizer Statistics Advisor                                                                              |
| <a href="#">CONVERT_RAW_VALUE Procedures</a>                | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| <a href="#">CONVERT_RAW_VALUE_NVARCHAR Procedure</a>        | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| <a href="#">CONVERT_RAW_VALUE_ROWID Procedure</a>           | Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value |
| <a href="#">COPY_TABLE_STATS Procedure</a>                  | Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling                                      |
| <a href="#">CREATE_EXTENDED_STATS Function</a>              | Creates a virtual column for a user specified column group or an expression in a table                                                    |
| <a href="#">CREATE_STAT_TABLE Procedure</a>                 | Creates a table with name <code>stattab</code> in <code>ownname</code> 's schema which is capable of holding statistics                   |
| <a href="#">DELETE_COLUMN_STATS Procedure</a>               | Deletes column-related statistics                                                                                                         |
| <a href="#">DELETE_DATABASE_PREFS Procedure</a>             | Deletes the statistics preferences of all the tables                                                                                      |
| <a href="#">DELETE_DATABASE_STATS Procedure</a>             | Deletes statistics for the entire database                                                                                                |
| <a href="#">DELETE_DICTIONARY_STATS Procedure</a>           | Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and database component schemas)                                            |
| <a href="#">DELETE_FIXED_OBJECTS_STATS Procedure</a>        | Deletes statistics of all fixed tables                                                                                                    |
| <a href="#">DELETE_INDEX_STATS Procedure</a>                | Deletes index-related statistics                                                                                                          |
| <a href="#">DELETE_PENDING_STATS Procedure</a>              | Deletes the private statistics that have been collected but have not been published                                                       |
| <a href="#">DELETE_PROCESSING_RATE Procedure</a>            | Deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources    |

**Table 174-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                                   |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DELETE_SCHEMA_PREFS Procedure</a>        | Deletes the statistics preferences of all the tables owned by the specified owner name                                                                                        |
| <a href="#">DELETE_SCHEMA_STATS Procedure</a>        | Deletes schema-related statistics                                                                                                                                             |
| <a href="#">DELETE_SYSTEM_STATS Procedure</a>        | Deletes system statistics                                                                                                                                                     |
| <a href="#">DELETE_TABLE_PREFS Procedure</a>         | Deletes statistics preferences of the specified table in the specified schema                                                                                                 |
| <a href="#">DELETE_TABLE_STATS Procedure</a>         | Deletes table-related statistics                                                                                                                                              |
| <a href="#">DIFF_TABLE_STATS_IN_HISTORY Function</a> | Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps                                                                  |
| <a href="#">DIFF_TABLE_STATS_IN_PENDING Function</a> | Compares pending statistics and statistics as of a timestamp or statistics from dictionary                                                                                    |
| <a href="#">DIFF_TABLE_STATS_IN_SOURCE Function</a>  | Compares statistics for a table from two different sources                                                                                                                    |
| <a href="#">DROP_ADVISOR_TASK Procedure</a>          | Drops the specified Optimizer Statistics Advisor task                                                                                                                         |
| <a href="#">DROP_EXTENDED_STATS Procedure</a>        | Drops the statistics entry that is created for the user specified extension                                                                                                   |
| <a href="#">DROP_STAT_TABLE Procedure</a>            | Drops a user statistics table created by <code>CREATE_STAT_TABLE</code>                                                                                                       |
| <a href="#">EXECUTE_ADVISOR_TASK Function</a>        | Executes a previously created Optimizer Statistics Advisor task                                                                                                               |
| <a href="#">EXPORT_COLUMN_STATS Procedure</a>        | Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>                                                  |
| <a href="#">EXPORT_DATABASE_PREFS Procedure</a>      | Exports the statistics preferences of all the tables                                                                                                                          |
| <a href="#">EXPORT_DATABASE_STATS Procedure</a>      | Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>                                  |
| <a href="#">EXPORT_DICTIONARY_STATS Procedure</a>    | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code> |
| <a href="#">EXPORT_FIXED_OBJECTS_STATS Procedure</a> | Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>                                                         |
| <a href="#">EXPORT_INDEX_STATS Procedure</a>         | Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>                                                   |
| <a href="#">EXPORT_PENDING_STATS Procedure</a>       | Exports the statistics gathered and stored as pending                                                                                                                         |
| <a href="#">EXPORT_SCHEMA_PREFS Procedure</a>        | Exports the statistics preferences of all the tables owned by the specified owner name                                                                                        |
| <a href="#">EXPORT_SCHEMA_STATS Procedure</a>        | Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>         |
| <a href="#">EXPORT_SYSTEM_STATS Procedure</a>        | Retrieves system statistics and stores them in the user statistics table                                                                                                      |

**Table 174-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                               | Description                                                                                                            |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EXPORT_TABLE_PREFS Procedure</a>             | Exports statistics preferences of the specified table in the specified schema into the specified statistics table      |
| <a href="#">EXPORT_TABLE_STATS Procedure</a>             | Retrieves statistics for a particular table and stores them in the user statistics table                               |
| <a href="#">FLUSH_DATABASE_MONITORING_INFO Procedure</a> | Flushes in-memory monitoring information for all the tables to the dictionary                                          |
| <a href="#">GATHER_DATABASE_STATS Procedures</a>         | Gathers statistics for all objects in the database                                                                     |
| <a href="#">GATHER_DICTIONARY_STATS Procedure</a>        | Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components                              |
| <a href="#">GATHER_FIXED_OBJECTS_STATS Procedure</a>     | Gathers statistics of fixed objects                                                                                    |
| <a href="#">GATHER_INDEX_STATS Procedure</a>             | Gathers index statistics                                                                                               |
| <a href="#">GATHER_PROCESSING_RATE Procedure</a>         | Starts the job of gathering the processing rates which end after <code>interval</code> defined in minutes              |
| <a href="#">GATHER_SCHEMA_STATS Procedures</a>           | Gathers statistics for all objects in a schema                                                                         |
| <a href="#">GATHER_SYSTEM_STATS Procedure</a>            | Gathers system statistics                                                                                              |
| <a href="#">GATHER_TABLE_STATS Procedure</a>             | Gathers table and column (and index) statistics                                                                        |
| <a href="#">GENERATE_STATS Procedure</a>                 | Generates object statistics from previously collected statistics of related objects                                    |
| <a href="#">GET_ADVISOR_OPR_FILTER Procedure</a>         | Creates an operation filter for an Optimizer Statistics Advisor operation                                              |
| <a href="#">GET_ADVISOR_RECS Function</a>                | Generates a recommendation report for the specified item                                                               |
| <a href="#">GET_COLUMN_STATS Procedures</a>              | Gets all column-related information                                                                                    |
| <a href="#">GET_INDEX_STATS Procedures</a>               | Gets all index-related information                                                                                     |
| <a href="#">GET_PARAM Function</a>                       | Gets the default value of parameters of DBMS_STATS procedures (see <a href="#">DBMS_STATS Deprecated Subprograms</a> ) |
| <a href="#">GET_PREFS Function</a>                       | Gets the default value of the specified preference                                                                     |
| <a href="#">GET_STATS_HISTORY_AVAILABILITY Function</a>  | Gets the oldest timestamp where statistics history is available                                                        |
| <a href="#">GET_STATS_HISTORY_RETENTION Function</a>     | Returns the current statistics history retention value                                                                 |
| <a href="#">GET_SYSTEM_STATS Procedure</a>               | Gets system statistics from <code>stattab</code> , or from the dictionary if <code>stattab</code> is NULL              |
| <a href="#">GET_TABLE_STATS Procedure</a>                | Gets all table-related information                                                                                     |
| <a href="#">IMPLEMENT_ADVISOR_TASK Function</a>          | Implements the recommendations made by Optimizer Statistics Advisor                                                    |

**Table 174-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                               | Description                                                                                                                                                                                           |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">IMPORT_COLUMN_STATS Procedure</a>            | Retrieves statistics for a particular column from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                                                      |
| <a href="#">IMPORT_DATABASE_PREFS Procedure</a>          | Imports the statistics preferences of all the tables                                                                                                                                                  |
| <a href="#">IMPORT_DATABASE_STATS Procedure</a>          | Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary                                                                                 |
| <a href="#">IMPORT_DICTIONARY_STATS Procedure</a>        | Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary                                        |
| <a href="#">IMPORT_FIXED_OBJECTS_STATS Procedure</a>     | Retrieves statistics for fixed tables from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                                                             |
| <a href="#">IMPORT_INDEX_STATS Procedure</a>             | Retrieves statistics for a particular index from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                                                       |
| <a href="#">IMPORT_SCHEMA_PREFS Procedure</a>            | Imports the statistics preferences of all the tables owned by the specified owner name                                                                                                                |
| <a href="#">IMPORT_SCHEMA_STATS Procedure</a>            | Retrieves statistics for all objects in the schema identified by <code>ownname</code> from the user statistics table and stores them in the dictionary                                                |
| <a href="#">IMPORT_SYSTEM_STATS Procedure</a>            | Retrieves system statistics from the user statistics table and stores them in the dictionary                                                                                                          |
| <a href="#">IMPORT_TABLE_PREFS Procedure</a>             | Sets the statistics preferences of the specified table in the specified schema                                                                                                                        |
| <a href="#">IMPORT_TABLE_STATS Procedure</a>             | Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary                                                       |
| <a href="#">INTERRUPT_ADVISOR_TASK Procedure</a>         | Interrupts a currently executing Optimizer Statistics Advisor task.                                                                                                                                   |
| <a href="#">LOCK_PARTITION_STATS Procedure</a>           | Locks statistics for a partition                                                                                                                                                                      |
| <a href="#">LOCK_SCHEMA_STATS Procedure</a>              | Locks the statistics of all tables of a schema                                                                                                                                                        |
| <a href="#">LOCK_TABLE_STATS Procedure</a>               | Locks the statistics on the table                                                                                                                                                                     |
| <a href="#">MERGE_COL_USAGE Procedure</a>                | Merges column usage information from a source database, by means of a <code>dblink</code> , into the local database                                                                                   |
| <a href="#">PREPARE_COLUMN_VALUES Procedures</a>         | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PREPARE_COLUMN_VALUES_NVARCHAR Procedure</a> | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PREPARE_COLUMN_VALUES_ROWID Procedure</a>    | Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the <a href="#">SEED_COL_USAGE Procedure</a> |
| <a href="#">PUBLISH_PENDING_STATS Procedure</a>          | Publishes the statistics gathered and stored as pending                                                                                                                                               |
| <a href="#">PURGE_STATS Procedure</a>                    | Purges old versions of statistics saved in the dictionary                                                                                                                                             |
| <a href="#">REMAP_STAT_TABLE Procedure</a>               | Remaps the names of objects in the user statistics table                                                                                                                                              |

**Table 174-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                                | Description                                                                                                                                                        |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">REPORT_ADVISOR_TASK Function</a>              | Reports the results of an Optimizer Advisor Task.                                                                                                                  |
| <a href="#">REPORT_COL_USAGE Function</a>                 | Reports the recorded column (group) usage information                                                                                                              |
| <a href="#">REPORT_GATHER_AUTO_STATS Function</a>         | Runs the auto statistics gathering job in reporting mode                                                                                                           |
| <a href="#">REPORT_GATHER_DATABASE_STATS Functions</a>    | Runs the <a href="#">GATHER_DATABASE_STATS Procedures</a> in reporting mode.                                                                                       |
| <a href="#">REPORT_GATHER_DICTIONARY_STATS Functions</a>  | Runs the <a href="#">GATHER_DICTIONARY_STATS Procedure</a> in reporting mode                                                                                       |
| <a href="#">REPORT_GATHER_FIXED_OBJECT_STATS Function</a> | Runs the <a href="#">GATHER_FIXED_OBJECTS_STATS Procedure</a> in reporting mode                                                                                    |
| <a href="#">REPORT_GATHER_SCHEMA_STATS Functions</a>      | Runs the <a href="#">GATHER_SCHEMA_STATS Procedures</a> in reporting mode                                                                                          |
| <a href="#">REPORT_GATHER_TABLE_STATS Function</a>        | Runs the <a href="#">GATHER_TABLE_STATS Procedure</a> in reporting mode                                                                                            |
| <a href="#">REPORT_STATS_OPERATIONS Function</a>          | Generates a report of all statistics operations that take place between two timestamps which may or may not have been provided                                     |
| <a href="#">RESET_ADVISOR_TASK Procedure</a>              | Resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing                                      |
| <a href="#">RESET_COL_USAGE Procedure</a>                 | Resets the recorded column (group) usage information                                                                                                               |
| <a href="#">RESET_GLOBAL_PREF_DEFAULTS Procedure</a>      | Resets the default values of all parameters to Oracle recommended values                                                                                           |
| <a href="#">RESET_PARAM_DEFAULTS Procedure</a>            | Resets global preferences to default values (see <a href="#">DBMS_STATS Deprecated Subprograms</a> )                                                               |
| <a href="#">RESTORE_DICTIONARY_STATS Procedure</a>        | Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp                                   |
| <a href="#">RESTORE_FIXED_OBJECTS_STATS Procedure</a>     | Restores statistics of all fixed tables as of a specified timestamp                                                                                                |
| <a href="#">RESTORE_SCHEMA_STATS Procedure</a>            | Restores statistics of all tables of a schema as of a specified timestamp                                                                                          |
| <a href="#">RESTORE_SYSTEM_STATS Procedure</a>            | Restores statistics of all tables of a schema as of a specified timestamp                                                                                          |
| <a href="#">RESTORE_TABLE_STATS Procedure</a>             | Restores statistics of a table as of a specified timestamp ( <i>as_of_timestamp</i> ), as well as statistics of associated indexes and columns                     |
| <a href="#">RESUME_ADVISOR_TASK Procedure</a>             | Resumes an interrupted task. It only resumes the execution that was most recently interrupted                                                                      |
| <a href="#">SCRIPT_ADVISOR_TASK Function</a>              | Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor                                                |
| <a href="#">SEED_COL_USAGE Procedure</a>                  | Iterates over the SQL statements in the specified SQL tuning set, compiles them and seeds column usage information for the columns that appear in these statements |
| <a href="#">SET_ADVISOR_TASK_PARAMETER Procedure</a>      | Updates the value of an Optimizer Statistics Advisor task parameter                                                                                                |

**Table 174-3 (Cont.) DBMS\_STATS Package Subprograms**

| Subprogram                                        | Description                                                                                                               |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_COLUMN_STATS Procedures</a>       | Sets column-related information                                                                                           |
| <a href="#">SET_DATABASE_PREFS Procedure</a>      | Sets the statistics preferences of all the tables                                                                         |
| <a href="#">SET_GLOBAL_PREFS Procedure</a>        | Sets the global statistics preferences                                                                                    |
| <a href="#">SET_INDEX_STATS Procedures</a>        | Sets index-related information                                                                                            |
| <a href="#">SET_PARAM Procedure</a>               | Sets default values for parameters of DBMS_STATS procedures (see <a href="#">DBMS_STATS Deprecated Subprograms</a> )      |
| <a href="#">SET_PROCESSING_RATE Procedure</a>     | Sets the value of rate of processing for a given operation                                                                |
| <a href="#">SET_SCHEMA_PREFS Procedure</a>        | Sets the statistics preferences of all the tables owned by the specified owner name                                       |
| <a href="#">SET_SYSTEM_STATS Procedure</a>        | Sets system statistics                                                                                                    |
| <a href="#">SET_TABLE_PREFS Procedure</a>         | Sets the statistics preferences of the specified table in the specified schema                                            |
| <a href="#">SET_TABLE_STATS Procedure</a>         | Sets table-related information                                                                                            |
| <a href="#">SHOW_EXTENDED_STATS_NAME Function</a> | Returns the name of the virtual column that is created for the user-specified extension                                   |
| <a href="#">TRANSFER_STATS Procedure</a>          | Transfers statistics for specified table(s) from a remote database specified by <code>dblink</code> to the local database |
| <a href="#">UNLOCK_PARTITION_STATS Procedure</a>  | Unlocks the statistics for a partition                                                                                    |
| <a href="#">UNLOCK_SCHEMA_STATS Procedure</a>     | Unlocks the statistics on all the tables in schema                                                                        |
| <a href="#">UNLOCK_TABLE_STATS Procedure</a>      | Unlocks the statistics on the table                                                                                       |
| <a href="#">UPGRADE_STAT_TABLE Procedure</a>      | Upgrades user statistics on an older table                                                                                |

## 174.7.1 ALTER\_STATS\_HISTORY\_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and [PURGE\\_STATS Procedure](#).

### Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
    retention      IN      NUMBER);
```

## Parameters

**Table 174-4 ALTER\_STATS\_HISTORY\_RETENTION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retention | The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes: <ul style="list-style-type: none"><li>• -1: Statistics history is never purged by automatic purge</li><li>• 0: Old statistics are never saved. The automatic purge will delete all statistics history</li><li>• NULL: Change statistics history retention to default value</li></ul> |

## Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

## Exceptions

ORA-20000: Insufficient privileges

## 174.7.2 CANCEL\_ADVISOR\_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

## Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

## Parameters

**Table 174-5 CANCEL\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

## Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

#### Example 174-1 Canceling an Optimizer Statistics Advisor

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
  v_tname  VARCHAR2(128) := 'my_task';
  v_ename  VARCHAR2(128) := NULL;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

## 174.7.3 CONFIGURE\_ADVISOR\_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

### Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name      IN   VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  configuration_type IN VARCHAR2,
  filter         IN   StatsAdvFilterTab  := NULL)
RETURN CLOB;
```

## Parameters

**Table 174-6 CONFIGURE\_ADVISOR\_FILTER Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name          | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                                                                                                                          |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. The function permits you to specify a combination of operation types by using the plus (+) operator, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of advisor operations.                                   |
| configuration_type | The type of configuration. Possible values are as follows: <ul style="list-style-type: none"> <li>• SET: Sets the specified filter list values. The submitted filter overrides existing filter values.</li> <li>• CLEAR: Clears the existing values for the specified filter.</li> <li>• SHOW: Shows the current values of the specified filter.</li> </ul> |
| filter             | The list of filter items for the script.                                                                                                                                                                                                                                                                                                                    |

## Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## Usage Notes

To provide fine-grained control and a unified interface across all procedures, DBMS\_STATS provides the StatsAdvFilter type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type StatsAdvFilter to CONFIGURE\_ADVISOR\_FILTER along with a Boolean variable that specifies either of the following:

- Inclusion list  
Only include these objects in the check.
- Exclusion list  
Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- **Rule filter**  
This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.
- **Operation filter**  
This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the `DBA_OPTSTAT_OPERATIONS` view. To obtain the filter for an operation, use `DBMS_STATS.GET_ADVISOR_OPR_FILTER`.
- **Object filter**  
This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

#### Example 174-2 Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```
DECLARE
    v_task_name    VARCHAR2(128)                := 'my_task';
    v_ret          VARCHAR2(128);
    filter         DBMS_STATS.StatsAdvFilter     := null;
    filterTab      DBMS_STATS.StatsAdvFilterTab  := null;
    v_counter      NUMBER                       := 0;
    v_filterReport CLOB;
BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize the filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- First filter: set filters to be FALSE by default
    filter.include := FALSE;

    -- Add this filter to the filter table
    v_counter := v_counter + 1;
    filterTab.extend;
    filterTab(v_counter) := filter;

    -- Second filter: turn on filter for one rule
    filter.include := TRUE;
    filter.rulename := 'TurnOnSQLPlanDirective';

    -- Add the SQL plan directive filter to the filter table
    v_counter := v_counter + 1;
    filterTab.extend;
```

```

filterTab(v_counter) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name      => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter         => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

### Example 174-3 Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

```

DECLARE
    v_task_name    VARCHAR2(128)           := 'my_task';
    v_ret          VARCHAR2(128);
    filter         DBMS_STATS.StatsAdvFilter := null;
    filterTab      DBMS_STATS.StatsAdvFilterTab := null;
    opr            DBMS_STATS.StatsAdvOpr;
    oprTab         DBMS_STATS.StatsAdvOprTab;
    v_oprCnt       NUMBER                   := 0;
    TYPE numTab IS TABLE OF NUMBER;
    opr_tab        numTab;
    v_filterReport CLOB;

BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Initialize operations filter
    oprTab := DBMS_STATS.StatsAdvOprTab();

    SELECT ID
        BULK COLLECT INTO opr_tab
    FROM   WRI$_OPTSTAT_OPR
    WHERE  OPERATION = 'set_table_stats'
    AND    TARGET = 'HR.EMPLOYEES';

    -- Populate the operations table
    FOR i IN 1..opr_tab.count LOOP

        -- Use the procedure GET_ADVISOR_OPR_FILTER to construct
        -- an operation filter
        DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);

        v_oprCnt := v_oprCnt + 1;
        oprTab.extend;
        oprTab(v_oprCnt) := opr;
    
```

```

END LOOP;

filter.include := FALSE;
filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name      => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter         => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
```

#### Example 174-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the `sh` schema. Also, you want to skip the `sh.products` table. You create an object filter as follows:

```

DECLARE
    v_task_name      VARCHAR2(128)           := 'my_task';
    v_ret            VARCHAR2(128);
    filter           DBMS_STATS.StatsAdvFilter := null;
    filterTab        DBMS_STATS.StatsAdvFilterTab := null;
    v_filterReport    CLOB;
    v_counter        NUMBER                   := 0;
    obj              DBMS_STATS.ObjectElem;
    objTab           DBMS_STATS.ObjectTab;
    v_objCnt         NUMBER                   := 0;
BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Set object filter to be off by default
    filter.include := FALSE;

    objTab := DBMS_STATS.ObjectTab();

    obj.ownname := NULL;
    obj.objname := NULL;

    -- Add to the object table

    v_objCnt := v_objCnt + 1;
    objTab.extend;
    objTab(v_objCnt) := obj;
```

```

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH

filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products

filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(

```

```
task_name          => v_task_name,
stats_adv_opr_type => NULL,
configuration_type => 'SET',
filter             => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;
```

## 174.7.4 CONFIGURE\_ADVISOR\_OBJ\_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER (
  task_name          IN VARCHAR2,
  stats_adv_opr_type IN VARCHAR2,
  rule_name          IN VARCHAR2,
  ownname            IN VARCHAR2,
  tabname            IN VARCHAR2,
  action             IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 174-7** CONFIGURE\_ADVISOR\_OBJ\_FILTER Function Parameters

| Parameter          | Description                                                                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name          | The name of the Optimizer Statistics Advisor task.                                                                                                                 |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT.<br>See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ". |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all operation-level rules.                                                          |
| ownname            | The owner name of the operation target. If null, the function applies the filter to all owner names.                                                               |
| tabname            | The table name of the operation target.                                                                                                                            |
| action             | The configuration action to take for the specified rule.<br>See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                        |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Return Values

This function returns an XML CLOB that contains the updated values of the filter.

## Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

# 174.7.5 CONFIGURE\_ADVISOR\_OPR\_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

## Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_name     IN VARCHAR2,
    ownname            IN VARCHAR2,
    tabname            IN VARCHAR2,
    action             IN VARCHAR2)
RETURN CLOB;
```

```
DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (
    task_name          IN VARCHAR2,
    stats_adv_opr_type IN VARCHAR2,
    rule_name          IN VARCHAR2,
    operation_id       IN NUMBER,
    action             IN VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 174-8 CONFIGURE\_ADVISOR\_OPR\_FILTER Function Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

**Table 174-8 (Cont.) CONFIGURE\_ADVISOR\_OPR\_FILTER Function Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT.<br>See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                                                                                                                            |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all operation-level rules.                                                                                                                                                                                                     |
| operation_name     | The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.                                                                                                                                                                                             |
| operation_id       | The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OPTSTAT_OPERATIONS.ID. This value cannot be null. |
| ownname            | The owner name of the operation target. This value cannot be null.                                                                                                                                                                                                                                            |
| tabname            | The table name of the operation target.                                                                                                                                                                                                                                                                       |
| action             | The configuration action to take for the specified rule.<br>See " <a href="#">CONFIGURE_ADVISOR_RULE_FILTER Function</a> ".                                                                                                                                                                                   |

**Security Model**

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

**Return Values**

This function returns an XML CLOB that contains the updated values of the filter.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

**Example 174-5 Excluding Operations for Gathering Table Statistics**

In this example, your goal is to exclude operations that gather table statistics in the `hr` schema. User account `stats` has been granted the `DBA` role, `ADVISOR` privilege, and `SELECT ON DBA_OPTSTAT_OPERATIONS` privilege. You perform the following steps:

1. Log in to the database as `stats`.
2. Drop any existing task named `opt_adv_task1`.

```

DECLARE
    v_tname VARCHAR2(32767);
BEGIN
    v_tname := 'opt_adv_task1';
    DBMS_STATS.DROP_ADVISOR_TASK(v_tname);

```

```
END;  
/
```

3. Create a procedure named `opr_filter` that configures a task to advise on all operations except those that gather statistics for tables in the `hr` schema.

```
CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS  
    v_retc CLOB;  
BEGIN  
    -- For all rules, prevent the advisor from operating  
    -- on the operations selected in the following query  
    FOR rec IN  
        (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION =  
        'gather_table_stats' AND TARGET LIKE 'HR.%')  
    LOOP  
        v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(  
            task_name          => p_tname  
            , stats_adv_opr_type => NULL  
            , rule_name         => NULL  
            , operation_id      => rec.id  
            , action            => 'DISABLE');  
    END LOOP;  
END;  
/  
SHOW ERRORS
```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```
DECLARE  
    v_tname VARCHAR2(32767);  
    v_ret VARCHAR2(32767);  
BEGIN  
    v_tname := 'opt_adv_task1';  
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);  
    opr_filter(v_tname);  
END;  
/
```

5. Execute the task `opt_adv_task1`.

```
DECLARE  
    v_tname VARCHAR2(32767);  
    v_ret VARCHAR2(32767);  
begin  
    v_tname := 'opt_adv_task1';  
    v_ret := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);  
END;  
/
```

6. Print the report.

```
SPOOL /tmp/rep.txt  
SET LONG 1000000  
COLUMN report FORMAT A200
```

```
SET LINESIZE 250
SET PAGESIZE 1000

SELECT DBMS_STATS.REPORT_ADVISOR_TASK (
    task_name      => 'opt_adv_task1'
    , execution_name => NULL
    , type          => 'TEXT'
    , section       => 'ALL'
) AS report
FROM   DUAL;
SPOOL OFF
```

## 174.7.6 CONFIGURE\_ADVISOR\_RULE\_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (
    task_name      IN   VARCHAR2,
    stats_adv_opr_Type IN VARCHAR2,
    rule_name       IN   VARCHAR2,
    action          IN   VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 174-9** SCRIPT\_ADVISOR\_TASK Function Parameters

| Parameter          | Description                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name          | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                                                          |
| stats_adv_opr_type | The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations. |
| rule_name          | The name of the rule to configure. If null, the function applies the filter to all rules.                                                                                                                                                                                                   |
| action             | The configuration action to take for the specified rule. Possible values are: <ul style="list-style-type: none"> <li>• ENABLE: Enables the filter</li> <li>• DISABLE: Disables the filter</li> <li>• DELETE: Deletes the filter</li> <li>• SHOW: Shows the current filter value</li> </ul>  |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Return Values

This function returns an XML CLOB that contains the updated values of the filter.

## Exceptions

- `ORA-20000: Insufficient privileges`
- `ORA-20001: Invalid input values`
- `ORA-20012: Optimizer Statistics Advisor errors`

## 174.7.7 CONVERT\_RAW\_VALUE Procedures

This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The `minval`, `maxval`, and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

## Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT VARCHAR2);
```

## Parameters

**Table 174-10 CONVERT\_RAW\_VALUE Procedure Parameters**

| Parameter           | Description                                                                      |
|---------------------|----------------------------------------------------------------------------------|
| <code>rawval</code> | Raw representation of a column minimum, maximum, histogram endpoint actual value |

**Table 174-10 (Cont.) CONVERT\_RAW\_VALUE Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| resval    | Converted, type-specific value |

**Usage Notes**

No special privilege or role is needed to invoke this procedure.

## 174.7.8 CONVERT\_RAW\_VALUE\_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

**Syntax**

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (  
    rawval      RAW,  
    resval OUT NVARCHAR2);
```

**Parameters****Table 174-11 CONVERT\_RAW\_VALUE\_NVARCHAR Procedure Parameters**

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| rawval    | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval    | The converted, type-specific value                                                        |

**Usage Notes**

No special privilege or role is needed to invoke this procedure.

## 174.7.9 CONVERT\_RAW\_VALUE\_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The `minval`, `maxval` and `eavals` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

**Syntax**

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (  
    rawval      RAW,  
    resval OUT ROWID);
```

**Pragmas**

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

## Parameters

**Table 174-12 CONVERT\_RAW\_VALUE\_ROWID Procedure Parameters**

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| rawval    | The raw representation of a column minimum or maximum datatype-specific output parameters |
| resval    | The converted, type-specific value                                                        |

## Usage Notes

No special privilege or role is needed to invoke this procedure.

## 174.7.10 COPY\_TABLE\_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of `blks`, or number of rows) based on the given `scale_factor`.

## Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    srcpartname      VARCHAR2,
    dstpartname      VARCHAR2,
    scale_factor      VARCHAR2 DEFAULT 1,
    flags            NUMBER DEFAULT NULL,
    force            BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-13 COPY\_TABLE\_STATS Procedure Parameters**

| Parameter    | Description                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------|
| ownname      | Schema of the table of source and destination [sub] partitions                                                    |
| tabname      | Table name of source and destination [sub] partitions                                                             |
| srcpartname  | Source [sub] partition                                                                                            |
| dstpartname  | Destination [sub] partition                                                                                       |
| scale_factor | Scale factor to scale <code>nblks</code> , <code>nrows</code> etc. in <code>dstpartname</code>                    |
| flags        | For internal Oracle use (should be left as <code>NULL</code> )                                                    |
| force        | When value of this argument is <code>TRUE</code> copy statistics even if the destination [sub]partition is locked |

## Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

## Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:

- If the partitioning type is `HASH`, then the minimum and maximum values of the destination partition are same as that of the source partition.
- If the partitioning type is `LIST`, then the behavior depends on the setting of the destination partition:
  - If the destination partition is a `NOT DEFAULT` partition, then the following statements are true:
    - \* The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
    - \* The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.
  - Alternatively, if the destination partition is a `DEFAULT` partition, then the following statements are true:
    - \* The minimum value of the destination partition is set to the minimum value of the source partition.
    - \* The maximum value of the destination partition is set to the maximum value of the source partition.
- If the partitioning type is `RANGE`, then the following statements are true:
  - The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.
  - The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is `MAXVALUE`, in which case the maximum value of the destination partition is set to the high bound of the previous partition.
  - If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is `D` and its preceding partition is `D-1` and the key column to be adjusted is `Cn`, the maximum value for `Cn` is set to the upper bound of `D` (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column `Cn-1` are the same in partitions `D` and `D-1`.

- If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.
- If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.

## 174.7.11 CREATE\_ADVISOR\_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

### Syntax

```
DBMS_STATS.CREATE_ADVISOR_TASK (  
    task_name    IN    VARCHAR2    := NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 174-14** CREATE\_ADVISOR\_TASK Function Parameters

| Parameter | Description                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name | Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- This subprogram executes using invoker's rights.

### Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

### Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20012: Optimizer Statistics Advisor errors

### Example 174-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE  
    v_tname    VARCHAR2(128) := 'my_task';  
BEGIN  
    -- create a task  
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);  
    -- execute the task
```

```
v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);  
END;
```

**Note:**

*Oracle Database SQL Tuning Guide* to learn how manage Optimizer Statistics Advisor

## 174.7.12 CREATE\_EXTENDED\_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called **extended statistics**. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the [SEED\\_COL\\_USAGE Procedure](#). This function returns a report of extensions created.

### Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension   VARCHAR2)  
RETURN VARCHAR2;
```

```
DBMS_STATS.CREATE_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2)  
RETURN CLOB;
```

### Parameters

**Table 174-15** CREATE\_EXTENDED\_STATS Function Parameters

| Parameter | Description                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table                                                                                                                                                       |
| tabname   | Name of the table                                                                                                                                                           |
| extension | Can be either a column group or an expression. Suppose the specified table has columns c1, c2. An example column group is "(c1, c2)". An example expression is "(c1 + c2)". |

### Return Values

This function returns the name of this newly created entry for the extension.

## Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

## Usage Notes

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have either the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

The extension has the following restrictions:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by `SYS`.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables, or external tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column cannot appear more than once in a column group.
- The extension can contain an expression only if a corresponding virtual column has been created.
- An expression must contain at least one column.
- An expression cannot contain a subquery.
- The `COMPATIBLE` parameter must be 11.0.0.0.0 or greater.

## 174.7.13 CREATE\_STAT\_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

### Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
    ownname          VARCHAR2,
    stattab           VARCHAR2,
    tblspace          VARCHAR2 DEFAULT NULL,
    global_temporary  BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-16 CREATE\_STAT\_TABLE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Name of the schema                                                                                                                                                                           |
| stattab          | Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly. |
| tblspace         | Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.                                                           |
| global_temporary | Whether or not the table should be created as a global temporary table                                                                                                                       |

## Security Model

To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

## Exceptions

ORA-20000: Table already exists or insufficient privileges

ORA-20001: Tablespace does not exist

## 174.7.14 DELETE\_COLUMN\_STATS Procedure

This procedure deletes column-related statistics.

## Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (  
    ownname          VARCHAR2,  
    tabname          VARCHAR2,  
    colname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2 DEFAULT NULL,  
    statid           VARCHAR2 DEFAULT NULL,  
    cascade_parts    BOOLEAN   DEFAULT TRUE,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (  
                                                get_param('NO_INVALIDATE')),  
    force            BOOLEAN   DEFAULT FALSE,  
    col_stat_type    VARCHAR2 DEFAULT 'ALL');
```

## Parameters

**Table 174-17 DELETE\_COLUMN\_STATS Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| ownname   | Name of the schema                             |
| tabname   | Name of the table to which this column belongs |
| colname   | Name of the column or extension                |

**Table 174-17 (Cont.) DELETE\_COLUMN\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| partname      | Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| stattab       | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| cascade_parts | If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | When value of this argument is TRUE, deletes column statistics even if locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| col_stat_type | Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> <li>HISTOGRAM - delete column histogram only</li> <li>ALL - delete base column statistics and histogram</li> </ul>                                                                                                                                                                                                                                                                                                                                                 |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.15 DELETE\_DATABASE\_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname          IN   VARCHAR2,
    add_sys        IN   BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 174-18 DELETE\_DATABASE\_PREFS Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>pname</code>   | <p>Preference name. | <code>add_sys</code> | Determines whether <code>SYS</code> tables will be included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 174-19 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DEGREE                    | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ESTIMATE_PERCENT          | Determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GLOBAL_TEMP_TABLE_STATS   | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| GRANULARITY               | Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| INCREMENTAL               | Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| INCREMENTAL_LEVEL         | Controls which synopses to collect when INCREMENTAL preference is set to TRUE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 174-19 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |
| METHOD_OPT            | <p>Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 174-19 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NO_INVALIDATE                  | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                              |
| OPTIONS                        | Determines the <code>options</code> parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> Specifying this preference does not change the order of precedence of table, global, and default.                                                                                                                                                                                                                                                                                                          |
| PUBLISH                        | Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STALE_PERCENT                  | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STAT_CATEGORY                  | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default)</li> <li><code>SYNOPSIS</code> — information to support incremental statistics</li> <li><code>REALTIME_STATS</code> — Specifies only real-time statistics.</li> <li><code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats.</li> </ul> The value ' <code>OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS</code> ' specifies table statistics, column statistics, index statistics, and synopses. The default value is ' <code>OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS</code> '. |
| TABLE_CACHED_BLOCKS            | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Security Model

To run this procedure, you must have the `SYSDBA` role or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

## Usage Notes

All `pname` arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Example 174-7 Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

## 174.7.16 DELETE\_DATABASE\_STATS Procedure

This procedure deletes statistics for all the tables in a database.

### Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

### Parameters

**Table 174-20 DELETE\_DATABASE\_STATS Procedure Parameters**

| Parameter            | Description                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>stattab</code> | User statistics table identifier describing from where to delete the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary. |
| <code>statid</code>  | Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )                                     |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                   |

**Table 174-20 (Cont.) DELETE\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | When the value of this argument is <code>TRUE</code> , deletes statistics of tables in a database even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <li>• <code>OBJECT_STATS</code> — table statistics, column statistics and index statistics</li> <li>• <code>SYNOPSIS</code> — information to support incremental statistics</li> <li>• <code>REALTIME_STATS</code> — specifies only real-time statistics.</li> <li>• <code>MODELS</code> — supports import, export, and deletion for regression models in real-time stats.</li> </ul> The default is ' <code>OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS</code> '                                                   |

#### Exceptions

ORA-20000: Object does not exist or insufficient privileges

#### Usage Notes

To run this procedure, you need to have the `SYSDBA` role or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

## 174.7.17 DELETE\_DICTIONARY\_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and `RDBMS` component schemas).

#### Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  stattype     VARCHAR2 DEFAULT 'ALL',
  force        BOOLEAN DEFAULT FALSE,
  stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

## Parameters

**Table 174-21 DELETE\_DICTIONARY\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| stattype      | Statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| force         | When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <li>• OBJECT_STATS — table statistics, column statistics and index statistics</li> <li>• SYNOPSSES — information to support incremental statistics</li> <li>• REALTIME_STATS — Specifies only real-time statistics.</li> <li>• MODELS — supports import, export, and deletion for regression models in real-time stats.</li> </ul> The default is 'OBJECT_STATS, SYNOPSSES, REALTIME_STATS, MODELS'                                                                           |

## Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## 174.7.18 DELETE\_FIXED\_OBJECTS\_STATS Procedure

This procedure deletes statistics of all fixed tables.

## Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
    stattab          VARCHAR2 DEFAULT NULL,
```

```

statid          VARCHAR2 DEFAULT NULL,
statown         VARCHAR2 DEFAULT NULL,
no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
force           BOOLEAN  DEFAULT FALSE);

```

## Parameters

**Table 174-22 DELETE\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statid        | The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Ignores the statistics lock on objects and deletes the statistics if set to TRUE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

## Exceptions

ORA-20000: Insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## 174.7.19 DELETE\_INDEX\_STATS Procedure

This procedure deletes index-related statistics.

## Syntax

```

DBMS_STATS.DELETE_INDEX_STATS (
  ownname        VARCHAR2,
  indname        VARCHAR2,
  partname       VARCHAR2 DEFAULT NULL,
  stattab        VARCHAR2 DEFAULT NULL,
  statid         VARCHAR2 DEFAULT NULL,
  cascade_parts  BOOLEAN  DEFAULT TRUE,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype       VARCHAR2 DEFAULT 'ALL',

```

```

force          BOOLEAN DEFAULT FALSE);
stat_category  VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);

```

## Parameters

**Table 174-23 DELETE\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Name of the schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| indname       | Name of the index                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| partname      | Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| stattab       | User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid        | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| cascade_parts | If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well                                                                                                                                                                                                                                                                                                                                                                                                                        |
| statown       | Schema containing stattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| stattype      | Statistics type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| force         | When value of this argument is TRUE, deletes index statistics even if locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| stat_category | Statistics to delete. It accepts multiple values separated by comma: <ul style="list-style-type: none"> <li>• OBJECT_STATS — table statistics, column statistics and index statistics</li> <li>• SYNOPSIS — information to support incremental statistics</li> <li>• REALTIME_STATS — Specifies only real-time statistics.</li> <li>• MODELS — supports import, export, and deletion for regression models in real-time stats.</li> </ul> The default is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'                                                                                    |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.20 DELETE\_PENDING\_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

### Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname      IN  VARCHAR2  DEFAULT USER,  
    tabname      IN  VARCHAR2);
```

### Parameters

**Table 174-24** DELETE\_PENDING\_STATS Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |
| tabname   | Table name  |

### Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

If the parameter `tabname` is `NULL` delete applies to all tables of the specified schema.

### Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

## 174.7.21 DELETE\_PROCESSING\_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

### Syntax

```
DBMS_STATS.DELETE_PROCESSING_RATE (  
    stat_source  IN  VARCHAR2  DEFAULT NULL);
```

## Parameters

**Table 174-25 DELETE\_PROCESSING\_RATE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stat_source | Source of processing rates: <ul style="list-style-type: none"><li>'MANUAL': values set by the user manually using the <a href="#">SET_PROCESSING_RATE Procedure</a></li><li>'CALIBRATION': values collected by the calibration <a href="#">GATHER_PROCESSING_RATE Procedure</a> run explicitly by the user</li><li>'FEEDBACK': values obtained by time feedback</li></ul> |

## Usage Notes

You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure since `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 174.7.22 DELETE\_SCHEMA\_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

## Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (  
    ownname    IN    VARCHAR2,  
    pname      IN    VARCHAR2);
```

## Parameters

**Table 174-26 DELETE\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |

**Table 174-26 (Cont.) DELETE\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. The existing value for following preferences can be deleted and default preference values will be used:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• CASCADE</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• TABLE_CACHED_BLOCKS</li> </ul> |

**Table 174-27 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>• REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format.</p> </li> <li>• ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses.</p> </li> <li>• HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses.</p> </li> </ul> |

Table 174-27 (Cont.) Statistics Preferences

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the <code>CREATE_EXTENDED_STATS</code> function is executed, or when extended statistics are specified explicitly in the <code>METHOD_OPT</code> clause of <code>DBMS_STATS</code>. This is the default.</li> </ul>                                                                                                                                                                          |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| COORDINATOR_TRIGGER_SHARD | <p>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards.</p> <p>While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>TRUE — Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale.</li> <li>FALSE — Ignores the statistics gathering command triggered from the shard coordinator.</li> </ul> <p>The default value is <code>FALSE</code>.</p> |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ESTIMATE_PERCENT          | The value determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| METHOD_OPT                | Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NO_INVALIDATE             | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code>, then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                     |
| GRANULARITY               | The value determines granularity of statistics to collect (only pertinent if the table is partitioned)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PUBLISH                   | This value determines whether or not newly gathered statistics will be published once the gather job has completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 174-27 (Cont.) Statistics Preferences**

| Preference        | Description                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.                                              |

**Table 174-27 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |

**Table 174-27 (Cont.) Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROOT_TRIGGER_PDB        | <p>The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB.</p> <p>During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"><li>• <b>TRUE</b>—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale.</li><li>• <b>FALSE</b>—Ignores the statistics gathering command triggered from application root.</li></ul> <p>The default value is <b>FALSE</b>.</p> |
| STALE_PERCENT           | <p>This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TABLE_CACHED_BLOCKS     | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OPTIONS                 | <p>Determines the <code>options</code> parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Note:**

CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

**Security Model**

To run this procedure, you must be the object owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

**Exceptions**

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

**Usage Notes**

All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

## 174.7.23 DELETE\_SCHEMA\_STATS Procedure

This procedure deletes statistics for an entire schema.

### Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
    ownname          VARCHAR2,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE,
    stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

### Parameters

**Table 174-28 DELETE\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| stattab       | Identifies the table where statistics are stored. If stattab is NULL, then the procedure deletes statistics directly from the data dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid        | Specifies the identifier (optional) associated with these statistics within stattab. This parameter is only relevant if stattab is not NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| statown       | Specifies the schema containing stattab (if different than ownname).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Indicates whether to force the deletion for locked statistics. When the value is TRUE, this procedure deletes table statistics even if locked.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 174-28 (Cont.) DELETE\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> <li>MODELS — supports import, export, and deletion for regression models in real-time stats.</li> </ul> <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'.</p> |

#### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

#### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## 174.7.24 DELETE\_SYSTEM\_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to `noworkload` statistics (collected using 'NOWORKLOAD' option), if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

#### Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
    stattab      VARCHAR2 DEFAULT NULL,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 174-29 DELETE\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| stattab   | Identifier of the user statistics table where the statistics will be saved           |
| statid    | Optional identifier associated with the statistics saved in the <code>stattab</code> |
| statown   | Schema containing <code>stattab</code> (if different from current schema)            |

#### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

## Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

## 174.7.25 DELETE\_TABLE\_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

### Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    pname      IN  VARCHAR2);
```

### Parameters

**Table 174-30 DELETE\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| tabname   | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| pname     | <p>Preference name. **Table 174-31 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> </li> <li>ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> </li> <li>HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CASCADE                   | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ESTIMATE_PERCENT          | Determines the percentage of rows to estimate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| GRANULARITY               | Determines granularity of statistics to collect. This value is only relevant for partitioned tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GLOBAL_TEMP_TABLE_STATS   | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 174-31 (Cont.) Statistics Preferences**

| Preference        | Description                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. |
| INCREMENTAL_LEVEL | This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.                                              |

**Table 174-31 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |

**Table 174-31 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD_OPT                     | Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only 'FOR ALL' syntax is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NO_INVALIDATE                  | The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OPTIONS                        | Determines the <code>options</code> parameter used in the <a href="#">GATHER_TABLE_STATS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are: <ul style="list-style-type: none"> <li>TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>FALSE — Obeys input parameter values.</li> </ul> Specifying this preference does not change the order of precedence of table, global, and default.                                                                                                                                                                                                                          |
| PUBLISH                        | Determines whether newly gathered statistics will be published after the statistics gathering job has completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| STALE_PERCENT                  | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STAT_CATEGORY                  | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"> <li>OBJECT_STATS — table statistics, column statistics and index statistics (default)</li> <li>SYNOPSIS — information to support incremental statistics</li> <li>REALTIME_STATS — specifies only real-time statistics.</li> <li>MODELS — supports import, export, and deletion for regression models in real-time stats.</li> </ul> The value 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, SYNOPSIS, REALTIME_STATS, MODELS'. |
| TABLE_CACHED_BLOCKS            | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Exceptions**

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner of the table, be granted `ANALYZE` privilege on the table, or `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

## 174.7.26 DELETE\_TABLE\_STATS Procedure

This procedure deletes table-related statistics.

### Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    cascade_parts     BOOLEAN  DEFAULT TRUE,
    cascade_columns   BOOLEAN  DEFAULT TRUE,
    cascade_indexes   BOOLEAN  DEFAULT TRUE,
    statown           VARCHAR2 DEFAULT NULL,
    no_invalidate     BOOLEAN  DEFAULT to_no_invalidate_type (
                                                get_param('NO_INVALIDATE')),
    force             BOOLEAN  DEFAULT FALSE,
    stat_category     VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 174-32 DELETE\_TABLE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Specifies the name of the schema.                                                                                                                                                                                                          |
| tabname       | Specifies the name of the table to which this column belongs.                                                                                                                                                                              |
| partname      | Specifies the name of the table partition or subpartition from which to get the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved from the global table level. |
| stattab       | Identifies the user statistics table where statistics will be retrieved. If <code>stattab</code> is <code>NULL</code> , then the procedure retrieves statistics directly from the dictionary.                                              |
| statid        | Specifies the identifier (optional) associated with these statistics within <code>stattab</code> . This parameter is only relevant if <code>stattab</code> is not <code>NULL</code> .                                                      |
| cascade_parts | Specifies whether the procedure should operate on underlying partitions. If the table is partitioned, and if <code>partname</code> is <code>NULL</code> , then specifying <code>TRUE</code> deletes statistics for underlying partitions.  |

**Table 174-32 (Cont.) DELETE\_TABLE\_STATS Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cascade_columns</code> | Indicates whether to invoke the <code>DELETE_COLUMN_STATS</code> procedure. If <code>TRUE</code> , then this procedure calls <code>DELETE_COLUMN_STATS</code> for all underlying columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>cascade_indexes</code> | Indicates whether to invoke the <code>DELETE_INDEX_STATS</code> procedure. If <code>TRUE</code> , then this procedure calls <code>DELETE_INDEX_STATS</code> for all underlying columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>statown</code>         | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>no_invalidate</code>   | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .            |
| <code>force</code>           | Indicates whether to force the deletion for locked statistics. When the value is <code>TRUE</code> , this procedure deletes table statistics even if locked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>stat_category</code>   | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics.</li> <li><code>SYNOPSIS</code> — Specifies metadata for incremental statistics.</li> <li><code>REALTIME_STATS</code> — Specifies only real-time statistics.</li> </ul> You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses. The default value is <code>'OBJECT_STATS, REALTIME_STATS'</code> . |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

## 174.7.27 DIFF\_TABLE\_STATS\_IN\_HISTORY Function

This function compares statistics for a table as of two specified timestamps.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
    ownname      IN  VARCHAR2,
    tabname      IN  VARCHAR2,
    time1        IN  TIMESTAMP WITH TIME ZONE,
```

```

time2          IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
pctthreshold   IN  NUMBER                      DEFAULT 10)
RETURN DiffRepTab pipelined;

```

### Parameters

**Table 174-33 DIFF\_TABLE\_STATS\_IN\_HISTORY Function Parameters**

| Parameter    | Description                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname      | Specifies the owner of the table. Specify NULL for current schema.                                                                                       |
| tabname      | Specifies the table for which statistics are to be compared.                                                                                             |
| time1        | Specifies the first timestamp for comparison.                                                                                                            |
| time2        | Specifies the second timestamp for comparison.                                                                                                           |
| pctthreshold | Specifies the threshold limit. The function reports differences in statistics only if the change percentage exceeds this limit. The default value is 10. |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in the data dictionary with the statistics as of the first timestamp.

## 174.7.28 DIFF\_TABLE\_STATS\_IN\_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

### Syntax

```

DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
    ownname          IN  VARCHAR2,
    tabname          IN  VARCHAR2,
    timestamp        IN  TIMESTAMP WITH TIME ZONE,
    pctthreshold      IN  NUMBER  DEFAULT 10)
RETURN DiffRepTab pipelined;

```

### Parameters

**Table 174-34 DIFF\_TABLE\_STATS\_IN\_PENDING Function Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| ownname   | Owner of the table. Specify NULL for the current schema. |
| tabname   | Table for which statistics are to be compared.           |

**Table 174-34 (Cont.) DIFF\_TABLE\_STATS\_IN\_PENDING Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timestamp    | Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is <code>NULL</code> , then this function compares the current statistics in the dictionary with the pending statistics (default). |
| pctthreshold | Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.                                                                                                 |

### Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.29 DIFF\_TABLE\_STATS\_IN\_STATTAB Function

This function compares table statistics from two sources.

The function can obtain statistics from the following sources:

- Two user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary

The function also compares the statistics of the dependent objects: indexes, columns, and partitions. It displays statistics of the objects from both sources when the difference between those statistics exceeds a certain threshold (%). You can specify this threshold as an argument to the function. The function uses the statistics corresponding to the first source (`stattab1` or `time1`) as the basis for computing the difference percentage.

### Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(  
    ownname          IN  VARCHAR2,  
    tabname          IN  VARCHAR2,  
    stattab1         IN  VARCHAR2,  
    stattab2         IN  VARCHAR2 DEFAULT NULL,  
    pctthreshold     IN  NUMBER  DEFAULT 10,  
    statid1          IN  VARCHAR2 DEFAULT NULL,  
    statid2          IN  VARCHAR2 DEFAULT NULL,  
    stattab1own      IN  VARCHAR2 DEFAULT NULL,  
    stattab2own      IN  VARCHAR2 DEFAULT NULL)  
RETURN DiffRepTab pipelined;
```

## Parameters

**Table 174-35 DIFF\_TABLE\_STATS\_IN\_STATTAB Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname      | Specifies the owner of the table. Specify NULL for current schema.                                                                                                                                                                                                        |
| tabname      | Specifies the table for which statistics are to be compared.                                                                                                                                                                                                              |
| stattab1     | Specifies the user statistics table 1.                                                                                                                                                                                                                                    |
| stattab2     | Specifies the user statistics table 2. If NULL, the function compares statistics in stattab1 with current statistics in the data dictionary. This is the default. To compare two sets within the statistics table, specify the same table as stattab1 (see statid below). |
| pctthreshold | Specifies the percent thresholds for comparison. The function reports difference in statistics only if it exceeds this limit. The default value is 10.                                                                                                                    |
| statid1      | (optional) Identifies statistics set within stattab1.                                                                                                                                                                                                                     |
| statid2      | (optional) Identifies statistics set within stattab2.                                                                                                                                                                                                                     |
| stattab1own  | Specifies the schema containing stattab1 (if other than ownname).                                                                                                                                                                                                         |
| stattab2own  | Specifies the schema containing stattab2 (if other than ownname).                                                                                                                                                                                                         |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.30 DROP\_ADVISOR\_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

## Syntax

```
DBMS_STATS.DROP_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

## Parameters

**Table 174-36 DROP\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 174-8 Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

## 174.7.31 DROP\_EXTENDED\_STATS Procedure

This function drops the statistics entry that is created for the user specified extension.

This cancels the effects of the [CREATE\\_EXTENDED\\_STATS Function](#).

### Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2);
```

### Parameters

**Table 174-37 DROP\_EXTENDED\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table                                                                                                                                                                                                                               |
| tabname   | Name of the table                                                                                                                                                                                                                                   |
| extension | Can be either a column group or an expression. Suppose the specified table has two column <code>c1</code> , <code>c2</code> . An example column group can be " <code>(c1, c2)</code> " and an example expression can be " <code>(c1 + c2)</code> ". |

### Exceptions

- ORA-20000: Insufficient privileges or extension does not exist
- ORA-20001: Error when processing extension

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- If no extended statistics set is created for the extension, this function throws an error.

## 174.7.32 DROP\_STAT\_TABLE Procedure

This procedure drops a user statistics table.

### Syntax

```
DBMS_STATS.DROP_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2);
```

### Parameters

**Table 174-38 DROP\_STAT\_TABLE Procedure Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ownname   | Name of the schema               |
| stattab   | User statistics table identifier |

### Exceptions

ORA-20000: Table does not exists or insufficient privileges.

### Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.

## 174.7.33 EXECUTE\_ADVISOR\_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.EXECUTE_ADVISOR_TASK (  
    task_name      IN   VARCHAR2,  
    execution_name IN   VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 174-39 EXECUTE\_ADVISOR\_TASK Parameters**

| Parameter      | Description                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | Name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                    |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it.<br><br>If the specified execution conflicts with the name of an existing execution, then the function returns an error. |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- **Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

## Exceptions

- `ORA-20000: Insufficient privileges`
- `ORA-20001: Invalid input values`
- `ORA-20012: Optimizer Statistics Advisor errors`

## Returns

This function returns the name of the new execution.

## Usage Notes

The results of the execution depend on user privileges and the type of rules:

- **System**

To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- **Operation**

If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- **Object**

If you have the privilege to collect statistics for an object, then you can execute this function for the object.

#### Example 174-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```
DECLARE
    v_tname    VARCHAR2(128) := 'my_task';
BEGIN
    -- create a task
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
    -- execute the task
    v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```

## 174.7.34 EXPORT\_COLUMN\_STATS Procedure

This procedure exports statistics for a specified column and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    colname    VARCHAR2,
    partname   VARCHAR2 DEFAULT NULL,
    stattab    VARCHAR2,
    statid     VARCHAR2 DEFAULT NULL,
    statown    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-40 EXPORT\_COLUMN\_STATS Procedure Parameters**

| Parameter            | Description                                    |
|----------------------|------------------------------------------------|
| <code>ownname</code> | Name of the schema                             |
| <code>tabname</code> | Name of the table to which this column belongs |
| <code>colname</code> | Name of the column or extension                |

**Table 174-40 (Cont.) EXPORT\_COLUMN\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| partname  | Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are exported. |
| stattab   | User statistics table identifier describing where to store the statistics                                                                   |
| statid    | Identifier (optional) to associate with these statistics within stattab                                                                     |
| statown   | Schema containing stattab (if different than ownname)                                                                                       |

#### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

#### Exceptions

ORA-20000: Object does not exist or insufficient privileges

#### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.35 EXPORT\_DATABASE\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

#### Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (  
    stattab      IN  VARCHAR2,  
    statid       IN  VARCHAR2 DEFAULT NULL,  
    statown      IN  VARCHAR2 DEFAULT NULL,  
    add_sys      IN  BOOLEAN  DEFAULT FALSE);
```

#### Parameters

**Table 174-41 EXPORT\_DATABASE\_PREFS Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| stattab   | Statistics table name to where statistics should be exported            |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |
| add_sys   | Value <code>TRUE</code> will include the Oracle-owned tables            |

#### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## 174.7.36 EXPORT\_DATABASE\_STATS Procedure

This procedure exports statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

### Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (  
    stattab          VARCHAR2,  
    statid           VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 174-42 EXPORT\_DATABASE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing where to store the statistics                                                                                                                                                                                                                                                                                                                                                                 |
| statid        | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                      |
| statown       | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                 |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"><li>• OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li><li>• SYNOPSSES - information to support incremental statistics</li></ul> If 'OBJECT_STATS, SYNOPSSES' is specified, table statistics, column statistics, index statistics and synopses are deleted. |

### Security Model

To invoke this procedure you must be owner of the table or have the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table or have either the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.37 EXPORT\_DICTIONARY\_STATS Procedure

This procedure exports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

## Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (  
    stattab          VARCHAR2,  
    statid           VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 174-43 EXPORT\_DICTIONARY\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>stattab</code>       | User statistics table identifier describing where to store the statistics                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>statid</code>        | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>statown</code>       | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>stat_category</code> | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"><li>• <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (Default)</li><li>• <code>SYNOPSIS</code> - information to support incremental statistics</li></ul> If ' <code>OBJECT_STATS, SYNOPSIS</code> ' is specified, table statistics, column statistics, index statistics and synopses are deleted. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.38 EXPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure exports statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (  
    stattab  VARCHAR2,  
    statid   VARCHAR2 DEFAULT NULL,  
    statown  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-44 EXPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter            | Description                                                                          |
|----------------------|--------------------------------------------------------------------------------------|
| <code>stattab</code> | User statistics table identifier describing where to store the statistics            |
| <code>statid</code>  | Identifier (optional) to associate with these statistics within <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema)            |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.39 EXPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (  
    ownname  VARCHAR2,  
    indname  VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab  VARCHAR2,  
    statid   VARCHAR2 DEFAULT NULL,  
    statown  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 174-45 EXPORT\_INDEX\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Name of the schema                                                                                                                         |
| indname   | Name of the index                                                                                                                          |
| partname  | Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported. |
| stattab   | User statistics table identifier describing where to store the statistics                                                                  |
| statid    | Identifier (optional) to associate with these statistics within stattab                                                                    |
| statown   | Schema containing stattab (if different than ownname)                                                                                      |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- Oracle does not support export or import of statistics across databases of different character sets.

## 174.7.40 EXPORT\_PENDING\_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

## Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (  
    ownname    IN  VARCHAR2  DEFAULT USER,  
    tabname    IN  VARCHAR2,  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2  DEFAULT NULL,  
    statown    IN  VARCHAR2  DEFAULT USER);
```

## Parameters

**Table 174-46 EXPORT\_PENDING\_STATS Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ownname   | Owner name                                                              |
| tabname   | Table name                                                              |
| stattab   | Statistics table name to where to export the statistics                 |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- If the parameter `tabname` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

## 174.7.41 EXPORT\_SCHEMA\_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

## Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 174-47 EXPORT\_SCHEMA\_PREFS Procedure Parameters**

| Parameter            | Description                                                                          |
|----------------------|--------------------------------------------------------------------------------------|
| <code>ownname</code> | Owner name                                                                           |
| <code>stattab</code> | Statistics table name to where to export the statistics                              |
| <code>statid</code>  | (Optional) Identifier to associate with these statistics within <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different than <code>ownname</code> )     |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.

- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

## 174.7.42 EXPORT\_SCHEMA\_STATS Procedure

This procedure exports statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
    ownname          VARCHAR2,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 174-48 EXPORT\_SCHEMA\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>stattab</code>       | Identifies the user statistics table in which to store the exported statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>statid</code>        | Specifies the identifier (optional) associated with these statistics within <code>stattab</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>statown</code>       | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>stat_category</code> | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"><li>• <code>OBJECT_STATS</code> — Specifies table statistics, column statistics, and index statistics.</li><li>• <code>SYNOPSIS</code> — Specifies metadata for incremental statistics.</li><li>• <code>REALTIME_STATS</code> — Specifies only real-time statistics.</li></ul> <p>You can specify a list of comma-delimited values. For example, <code>'OBJECT_STATS, SYNOPSIS'</code> specifies table statistics, column statistics, index statistics, and synopses. The default value is <code>'OBJECT_STATS, REALTIME_STATS'</code>.</p> |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.43 EXPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

### Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
    stattab      VARCHAR2,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-49 EXPORT\_SYSTEM\_STATS Procedure Parameters**

| Parameter            | Description                                                                                |
|----------------------|--------------------------------------------------------------------------------------------|
| <code>stattab</code> | Identifier of the user statistics table that describes where the statistics will be stored |
| <code>statid</code>  | Optional identifier associated with the statistics stored from the <code>stattab</code>    |
| <code>statown</code> | Schema containing <code>stattab</code> (if different from current schema)                  |

### Security Model

To run this procedure, you must have the `GATHER_SYSTEM_STATISTICS` role.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to export system statistics

### Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

## 174.7.44 EXPORT\_TABLE\_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

### Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname      IN  VARCHAR2,
    tabname      IN  VARCHAR2,
    stattab      IN  VARCHAR2,
```

```
statid      IN VARCHAR2 DEFAULT NULL,  
statown     IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 174-50 EXPORT\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                                        |
|-----------|------------------------------------------------------------------------------------|
| ownname   | Owner name                                                                         |
| tabname   | Table name                                                                         |
| stattab   | Statistics table name where to export the statistics                               |
| statid    | Optional identifier to associate with these statistics within <code>stattab</code> |
| statown   | Schema containing <code>stattab</code> (if other than <code>ownname</code> )       |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## 174.7.45 EXPORT\_TABLE\_STATS Procedure

This procedure exports statistics for a specified table (including associated index statistics) and stores them in the user statistics table identified by `stattab`.

## Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (  
    ownname      VARCHAR2,  
    tabname      VARCHAR2,  
    partname     VARCHAR2 DEFAULT NULL,  
    stattab      VARCHAR2,  
    statid       VARCHAR2 DEFAULT NULL,  
    cascade      BOOLEAN  DEFAULT TRUE,  
    statown      VARCHAR2 DEFAULT NULL,  
    stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 174-51 EXPORT\_TABLE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| tabname       | Specifies the name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| partname      | Specifies the name of the table partition. If the table is partitioned, and if partname is NULL, then the procedure exports global and partition statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| stattab       | Specifies the identifier (optional) associated with these statistics within stattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid        | Specifies the identifier (optional) associated with these statistics within stattab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| cascade       | Indicates whether to export column and index statistics. If TRUE, then the procedure exports column and index statistics for the specified table. This is the default.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| statown       | Specifies the schema containing stattab (if different than ownname).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| stat_category | <p>Specifies which statistics to process. The following values are supported:</p> <ul style="list-style-type: none"><li>• OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li><li>• SYNOPSES — Specifies metadata for incremental statistics.</li><li>• REALTIME_STATS — Specifies only real-time statistics.</li></ul> <p>You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.</p> |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.46 FLUSH\_DATABASE\_MONITORING\_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the \*\_TAB\_MODIFICATIONS, \*\_TAB\_STATISTICS and \*\_IND\_STATISTICS views.

### Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

### Security Model

The ANALYZE\_ANY system privilege is required to run this procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call FLUSH\_DATABASE\_MONITORING\_INFO to view the latest information in \*\_TAB\_STATISTICS and \*\_IND\_STATISTICS because these views show statistics cached in the SGA and stored on disk. Because the GATHER\_\*\_STATS procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.

## 174.7.47 GATHER\_DATABASE\_STATS Procedures

This procedure gathers statistics for all objects in the database.

### Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
    estimate_percent NUMBER    DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
    block_sample           BOOLEAN DEFAULT FALSE,
    method_opt             VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree                 NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
    granularity            VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade                 BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab                VARCHAR2 DEFAULT NULL,
    statid                 VARCHAR2 DEFAULT NULL,
    options                VARCHAR2 DEFAULT 'GATHER',
    objlist                OUT      ObjectTab,
    statown                VARCHAR2 DEFAULT NULL,
    gather_sys             BOOLEAN DEFAULT TRUE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    obj_filter_list        ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_DATABASE_STATS (
    estimate_percent NUMBER    DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
    block_sample      BOOLEAN  DEFAULT FALSE,
    method_opt        VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree            NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    cascade           BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    options           VARCHAR2 DEFAULT 'GATHER',
    statown           VARCHAR2 DEFAULT NULL,
    gather_sys        BOOLEAN  DEFAULT TRUE,
    no_invalidate     BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    obj_filter_list   ObjectTab DEFAULT NULL);
```

## Parameters

**Table 174-52 GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| block_sample     | <p>Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| method_opt       | <p>When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>REPEAT: Collects histograms only on the columns that already have histograms.</li> <li>AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 174-52 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | <p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</p> |
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics</p>                                                                                                                                                              |
| cascade     | <p>Determines whether to collect index statistics as part of gathering table statistics.</p> <p>Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| stattab     | <p>User statistics table identifier describing where to save the current statistics.</p> <p>The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| statid      | <p>Identifier (optional) to associate with these statistics within stattab.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 174-52 (Cont.) GATHER\_DATABASE\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li><b>GATHER</b> — Gathers statistics on all objects in the database. This is the default.</li> <li><b>GATHER AUTO</b> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <b>comp_id</b>, <b>no_invalidate</b>, <b>stattab</b>, <b>statid</b>, and <b>statown</b>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li><b>GATHER STALE</b> — Gathers statistics on stale objects by querying the <b>*_TAB_MODIFICATIONS</b> views. Also, the database returns a list of objects found to be stale.</li> <li><b>GATHER EMPTY</b> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li><b>LIST AUTO</b> — Returns a list of objects to be processed with <b>GATHER AUTO</b>.</li> <li><b>LIST STALE</b> — Returns list of stale objects as determined by looking at the <b>*_TAB_MODIFICATIONS</b> views.</li> <li><b>LIST EMPTY</b> — Returns a list of objects that currently have no statistics.</li> </ul> |
| objlist         | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statown         | Schema containing <b>stattab</b> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| gather_sys      | Gathers statistics on the objects owned by the <b>SYS</b> user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate   | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <b>DBMS_STATS.AUTO_INVALIDATE</b>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <b>TRUE</b>, then the database not invalidate dependent cursors. If set to <b>FALSE</b>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| obj_filter_list | <p>A list of object filters. When provided, <b>GATHER_DATABASE_STATS</b> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <b>s1</b>, <b>s2</b>, ... are specified for attributes <b>a1</b>, <b>a2</b>, ... in one object filter. An object <b>o</b> is said to satisfy this object filter if (<b>o.a1</b> like <b>s1</b>) or (<b>o.a2</b> like <b>s2</b>) or ... is true.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

## Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on `gather_table_stats`.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

## 174.7.48 GATHER\_DICTIONARY\_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

### Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  objlist          OUT      ObjectTab,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT
                                to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,

  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT
                                to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);
```

## Parameters

**Table 174-53 GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comp_id          | Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| estimate_percent | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| block_sample     | Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| method_opt       | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| degree           | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.                                             |

**Table 174-53 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics</p> |
| cascade     | <p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                       |
| stattab     | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| statid      | The (optional) identifier to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 174-53 (Cont.) GATHER\_DICTIONARY\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options         | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li><b>GATHER AUTO</b> — Gathers all necessary statistics automatically. This is the default.<br/>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <b>GATHER AUTO</b> is specified, the only additional valid parameters are <b>comp_id</b>, <b>no_invalidate</b>, <b>stattab</b>, <b>statid</b>, and <b>statown</b>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li><b>GATHER</b> — Gathers statistics on all objects in the relevant schema.</li> <li><b>GATHER STALE</b> — Gathers statistics on stale objects by querying the <b>*_TAB_MODIFICATIONS</b> views. Also, the database returns a list of objects found to be stale.</li> <li><b>GATHER EMPTY</b> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li><b>LIST AUTO</b> — Returns a list of objects to be processed with <b>GATHER AUTO</b>.</li> <li><b>LIST STALE</b> — Returns list of stale objects as determined by looking at the <b>*_TAB_MODIFICATIONS</b> views.</li> <li><b>LIST EMPTY</b> — Returns a list of objects that currently have no statistics.</li> </ul> |
| objlist         | The list of objects found to be stale or empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| statown         | Schema containing <b>stattab</b> , if different from the current schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate   | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to <b>TRUE</b>, then the procedure does not invalidate dependent cursors. If set to <b>FALSE</b>, then the procedure invalidates the dependent cursors immediately. Use <b>DBMS_STATS.AUTO_INVALIDATE</b> to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| obj_filter_list | <p>A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <b>s1</b>, <b>s2</b>, ... are specified for attributes <b>a1</b>, <b>a2</b>, ... in one object filter. An object <b>o</b> is said to satisfy this object filter if (<b>o.a1</b> like <b>s1</b>) and (<b>o.a2</b> like <b>s2</b>) and ... is true. See <a href="#">Applying an Object Filter List</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Usage Notes

You must have the **SYSDBA** or both **ANALYZE ANY DICTIONARY** and **ANALYZE ANY** system privilege to execute this procedure.

If the **GATHER AUTO** option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where **GATHER AUTO** is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 174.7.49 GATHER\_FIXED\_OBJECTS\_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

### Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                                get_param('NO_INVALIDATE')));
```

### Parameters

**Table 174-54 GATHER\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>stattab</code>       | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>statid</code>        | Identifier to associate with these statistics within <code>stattab</code> (optional)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>statown</code>       | Schema containing <code>stattab</code> (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>no_invalidate</code> | Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Usage Notes

You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege to execute this procedure.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 174.7.50 GATHER\_INDEX\_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

### Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                (GET_PARAM('ESTIMATE_PERCENT')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    no_invalidate     BOOLEAN  DEFAULT to_no_invalidate_type
                                (GET_PARAM('NO_INVALIDATE')),
    force            BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 174-55 GATHER\_INDEX\_STATS Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>          | Schema of index to analyze                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>indname</code>          | Name of index                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>partname</code>         | Name of partition                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>estimate_percent</code> | Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| <code>stattab</code>          | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>statid</code>           | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>statown</code>          | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 174-55 (Cont.) GATHER\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree        | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution. |
| granularity   | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>'ALL' - Gathers all (subpartition, partition, and global) statistics<br>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.<br>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>'GLOBAL' - Gathers global statistics<br>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>'PARTITION' - Gathers partition-level statistics<br>'SUBPARTITION' - Gathers subpartition-level statistics.                                                                                                  |
| no_invalidate | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| force         | Gather statistics on object even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.51 GATHER\_PROCESSING\_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an `interval` defined in minutes.

### Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (
    gathering_mode    IN    VARCHAR2  DEFAULT 'START',
    interval          IN    NUMBER     DEFAULT NULL);
```

### Parameters

**Table 174-56 GATHER\_PROCESSING\_RATE Procedure Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>gathering_mode</code> | Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If <code>interval</code> is not specified, its default value is set to 60 minutes. |
| <code>interval</code>       | Time interval (number of minutes) for which the processing must be gathered                                                                                                                                                                                                                                                          |

### Usage Notes

- You require the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.
- `AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 174.7.52 GATHER\_SCHEMA\_STATS Procedures

This procedure gathers statistics for all objects in a schema.

### Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
    ownname          VARCHAR2,
    estimate_percent NUMBER  DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE'));
```

```

granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
stattab          VARCHAR2 DEFAULT NULL,
statid           VARCHAR2 DEFAULT NULL,
options          VARCHAR2 DEFAULT 'GATHER',
objlist          OUT       ObjectTab,
statown          VARCHAR2 DEFAULT NULL,
no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
force            BOOLEAN  DEFAULT FALSE,
obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
  ownname          VARCHAR2,
  estimate_percent NUMBER  DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),

## Parameters

**Table 174-57 GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Schema to analyze (NULL means current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| estimate_percent | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| block_sample     | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.                                                                                                                                                                                                                                       |

**Table 174-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| method_opt  | <p>Accepts:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>REPEAT : Collects histograms only on the columns that already have histograms</li> <li>AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                           |
| degree      | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p> |
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>                                                                            |

**Table 174-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cascade</code>       | Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>stattab</code>       | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>statid</code>        | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>options</code>       | Specifies which objects require statistics to be gathered. Valid values are as follows: <ul style="list-style-type: none"> <li>• <code>GATHER</code> — Gathers statistics on all objects in the schema. This is the default.</li> <li>• <code>GATHER AUTO</code> — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>no_invalidate</code>, <code>stattab</code>, <code>statid</code>, and <code>statown</code>; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</li> <li>• <code>GATHER STALE</code> — Gathers statistics on stale objects by querying the <code>*_TAB_MODIFICATIONS</code> views. Also, the database returns a list of objects found to be stale.</li> <li>• <code>GATHER EMPTY</code> — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</li> <li>• <code>LIST AUTO</code> — Returns a list of objects to be processed with <code>GATHER AUTO</code>.</li> <li>• <code>LIST STALE</code> — Returns list of stale objects as determined by looking at the <code>*_TAB_MODIFICATIONS</code> views.</li> <li>• <code>LIST EMPTY</code> — Returns a list of objects that currently have no statistics.</li> </ul> |
| <code>objlist</code>       | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>statown</code>       | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>no_invalidate</code> | Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>force</code>         | Gather statistics on objects even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Table 174-57 (Cont.) GATHER\_SCHEMA\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| obj_filter_list | A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.
- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

### Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

### Examples

#### Applying an Object Filter List

The following example specifies that the tables `SH.SALES` and `SH.COSTS`, if stale, will have statistics gathered upon them.

```
DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
```

## 174.7.53 GATHER\_SYSTEM\_STATS Procedure

This procedure gathers system statistics.

### Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
    gathering_mode    VARCHAR2 DEFAULT 'NOWORKLOAD',
    interval          INTEGER  DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    statown           VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-58 GATHER\_SYSTEM\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gathering_mode | <p>Specifies the mode in which the database gathers system statistics. Possible values are:</p> <ul style="list-style-type: none"> <li><b>NOWORKLOAD</b><br/>The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads.<br/>To fine tune system statistics for the workload, use <b>START</b> and <b>STOP</b> or the <b>INTERVAL</b> option. If you gather both <b>NOWORKLOAD</b> and workload-specific statistics (statistics collected using <b>INTERVAL</b> or <b>START</b> and <b>STOP</b>), the optimizer uses the workload statistics. Collected components include <b>cpuspeednw</b>, <b>ioseektim</b>, and <b>iotfrspeed</b>.</li> <li><b>INTERVAL</b><br/>The database captures system activity during a specified interval in minutes. This parameter works in combination with the <b>interval</b> parameter. The database creates or updates system statistics in the dictionary or <b>stattab</b>. You can use <b>GATHER_SYSTEM_STATS (gathering_mode=&gt;'STOP')</b> to stop gathering earlier than scheduled. Collected components include <b>maxthr</b>, <b>slavethr</b>, <b>cpuspeed</b>, <b>sreadtim</b>, <b>mreadtim</b>, and <b>mbrc</b>.</li> <li><b>START   STOP</b><br/>The database captures system activity during specified start and stop times and refreshes the dictionary or <b>stattab</b> with statistics for the elapsed period. The database ignores the <b>INTERVAL</b> value. Collected components include <b>maxthr</b>, <b>slavethr</b>, <b>cpuspeed</b>, <b>sreadtim</b>, <b>mreadtim</b>, and <b>mbrc</b>.</li> <li><b>EXADATA</b><br/>In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.</li> </ul> |
| interval       | <p>Specifies the number of minutes in which to gather system statistics. This parameter applies only when <b>gathering_mode='INTERVAL'</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 174-58 (Cont.) GATHER\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| stattab   | Specifies the table in which the database stores the statistics.                  |
| statid    | Specifies an optional identifier associated with the statistics saved in stattab. |
| statown   | Specifies the schema containing stattab, if different from the current schema.    |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job\_queue\_processes must be >0

### Usage Notes

To run this procedure, you must have the GATHER\_SYSTEM\_STATISTICS role.

### Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
```

```

DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
('mystats','OLTP');'
sysdate, 'sysdate + 1');
COMMIT;
END;

BEGIN
DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
('mystats','OLAP');'
sysdate + 0.5, 'sysdate + 1');
COMMIT;
END;

```

## 174.7.54 GATHER\_TABLE\_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

### Syntax

```

DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),

  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2  DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2  DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab         VARCHAR2  DEFAULT NULL,
  statid           VARCHAR2  DEFAULT NULL,
  statown         VARCHAR2  DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),

  stattype         VARCHAR2  DEFAULT 'DATA',
  force           BOOLEAN   DEFAULT FALSE,
  context         DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative
  options         VARCHAR2  DEFAULT get_param('OPTIONS'));

```

### Parameters

**Table 174-59 GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| ownname   | Schema containing the table. |
| tabname   | Name of the table.           |
| partname  | Name of the partition.       |

**Table 174-59 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p> <p>You can change the default value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| block_sample     | <p>Determines whether the database uses random block sampling (<code>TRUE</code>) or random row sampling (<code>FALSE</code>). The default is <code>FALSE</code>.</p> <p>Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| method_opt       | <p><code>METHOD_OPT</code> - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, <code>method_opt</code> accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>FOR COLUMNS [column_clause] [size_clause]</li> </ul> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code></p> <p><code>column_clause</code> is defined as <code>column_clause := column_name   extension name   extension</code></p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</li> </ul> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 174-59 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | <p>Determines the degree of parallelism used for gathering statistics.</p> <p>The default for <code>degree</code> is <code>NULL</code>. <code>NULL</code> means to use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Change the default using the <code>SET_DATABASE_PREFS</code>, <code>SET_GLOBAL_PREFS</code>, <code>SET_SCHEMA_PREFS</code>, and <code>SET_TABLE_PREFS</code> procedures. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement.</p> <p>Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using <code>DEGREE=&gt;NULL</code>, <code>DEGREE=&gt;n</code>, or <code>DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution when the size of the object does not warrant parallel execution.</p>                                                                                                                                                                                                                                                                                              |
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if <code>partname</code> is <code>NULL</code> or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |

**Table 174-59 (Cont.) GATHER\_TABLE\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>cascade</code>       | Determines whether to collect index statistics as part of gathering table statistics.<br><br>Specifying this option is equivalent to running the <code>GATHER_INDEX_STATS</code> procedure on each index of the table. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the <code>SET_DATABASE_PREFS</code> , <code>SET_GLOBAL_PREFS</code> , <code>SET_SCHEMA_PREFS</code> , and <code>SET_TABLE_PREFS</code> procedures.                                                                                                                                                                                        |
| <code>stattab</code>       | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>statid</code>        | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>statown</code>       | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>no_invalidate</code> | Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code> , which means the database decides when to invalidate dependent cursors.<br><br>If set to <code>TRUE</code> , then the database not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates dependent cursors immediately.                                                                                                                                                                                                                                                                                                                                     |
| <code>stattype</code>      | Statistics type. The only value allowed is <code>DATA</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>force</code>         | Gather statistics of table even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>context</code>       | Not used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>options</code>       | Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values: <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the `GATHER AUTO` option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where `GATHER AUTO` is used:

- A table is created like this: `CREATE TABLE NEWTAB as SELECT * FROM .....`  
This will create statistics on `NEWTAB` but no histograms.
- Next, the DBA creates the histograms using `GATHER AUTO` on `gather_table_stats`.

- The `FREQUENCY` histograms on `NEWTAB` will be created using a sample rather than a full table scan.

### Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

### Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

#### Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

#### Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

## 174.7.55 GENERATE\_STATS Procedure

This **deprecated procedure** generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

### Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the `GATHER_INDEX_STAT` procedure. See "[GATHER\\_INDEX\\_STATS Procedure](#)".

### Syntax

```
DBMS_STATS.GENERATE_STATS (
    ownname    VARCHAR2,
    objname    VARCHAR2,
    organized  NUMBER DEFAULT 7,
    force      BOOLEAN default FALSE);
```

### Parameters

**Table 174-60 GENERATE\_STATS Procedure Parameters**

| Parameter            | Description      |
|----------------------|------------------|
| <code>ownname</code> | Schema of object |
| <code>objname</code> | Name of object   |

**Table 174-60 (Cont.) GENERATE\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| organized | <p>Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk.</p> <p>This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.</p> |
| force     | If TRUE, generates statistics for the target object even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

### Exceptions

ORA-20000: Unsupported object type of object does not exist

ORA-20001: Invalid option or invalid statistics

## 174.7.56 GET\_ADVISOR\_OPR\_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.GET_ADVISOR_OPR_FILTER (  
    opr_id          IN          NUMBER,  
    opr_filter      IN OUT NOCOPY StatsAdvOpr);
```

### Parameters

**Table 174-61 GET\_ADVISOR\_OPR\_FILTER Procedure Parameters**

| Parameter  | Description                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------|
| opr_id     | The ID of the statistics operation stored in the <code>DBA_OPTSTAT_OPERATIONS</code> view.             |
| opr_filter | The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.

- You must be the owner of the task.
- This subprogram executes using invoker's rights.

#### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

#### Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

## 174.7.57 GET\_ADVISOR\_RECS Function

This function generates a recommendation report for the specified item.

#### Syntax

```
DBMS_STATS.GET_ADVISOR_RECS (  
    ownname      IN   VARCHAR2,  
    tabname      IN   VARCHAR2,  
    rec          IN   VARCHAR2,  
    type         IN   VARCHAR2    := 'TEXT')  
RETURN CLOB;
```

#### Parameters

**Table 174-62** GET\_ADVISOR\_RECS Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | The owner of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| tabname   | The name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| rec       | The Optimizer Statistics Advisor recommendation. <ul style="list-style-type: none"><li>• INCREMENTAL<br/>When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off.</li><li>• CONCURRENT<br/>The report recommends either setting the CONCURRENT preference, or specifying AUTO_DEGREE for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting CONCURRENT first. The advisor only recommends AUTO_DEGREE when statistics gathering on an individual table take a long time and the CONCURRENT preference is already set.</li></ul> |
| type      | Type of the report: TEXT, HTML, or XML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must have the privileges to gather statistics for the objects for which recommendations are generated.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

## Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

## Exceptions

- `ORA-20000: Insufficient privileges`
- `ORA-20001: Invalid input values`
- `ORA-20012: Optimizer Statistics Advisor errors`

## 174.7.58 GET\_COLUMN\_STATS Procedures

These overloaded procedures get column-related statistics. In the user-defined statistics version, the procedure returns the type of statistics stored.

### Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    colname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    distcnt OUT       NUMBER,
    density OUT       NUMBER,
    nullcnt OUT       NUMBER,
    srec OUT          StatRec,
    avgclen OUT       NUMBER,
    statown           VARCHAR2 DEFAULT NULL,
    realtime_stats    BOOLEAN IDEFAULT TRUE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    colname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
```

```

stattab          VARCHAR2 DEFAULT NULL,
statid           VARCHAR2 DEFAULT NULL,
ext_stats        OUT RAW,
stattypown       OUT VARCHAR2 DEFAULT NULL,
stattypname      OUT VARCHAR2 DEFAULT NULL,
statown          VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 174-63 GET\_COLUMN\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname        | Name of the schema                                                                                                                                                                                               |
| tabname        | Specifies the name of the table to which this column belongs.                                                                                                                                                    |
| colname        | Specifies the name of the column or extension.                                                                                                                                                                   |
| partname       | Specifies the name of the table partition from which to get the statistics. If the table is partitioned, and if partname is NULL, then the procedure retrieves statistics at the global table level.             |
| stattab        | Specifies the statistics table ID describing where to retrieve the statistics. If stattab is NULL, then the procedure retrieves statistics directly from the data dictionary.                                    |
| statid         | Specifies an optional identifier associated with these statistics within stattab. This parameter is only relevant when stattab is not NULL.                                                                      |
| ext_stats      | Specifies the user-defined statistics.                                                                                                                                                                           |
| stattypown     | Specifies the schema of the statistics type.                                                                                                                                                                     |
| stattypname    | Specifies the name of the statistics type.                                                                                                                                                                       |
| distcnt        | Specifies the number of distinct values.                                                                                                                                                                         |
| density        | Specifies the column density.                                                                                                                                                                                    |
| nullcnt        | Specifies the number of NULL values.                                                                                                                                                                             |
| srec           | Specifies the structure holding the internal representation of the column minimum, maximum, and histogram values.                                                                                                |
| avgclen        | Specifies the average length of the column (in bytes).                                                                                                                                                           |
| statown        | Specifies the schema containing stattab (if different than ownname).                                                                                                                                             |
| realtime_stats | Specifies whether to include real-time statistics. The default value is TRUE. When realtime_stats is FALSE, the database only includes optimizer statistics that were gathered by the GATHER_*_STATS procedures. |

## Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be the owner of the table, or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## Usage Notes

Before invoking this procedure, ensure that the table exists.

## 174.7.59 GET\_INDEX\_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

### Syntax

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numblks          OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblk          OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL);
```

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numblks          OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblk          OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL,
    guessq           OUT NUMBER);
```

Use the following form of the procedure for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    ext_stats        OUT RAW,
    stattypown       OUT VARCHAR2 DEFAULT NULL,
```

```

stattypname OUT  VARCHAR2 DEFAULT NULL,
statown          VARCHAR2 DEFAULT NULL);

```

## Parameters

**Table 174-64 GET\_INDEX\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname     | Name of the schema                                                                                                                                                                                         |
| indname     | Name of the index                                                                                                                                                                                          |
| partname    | Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level. |
| stattab     | User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.          |
| statid      | Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )                                                    |
| ext_stats   | User-defined statistics                                                                                                                                                                                    |
| stattypown  | Schema of the statistics type                                                                                                                                                                              |
| stattypname | Name of the statistics type                                                                                                                                                                                |
| numrows     | Number of rows in the index (partition)                                                                                                                                                                    |
| numblks     | Number of leaf blocks in the index (partition)                                                                                                                                                             |
| numdist     | Number of distinct keys in the index (partition)                                                                                                                                                           |
| avgblbk     | Average integral number of leaf blocks in which each distinct key appears for this index (partition)                                                                                                       |
| avgdblk     | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)                                                                                                |
| clstfct     | Clustering factor for the index (partition)                                                                                                                                                                |
| indlevel    | Height of the index (partition)                                                                                                                                                                            |
| statown     | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                           |
| guessq      | Guess quality for the index (partition)                                                                                                                                                                    |

## Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

## Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by

combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values

## 174.7.60 GET\_PARAM Function

This function returns the default value of parameters of `DBMS_STATS` procedures.

#### Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET\\_PREFS Function](#).

See also [DBMS\\_STATS Depreciated Subprograms](#).

#### Syntax

```
DBMS_STATS.GET_PARAM (
    pname      IN   VARCHAR2)
RETURN VARCHAR2;
```

## Parameters

**Table 174-65 GET\_PARAM Function Parameters**

| Parameter | Description    |
|-----------|----------------|
| pname     | Parameter name |

## Exceptions

ORA-20001: Invalid input values

## 174.7.61 GET\_PREFS Function

This function returns the default value of the specified preference.

### Syntax

```
DBMS_STATS.GET_PREFS (  
    pname      IN    VARCHAR2,  
    ownname    IN    VARCHAR2 DEFAULT NULL,  
    tabname    IN    VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

## Parameters

**Table 174-66 GET\_PREFS Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> </li> <li>ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> </li> <li>HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AUTO_TASK_STATUS          | <p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> <li>ON — Enables high-frequency automatic optimizer statistics collection.</li> <li>OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Preference Name         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_TASK_MAX_RUN_TIME  | Configures the maximum run time in seconds of an execution of high-frequency automatic optimizer statistics collection. The maximum value is 3600 (equal to 1 hour), which is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AUTO_TASK_INTERVAL      | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The default value is 3600 but Oracle sets it differently for some platforms and Oracle Database releases.                                                                                                                                                                                                                                                                                                                                                                                                    |
| CASCADE                 | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CONCURRENT              | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are: <ul style="list-style-type: none"><li>• <b>MANUAL</b> — Concurrency is enabled only for manual statistics gathering.</li><li>• <b>AUTOMATIC</b> — Concurrency is enabled only for the automatic statistics gathering.</li><li>• <b>ALL</b> — Concurrency is enabled for both manual and automatic statistics gathering.</li><li>• <b>OFF</b> — Concurrency is disabled for both manual and automatic statistics.</li></ul>                                                                   |
| DEGREE                  | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ESTIMATE_PERCENT        | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.                                                                                                                                                                                                                                                                                                                                                               |
| GLOBAL_TEMP_TABLE_STATS | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values: <ul style="list-style-type: none"><li>• <b>SHARED</b> — All sessions see the same set of statistics</li><li>• <b>SESSION</b> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li></ul> |

**Table 174-67 (Cont.) Preference Descriptions**

| Preference Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANULARITY     | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• <b>ALL</b> — Gathers all statistics: subpartition, partition, and global.</li> <li>• <b>AUTO</b> — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• <b>DEFAULT</b> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <b>GLOBAL AND PARTITION</b> for this functionality.</li> <li>• <b>GLOBAL</b> — Gathers global statistics.</li> <li>• <b>GLOBAL AND PARTITION</b> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• <b>PARTITION</b> — Gathers partition-level statistics.</li> <li>• <b>SUBPARTITION</b> — Gathers subpartition-level statistics.</li> </ul>                                                                                                                  |
| INCREMENTAL     | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The <b>INCREMENTAL</b> value for the partitioned table is set to <b>TRUE</b>.</li> <li>• The <b>PUBLISH</b> value for the partitioned table is set to <b>TRUE</b>.</li> <li>• The user specifies <b>AUTO_SAMPLE_SIZE</b> for <b>ESTIMATE_PERCENT</b> and <b>AUTO</b> for <b>GRANULARITY</b> when gathering statistics on the table.</li> </ul> <p>If the <b>INCREMENTAL</b> value for the partitioned table was set to <b>FALSE</b> (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |

**Table 174-67 (Cont.) Preference Descriptions**

| Preference Name   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> <li>PARTITION — Gathers partition-level synopses.<br/>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li> <li>TABLE — Gathers table-level synopses.<br/>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li> </ul> |

**Table 174-67 (Cont.) Preference Descriptions**

| Preference Name       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. Note that the following two executions are different:</li> </ul> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets</p> |

**Table 174-67 (Cont.) Preference Descriptions**

| Preference Name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD_OPT      | <p>the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p> <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed:</p> <ul style="list-style-type: none"> <li><code>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</code></li> </ul> <p>The <code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code></p> <p><code>integer</code> — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p><code>REPEAT</code> — Collects histograms only on the columns that already have histograms.</p> <p><code>AUTO</code> — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p><code>SKEWONLY</code> — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. You can change the value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| NO_INVALIDATE   | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| OPTIONS         | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 174-67 (Cont.) Preference Descriptions**

| Preference Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li>TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>FALSE — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                            |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                              |
| STAT_CATEGORY                  | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li>OBJECT_STATS - table statistics, column statistics and index statistics (default)</li> <li>SYNOPSSES - information to support incremental statistics</li> <li>REALTIME_STATS — specifies only real-time statistics.</li> </ul> <p>The value 'OBJECT_STATS, SYNOPSSES' specifies table statistics, column statistics, index statistics, and synopses.</p>                                                                                                                                                                          |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WAIT_TIME_TO_UPDATE_STATS      | <p>Specifies the number of minutes to wait before timing out on locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default is 0.0033 minutes (approximately 0.2 seconds). A lock request may fail if other locks exist on the same object, in which case the system retries the request up to 100 times. Each retry includes a brief sleep interval, with a total sleep time of up to 990 seconds. In the worst-case scenario of 100 retries and a 0.2 second wait per attempt, the total wait time can reach approximately 16.8 minutes (990 + 0.2×100 seconds). A value of 0 results in a minimum combined wait and sleep time of 990 seconds.</p> |

## Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, and MANAGE ANY QUEUE.

## Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

## Usage Notes

Note the following guidelines:

- The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER\_\*\_STATS procedures. DBMS\_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB\_QUEUE\_PROCESSES initialization parameter must be at least 4.

- If the ownname and tabname are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

## 174.7.62 GET\_STATS\_HISTORY\_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

## Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

## Usage Notes

No special privilege or role is needed to invoke this procedure.

## 174.7.63 GET\_STATS\_HISTORY\_RETENTION Function

This function returns the current statistics history retention value.

### Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
```

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 174.7.64 GET\_SYSTEM\_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

### Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
    status      OUT  VARCHAR2,
    dstart      OUT  DATE,
    dstop       OUT  DATE,
    pname       IN   VARCHAR2,
    pvalue      OUT  NUMBER,
    stattab     IN   VARCHAR2 DEFAULT NULL,
    statid      IN   VARCHAR2 DEFAULT NULL,
    statown     IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-68 GET\_SYSTEM\_STATS Procedure Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>status</code> | Output is one of the following: <ul style="list-style-type: none"> <li>• <code>COMPLETED</code>:</li> <li>• <code>AUTOGATHERING</code>:</li> <li>• <code>MANUALGATHERING</code>:</li> <li>• <code>BADSTATS</code>:</li> </ul>                                                                                                           |
| <code>dstart</code> | Date when statistics gathering started.<br>If <code>status = MANUALGATHERING</code> , the start date is returned.                                                                                                                                                                                                                       |
| <code>dstop</code>  | Date when statistics gathering stopped. <ul style="list-style-type: none"> <li>• If <code>status = COMPLETE</code>, the finish date is returned.</li> <li>• If <code>status = AUTOGATHERING</code>, the future finish date is returned.</li> <li>• If <code>status = BADSTATS</code>, the must-finished-by date is returned.</li> </ul> |

**Table 174-68 (Cont.) GET\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> <li>iotfrspeed - I/O transfer speed in bytes for each millisecond</li> <li>ioseektim - seek time + latency time + operating system overhead time, in milliseconds</li> <li>sreadtim - average time to read single block (random read), in milliseconds</li> <li>mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option).</li> <li>mbrc - average multiblock read count for sequential read, in blocks</li> <li>maxthr - maximum I/O system throughput, in bytes/second</li> <li>slavethr - average slave I/O throughput, in bytes/second</li> </ul> |
| pvalue    | Parameter value to get                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| stattab   | Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statid    | Optional identifier associated with the statistics saved in the stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statown   | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

### Usage Notes

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 174.7.65 GET\_TABLE\_STATS Procedure

This overloaded procedure gets all table-related statistics.

### Syntax

```
DBMS_STATS.GET_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
```

```

numblks      OUT NUMBER,
avgrlen      OUT NUMBER,
statown      VARCHAR2 DEFAULT NULL,
realtime_stats  BOOLEAN DEFAULT TRUE);

DBMS_STATS.GET_TABLE_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  numrows      OUT NUMBER,
  numblks      OUT NUMBER,
  avgrlen      OUT NUMBER,
  statown      VARCHAR2 DEFAULT NULL,
  im_imcu_count OUT NUMBER,
  im_block_count OUT NUMBER,
  scanrate     OUT NUMBER,
  realtime_stats  BOOLEAN DEFAULT TRUE);

```

```

DBMS_STATS.GET_TABLE_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  numrows      OUT NUMBER,
  numblks      OUT NUMBER,
  avgrlen      OUT NUMBER,
  cachedblk    OUT NUMBER,
  cachehit     OUT NUMBER,
  realtime_stats  BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 174-69 GET\_TABLE\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                     |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Specifies the name of the schema.                                                                                                                                                               |
| tabname   | Specifies the name of the table to which this column belongs.                                                                                                                                   |
| partname  | Specifies the name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level. |
| stattab   | Specifies the user statistics table ID. This ID describes where to retrieve the statistics. If stattab is NULL, then the procedure gathers statistics directly from the data dictionary.        |
| statid    | Specifies the optional ID associates with these statistics within stattab. This ID is only relevant when stattab is not NULL.                                                                   |
| numrows   | Specifies the number of rows in the table or partition.                                                                                                                                         |
| numblks   | Specifies the number of blocks in the table or partition.                                                                                                                                       |

**Table 174-69 (Cont.) GET\_TABLE\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| avglen         | Specifies the average row length for the table or partition.                                                                                                                                                                                                           |
| statown        | Specifies the schema containing <code>stattab</code> (if different from <code>ownname</code> ).                                                                                                                                                                        |
| im_imcu_count  | Specifies the number of In-Memory Compression Units (IMCUs) in the table or partition.                                                                                                                                                                                 |
| im_block_count | Specifies the number of In-Memory blocks in the table or partition.<br>An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks.  |
| scanrate       | Specifies the rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.                                                                                                                                         |
| realtime_stats | Specifies whether to include real-time statistics. The default value is <code>TRUE</code> . When <code>realtime_stats</code> is <code>FALSE</code> , the database only includes optimizer statistics that were gathered by the <code>GATHER_*_STATS</code> procedures. |
| cachedblk      | For internal use only.                                                                                                                                                                                                                                                 |
| cachehit       | For internal use only.                                                                                                                                                                                                                                                 |

### Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

### Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_*_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.
- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

## 174.7.66 IMPLEMENT\_ADVISOR\_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

### Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (  
    task_name          IN    VARCHAR2,  
    execution_name      IN    VARCHAR2    := NULL,  
    level              IN    VARCHAR2    := 'TYPICAL')  
RETURN CLOB;
```

### Parameters

**Table 174-70** IMPLEMENT\_ADVISOR\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                       |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it.<br>If the specified execution conflicts with the name of an existing execution, then the function returns an error.            |
| level          | The level of the implementation. Possible values are <ul style="list-style-type: none"><li>• ALL: Ignores the filters and implements all recommendations.</li><li>• TYPICAL: Implements the recommendations according to the filters in place.</li></ul> |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.

- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- **Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

### Return Values

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 174-10 Implementing Optimizer Statistics Advisor Recommendations

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```
DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
```

```

v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
DBMS_OUTPUT.PUT_LINE(v_report);

-- implement all recommendations
v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

## 174.7.67 IMPORT\_COLUMN\_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

### Syntax

```

DBMS_STATS.IMPORT_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 174-71** IMPORT\_COLUMN\_STATS Procedure Parameters

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>       | Name of the schema                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>tabname</code>       | Name of the table to which this column belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>colname</code>       | Name of the column or extension                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>partname</code>      | Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>stattab</code>       | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>statid</code>        | Identifier to associate with these statistics within <code>stattab</code> (optional)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>statown</code>       | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>no_invalidate</code> | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| <code>force</code>         | If set to <code>TRUE</code> , imports statistics even if statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

### Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

## 174.7.68 IMPORT\_DATABASE\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab      IN  VARCHAR2,
    statid       IN  VARCHAR2 DEFAULT NULL,
    statown      IN  VARCHAR2 DEFAULT NULL,
    add_sys      IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 174-72 IMPORT\_DATABASE\_PREFS Procedure Parameters**

| Parameter            | Description                                                                        |
|----------------------|------------------------------------------------------------------------------------|
| <code>stattab</code> | Statistics table name where to import the statistics                               |
| <code>statid</code>  | Optional identifier to associate with these statistics within <code>stattab</code> |
| <code>statown</code> | Schema containing <code>stattab</code> (if different than <code>ownname</code> )   |
| <code>add_sys</code> | Value <code>TRUE</code> will include the Oracle-owned tables                       |

### Exceptions

ORA-20000: Insufficient privileges.

### Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

## 174.7.69 IMPORT\_DATABASE\_STATS Procedure

This procedure imports statistics for all objects in the database from the user statistics table and stores them in the data dictionary.

### Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (  
    stattab          VARCHAR2,  
    statid           VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(  
                                                get_param('NO_INVALIDATE')),  
    force            BOOLEAN DEFAULT FALSE,  
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 174-73** IMPORT\_DATABASE\_STATS Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | Specifies the statistics table that contains the statistics to be imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statid        | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"><li>TRUE - Ignores the statistics lock and imports the statistics</li><li>FALSE - The statistics will be imported only if they are not locked</li></ul>                                                                                                                                                                                                                                                                                                                                           |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"><li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li><li>SYNOPSIS - information to support incremental statistics</li></ul>                                                                                                                                                                                                                                                                                    |

### Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.70 IMPORT\_DICTIONARY\_STATS Procedure

This procedure imports statistics for all data dictionary schemas (SYS, SYSTEM, and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

## Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (  
    stattab          VARCHAR2,  
    statid           VARCHAR2 DEFAULT NULL,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(  
                                get_param('NO_INVALIDATE')),  
    force            BOOLEAN DEFAULT FALSE,  
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 174-74    IMPORT\_DICTIONARY\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| statid        | The (optional) identifier to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics lock at the object (table) level: <ul style="list-style-type: none"><li>TRUE - Ignores the statistics lock and imports the statistics.</li><li>FALSE - The statistics will be imported only if there is no lock.</li></ul>                                                                                                                                                                                                                                                                                                                                          |
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"><li>OBJECT_STATS - table statistics, column statistics and index statistics (Default)</li><li>SYNOPSIS - information to support incremental statistics</li></ul>                                                                                                                                                                                                                                                                                |

## Security Model

You must have either the SYSDBA privilege or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

# 174.7.71 IMPORT\_FIXED\_OBJECTS\_STATS Procedure

This procedure imports statistics for fixed tables from the user statistics table and stores them in the data dictionary.

## Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab      VARCHAR2,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force        BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-75 IMPORT\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing from where to retrieve the statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| statid        | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Overrides statistics lock: <ul style="list-style-type: none"> <li>TRUE - Ignores the statistics lock and imports the statistics</li> <li>FALSE - The statistics will be imported only if there is no lock</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

## Security Model

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table, may need to upgrade it

## Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

# 174.7.72 IMPORT\_INDEX\_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

## Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-76** IMPORT\_INDEX\_STATS Procedure Parameters

| Parameter             | Description                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>  | Name of the schema                                                                                                                                      |
| <code>indname</code>  | Name of the index                                                                                                                                       |
| <code>partname</code> | Name of the index partition. If the index is partitioned and if <code>partname</code> is NULL, then global and partition index statistics are imported. |
| <code>stattab</code>  | User statistics table identifier describing from where to retrieve the statistics                                                                       |
| <code>statid</code>   | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                    |
| <code>statown</code>  | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                        |

**Table 174-76 (Cont.) IMPORT\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Imports statistics even if index statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Oracle does not support export or import of statistics across databases of different character sets.

## 174.7.73 IMPORT\_SCHEMA\_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

### Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (  
    ownname      IN  VARCHAR2,  
    stattab      IN  VARCHAR2,  
    statid       IN  VARCHAR2 DEFAULT NULL,  
    statown      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-77 IMPORT\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ownname   | Owner name                                                              |
| stattab   | Statistics table name from where to import the statistics               |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

## Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

## Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

## 174.7.74 IMPORT\_SCHEMA\_STATS Procedure

This procedure imports statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the data dictionary.

## Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
  ownname          VARCHAR2,
  stattab          VARCHAR2,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE,
  stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

## Parameters

**Table 174-78 IMPORT\_SCHEMA\_STATS Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>       | Specifies the name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>stattab</code>       | Identifies the user table that stores the statistics to be imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>statid</code>        | Specifies the ID associated with these statistics within <code>stattab</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>statown</code>       | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>no_invalidate</code> | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

**Table 174-78 (Cont.) IMPORT\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force         | Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> <li>TRUE — Ignores the statistics lock and imports the statistics.</li> <li>FALSE — Imports the statistics only if there is no lock. This is the default.</li> </ul>                                                                                                                                                                                                                                                               |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> </ul> You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'. |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.75 IMPORT\_SYSTEM\_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

### Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
    stattab      VARCHAR2,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 174-79 IMPORT\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| stattab   | Identifier of the user statistics table where the statistics will be retrieved |

**Table 174-79 (Cont.) IMPORT\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| statid    | Optional identifier associated with the statistics retrieved from the stattab |
| statown   | Schema containing stattab (if different from current schema)                  |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to import system statistics

**Usage Notes**

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

Oracle does not support export or import of statistics across databases of different character sets.

## 174.7.76 IMPORT\_TABLE\_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

**Syntax**

```
DBMS_STATS.IMPORT_TABLE_PREFS (  
    ownname      IN  VARCHAR2,  
    tabname      IN  VARCHAR2,  
    stattab      IN  VARCHAR2,  
    statid       IN  VARCHAR2 DEFAULT NULL,  
    statown      IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 174-80 IMPORT\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ownname   | Owner name                                                              |
| tabname   | Table name                                                              |
| stattab   | Statistics table name from where to import the statistics               |
| statid    | (Optional) Identifier to associate with these statistics within stattab |
| statown   | Schema containing stattab (if other than ownname)                       |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

### Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

## 174.7.77 IMPORT\_TABLE\_STATS Procedure

This procedure import statistics for a specified table from the user statistics table identified by `stattab` and stores them in the data dictionary.

### Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (  
    ownname          VARCHAR2,  
    tabname          VARCHAR2,  
    partname         VARCHAR2 DEFAULT NULL,  
    stattab          VARCHAR2,  
    statid           VARCHAR2 DEFAULT NULL,  
    cascade          BOOLEAN  DEFAULT TRUE,  
    statown          VARCHAR2 DEFAULT NULL,  
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type(  
                                     get_param('NO_INVALIDATE')),  
    force            BOOLEAN  DEFAULT FALSE,  
    stat_category    VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

### Parameters

**Table 174-81** IMPORT\_TABLE\_STATS Procedure Parameters

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Specifies the name of the schema.                                                                                                                                     |
| tabname   | Specifies the name of the table.                                                                                                                                      |
| partname  | Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition table statistics are imported. |
| stattab   | Identifies the user statistics table that describes where to retrieve the statistics.                                                                                 |
| statid    | Specifies the ID associated with these statistics within <code>stattab</code> .                                                                                       |
| cascade   | Indicates whether to import column and index statistics for this table. The default is <code>TRUE</code> .                                                            |
| statown   | Specifies the schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                       |

**Table 174-81 (Cont.) IMPORT\_TABLE\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> |
| force         | Specifies whether to override statistics locked at the object level. The possible values are as follows: <ul style="list-style-type: none"> <li>TRUE — Ignores the statistics lock and imports the statistics.</li> <li>FALSE — Imports the statistics only if there is no lock. This is the default.</li> </ul>                                                                                                                                                                                                                                                                       |
| stat_category | Specifies which statistics to process. The following values are supported: <ul style="list-style-type: none"> <li>OBJECT_STATS — Specifies table statistics, column statistics, and index statistics.</li> <li>SYNOPSIS — Specifies metadata for incremental statistics.</li> <li>REALTIME_STATS — Specifies only real-time statistics.</li> </ul> You can specify a list of comma-delimited values. For example, 'OBJECT_STATS, SYNOPSIS' specifies table statistics, column statistics, index statistics, and synopses. The default value is 'OBJECT_STATS, REALTIME_STATS'.         |

### Security Model

To invoke this procedure you must be owner of the table or have the `ANALYZE ANY` privilege. For objects owned by SYS, you must be either the owner of the table or have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

### Usage Notes

Oracle Database does not support export or import of statistics across databases of different character sets.

## 174.7.78 INTERRUPT\_ADVISOR\_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the ["RESUME\\_ADVISOR\\_TASK Procedure"](#).

## Syntax

```
DBMS_STATS.INTERRUPT_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

## Parameters

**Table 174-82** INTERRUPT\_ADVISOR\_TASK Procedure Parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

## Exceptions

- `ORA-20000: Insufficient privileges`
- `ORA-20001: Invalid input values`
- `ORA-20012: Optimizer Statistics Advisor errors`

## Example 174-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE  
    v_tname    VARCHAR2(128) := 'my_task';  
    v_ename    VARCHAR2(128) := NULL;  
BEGIN  
    -- create a task  
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);  
  
    -- execute the task  
    v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);  
END;  
/
```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

## 174.7.79 LOCK\_PARTITION\_STATS Procedure

This procedure enables the user to lock statistics for a partition.

### Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);
```

### Parameters

**Table 174-83** LOCK\_PARTITION\_STATS Procedure Parameters

| Parameter | Description                |
|-----------|----------------------------|
| ownname   | Name of the schema to lock |
| tabname   | Name of the table          |
| partname  | [Sub]Partition name        |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.80 LOCK\_SCHEMA\_STATS Procedure

This procedure locks the statistics of all tables of a schema.

### Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

### Parameters

**Table 174-84** LOCK\_SCHEMA\_STATS Procedure Parameters

| Parameter | Description                |
|-----------|----------------------------|
| ownname   | Name of the schema to lock |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*` `_STATS` procedures.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 174.7.81 LOCK\_TABLE\_STATS Procedure

This procedure locks the statistics on the table.

### Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname      VARCHAR2,  
    tabname      VARCHAR2);
```

### Parameters

**Table 174-85 LOCK\_TABLE\_STATS Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| tabname   | Name of the table  |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.

- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.
- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 174.7.82 MERGE\_COL\_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

### Syntax

```
DBMS_STATS.MERGE_COL_USAGE (
    dblink    IN    VARCHAR2);
```

### Parameters

**Table 174-86 MERGE\_COL\_USAGE Procedure Parameters**

| Parameter           | Description                 |
|---------------------|-----------------------------|
| <code>dblink</code> | Name of <code>dblink</code> |

### Usage Notes

User must be `SYS` to execute this procedure. addition the user specified during the creation of the `dblink` is expected to have privileges to select from tables in the `SYS` schema.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Parameter `dblink` cannot be `NULL`

ORA-20002: Unable to create a `TEMP` table

## 174.7.83 PREPARE\_COLUMN\_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    charvals   CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    datevals   DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    dblvals    DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    fltvals    FLTARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    numvals    NUMARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
    srec      IN OUT StatRec,
    rawvals    RAWARRAY);
```

### Parameters

**Table 174-87 PREPARE\_COLUMN\_VALUES Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srec.epc    | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p> |
| srec.bkvals | <p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 174-87 (Cont.) PREPARE\_COLUMN\_VALUES Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>srec.rpcnts</code> | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output argument and must be set to <code>NULL</code> when this procedure is called.</p> <p>As an example, for a given array <code>numvals</code> with <code>numvals(i)=4</code>, <code>rpcnts(i)=13</code> means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>Whenever <code>srec.rpcnts</code> is populated, <code>srec.bkvals</code> must be populated as described above.</li> <li>Whenever <code>bkvals</code> and/or <code>rpcnts</code> are populated, there should not be any duplicates in <code>charvals</code>, <code>datevals</code>, <code>numvals</code>, or <code>rawvals</code>.</li> </ul> |

Datatype-specific input parameters (use one) are shown in [Table 174-88](#).

**Table 174-88 Datatype-Specific Input Parameters**

| Type                      | Description                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>charvals</code>     | The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization. |
| <code>datevals</code>     | Array of values when the column type is date-based                                                                                                                                                                                                                                                         |
| <code>dblvals</code>      | Array of values when the column type is double-based                                                                                                                                                                                                                                                       |
| <code>fltvals</code>      | Array of values when the column type is float-based                                                                                                                                                                                                                                                        |
| <code>numvals</code>      | Array of values when the column type is numeric-based                                                                                                                                                                                                                                                      |
| <code>rawvals</code>      | Array of values when the column type is <code>RAW</code> . Up to the first 64 bytes of each value should be provided.                                                                                                                                                                                      |
| <code>nvmin, nvmax</code> | Minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization.                             |
| <code>rwmin, rwmax</code> | Minimum and maximum values when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.                                                                                                                                                                    |

### Output Parameters

**Table 174-89 PREPARE\_COLUMN\_VALUES Procedure Output Parameters**

| Parameter                | Description                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------|
| <code>srec.minval</code> | Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code> |
| <code>srec.maxval</code> | Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code> |
| <code>srec.bkvals</code> | Array suitable for use in a call to <code>SET_COLUMN_STATS</code>                                  |

**Table 174-89 (Cont.) PREPARE\_COLUMN\_VALUES Procedure Output Parameters**

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| srec.novals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.eavals | Array suitable for use in a call to SET_COLUMN_STATS |
| srec.rpcnts | Array suitable for use in a call to SET_COLUMN_STATS |

**Exceptions**

ORA-20001: Invalid or inconsistent input values

**Usage Notes**

No special privilege or role is needed to invoke this procedure.

## 174.7.84 PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET\_COLUMN\_STATS Procedures.

**Syntax**

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (  
    srec      IN OUT StatRec,  
    nvmin     NVARCHAR2,  
    nvmax     NVARCHAR2);
```

**Parameters****Table 174-90 PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srec.epc    | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p> |
| srec.bkvals | <p>If you want a frequency or hybrid histogram, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 174-90 (Cont.) PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure Parameters**

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>srec.rpcnts</code> | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in <code>charvals</code>, <code>datevals</code>, <code>numvals</code>, or <code>rawvals</code>. Otherwise, it is merely an output argument and must be set to <code>NULL</code> when this procedure is called.</p> <p>As an example, for a given array <code>numvals</code> with <code>numvals(i)=4</code>, <code>rpcnts(i)=13</code> means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>Whenever <code>srec.rpcnts</code> is populated, <code>srec.bkvals</code> must be populated as described above.</li> <li>Whenever <code>bkvals</code> and/or <code>rpcnts</code> are populated, there should not be any duplicates in <code>charvals</code>, <code>datevals</code>, <code>numvals</code>, or <code>rawvals</code>.</li> </ul> |

Datatype-specific input parameters (use one) are shown in [Table 174-88](#).

**Table 174-91 PREPARE\_COLUMN\_VALUES\_NVARCHAR Datatype-Specific Input Parameters**

| Type                                    | Description                                                                                                                                                                                                                                                                        |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>nvmin</code> , <code>nvmax</code> | The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization. |

### Output Parameters

**Table 174-92 PREPARE\_COLUMN\_VALUES\_NVARCHAR Procedure Output Parameters**

| Parameter                | Description                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------|
| <code>srec.minval</code> | Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code> |
| <code>srec.maxval</code> | Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code> |
| <code>srec.bkvals</code> | Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .                                |
| <code>srec.novals</code> | Array suitable for use in a call to <code>SET_COLUMN_STATS</code>                                  |
| <code>srec.eavals</code> | Array suitable for use in a call to <code>SET_COLUMN_STATS</code>                                  |
| <code>srec.rpcnts</code> | Array suitable for use in a call to <code>SET_COLUMN_STATS</code>                                  |

### Exceptions

ORA-20001: Invalid or inconsistent input values

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 174.7.85 PREPARE\_COLUMN\_VALUES\_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET\_COLUMN\_STATS.

### Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
    srec  IN OUT StatRec,
    rwmn      ROWID,
    rwmx      ROWID);
```

### Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 174-93 PREPARE\_COLUMN\_VALUES\_ROWID Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srec      | <p>Values (IN):</p> <ul style="list-style-type: none"> <li>• epc</li> <li>• bkvals</li> <li>• rpcnts</li> </ul> <p>Values (OUT):</p> <ul style="list-style-type: none"> <li>• minval</li> <li>• maxval</li> <li>• bkvals</li> <li>• novals</li> <li>• eavals</li> <li>• rpcnts</li> </ul> |
| rwmn      | Minimum value when the column type is rowid. No histogram information is provided for a column of this type.                                                                                                                                                                              |
| rwmx      | Maximum value when the column type is rowid. No histogram information is provided for a column of this type.                                                                                                                                                                              |

**Table 174-94 StatRec Record Type Fields**

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| epc (IN)     | <p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>                    |
| bkvals (IN)  | <p>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| rpcnts (IN)  | <p>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called.</p> <p>As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.</li> <li>Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.</li> </ul> |
| minval (OUT) | Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| maxval (OUT) | Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| bkvals (OUT) | Array suitable for use in a call to SET_COLUMN_STATS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Usage Notes

No special privilege or role is needed to invoke this procedure.

## 174.7.86 PUBLISH\_PENDING\_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

### Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (  
    ownname          IN  VARCHAR2 DEFAULT USER,  
    tabname          IN  VARCHAR2,  
    no_invalidate     BOOLEAN DEFAULT  
        TO_NO_INVALIDATE_TYPE(GET_PARAM('NO_INVALIDATE')),  
    force            IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 174-95 PUBLISH\_PENDING\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname       | Owner name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| tabname       | Table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | If TRUE, will override the lock                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

- If the parameter `tabname` is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

### Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

## 174.7.87 PURGE\_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Syntax

```
DBMS_STATS.PURGE_STATS (
    before_timestamp          TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 174-96 PURGE\_STATS Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| before_timestamp | Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days. |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

### Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

## 174.7.88 REMAP\_STAT\_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

### Syntax

```
DBMS_STATS.REMAP_STAT_TABLE (
    ownname      IN      VARCHAR2,
    stattab      IN      VARCHAR2,
    src_own      IN      VARCHAR2,
    src_tab      IN      VARCHAR2,
    tgt_own      IN      VARCHAR2,
    tgt_tab      IN      VARCHAR2);
```

## Parameters

**Table 174-97 REMAP\_STAT\_TABLE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner of the statistics table. NULL means the current schema.                                                                                                                                                              |
| stattab   | User statistics table identifier                                                                                                                                                                                           |
| src_own   | Owner of the table to be renamed. This argument cannot be NULL.                                                                                                                                                            |
| src_tab   | Name of the table to be renamed. If NULL, all tables are owned by src_own.                                                                                                                                                 |
| tgt_own   | New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL. |
| tgt_tab   | New name of the table. This argument is valid only if src_tab is not NULL.                                                                                                                                                 |

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid input

## Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers\_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

## 174.7.89 REPORT\_ADVISOR\_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

### Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(  
    task_name          IN    VARCHAR2,  
    execution_name     IN    VARCHAR2    := NULL,  
    type               IN    VARCHAR2    := 'TEXT',  
    section            IN    VARCHAR2    := 'ALL',  
    level              IN    VARCHAR2    := 'TYPICAL')  
RETURN CLOB;
```

## Parameters

**Table 174-98 REPORT\_ADVISOR\_TASK Function Parameters**

| Parameter                   | Description                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>task_name</code>      | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                        |
| <code>execution_name</code> | A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.                                                                                           |
| <code>type</code>           | The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.                                                                                                                                             |
| <code>section</code>        | A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'. |
| <code>level</code>          | The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.                        |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- **Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

### Returns

This function returns a CLOB that contains the report.

### Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

#### Example 174-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fctype VARCHAR2, which
VARCHAR2)
IS
    v_report CLOB          := null;
    v_script CLOB          := null;
    v_fctype VARCHAR2(400) := p_fctype;
    v_tname  VARCHAR2(400) := p_tname;
    v_len    NUMBER(10);
    v_ps     NUMBER(10) := 10000;
    v_pn     NUMBER(10) := 1;
    v_ret    VARCHAR2(32767);
BEGIN
    IF which = 'REPORT'
    THEN
        -- generate a report
        v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
            task_name => v_tname,
            type       => v_fctype,
            section    => 'ALL',
            level      => 'ALL');
        v_len := DBMS_LOB.getlength(v_report);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    ELSE
        -- generate a script
```

```

        v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
        v_len := DBMS_LOB.getlength(v_script);
        WHILE (v_pn < v_len)
        LOOP
            DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR( v_script, v_ps, v_pn));
            v_pn := v_pn + v_ps;
        END LOOP;
    END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','HTML','REPORT');
SPOOL OFF

```

### Example 174-13 Generating a Textual Report for AUTO\_STATS\_ADVISOR\_TASK

The following example invokes the `myrep` procedure created in the preceding example for `AUTO_STATS_ADVISOR_TASK`:

```
EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');
```

The following sample output shows part of the report:

```

GENERAL INFORMATION
-----
-

Task Name           : AUTO_STATS_ADVISOR_TASK
Execution Name      : EXEC_97
Created             : 07-08-16 10:18:10
Last Modified       : 07-11-16 03:02:30

-----
-

SUMMARY
-----
-

For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics
Advisor
has 10 finding(s). The findings are related to the following rules:
COMPLETEAUTOJOB, MAINTAINSTATSHISTORY, USEDEFAULTPREFERENCE,
AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMASTATS, AVOIDSTALESTATS,
UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please refer to
the
finding section for detailed information.

-----
-

FINDINGS
-----
-

Rule Name:           MaintainStatsHistory
Rule Description:    Maintain Statistics History

```

Finding: Statistics history tables are too big.

Recommendation: Check the other findings of this rule, as well as the

findings for the rules  
AvoidFrequentStatsCollection,  
UseDefaultPreference, UseDefaultParams for possible  
causes  
and  
recommendations.

Rationale: The size of the statistics history table could be big because  
of  
violations of other rules.

-----  
Rule Name: UseDefaultPreference  
Rule Description: Use Default Preference for Stats Collection  
Finding: Global preference SYS\_FLAGS is set to a non-default value '1'.

Recommendation: Set the value of preference SYS\_FLAGS to '0'.

Example:

```
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);
```

Rationale: Preference SYS\_FLAGS is for Oracle internal use only, setting  
it  
to nondefault value '1' could cause unforeseen consequences.

## 174.7.90 REPORT\_COL\_USAGE Function

This function reports the recorded column (group) usage information.

### Syntax

```
DBMS_STATS.REPORT_COL_USAGE (
    ownname    IN    VARCHAR2,
    tabname    IN    VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 174-99 REPORT\_COL\_USAGE Function Parameters**

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| ownname   | Owner name. If NULL it reports column usage information for tables in all schemas in the database. |
| tabname   | Table name. If NULL it reports column usage information for all tables of ownname.                 |

### Usage Notes

To run this procedure, you need to have the `SYSDBA` administrative privilege or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

## 174.7.91 REPORT\_GATHER\_AUTO\_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

### Syntax

```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (  
    detail_level    VARCHAR2  DEFAULT 'TYPICAL',  
    format          VARCHAR2  DEFAULT 'TEXT')  
RETURN CLOB;
```

## Parameters

**Table 174-100 REPORT\_GATHER\_AUTO\_STATS Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| detail_level | <p>Detail level for the content of the report</p> <ul style="list-style-type: none"> <li> <b>BASIC:</b> The report includes <ul style="list-style-type: none"> <li>- operation ID</li> <li>- operation name</li> <li>- operation target object</li> <li>- start time</li> <li>- end time</li> <li>- completion status (such as: succeeded, failed)</li> </ul> </li> <li> <b>TYPICAL:</b> In addition to the information provided at level <b>BASIC</b>, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> <li>- total number of target objects</li> <li>- total number of successfully completed objects</li> <li>- total number of failed objects</li> <li>- total number of timed-out objects (applies to only auto statistics gathering)</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- owner and name of each target object</li> <li>- target object type (such as: table, index)</li> <li>- start time</li> <li>- end time</li> <li>- completion status</li> </ul> </li> <li> <b>ALL:</b> In addition to the information provided at level <b>TYPICAL</b>, the report includes further information on each target object. | format    | Report format: <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul> |

#### Usage Notes

Only user SYS can run the REPORT\_GATHER\_AUTO\_STATS function.

## 174.7.92 REPORT\_GATHER\_DATABASE\_STATS Functions

This function runs the GATHER\_DATABASE\_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER\_DATABASE\_STATS. The input set of parameters is the same as in GATHER\_DATABASE\_STATS, with two extra parameters.

#### Syntax

```
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (
    estimate_percent      IN      NUMBER      DEFAULT to_estimate_percent_type (
                                GET_PARAM('ESTIMATE_PERCENT')),
    block_sample          IN      BOOLEAN     DEFAULT FALSE,
    method_opt            IN      VARCHAR2    DEFAULT GET_PARAM('METHOD_OPT'),
    degree                IN      NUMBER      DEFAULT TO_DEGREE_TYPE (
                                GET_PARAM('DEGREE')),
    granularity           IN      VARCHAR2    DEFAULT GET_PARAM('GRANULARITY'),
    cascade               IN      BOOLEAN     DEFAULT to_cascade_type (
                                GET_PARAM('CASCADE')),
    stattab               IN      VARCHAR2    DEFAULT NULL,
    statid                IN      VARCHAR2    DEFAULT NULL,
    options               IN      VARCHAR2    DEFAULT 'GATHER',

## Parameters

**Table 174-101 REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| estimate_percent | <p>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute.</p> <p>Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| block_sample     | <p>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| method_opt       | <p>Method options. This parameter accepts the following values: <code>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</code>.</p> <p><code>size_clause</code> is defined as <code>size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</code></p> <ul style="list-style-type: none"> <li>- <code>integer</code>: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- <code>REPEAT</code>: Collects histograms only on the columns that already have histograms.</li> <li>- <code>AUTO</code>: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- <code>SKEWONLY</code>: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> <p>The default is <code>FOR ALL COLUMNS SIZE AUTO</code>. The value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                          |
| degree           | <p>Degree of parallelism. The default for <code>degree</code> is <code>NULL</code>. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. <code>NULL</code> means use the table default value specified by the <code>DEGREE</code> clause in the <code>CREATE TABLE</code> or <code>ALTER TABLE</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=&gt;NULL</code>, <code>DEGREE=&gt;n</code>, or <code>DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE</code>, the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution.</p> |

**Table 174-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>GLOBAL — Gathers global statistics.</li> <li>GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>PARTITION — Gathers partition-level statistics.</li> <li>SUBPARTITION — Gathers subpartition-level statistics.</li> </ul>                                                                                                                                   |
| cascade     | <p>Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| stattab     | <p>User statistics table identifier describing where to save the current statistics.</p> <p>The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| statid      | <p>Identifier (optional) to associate with these statistics within stattab.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| options     | <p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO</p> <p>LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views</p> <p>LIST EMPTY: Returns a list of objects which currently have no statistics</p> |
| statown     | <p>Schema containing stattab, if different from current schema.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 174-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gather_sys      | Gathers statistics on the objects owned by the SYS user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| no_invalidate   | Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                         |
| gather_temp     | Gathers statistics on global temporary tables when TRUE. The default is FALSE.<br><br>The temporary table must be created with the ON COMMIT PRESERVE ROWS clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.                                                                                                                                                                                                                                                                                                            |
| gather_fixed    | Gather statistics on fixed tables when TRUE. The default is FALSE.<br><br>Only user SYS can collect statistics for fixed tables. The ownname must be SYS or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments: <ul style="list-style-type: none"> <li>estimate_percent</li> <li>block_sample</li> <li>stattab</li> <li>statid</li> <li>statown</li> </ul> The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.                                                |
| stattype        | The type of statistics: <ul style="list-style-type: none"> <li>DATA — Data statistics only</li> <li>CACHE — Cache statistics only</li> <li>ALL — All statistics</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| obj_filter_list | A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values.<br><br>When specified, GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true. |

**Table 174-101 (Cont.) REPORT\_GATHER\_DATABASE\_STATS Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| detail_level | <p>The level of detail for the content of the report. Valid values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>BASIC:</b> The report includes <ul style="list-style-type: none"> <li>- operation ID</li> <li>- operation name</li> <li>- operation target object</li> <li>- start time</li> <li>- end time</li> <li>- completion status (such as: succeeded, failed)</li> </ul> </li> <li>• <b>TYPICAL:</b> In addition to the information provided at level <b>BASIC</b>, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details: <ul style="list-style-type: none"> <li>- total number of target objects</li> <li>- total number of successfully completed objects</li> <li>- total number of failed objects</li> <li>- total number of timed-out objects (applies to only auto statistics gathering)</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- owner and name of each target object</li> <li>- target object type (such as: table, index)</li> <li>- start time</li> <li>- end time</li> <li>- completion status</li> </ul> </li> <li>• <b>ALL:</b> In addition to the information provided at level <b>TYPICAL</b>, the report includes further information on each target object. Specifically, with regard to operation-related details: <ul style="list-style-type: none"> <li>- job name</li> <li>- session ID</li> <li>- parameter values</li> <li>- error message if the operation failed</li> </ul> <p>With regard to target objects:</p> <ul style="list-style-type: none"> <li>- job name</li> <li>- batching details</li> <li>- estimated cost</li> <li>- rank in the target list</li> <li>- columns for which histograms were collected</li> <li>- list of collected extended statistics (if any)</li> <li>- additional error details if the task has failed.</li> </ul> <p>Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (<b>CONCURRENT</b> preference is turned on).</p> </li> </ul> |
| format       | <p>The format of the report. Valid values are:</p> <ul style="list-style-type: none"> <li>• XML</li> <li>• HTML</li> <li>• TEXT (Default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Return Values

A CLOB object that contains the report

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

## Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

# 174.7.93 REPORT\_GATHER\_DICTIONARY\_STATS Functions

This function runs the GATHER\_DICTIONARY\_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER\_DICTIONARY\_STATS. The detail level for the report is defined by the detail\_level input parameter. See the descriptions of detail\_level and format in [REPORT\\_GATHER\\_DICTIONARY\\_STATS Functions](#). For all other input parameters, see [GATHER\\_DICTIONARY\\_STATS Procedure](#).

## Syntax

```
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (
    comp_id          IN    VARCHAR2    DEFAULT NULL,
    estimate_percent IN    NUMBER       DEFAULT TO_ESTIMATE_PERCENT_TYPE

    (GET_PARAM('ESTIMATE_PERCENT')),
    block_sample     IN    BOOLEAN     DEFAULT FALSE,
    method_opt       IN    VARCHAR2    DEFAULT GET_PARAM('METHOD_OPT'),
    degree           IN    NUMBER       DEFAULT TO_DEGREE_TYPE
                                     (GET_PARAM('DEGREE')),
    granularity      IN    VARCHAR2    DEFAULT GET_PARAM('GRANULARITY'),
    cascade          IN    BOOLEAN     DEFAULT TO_CASCADE_TYPE
                                     (GET_PARAM('CASCADE')),
    stattab          IN    VARCHAR2    DEFAULT NULL,
    options          IN    VARCHAR2    DEFAULT 'GATHER AUTO',
    no_invalidate    IN    BOOLEAN     DEFAULT TO_NO_INVALIDATE_TYPE
                                     (GET_PARAM('NO_INVALIDATE')),
    stattype         IN    VARCHAR2    DEFAULT 'DATA',
    obj_filter_list  IN    ObjectTab    DEFAULT NULL,
    detail_level     IN    VARCHAR2    DEFAULT 'TYPICAL',
    format           IN    VARCHAR2    DEFAULT 'TEXT')
RETURN CLOB;
```

## Parameters

**Table 174-102 REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| comp_id          | Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| estimate_percent | Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| block_sample     | Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| method_opt       | <p>The method options. This parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>REPEAT : Collects histograms only on the columns that already have histograms.</li> <li>AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| degree           | <p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</p> <p>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</p>                             |

Table 174-102 (Cont.) REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• ALL — Gathers all statistics: subpartition, partition, and global.</li> <li>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</li> <li>• GLOBAL — Gathers global statistics.</li> <li>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• PARTITION — Gathers partition-level statistics.</li> <li>• SUBPARTITION — Gathers subpartition-level statistics.</li> </ul>                                                                                                                                                                                                                             |
| cascade     | <p>Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| stattab     | <p>User statistics table identifier describing where to save the current statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| options     | <p>Further specification of objects for which to gather statistics:</p> <ul style="list-style-type: none"> <li>• 'GATHER' - Gathers statistics on all objects in the schema</li> <li>• 'GATHER AUTO' - Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed.</li> <li>• 'GATHER STALE' - Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale.</li> <li>• 'GATHER EMPTY' - Gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics.</li> <li>• 'LIST AUTO' - Returns list of objects to be processed with 'GATHER AUTO'</li> <li>• 'LIST STALE' - Returns list of stale objects as determined by looking at the *_tab_modifications views</li> <li>• 'LIST EMPTY' - Returns list of objects which currently have no statistics</li> </ul> |

**Table 174-102 (Cont.) REPORT\_GATHER\_DICTIONARY\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate   | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                        |
| stattype        | The type of statistics: <ul style="list-style-type: none"> <li>• <code>DATA</code> — Data statistics only</li> <li>• <code>CACHE</code> — Cache statistics only</li> <li>• <code>ALL</code> — All statistics</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| obj_filter_list | A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if ( <code>o.a1</code> like <code>s1</code> ) and ( <code>o.a2</code> like <code>s2</code> ) and ... is true. |
| detail_level    | See the description in <a href="#">REPORT_GATHER_DICTIONARY_STATS Functions</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| format          | See the description in <a href="#">REPORT_GATHER_DICTIONARY_STATS Functions</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

#### Return Values

A CLOB object that contains the report

#### Usage Notes

You must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege to execute this procedure.

#### Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## 174.7.94 REPORT\_GATHER\_FIXED\_OBJ\_STATS Function

This function runs the `GATHER_FIXED_OBJECTS_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_FIXED_OBJ_STATS` is invoked are reported. The input set of parameters are exactly the same as in `GATHER_FIXED_OBJ_STATS` with two extra parameters.

## Syntax

```
DBMS_STATS.REPORT_GATHER_FIXED_OBJ_STATS (
    stattab          IN  VARCHAR2  DEFAULT NULL,
    statid           IN  VARCHAR2  DEFAULT NULL,
    statown          IN  VARCHAR2  DEFAULT NULL,
    no_invalidate    IN  BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE (
                                GET_PARAM('NO_INVALIDATE')),
    detail_level     IN  VARCHAR2  DEFAULT 'TYPICAL',
    format           IN  VARCHAR2  DEFAULT 'TEXT')
RETURN CLOB;
```

## Parameters

**Table 174-103 REPORT\_GATHER\_FIXED\_OBJ\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab       | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| statid        | Identifier to associate with these statistics within stattab (optional)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| statown       | Schema containing stattab (if different from current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

## Return Values

A CLOB object that contains the report

## Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

## Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Bad input value

ORA-20002: Bad user statistics table, may need to upgrade it

## Related Topics

- [GATHER\\_FIXED\\_OBJECTS\\_STATS Procedure](#)  
This procedure gathers statistics for all fixed objects (dynamic performance tables).

# 174.7.95 REPORT\_GATHER\_SCHEMA\_STATS Functions

This function runs the GATHER\_SCHEMA\_STATS procedure in reporting mode.

The database does not actually gather statistics, but reports all objects that would be affected when invoking GATHER\_SCHEMA\_STATS. The input set of parameters is exactly the same as in GATHER\_SCHEMA\_STATS, with two extra parameters.

## Syntax

```
DBMS_STATS.REPORT_GATHER_SCHEMA_STATS (
  ownname          IN   VARCHAR2,
  estimate_percent IN   NUMBER          DEFAULT TO_ESTIMATE_PERCENT_TYPE (
                                     GET_PARAM ('ESTIMATE_PERCENT')),
  block_sample     IN   BOOLEAN         DEFAULT FALSE,
  method_opt       IN   VARCHAR2       DEFAULT GET_PARAM ('METHOD_OPT'),
  degree           IN   NUMBER          DEFAULT TO_DEGREE_TYPE (
                                     GET_PARAM ('DEGREE')),
  granularity      IN   VARCHAR2       DEFAULT GET_PARAM ('GRANULARITY'),
  cascade          IN   BOOLEAN         DEFAULT TO_CASCADE_TYPE (
                                     GET_PARAM ('CASCADE')),
  stattab          IN   VARCHAR2       DEFAULT NULL,
  statid           IN   VARCHAR2       DEFAULT NULL,
  options          IN   VARCHAR2       DEFAULT 'GATHER',
  statown          IN   VARCHAR2       DEFAULT NULL,
  no_invalidate    IN   BOOLEAN         DEFAULT TO_NO_INVALIDATE_TYPE (
                                     GET_PARAM ('NO_INVALIDATE')),
  force            IN   BOOLEAN         DEFAULT FALSE,
  obj_filter_list  IN   ObjectTab      DEFAULT NULL,
  detail_level     IN   VARCHAR2       DEFAULT 'TYPICAL',
  format           IN   VARCHAR2       DEFAULT 'TEXT')
RETURN CLOB;
```

## Parameters

**Table 174-104 REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname          | Schema to analyze (NULL means current schema)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| estimate_percent | Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| block_sample     | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| method_opt       | <p>Accepts:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>REPEAT : Collects histograms only on the columns that already have histograms</li> <li>AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                     |
| degree           | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> to specify the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is between 1 (serial execution) and <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using <code>DEGREE=&gt;NULL</code> , <code>DEGREE=&gt;n</code> , or <code>DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE</code> , the current implementation of <code>DBMS_STATS</code> may use serial execution if the size of the object does not warrant parallel execution. |

**Table 174-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| granularity | <p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p>                                                                                                                                                                                                                                                                                                                       |
| cascade     | <p>Gather statistics on the indexes as well. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| stattab     | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| statid      | Identifier (optional) to associate with these statistics within <code>stattab</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| options     | <p>Further specification of which objects to gather statistics for:</p> <p>GATHER: Gathers statistics on all objects in the schema.</p> <p>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>ownname</code>, <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p>GATHER STALE: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p>LIST AUTO: Returns a list of objects to be processed with <code>GATHER AUTO</code>.</p> <p>LIST STALE: Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views.</p> <p>LIST EMPTY: Returns list of objects which currently have no statistics.</p> |
| objlist     | List of objects found to be stale or empty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| statown     | Schema containing <code>stattab</code> (if different than <code>ownname</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 174-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate   | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code>, then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                     |
| force           | Gather statistics on objects even if they are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| obj_filter_list | <p>A list of object filters. When provided, <code>GATHER_SCHEMA_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code>, <code>s2</code>, ... are specified for attributes <code>a1</code>, <code>a2</code>, ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true. See <a href="#">Applying an Object Filter List</a>.</p> |

**Table 174-104 (Cont.) REPORT\_GATHER\_SCHEMA\_STATS Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

## Examples

### Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or any table in the `HR` schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'HR';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                options => 'GATHER STALE');
END;
```

## 174.7.96 REPORT\_GATHER\_TABLE\_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected when `GATHER_TABLE_STATS` is invoked are reported.

## Syntax

```
DBMS_STATS.REPORT_GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  stattype         VARCHAR2 DEFAULT 'DATA',
  force            BOOLEAN   DEFAULT FALSE)
