| partname         | Name of partition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| estimate_percent | Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| block_sample     | Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| method_opt       | <p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> <li>FOR COLUMNS [column_clause] [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>column_clause is defined as column_clause := column_name   extension name   extension</p> <ul style="list-style-type: none"> <li>- integer : Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</li> <li>- column_name : Name of a column</li> <li>- extension : can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |

**Table 174-105 (Cont.) REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| degree      | Degree of parallelism. The default for degree is NULL. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=>NULL, DEGREE=>n, or DEGREE=>DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| granularity | Granularity of statistics to collect (only pertinent if the table is partitioned).<br>'ALL' - Gathers all (subpartition, partition, and global) statistics<br>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).<br>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.<br>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.<br>'GLOBAL' - Gathers global statistics<br>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.<br>'PARTITION' - Gathers partition-level statistics<br>'SUBPARTITION' - Gathers subpartition-level statistics. |
| cascade     | Gathers statistics on the indexes for this table. Using this option is equivalent to running the <a href="#">GATHER_INDEX_STATS Procedure</a> on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| stattab     | User statistics table identifier describing where to save the current statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| statid      | Identifier (optional) to associate with these statistics within stattab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 174-105 (Cont.) REPORT\_GATHER\_TABLE\_STATS Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| stattype      | Statistics type. The only value allowed is DATA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| force         | Gather statistics of table even if it is locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Return Values

A CLOB object that contains the report

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Related Topics

- [GATHER\\_TABLE\\_STATS Procedure](#)  
This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

## 174.7.97 REPORT\_SINGLE\_STATS\_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

### Syntax

```
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (  
    opid                NUMBER,  
    detail_level         VARCHAR2  DEFAULT 'TYPICAL',  
    format               VARCHAR2  DEFAULT 'TEXT'  
    container_id         NUMBER    DEFAULT NULL)  
RETURN CLOB;
```

### Parameters

**Table 174-106** REPORT\_SINGLE\_STATS\_OPERATION Function Parameters

| Parameter | Description  |
|-----------|--------------|
| opid      | Operation ID |

**Table 174-106 (Cont.) REPORT\_SINGLE\_STATS\_OPERATION Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format       | Report format: <ul style="list-style-type: none"><li>• XML</li><li>• HTML</li><li>• TEXT (Default)</li></ul>                                                                                                                                                                                                                                                                                                                                                       |
| container_id | ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation. |

**Usage Notes**

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

## 174.7.98 REPORT\_STATS\_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

**Syntax**

```
DBMS_STATS.REPORT_STATS_OPERATIONS (  
  detail_level    VARCHAR2 DEFAULT 'TYPICAL',  
  format         VARCHAR2 DEFAULT 'TEXT',  
  latestN        NUMBER DEFAULT NULL,  
  since          TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  until          TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  auto_only      BOOLEAN DEFAULT FALSE,  
  container_ids  DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)  
RETURN CLOB;
```

## Parameters

**Table 174-107 REPORT\_STATS\_OPERATIONS Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| auto_only     | <p>When <b>TRUE</b>, the report will contain only auto statistics gathering job runs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| container_ids | <p>A multitenant environment contains one or more pluggable databases (PDBs). <b>container_ids</b> represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage Notes

To invoke this procedure you need the **ANALYZE ANY** privilege and the **ANALYZE ANY DICTIONARY** privilege.

## Examples

Note that the type for `container_ids` input parameter is `DBMS_UTILITY.NUMBER_ARRAY` which is an associative PL/SQL array collection. Although associative array type allows for more flexible `harvals` table-like organization of entries, this function treats `container_ids` as a regular table collection with the first ID located at index 1 and the last id located at index `container_ids.count` without any empty array slot left between any two IDs. An example for 3 container ids is provided.

```
DECLARE
    conid_tab DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;
```

## 174.7.99 RESET\_ADVISOR\_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

### Syntax

```
DBMS_STATS.RESET_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

### Parameters

**Table 174-108 RESET\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

## 174.7.100 RESET\_COL\_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

### Syntax

```
DBMS_STATS.RESET_COL_USAGE (
    ownname    IN    VARCHAR2,
    tabname    IN    VARCHAR2);
```

### Parameters

**Table 174-109 RESET\_COL\_USAGE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name. If NULL it deletes column usage information for tables in all schemas in the database.                                                                                                                                            |
| tabname   | Table name. If NULL it deletes column usage information for all tables of ownname. If both the owner and tabname is NULL, the seed column usage is stopped if applicable. See <a href="#">:SEED_COL_USAGE Procedure</a> for more information. |

### Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

## 174.7.101 RESET\_GLOBAL\_PREF\_DEFAULTS Procedure

This procedure sets global preference, such as CASCADE, ESTIMATE\_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the [SET\\_GLOBAL\\_PREFS Procedure](#).

### Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

### Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

## 174.7.102 RESET\_PARAM\_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

### Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the [RESET\\_GLOBAL\\_PREF\\_DEFAULTS Procedure](#).

See also . [DBMS\\_STATS Deprecated Subprograms](#)

### Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

## 174.7.103 RESTORE\_DATABASE\_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as\_of\_timestamp).

### Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
    as_of_timestamp      TIMESTAMP WITH TIME ZONE,
    force                BOOLEAN DEFAULT FALSE,
    no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                        (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 174-110 RESTORE\_DATABASE\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| force           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| no_invalidate   | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## 174.7.104 RESTORE\_DICTIONARY\_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
    as_of_timestamp      TIMESTAMP WITH TIME ZONE,
    force                BOOLEAN DEFAULT FALSE,
    no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                        (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 174-111 RESTORE\_DICTIONARY\_STATS Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>as_of_timestamp</code> | Timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>force</code>           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>no_invalidate</code>   | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## 174.7.105 RESTORE\_FIXED\_OBJECTS\_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

### Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
    as_of_timestamp      TIMESTAMP WITH TIME ZONE,
    force                BOOLEAN DEFAULT FALSE,
    no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                        (GET_PARAM('NO_INVALIDATE')));
```

## Parameters

**Table 174-112 RESTORE\_FIXED\_OBJECTS\_STATS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| force           | Restores statistics even if their statistics are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| no_invalidate   | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

## Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

## 174.7.106 RESTORE\_SCHEMA\_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as\_of\_timestamp).

## Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(  
    ownname          VARCHAR2,  
    as_of_timestamp   TIMESTAMP WITH TIME ZONE,  
    force             BOOLEAN DEFAULT FALSE,  
    no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type  
                        (GET_PARAM('NO_INVALIDATE')));
```

## Parameters

**Table 174-113 RESTORE\_SCHEMA\_STATS Procedure Parameters**

| Parameter       | Description                                                      |
|-----------------|------------------------------------------------------------------|
| ownname         | Schema of the tables for which the statistics are to be restored |
| as_of_timestamp | The timestamp to which to restore statistics                     |
| force           | Restores statistics even if their statistics are locked          |

**Table 174-113 (Cont.) RESTORE\_SCHEMA\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

## 174.7.107 RESTORE\_SYSTEM\_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as\_of\_timestamp).

### Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
    as_of_timestamp    TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 174-114 RESTORE\_SYSTEM\_STATS Procedure Parameters**

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| as_of_timestamp | The timestamp to which to restore statistics |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

### Usage Notes

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 174.7.108 RESTORE\_TABLE\_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (`as_of_timestamp`). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

### Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (  
    ownname          VARCHAR2,  
    tabname          VARCHAR2,  
    as_of_timestamp  TIMESTAMP WITH TIME ZONE,  
    restore_cluster_index  BOOLEAN DEFAULT FALSE,  
    force            BOOLEAN DEFAULT FALSE,  
    no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type  
                                (GET_PARAM('NO_INVALIDATE')));
```

### Parameters

**Table 174-115 RESTORE\_TABLE\_STATS Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ownname</code>               | The schema of the table for which the statistics are to be restored                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>tabname</code>               | The table name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>as_of_timestamp</code>       | The timestamp to which to restore statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>restore_cluster_index</code> | If the table is part of a cluster, restore statistics of the cluster index if set to TRUE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>force</code>                 | Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>no_invalidate</code>         | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

ORA-20006: Unable to restore statistics, statistics history not available

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.109 RESUME\_ADVISOR\_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

### Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

### Parameters

**Table 174-116 RESUME\_ADVISOR\_TASK Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task. |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

### Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

### Example 174-14 Resuming an Interrupted Task

In this example, you start a SQL\*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE  
    v_tname  VARCHAR2(128) := 'my_task';  
    v_ename  VARCHAR2(128) := NULL;  
BEGIN  
    -- create a task  
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);  
  
    -- execute the task  
    v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);  
END;  
/
```

In a separate terminal, you start a second SQL\*Plus session, and then execute the following program:

```
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13638: The user interrupted the current operation.
```

In the second SQL\*Plus session, you resume the task execution as follows:

```
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');
```

## 174.7.110 SCRIPT\_ADVISOR\_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

### Syntax

```
DBMS_STATS.SCRIPT_ADVISOR_TASK (  
  task_name      IN   VARCHAR2,  
  execution_name IN   VARCHAR2      := NULL,  
  dir_name       IN   VARCHAR2      := NULL,  
  level          IN   VARCHAR2      := 'TYPICAL')  
RETURN CLOB;
```

### Parameters

**Table 174-117** SCRIPT\_ADVISOR\_TASK Function Parameters

| Parameter      | Description                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| task_name      | The name of the Optimizer Statistics Advisor task.                                                                                                                                                                                                                             |
| execution_name | A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it.<br>If the specified execution conflicts with the name of an existing execution, then the function returns an error.                                  |
| dir_name       | Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory. |
| level          | The level of the script to generate. Possible values are <ul style="list-style-type: none"><li>ALL: Ignores the filter and generates a script for all findings</li><li>TYPICAL: Generates a script according to the filters in place</li></ul>                                 |

## Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- You can execute this subprogram for `AUTO_STATS_ADVISOR_TASK`, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**

Only users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task on system-level rules.

- **Operation level**

The results depend on the following privileges:

- Users with both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges can perform this task for all statistics operations.
- Users with the `ANALYZE ANY` privilege but *not* the `ANALYZE ANY DICTIONARY` privilege can perform this task for statistics operations related to any schema except `SYS`.
- Users with the `ANALYZE ANY DICTIONARY` privilege but *not* the `ANALYZE ANY` privilege can perform this task for statistics operations related to their own schema and the `SYS` schema.
- Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**

Users can perform this task for any object for which they have statistics collection privileges.

## Return Values

This function returns a CLOB that contains the script.

## Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

### Example 174-15 Creating an Optimizer Statistics Advisor Script

This example creates a procedure named `myrep`, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300
```

```

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_fotype VARCHAR2, which
VARCHAR2)
IS
  v_report CLOB          := null;
  v_script CLOB          := null;
  v_fotype VARCHAR2(400) := p_fotype;
  v_tname  VARCHAR2(400) := p_tname;
  v_len    NUMBER(10);
  v_ps     NUMBER(10)    := 10000;
  v_pn     NUMBER(10)    := 1;
  v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_fotype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
    LOOP
      DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
      v_pn := v_pn + v_ps;
    END LOOP;
  ELSE
    -- generate a script
    v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
    v_len := DBMS_LOB.getlength(v_script);
    WHILE (v_pn < v_len)
    LOOP
      DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
      v_pn := v_pn + v_ps;
    END LOOP;
  END IF;
END;
/

SHOW ERRORS

SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF

```

## 174.7.111 SEED\_COL\_USAGE Procedure

This procedure seeds column usage information from a statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for given amount of time and seed the and seed the column usage information based on the columns that appear in statements executed during the monitoring window.

### Syntax

```
DBMS_STATS.SEED_COL_USAGE (
    sqlset_name   IN   VARCHAR2,
    owner_name    IN   VARCHAR2,
    time_limit    IN   POSITIVE DEFAULT NULL);
```

### Parameters

**Table 174-118 SEED\_COL\_USAGE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sqlset_name | Name of the SQL tuning set that contains the statements to be monitored.<br>If this parameter and owner_name are both null, then the procedure monitors all statements in the database for the specified time limit.   |
| owner_name  | Owner of the SQL tuning set that contains the statements to be monitored.<br>If this parameter and sqlset_name are both null, then the procedure monitors all statements in the database for the specified time limit. |
| time_limit  | Time limit (in seconds).                                                                                                                                                                                               |

### Security Model

To invoke this procedure you must have the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

### Exceptions

ORA-20000: Insufficient privileges

### Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the [CREATE\\_EXTENDED\\_STATS Function](#) procedure. If `sqlset_name` and `owner_name` are `NULL`, then the procedure records the column (group) usage information for the statements executed in the system in next `time_limit` seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in `SYS.COL_USAGE$`. The procedure stores information in `SYS.COL_GROUP_USAGE$`.

### Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

```
BEGIN
  DBMS_STATS.SEED_COL_USAGE (null,null,300);
END;
```

## 174.7.112 SET\_ADVISOR\_TASK\_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

### Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (
  task_name      IN   VARCHAR2,
  parameter      IN   VARCHAR2,
  value          IN   VARCHAR2);
```

### Parameters

**Table 174-119 SET\_ADVISOR\_TASK\_PARAMETER Procedure Parameters**

| Parameter | Description                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------|
| task_name | The name of the Optimizer Statistics Advisor task.                                                         |
| parameter | The name of the parameter to set. The function returns an error if the specified parameter does not exist. |
| value     | The new value of the parameter.                                                                            |

### Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

### Exceptions

- `ORA-20000: Insufficient privileges`
- `ORA-20001: Invalid input values`
- `ORA-20012: Optimizer Statistics Advisor errors`

## 174.7.113 SET\_COLUMN\_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is `NULL`, the statistics type associated with the index or column is stored.

## Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    colname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    distcnt           NUMBER DEFAULT NULL,
    density            NUMBER DEFAULT NULL,
    nullcnt           NUMBER DEFAULT NULL,
    srec              StatRec DEFAULT NULL,
    avgclen           NUMBER DEFAULT NULL,
    flags             NUMBER DEFAULT NULL,
    statown           VARCHAR2 DEFAULT NULL,
    no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force             BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    colname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    ext_stats         RAW,
    stattypown        VARCHAR2 DEFAULT NULL,
    stattypname       VARCHAR2 DEFAULT NULL,
    statown           VARCHAR2 DEFAULT NULL,
    no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force             BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-120 SET\_COLUMN\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname     | Name of the schema.                                                                                                                                                       |
| tabname     | Name of the table to which this column belongs.                                                                                                                           |
| colname     | Name of the column or extension                                                                                                                                           |
| partname    | Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level. |
| stattab     | User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.                 |
| statid      | Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)                                                           |
| ext_stats   | User-defined statistics                                                                                                                                                   |
| stattypown  | Schema of the statistics type                                                                                                                                             |
| stattypname | Name of the statistics type                                                                                                                                               |

**Table 174-120 (Cont.) SET\_COLUMN\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| distcnt       | Number of distinct values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| density       | Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| nullcnt       | Number of NULLs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| srec          | StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| avgclen       | Average length for the column (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| flags         | For internal Oracle use (should be left as NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| statown       | Schema containingstattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| force         | Sets the values even if statistics of the column are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent input values

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

## 174.7.114 SET\_DATABASE\_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can be included by passing TRUE for the add\_sys parameter.

### Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (  
    pname          IN    VARCHAR2,  
    pvalue         IN    VARCHAR2,  
    add_sys        IN    BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 174-121 SET\_DATABASE\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| pvalue    | Preference value. If NULL is specified, it will set the Oracle default values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| add_sys   | Value TRUE will include the Oracle-owned tables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 174-122 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> </li> <li>ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> </li> <li>HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CASCADE                   | Determines whether to collect index statistics as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DEGREE                    | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ESTIMATE_PERCENT          | <p>Determines the percentage of rows to sample.</p> <p>The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 174-122 (Cont.) Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> <li>• <b>SHARED</b> — All sessions see the same set of statistics</li> <li>• <b>SESSION</b> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GRANULARITY             | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <b>ALL</b> — Gathers all statistics: subpartition, partition, and global.</li> <li>• <b>AUTO</b> — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• <b>DEFAULT</b> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <b>GLOBAL AND PARTITION</b> for this functionality.</li> <li>• <b>GLOBAL</b> — Gathers global statistics.</li> <li>• <b>GLOBAL AND PARTITION</b> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• <b>PARTITION</b> — Gathers partition-level statistics.</li> <li>• <b>SUBPARTITION</b> — Gathers subpartition-level statistics.</li> </ul>                                                                                                                  |
| INCREMENTAL             | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The <b>INCREMENTAL</b> value for the partitioned table is set to <b>TRUE</b>.</li> <li>• The <b>PUBLISH</b> value for the partitioned table is set to <b>TRUE</b>.</li> <li>• The user specifies <b>AUTO_SAMPLE_SIZE</b> for <b>ESTIMATE_PERCENT</b> and <b>AUTO</b> for <b>GRANULARITY</b> when gathering statistics on the table.</li> </ul> <p>If the <b>INCREMENTAL</b> value for the partitioned table was set to <b>FALSE</b> (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |

**Table 174-122 (Cont.) Statistics Preferences**

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"><li><b>PARTITION</b> — Gathers partition-level synopses.<br/>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li><li><b>TABLE</b> — Gathers table-level synopses.<br/>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li></ul> |

**Table 174-122 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p> |

**Table 174-122 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| METHOD_OPT                     | <p>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>The size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <p>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</p> <p>REPEAT — Collects histograms only on the columns that already have histograms.</p> <p>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</p> <p>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</p> <p>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p> |
| NO_INVALIDATE                  | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors.</p> <p>If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| OPTIONS                        | <p>Specifies which objects require statistics to be gathered. Valid values are as follows:</p> <ul style="list-style-type: none"> <li>GATHER — Gathers statistics on all objects in the database. This is the default.</li> <li>GATHER AUTO — Gathers all necessary statistics automatically. This is the default.</li> </ul> <p>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li>TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li>FALSE — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 174-122 (Cont.) Statistics Preferences**

| Preference          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PUBLISH             | Determines whether the database publishes newly gathered statistics after the gathering job completes.<br><br>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.                                                                                                                                                                                                                              |
| STALE_PERCENT       | Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.<br><br>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.                                                                                                                                                       |
| STAT_CATEGORY       | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported: <ul style="list-style-type: none"><li>• <code>OBJECT_STATS</code> - table statistics, column statistics and index statistics (default)</li><li>• <code>SYNOPSIS</code> - information to support incremental statistics</li></ul> The value ' <code>OBJECT_STATS, SYNOPSIS</code> ' specifies table statistics, column statistics, index statistics, and synopses. |
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.                                                                                                                                                                                                                                                                                                                                                       |

### Security Model

To run this procedure, you must have the `SYSDBA` role or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

### Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

### Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

## 174.7.115 SET\_GLOBAL\_PREFS Procedure

This procedure sets statistics preferences at the global level.

### Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

### Parameters

**Table 174-123 SET\_GLOBAL\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> <li>• APPROXIMATE_NDV_ALGORITHM</li> <li>• AUTO_STAT_EXTENSIONS</li> <li>• AUTO_TASK_STATUS</li> <li>• AUTO_TASK_MAX_RUN_TIME</li> <li>• AUTO_TASK_INTERVAL</li> <li>• AUTOSTATS_TARGET</li> <li>• CASCADE</li> <li>• CONCURRENT</li> <li>• DEGREE</li> <li>• ESTIMATE_PERCENT</li> <li>• GLOBAL_TEMP_TABLE_STATS</li> <li>• GRANULARITY</li> <li>• INCREMENTAL</li> <li>• INCREMENTAL_LEVEL</li> <li>• INCREMENTAL_STALENESS</li> <li>• METHOD_OPT</li> <li>• NO_INVALIDATE</li> <li>• OPTIONS</li> <li>• PREFERENCE_OVERRIDES_PARAMETER</li> <li>• PUBLISH</li> <li>• STALE_PERCENT</li> <li>• STAT_CATEGORY</li> <li>• TABLE_CACHED_BLOCKS</li> <li>• WAIT_TIME_TO_UPDATE_STATS</li> </ul> |
| pvalue    | Preference value. If NULL is specified, it will set the Oracle default values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 174-124 Global Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered. You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF— The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AUTO_TASK_STATUS          | <p>Enables or disables the high-frequency automatic optimizer statistics collection. Values are:</p> <ul style="list-style-type: none"> <li>ON — Enables high-frequency automatic optimizer statistics collection.</li> <li>OFF — Disables high-frequency automatic optimizer statistics collection. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| AUTO_TASK_MAX_RUN_TIME | Configures the maximum runtime in seconds of an execution of the the high-frequency automatic statistics collection. The default is 3600 but varies among Oracle Database platforms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| AUTO_TASK_INTERVAL     | Specifies the interval in seconds between executions of high-frequency automatic optimizer statistics collection. The minimum value is 60. The default is 900 (equal to 15 minutes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| AUTOSTATS_TARGET       | <p>Controls the objects considered for statistics collection. It takes the following values:</p> <ul style="list-style-type: none"> <li>'ALL' - Statistics collected for all objects in system</li> <li>'ORACLE' - Statistics collected for all Oracle owned objects</li> <li>'AUTO' - Oracle decides on which objects to collect statistics</li> </ul> <p>This preference is applicable only for automatic statistics collection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CASCADE                | Determines whether to collect index statistics as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CONCURRENT             | <p>Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are:</p> <ul style="list-style-type: none"> <li>MANUAL — Concurrency is enabled only for manual statistics gathering.</li> <li>AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering.</li> <li>ALL — Concurrency is enabled for both manual and automatic statistics gathering.</li> <li>OFF — Concurrency is disabled for both manual and automatic statistics.</li> </ul> <p>Note the following guidelines: The <code>CONCURRENT</code> preference determines whether statistics are gathered concurrently when the user issues <code>GATHER_*_STATS</code> procedures. <code>DBMS_STATS</code> can collect statistics for a single object in parallel based on the value of the <code>DEGREE</code> parameter. However, parallelism is limited to one object. The <code>CONCURRENT</code> preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers. To gather statistics concurrently, Resource Manager must be enabled, and the setting for the <code>JOB_QUEUE_PROCESSES</code> initialization parameter must be at least 4.</p> |
| DEGREE                 | Determines the degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTIMATE_PERCENT        | <p>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GLOBAL_TEMP_TABLE_STATS | <p>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</p> <ul style="list-style-type: none"> <li>• <code>SHARED</code> — All sessions see the same set of statistics</li> <li>• <code>SESSION</code> — Statistics gathered by the <code>GATHER_TABLE_STATS</code> procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| GRANULARITY             | <p>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>ALL</code> — Gathers all statistics: subpartition, partition, and global.</li> <li>• <code>AUTO</code> — Determines the granularity based on the partitioning type. This is the default value.</li> <li>• <code>DEFAULT</code> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <code>GLOBAL AND PARTITION</code> for this functionality.</li> <li>• <code>GLOBAL</code> — Gathers global statistics.</li> <li>• <code>GLOBAL AND PARTITION</code> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</li> <li>• <code>PARTITION</code> — Gathers partition-level statistics.</li> <li>• <code>SUBPARTITION</code> — Gathers subpartition-level statistics.</li> </ul> |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | <p>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan.</p> <p>When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</p> <ul style="list-style-type: none"> <li>• The INCREMENTAL value for the partitioned table is set to TRUE.</li> <li>• The PUBLISH value for the partitioned table is set to TRUE.</li> <li>• The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</p> <ul style="list-style-type: none"> <li>• PARTITION — Gathers partition-level synopses.<br/>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</li> <li>• TABLE — Gathers table-level synopses.<br/>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</li> </ul>                                                                                                                                              |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS,USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value <code>NULL</code>, whereas the second sets the preference to the default, which is <code>ALLOW_MIXED_FORMAT</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| METHOD_OPT    | <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]<br/>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY} <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT: Collects histograms only on the columns that already have histograms</li> <li>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name: name of a column</li> <li>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> </li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is <code>DBMS_STATS.AUTO_INVALIDATE</code>, which means the database decides when to invalidate dependent cursors.</p> <p>If set to <code>TRUE</code>, then the database not invalidate dependent cursors. If set to <code>FALSE</code>, then the procedure invalidates dependent cursors immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STAT_CATEGORY                  | <p>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</p> <ul style="list-style-type: none"> <li><code>OBJECT_STATS</code> — table statistics, column statistics and index statistics (default)</li> <li><code>SYNOPSIS</code> — information to support incremental statistics</li> <li><code>REALTIME_STATS</code> — specifies only real-time statistics.</li> </ul> <p>The value '<code>OBJECT_STATS</code>, <code>SYNOPSIS</code>' specifies table statistics, column statistics, index statistics, and synopses.</p>                                                                                                                                                                                |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 174-124 (Cont.) Global Statistics Preferences**

| Preference                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>WAIT_TIME_TO_UPDATE_STATS</code> | Specifies the number of minutes to wait before timing out on locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default is 0.0033 minutes (approximately 0.2 seconds). A lock request may fail if other locks exist on the same object, in which case the system retries the request up to 100 times. Each retry includes a brief sleep interval, with a total sleep time of up to 990 seconds. In the worst-case scenario of 100 retries and a 0.2 second wait per attempt, the total wait time can reach approximately 16.8 minutes (990 + 0.2×100 seconds). A value of 0 results in a minimum combined wait and sleep time of 990 seconds. |

### Security Model

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

### Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

### Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

### Example 174-16 Overriding Statistics Preferences at the Global Level

You use the `SET_GLOBAL_PREFS` procedure to set the `ESTIMATE_PERCENT` preference to 5 for every table in the database that does not have a table preference set. Because `sh.costs` does not have a preference set, the global setting applies to this table.

```
SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');
```

PL/SQL procedure successfully completed.

You use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to true for the `sh.sales` table only.

```
SQL> EXEC
DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRUE
');
```

PL/SQL procedure successfully completed.

A script attempts to set `ESTIMATE_PERCENT` to 10 when gathering statistics for `sh.sales`. However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, and because a

global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

```
SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs', ESTIMATE_PERCENT=>10);
```

PL/SQL procedure successfully completed.

### Example 174-17 Configuring High-Frequency Automatic Optimizer Statistics Collection

Oracle Database 19c introduces high-frequency automatic optimizer statistics collection. This lightweight task periodically gathers statistics for stale objects. The default interval is 15 minutes. In contrast to the automated statistics collection job, the high-frequency task does not perform actions such as purging statistics for non-existent objects or invoking Optimizer Statistics Advisor.

In this example, you enable high-frequency collection, set its maximum run time to a half hour, and then set the frequency interval to 10 minutes:

```
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_STATUS','ON');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_MAX_RUN_TIME','1800');
EXEC DBMS_STATS.SET_GLOBAL_PREFS('AUTO_TASK_INTERVAL','600');
```

## 174.7.116 SET\_INDEX\_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

### Syntax

```
DBMS_STATS.SET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          NUMBER DEFAULT NULL,
    numblks          NUMBER DEFAULT NULL,
    numdist          NUMBER DEFAULT NULL,
    avglblk          NUMBER DEFAULT NULL,
    avgdblk          NUMBER DEFAULT NULL,
    clstfct          NUMBER DEFAULT NULL,
    indlevel         NUMBER DEFAULT NULL,
```

```

flags          NUMBER      DEFAULT NULL,
statown        VARCHAR2    DEFAULT NULL,
no_invalidate  BOOLEAN     DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
guesssq        NUMBER      DEFAULT NULL,
cachedblk      NUMBER      DEFAULT NULL,
cachehit       NUMBER      DEFUALT NULL,
force          BOOLEAN     DEFAULT FALSE);

```

Use the following syntax for user-defined domain index statistics:

```

DBMS_STATS.SET_INDEX_STATS (
    ownname      VARCHAR2,
    indname      VARCHAR2,
    partname     VARCHAR2  DEFAULT NULL,
    stattab      VARCHAR2  DEFAULT NULL,
    statid       VARCHAR2  DEFAULT NULL,
    ext_stats    RAW,
    stattypown   VARCHAR2  DEFAULT NULL,
    stattypname  VARCHAR2  DEFAULT NULL,
    statown      VARCHAR2  DEFAULT NULL,
    no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
    force        BOOLEAN   DEFAULT FALSE);

```

## Parameters

**Table 174-125 SET\_INDEX\_STATS Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname     | Name of the schema                                                                                                                                                                                      |
| indname     | Name of the index                                                                                                                                                                                       |
| partname    | Name of the index partition in which to store the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global index level. |
| stattab     | User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.                    |
| statid      | Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code> )                                                 |
| ext_stats   | User-defined statistics                                                                                                                                                                                 |
| stattypown  | Schema of the statistics type                                                                                                                                                                           |
| stattypname | Name of the statistics type                                                                                                                                                                             |
| numrows     | Number of rows in the index (partition)                                                                                                                                                                 |
| numlblks    | Number of leaf blocks in the index (partition)                                                                                                                                                          |
| numdist     | Number of distinct keys in the index (partition)                                                                                                                                                        |
| avglblk     | Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from <code>numlblks</code> and <code>numdist</code> . |

**Table 174-125 (Cont.) SET\_INDEX\_STATS Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| avgdblk       | Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.                                                                                                                                                                                                                                                                                                                                                                                                           |
| clstfct       | See clustering_factor column of the all_indexes view for a description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| indlevel      | Height of the index (partition)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| flags         | For internal Oracle use (should be left as NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| statown       | Schema containingstattab (if different than ownname)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| no_invalidate | Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| guesssq       | Guess quality. See the pct_direct_access column of the all_indexes view for a description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| cachedblk     | Internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| cachehit      | Internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| force         | Sets the values even if statistics of the index are locked                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

### Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

## 174.7.117 SET\_PARAM Procedure

This deprecated procedure sets default values for parameters of DBMS\_STATS procedures.

#### Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET\\_GLOBAL\\_PREFS Procedure](#).

See also [DBMS\\_STATS Deprecated Subprograms](#).

You can use the GET\_PARAM Function to get the current default value of a parameter.

#### Syntax

```
DBMS_STATS.SET_PARAM (  
  pname      IN    VARCHAR2,  
  pval       IN    VARCHAR2);
```

## Parameters

**Table 174-126 SET\_PARAM Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>The parameter name. The default value for following parameters can be set.</p> <ul style="list-style-type: none"> <li>CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures. It is used only by gather procedures.</li> <li>DEGREE</li> <li>ESTIMATE_PERCENT</li> <li>METHOD_OPT</li> <li>NO_INVALIDATE</li> <li>GRANULARITY</li> <li>AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)</li> </ul> |
| pval      | <p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> <li>'ALL' - Statistics are collected for all objects in the system</li> <li>'ORACLE' - Statistics are collected for all Oracle owned objects</li> <li>'AUTO' - Oracle decides for which objects to collect statistics</li> </ul>                                                                                                                                            |

## Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':
  - When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  - In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

## 174.7.118 SET\_PROCESSING\_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

### Syntax

```
DBMS_STATS.SET_PROCESSING_RATE (  
    opname      IN    VARCHAR2,  
    procrate    IN    NUMBER);
```

### Parameters

**Table 174-127 SET\_PROCESSING\_RATE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| opname    | Name of the operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| procrate  | Processing rate. Valid values are as follows: <ul style="list-style-type: none"><li>• AGGR</li><li>• ALL</li><li>• CPU</li><li>• CPU_ACCESS</li><li>• CPU_AGGR</li><li>• CPU_BYTES_PER_SEC</li><li>• CPU_FILTER</li><li>• CPU_GBY</li><li>• CPU_HASH_JOIN</li><li>• CPU_JOIN</li><li>• CPU_NL_JOIN</li><li>• CPU_RANDOM_ACCESS</li><li>• CPU_SEQUENTIAL_ACCESS</li><li>• CPU_SM_JOIN</li><li>• CPU_SORT</li><li>• HASH</li><li>• IO</li><li>• IO_ACCESS</li><li>• IO_BYTES_PER_SEC</li><li>• IO_RANDOM_ACCESS</li><li>• IO_SEQUENTIAL_ACCESS</li><li>• MEMCMP</li><li>• MEMCPY</li></ul> |

### Security Model

You must have the `OPTIMIZER_PROCESSING_RATE` role to run this procedure.

### Usage Notes

`AUTO DOP` uses processing rates to determine the optimal degree of parallelism for a SQL statement.

## Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## 174.7.119 SET\_SCHEMA\_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

### Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

### Parameters

**Table 174-128 SET\_SCHEMA\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| pname     | <p>Preference name. You can set the default value for the following preferences:</p> <ul style="list-style-type: none"> <li>AUTO_STAT_EXTENSIONS</li> <li>CASCADE</li> <li>DEGREE</li> <li>ESTIMATE_PERCENT</li> <li>GLOBAL_TEMP_TABLE_STATS</li> <li>GRANULARITY</li> <li>INCREMENTAL</li> <li>INCREMENTAL_LEVEL</li> <li>INCREMENTAL_STALENESS</li> <li>METHOD_OPT</li> <li>NO_INVALIDATE</li> <li>OPTIONS</li> <li>PREFERENCE_OVERRIDES_PARAMETER</li> <li>PUBLISH</li> <li>STALE_PERCENT</li> <li>TABLE_CACHED_BLOCKS</li> </ul> |
| pvalue    | Preference value. If NULL is specified, it sets the database default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 174-129 Statistics Preferences

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| AUTO_STAT_EXTENSIONS    | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can set the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG <p>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</p> </li> <li>ADAPTIVE SAMPLING <p>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</p> </li> <li>HYPERLOGLOG <p>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</p> <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| CASCADE                 | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DEGREE                  | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ESTIMATE_PERCENT        | Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| GLOBAL_TEMP_TABLE_STATS | <p>This preference takes the following values:</p> <ul style="list-style-type: none"> <li>SHARED - All sessions see the same set of statistics</li> <li>SESSION - Statistics gathered by the <a href="#">GATHER_TABLE_STATS Procedure</a> on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 174-129 (Cont.) Statistics Preferences

| Preference  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GRANULARITY | <p>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>                                                                                 |
| INCREMENTAL | <p>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>• INCREMENTAL value for the partitioned table is set to TRUE</li> <li>• PUBLISH value for the partitioned table is set to TRUE;</li> <li>• User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> |

Table 174-129 (Cont.) Statistics Preferences

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_LEVEL | <p>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none"><li>• <b>TABLE</b> - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run <code>GATHER_TABLE_STATS</code> on this table with <code>INCREMENTAL</code> to <code>TRUE</code> and <code>INCREMENTAL_LEVEL</code> to <code>TABLE</code> before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the <a href="#">SET_TABLE_PREFS Procedure</a>. It is not allowed in the <code>SET_GLOBAL/DATABASE/SCHEMA_PREFS</code> procedures.</li><li>• <b>PARTITION</b> - partition level synopses are gathered. This is the default value. If <code>PARTITION</code> is set on a non partitioned table, no synopses are gathered.</li></ul> |

**Table 174-129 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales',  'INCREMENTAL_STALENESS', 'NULL'); EXEC DBMS_STATS.SET_TABLE_PREFS</pre> |

Table 174-129 (Cont.) Statistics Preferences

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>( 'sh', 'sales',   'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| METHOD_OPT    | <p>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name : name of a column</li> <li>- extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 174-129 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                      |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10%. Note that if you set <code>stale_percent</code> to zero the <code>AUTO STATS</code> gathering job will gather statistics for this table every time a row in the table is modified.</p>                                                                                                                                                                                                                                                                                                                           |
| TABLE_CACHED_BLOCKS            | <p>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Security Model**

To run this procedure, you must be the schema owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

## Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

## Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH','DEGREE','99');
```

## 174.7.120 SET\_SYSTEM\_STATS Procedure

This procedure sets systems statistics.

## Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
    pname          VARCHAR2,
    pvalue         NUMBER,
    stattab        IN   VARCHAR2 DEFAULT NULL,
    statid         IN   VARCHAR2 DEFAULT NULL,
    statown        IN   VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 174-130 SET\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>The parameter name to get, which can have one of the following values:</p> <ul style="list-style-type: none"> <li>iotfrspeed—I/O transfer speed in bytes for each millisecond</li> <li>ioseektim - Seek time + latency time + operating system overhead time, in milliseconds</li> <li>sreadtim - Average time to read single block (random read), in milliseconds</li> <li>mreadtim - Average time to read an mbrc block at once (sequential read), in milliseconds</li> <li>cpuspeed - Average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</li> <li>cpuspeednw - Average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option.</li> <li>mbrc - Average multiblock read count for sequential read, in blocks</li> <li>maxthr - Maximum I/O system throughput, in bytes/second</li> <li>slavethr - Average slave I/O throughput, in bytes/second</li> </ul> |
| pvalue    | Parameter value to get                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 174-130 (Cont.) SET\_SYSTEM\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| stattab   | Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary. |
| statid    | Optional identifier associated with the statistics saved in the stattab                                                                                 |
| statown   | Schema containing stattab (if different from current schema)                                                                                            |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to set system statistics

ORA-20004: Parameter does not exist

**Usage Notes**

To run this procedure, you need the GATHER\_SYSTEM\_STATISTICS role.

## 174.7.121 SET\_TABLE\_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

**Syntax**

```
DBMS_STATS.SET_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tablename  IN  VARCHAR2,  
    pname      IN  VARCHAR2,  
    pvalue     IN  VARCHAR2);
```

**Parameters****Table 174-131 SET\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ownname   | Owner name  |
| tablename | Table name  |

**Table 174-131 (Cont.) SET\_TABLE\_PREFS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pname     | <p>Preference name. You can set the default value for following preferences:</p> <ul style="list-style-type: none"><li>• APPROXIMATE_NDV_ALGORITHM</li><li>• AUTO_STAT_EXTENSIONS</li><li>• CASCADE</li><li>• DEGREE</li><li>• ESTIMATE_PERCENT</li><li>• GRANULARITY</li><li>• INCREMENTAL</li><li>• INCREMENTAL_LEVEL</li><li>• INCREMENTAL_STALENESS</li><li>• METHOD_OPT</li><li>• NO_INVALIDATE</li><li>• OPTIONS</li><li>• PREFERENCE_OVERRIDES_PARAMETER</li><li>• PUBLISH</li><li>• STALE_PERCENT</li><li>• TABLE_CACHED_BLOCKS</li></ul> |
| pvalue    | <p>Preference value. If NULL is specified, it will set the Oracle default value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 174-132 Statistics Preferences**

| Preference                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPROXIMATE_NDV_ALGORITHM | <p>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</p> <p>You can specify the following preferences:</p> <ul style="list-style-type: none"> <li>REPEAT OR HYPERLOGLOG<br/>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</li> <li>ADAPTIVE SAMPLING<br/>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</li> <li>HYPERLOGLOG<br/>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to adaptive sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are: <ul style="list-style-type: none"> <li>The accuracy of the new algorithm is similar to the original algorithm.</li> <li>The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</li> </ul> </li> </ul> |
| AUTO_STAT_EXTENSIONS      | <p>Controls the automatic creation of extensions when database statistics are gathered.</p> <p>You can set the following values:</p> <ul style="list-style-type: none"> <li>ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</li> <li>OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CASCADE                   | <p>Determines whether to collect index statistics as part of gathering table statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 174-132 (Cont.) Statistics Preferences**

| Preference              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONCURRENT              | <p>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</p> <ul style="list-style-type: none"> <li>'MANUAL' - Concurrency will be turned on only for manual statistics gathering.</li> <li>'AUTOMATIC': Concurrency will be turned on only for the automatic statistics gathering.</li> <li>'ALL': Concurrency will be turned on for both manual and automatic statistics gathering.</li> <li>'OFF': Concurrency will be turned off for both manual and automatic statistics</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |
| DEGREE                  | <p>Determines degree of parallelism used for gathering statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ESTIMATE_PERCENT        | <p>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| GLOBAL_TEMP_TABLE_STATS | <p>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</p> <ul style="list-style-type: none"> <li>SHARED - All sessions see the same set of statistics</li> <li>SESSION - Statistics gathered by the <a href="#">GATHER_TABLE_STATS Procedure</a> on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</li> </ul>                                                                                                                                                                                                                                                                                                                                  |
| GRANULARITY             | <p>Determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - Gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - Gathers global statistics</p> <p>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - Gathers partition-level statistics</p> <p>'SUBPARTITION' - Gathers subpartition-level statistics.</p> |

**Table 174-132 (Cont.) Statistics Preferences**

| Preference        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL       | <p>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> <li>INCREMENTAL value for the partitioned table is set to TRUE;</li> <li>PUBLISH value for the partitioned table is set to TRUE;</li> <li>User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</li> </ul> <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</p> |
| INCREMENTAL_LEVEL | <p>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</p> <ul style="list-style-type: none"> <li>TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the <a href="#">SET_TABLE_PREFS Procedure</a>. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.</li> <li>PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.</li> </ul>                    |

**Table 174-132 (Cont.) Statistics Preferences**

| Preference            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INCREMENTAL_STALENESS | <p>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT,USE_LOCKED_STATS,ALLOW_MIXED_FORMAT'.</p> <p>The parameter accepts the following values:</p> <ul style="list-style-type: none"> <li>• <b>USE_STALE_PERCENT</b>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference.<br/>For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics.<br/>Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</li> <li>• <b>USE_LOCKED_STATS</b>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</li> <li>• <b>ALLOW_MIXED_FORMAT</b>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</li> <li>• <b>NULL</b>—A partition or subpartition is considered stale when it has any DML changes.<br/>For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</li> </ul> |

**Table 174-132 (Cont.) Statistics Preferences**

| Preference    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p>Note that the following two executions are different:</p> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</pre> <pre>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</pre> <p>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| METHOD_OPT    | <p>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> <li>FOR ALL [INDEXED   HIDDEN] COLUMNS [size_clause]</li> </ul> <p>size_clause is defined as size_clause := SIZE {integer   REPEAT   AUTO   SKEWONLY}</p> <ul style="list-style-type: none"> <li>- integer: Number of histogram buckets. Must be in the range [1,2048].</li> <li>- REPEAT : Collects histograms only on the columns that already have histograms</li> <li>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</li> <li>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns</li> <li>- column_name: name of a column</li> <li>- extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression</li> </ul> <p>The default is FOR ALL COLUMNS SIZE AUTO.</p> |
| NO_INVALIDATE | <p>Indicates whether to invalidate dependent cursors. If this parameter is set to TRUE, then the procedure does not invalidate dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let Oracle Database decide when to invalidate dependent cursors. This is the default.</p> <p>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a>, <a href="#">SET_GLOBAL_PREFS Procedure</a>, <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 174-132 (Cont.) Statistics Preferences**

| Preference                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIONS                        | <p>Determines the <code>options</code> parameter used in the <code>GATHER_TABLE_STATS</code> procedure. The preference takes the following values:</p> <ul style="list-style-type: none"> <li><code>GATHER</code> — Gathers statistics for all objects in the table. This is the default.</li> <li><code>GATHER AUTO</code> — Gathers all necessary statistics automatically. Oracle recommends setting <code>GATHER AUTO</code> on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have <code>INCREMENTAL</code> enabled. Running <code>GATHER_TABLE_STATS</code> procedure on these tables with the <code>GATHER AUTO</code> option skips regathering the already fresh statistics.</li> </ul> |
| PREFERENCE_OVERRIDES_PARAMETER | <p>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</p> <ul style="list-style-type: none"> <li><code>TRUE</code> — Ignores input parameter values, and uses the value of the corresponding preference.</li> <li><code>FALSE</code> — Obeys input parameter values.</li> </ul> <p>Specifying this preference does not change the order of precedence of table, global, and default.</p>                                                                                                                                                                                                                                                                       |
| PUBLISH                        | <p>Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| STALE_PERCENT                  | <p>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</p> <p>The valid domain for <code>stale_percent</code> is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

**Usage Notes**

- To run this procedure, you must connect as owner of the table or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

**Examples**

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

**Example 174-18 Overriding Statistics Preferences**

In this example, legacy scripts set `ESTIMATE_PERCENT` explicitly rather than using the recommended `AUTO_SAMPLE_SIZE`. Your goal is to prevent users from using these scripts to set preferences on the `sh.costs` table.

No preference for `ESTIMATE_PERCENT` is set for `sh.costs` or at the global level, so the preference defaults to `AUTO_SAMPLE_SIZE`:

```
SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS
"STAT_PREFS" FROM DUAL;
```

```
STAT_PREFS
-----
DBMS_STATS.AUTO_SAMPLE_SIZE
```

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use `SET_TABLE_PREFS` to set the `PREFERENCE_OVERRIDES_PARAMETER` preference to `TRUE` for the `costs` table only:

```
EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs',
'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');
```

A user-created script attempts to set `estimate_percent` to 100 when gathering statistics for `sh.costs`.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs', ESTIMATE_PERCENT=>100);
```

However, because `PREFERENCE_OVERRIDES_PARAMETER` is `TRUE` for this table, Oracle Database gathers statistics using `AUTO_SAMPLE_SIZE`, which is the default, rather than the specified value of 100.

## 174.7.122 SET\_TABLE\_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

**Syntax**

```
DBMS_STATS.SET_TABLE_STATS (
    ownname          VARCHAR2,
    tabname           VARCHAR2,
    partname          VARCHAR2 DEFAULT NULL,
    stattab           VARCHAR2 DEFAULT NULL,
    statid            VARCHAR2 DEFAULT NULL,
    numrows           NUMBER    DEFAULT NULL,
    numblks           NUMBER    DEFAULT NULL,
```

```

avgrlen      NUMBER    DEFAULT NULL,
flags        NUMBER    DEFAULT NULL,
statown      VARCHAR2  DEFAULT NULL,
no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
cachedblk    NUMBER    DEFAULT NULL,
cachehit     NUMBER    DEFAULT NULL,
force        BOOLEAN   DEFAULT FALSE,
im_imcu_count NUMBER    DEFAULT NULL,
im_block_count NUMBER    DEFAULT NULL,
scanrate     NUMBER    DEFAULT NULL);

```

## Parameters

**Table 174-133 SET\_TABLE\_STATS Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname        | Name of the schema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| tablename      | Name of the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| partname       | Name of the table partition in which to store the statistics. If the table is partitioned and <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global table level.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| stattab        | Table in which to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the database stores the statistics in the data dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| statid         | Identifier (optional) to associate with these statistics within <code>stattab</code> . This identifier is only relevant if <code>stattab</code> is not <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| numrows        | Number of rows in the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| numblks        | Number of blocks that the table or partition occupies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| avgrlen        | Average row length for the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| flags          | For internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| statown        | Schema containing <code>stattab</code> (if different than <code>ownname</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| no_invalidate  | Indicates whether to invalidate dependent cursors. If this parameter is set to <code>TRUE</code> , then the procedure does not invalidate dependent cursors. If set to <code>FALSE</code> , then the procedure invalidates the dependent cursors immediately. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to let Oracle Database decide when to invalidate dependent cursors. This is the default.<br><br>You can change the default using the <a href="#">SET_DATABASE_PREFS Procedure</a> , <a href="#">SET_GLOBAL_PREFS Procedure</a> , <a href="#">SET_SCHEMA_PREFS Procedure</a> and <a href="#">SET_TABLE_PREFS Procedure</a> . |
| cachedblk      | For internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| cachehit       | For internal use only. Do not set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| force          | A flag that determines the behavior when statistics are locked. If <code>TRUE</code> , then the procedure sets the values even if the table statistics are locked. By default, the setting is <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                    |
| im_imcu_count  | The number of In-Memory Compression Units (IMCUs) in the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| im_block_count | The number of In-Memory blocks in the table or partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 174-133 (Cont.) SET\_TABLE\_STATS Procedure Parameters**

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| scanrate  | The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables. |

### Security Model

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to upgrade it

ORA-20005: Object statistics are locked

### Usage Notes

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

#### Note:

The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.

- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the database does not have one major workload, resulting in averages that do not correspond to real values

## 174.7.123 SHOW\_EXTENDED\_STATS\_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

### Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 174-134** SHOW\_EXTENDED\_STATS\_NAME Function Parameters

| Parameter | Description                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table                                                                                                                                                                     |
| tabname   | Name of the table                                                                                                                                                                         |
| extension | Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)". |

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.124 TRANSFER\_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

### Syntax

```
DBMS_STATS.TRANSFER_STATS (  
    ownname      IN      VARCHAR2,  
    tabname      IN      VARCHAR2,  
    dblink       IN      VARCHAR2,  options      IN      NUMBER DEFAULT NULL);
```

### Parameters

**Table 174-135 TRANSFER\_STATS Procedure Parameters**

| Parameter | Description                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| ownname   | Owner name of a table. If <code>NULL</code> all schemas in the database. If <code>NULL</code> , the procedure will transfer global preferences as well. |
| tabname   | Name of the table. If <code>NULL</code> , all tables in <code>OWNNAME</code> .                                                                          |
| dblink    | Database link name                                                                                                                                      |
| options   | By default the procedure does not transfer the global preferences. Specifying <code>ADD_GLOBAL_PREFS</code> copies global preferences.                  |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.125 UNLOCK\_PARTITION\_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

### Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (  
    ownname      VARCHAR2,  
    tabname      VARCHAR2,  
    partname     VARCHAR2);
```

### Parameters

**Table 174-136 UNLOCK\_PARTITION\_STATS Procedure Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| ownname   | Name of the schema to unlock |
| tabname   | Name of the table            |
| partname  | [Sub]Partition name          |

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

## 174.7.126 UNLOCK\_SCHEMA\_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

### Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
    ownname    VARCHAR2);
```

### Parameters

**Table 174-137 UNLOCK\_SCHEMA\_STATS Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |

### Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 174.7.127 UNLOCK\_TABLE\_STATS Procedure

This procedure unlocks the statistics on the table.

### Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2);
```

## Parameters

**Table 174-138 UNLOCK\_TABLE\_STATS Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| tabname   | Name of the table  |

## Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the [UNLOCK\\_SCHEMA\\_STATS Procedure](#) nor the [UNLOCK\\_TABLE\\_STATS Procedure](#) is designed to unlock statistics of corresponding partitions. When you invoke the [LOCK\\_TABLE\\_STATS Procedure](#), it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the [LOCK\\_PARTITION\\_STATS Procedure](#).

## 174.7.128 UPGRADE\_STAT\_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

## Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (  
    ownname    VARCHAR2,  
    stattab    VARCHAR2);
```

## Parameters

**Table 174-139 UPGRADE\_STAT\_TABLE Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| ownname   | Name of the schema |
| stattab   | Name of the table  |

## Exceptions

ORA-20000: Unable to upgrade table

### Usage Notes

To invoke this procedure you need the privileges to drop and create a table.

# DBMS\_STORAGE\_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Overview](#)
- [Operational Notes](#)
- [Summary of DBMS\\_STORAGE\\_MAP Subprograms](#)

## 175.1 DBMS\_STORAGE\_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

### See Also:

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for `V$MAP` views, including `V$MAP_FILE`, `V$MAP_ELEMENT`, `V$MAP_SUBELEMENT`, `V$MAP_FILE_EXTENT`

## 175.2 DBMS\_STORAGE\_MAP Operational Notes

Invoking the `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL` functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

### See Also:

*Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

## 175.3 Summary of DBMS\_STORAGE\_MAP Subprograms

This table lists the `DBMS_STORAGE_MAP` subprograms and briefly describes them.

**Table 175-1 DBMS\_STORAGE\_MAP Package Subprograms**

| Subprogram                            | Description                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DROP_ALL Function</a>     | Drops all mapping information in the shared memory of the instance                                                                             |
| <a href="#">DROP_ELEMENT Function</a> | Drops the mapping information for the element defined by <code>elemname</code>                                                                 |
| <a href="#">DROP_FILE Function</a>    | Drops the file mapping information defined by <code>filename</code>                                                                            |
| <a href="#">LOCK_MAP Procedure</a>    | Locks the mapping information in the shared memory of the instance                                                                             |
| <a href="#">MAP_ALL Function</a>      | Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements |
| <a href="#">MAP_ELEMENT Function</a>  | Builds mapping information for the element identified by <code>elemname</code>                                                                 |
| <a href="#">MAP_FILE Function</a>     | Builds mapping information for the file identified by <code>filename</code>                                                                    |
| <a href="#">MAP_OBJECT Function</a>   | Builds the mapping information for the Oracle object identified by the object name, owner, and type                                            |
| <a href="#">RESTORE Function</a>      | Loads the entire mapping information from the data dictionary into the shared memory of the instance                                           |
| <a href="#">SAVE Function</a>         | Saves information needed to regenerate the entire mapping into the data dictionary                                                             |
| <a href="#">UNLOCK_MAP Procedure</a>  | Unlocks the mapping information in the shared memory of the instance.                                                                          |

### 175.3.1 DROP\_ALL Function

This function drops all mapping information in the shared memory of the instance.

#### Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 175-2 DROP\_ALL Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

## 175.3.2 DROP\_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

### Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(  
    elemname          IN VARCHAR2,  
    cascade            IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 175-3 DROP\_ELEMENT Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| elemname          | The element for which mapping information is dropped.                                                                                                          |
| cascade           | If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by <code>elemname</code> , if possible.                                   |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

## 175.3.3 DROP\_FILE Function

This function drops the file mapping information defined by `filename`.

### Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(  
    filename          IN VARCHAR2,  
    cascade            IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 175-4 DROP\_FILE Function Parameters**

| Parameter | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| filename  | The file for which file mapping information is dropped.                                               |
| cascade   | If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible. |

**Table 175-4 (Cont.) DROP\_FILE Function Parameters**

| Parameter         | Description                                                                                                                                                    |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument. |

## 175.3.4 LOCK\_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP\_ELEMENT and V\$MAP\_SUBELEMENT, for example, may be inconsistent.

### Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

## 175.3.5 MAP\_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

### Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(  
    max_num_fileext IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 175-5 MAP\_ALL Function Parameters**

| Parameter         | Description                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_num_fileext   | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument. |
| dictionary_update | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.                                    |

### Usage Notes

You must explicitly call MAP\_ALL in a cold startup scenario.

## 175.3.6 MAP\_ELEMENT Function

This function builds mapping information for the element identified by elemname. It may not obtain the latest mapping information if the element being mapped, or any one of the elements

within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

### Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(  
    elemname          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 175-6 MAP\_ELEMENT Function Parameters**

| Parameter                      | Description                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>elemname</code>          | The element for which mapping information is built.                                                                                                                                                     |
| <code>cascade</code>           | If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped.                                                                                                          |
| <code>dictionary_update</code> | If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument. |

## 175.3.7 MAP\_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

### Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(  
    filename          IN VARCHAR2,  
    filetype          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    max_num_fileextent IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 175-7 MAP\_FILE Function Parameters**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>filename</code> | The file for which mapping information is built.                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>filetype</code> | Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".                                                                                                                                                                                                                                                                                                           |
| <code>cascade</code>  | Should be <code>TRUE</code> only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an <code>ALTER SYSTEM</code> command or DML operations on extended files), <code>cascade</code> can be set to <code>FALSE</code> because the mapping changes are limited to the file extents only.<br><br>If <code>TRUE</code> , mapping DAGs are also built for the elements where the file resides. |

**Table 175-7 (Cont.) MAP\_FILE Function Parameters**

| Parameter          | Description                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_num_fileextent | Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument. |
| dictionary_update  | If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.                                    |

**Usage Notes**

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is TRUE), is owned by a library that must be explicitly synchronized.

## 175.3.8 MAP\_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

**Syntax**

```
DBMS_STORAGE_MAP.MAP_OBJECT(  
    objname IN VARCHAR2,  
    owner   IN VARCHAR2,  
    objtype IN VARCHAR2);
```

**Parameters****Table 175-8 MAP\_OBJECT Function Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| objname   | The name of the object.  |
| owner     | The owner of the object. |
| objtype   | The type of the object.  |

## 175.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

**Syntax**

```
DBMS_STORAGE_MAP.RESTORE;
```

## 175.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

### Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

## 175.3.11 UNLOCK\_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

### Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

# DBMS\_SYNC\_REFRESH

The `DBMS_SYNC_REFRESH` package provides an interface to perform a synchronous refresh of materialized views.

## See Also:

*Oracle Database Data Warehousing Guide* for more information on using `DBMS_SYNC_REFRESH`

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_SYNC\\_REFRESH Subprograms](#)

## 176.1 DBMS\_SYNC\_REFRESH Overview

Synchronous refresh is a refresh method introduced in Oracle Database Release 12c, which enables you to keep a set of tables and the materialized views defined on them to be always in sync.

## See Also:

*Oracle Database Data Warehousing Guide* for more information about using synchronous refresh

## 176.2 DBMS\_SYNC\_REFRESH Security Model

The execute privilege for this package is granted to `PUBLIC`, so all users can execute the procedures in this package to perform synchronous refresh on objects owned by them. The database administrator can perform synchronous refresh operations on all tables and materialized views in the database.

In general, if a user without the `DBA` privilege wants to use synchronous refresh on another user's table, he must complete privileges to read from and write to that table, that is, the user must have the `SELECT` or `READ`, `INSERT`, `UPDATE`, and `DELETE` privileges on that table or materialized view. A couple of exceptions are:

- `PURGE_REFRESH_STATS` and `ALTER_REFRESH_STATS_RETENTION` Functions

These two functions implement the purge policy and can be used to change the default retention period. These functions can be only be executed by the database administrator.

- The CAN\_SYNCREF\_TABLE Function

This is an advisory function which examines the eligibility for sync refresh of all the materialized views associated with a specified table. Hence, this function requires the SELECT or READ privilege on all materialized views associated with the specified table.

## 176.3 Summary of DBMS\_SYNC\_REFRESH Subprograms

This table lists and briefly describes the DBMS\_SYNC\_REFRESH package subprograms.

**Table 176-1 DBMS\_SYNC\_REFRESH Package Subprograms**

| Subprogram                                               | Description                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">ABORT_REFRESH Procedure</a>                  | Aborts a refresh.                                                                                              |
| <a href="#">ALTER_REFRESH_STATS_RETENTION Procedure</a>  | Alters the refresh history retention value, specified in days.                                                 |
| <a href="#">CAN_SYNCREF_TABLE Procedure</a>              | Advises on whether a table and its dependent materialized views are eligible for synchronous refresh.          |
| <a href="#">EXECUTE_REFRESH Procedure</a>                | Executes synchronous refresh on the synchronous refresh groups.                                                |
| <a href="#">GET_ALL_GROUP_IDS Function</a>               | Returns the group IDs of all the synchronous refresh groups in the database.                                   |
| <a href="#">GET_GROUP_ID Function</a>                    | Returns the group ID of a table or materialized view.                                                          |
| <a href="#">GET_GROUP_ID_LIST Function</a>               | Returns the group IDs of the tables in a given list of objects (tables or materialized views).                 |
| <a href="#">PREPARE_REFRESH Procedure</a>                | Prepares the sync refresh groups for refresh.                                                                  |
| <a href="#">PREPARE_STAGING_LOG Procedure</a>            | Validates and collects statistics on the data in the staging log.                                              |
| <a href="#">PURGE_REFRESH_STATS Procedure</a>            | Purges the refresh history of sync refreshes that took place within a time specified by a timestamp parameter. |

| <a href="#">REGISTER_PARTITION_OPERATION Procedure</a>   | Registers a partition maintenance operation on a partition of a base table.                                    |
| <a href="#">UNREGISTER_MVIEWS</a>                        | Unregisters materialized views from synchronous refresh.                                                       |
| <a href="#">UNREGISTER_PARTITION_OPERATION Procedure</a> | Unregisters a partition maintenance operation on a partition of a base table.                                  |

### 176.3.1 ABORT\_REFRESH Procedure

This procedure undoes all the changes made by PREPARE\_REFRESH or EXECUTE\_REFRESH for the specified sync refresh groups. It helps you to recover to a state where the tables and materialized views are usable and consistent in case they encounter unexpected errors.

This procedure is overloaded.

#### Syntax

```
DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id          IN NUMBER);

DBMS_SYNC_REFRESH.ABORT_REFRESH (
    group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

## Parameters

**Table 176-2 ABORT\_REFRESH Procedure Parameters**

| Parameter     | Description                                                                      |
|---------------|----------------------------------------------------------------------------------|
| group_id      | The group ID of a sync refresh group.                                            |
| group_id_list | An array of group IDs of the sync refresh groups to be aborted for sync refresh. |

## Usage Notes

If called after `PREPARE_REFRESH`, this procedure drops the outside tables created by it and unlocks the tables and materialized views in the sync refresh group.

If called after `EXECUTE_REFRESH` fails, this procedure restores the state of tables to before `EXECUTE_REFRESH` by undoing any partition exchanges which successfully finished.

This procedure releases the locks placed on the tables in the sync refresh group which were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE\\_REFRESH Procedure](#)" for a description of these locks.

`ABORT_REFRESH` will work only if a `PREPARE_REFRESH` or `EXECUTE_REFRESH` statement has failed. It cannot be used after successful runs of those commands, and throws an error in such cases.

## 176.3.2 ALTER\_REFRESH\_STATS\_RETENTION Procedure

This procedure alters the refresh history retention value, specified in days. It is intended for use in conjunction with `PURGE_REFRESH_HISTORY`. It also requires the `SYSDBA` privilege in addition to the privilege to execute it.

## Syntax

```
DBMS_SYNC_REFRESH.ALTER_REFRESH_STATS_RETENTION (  
    retention    IN NUMBER);
```

## Parameters

**Table 176-3 ALTER\_REFRESH\_STATS\_RETENTION Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retention | <p>The retention time in days. The refresh history will be retained for at least these many number of days. The valid range is 1 to 365,000.</p> <p>You can use the following values for special purposes:</p> <ul style="list-style-type: none"><li>• -1 - Refresh history is never purged by <code>PREPARE_REFRESH</code>.</li><li>• 0 - Old refresh history is never saved. <code>PREPARE_REFRESH</code> will delete all refresh history.</li><li>• NULL - Change refresh history retention to default value.</li></ul> |

## 176.3.3 CAN\_SYNCREF\_TABLE Procedure

This procedure advises on whether a table and its dependent materialized views are eligible for sync refresh. It provides an explanation of its analysis. If not eligible, you can examine the reasons and take appropriate action if possible.

This procedure lists all of the table's dependent materialized views and whether they qualify for sync refresh. Note that a materialized view may qualify for sync refresh even though the base table may not.

The eligibility rules for materialized views for synchronous refresh are discussed in detail in *Oracle Database Data Warehousing Guide*.

You can invoke CAN\_SYNCREF\_TABLE in two ways. The first is to use a table, while the second is to create a VARRAY.

### Syntax

```
DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    statement_id   IN VARCHAR2);

DBMS_SYNC_REFRESH.CAN_SYNCREF_TABLE (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    output_array   IN OUT Sys.CanSyncRefTypeArray);
```

Note that only one of `statement_id` or `output_array` need be provided to CAN\_SYNCREF\_TABLE.

### Parameters

**Table 176-4 CAN\_SYNCREF\_TABLE Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schema_name</code>  | The name of the schema of the base table.                                                                                                                                      |
| <code>table_name</code>   | The name of the base table.                                                                                                                                                    |
| <code>statement_id</code> | A string (VARCHAR2(30)) to identify the rows pertaining to an invocation of CAN_SYNCREF_TABLE when the output is directed to a table named SYNCREF_TABLE in the user's schema. |
| <code>output_array</code> | The output array into which CAN_SYNCREF_TABLE records the information on the eligibility of the base table and its dependent materialized views for synchronous refresh.       |

### Using SYNCREF\_TABLE

The output of CAN\_SYNCREF\_TABLE can be directed to a table named SYNCREF\_TABLE. The user is responsible for creating the SYNCREF\_TABLE; it can be dropped when it is no longer needed. Its structure is as follows:

```
CREATE TABLE SYNCREF_TABLE (
    statement_id   VARCHAR2(30),
    schema_name    VARCHAR2(30),
    table_name     VARCHAR2(30),
    mv_schema_name VARCHAR2(30),
```

```
mv_name          VARCHAR2(30),
eligible         VARCHAR2(1),
seq_num         NUMBER,
msg_number      NUMBER,
message         VARCHAR2(4000));
```

### Using a VARRAY

You can save the output of `CAN_SYNCREF_TABLE` in a PL/SQL VARRAY. The elements of this array are of type `CanSyncRefMessage`, which is predefined in the `SYS` schema, as shown in the following:

```
TYPE CanSyncRefMessage IS OBJECT (
    schema_name    VARCHAR2(30),
    table_name     VARCHAR2(30),
    mv_schema_name VARCHAR2(30),
    mv_name        VARCHAR2(30),
    eligible       VARCHAR2(1),
    seq_num        NUMBER,
    msg_number     NUMBER,
    message        VARCHAR2(4000));
```

The array type `CanSyncRefArrayType`, which is a varray of `CanSyncRefMessage` objects, is predefined in the `SYS` schema as follows:

```
TYPE CanSyncRefArrayType AS VARRAY(256) OF CanSyncRefMessage;
```

Each `CanSyncRefMessage` record provides a message concerning the eligibility of the base table or a dependent materialized view for synchronous refresh. The semantics of the fields is the same as that of the corresponding fields in the `SYNCREF_TABLE`. However, the `SYNCREF_TABLE` has a `statement_id` field which is absent in `CanSyncRefMessage` because no `statement_id` is supplied (because it is not required) when `CAN_SYNCREF_TABLE` is called with a VARRAY parameter.

## 176.3.4 EXECUTE\_REFRESH Procedure

This procedure executes sync refresh on the sync refresh groups prepared by `DBMS_SYNC_REFRESH.PREPARE_REFRESH`. These groups are identified by their group IDs.

Note this procedure will only perform the refresh on those materialized views that have been registered for synch refresh; any other materialized views will become stale once this procedure completes.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

This procedure is overloaded.

### Syntax

```
DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id    IN NUMBER);

DBMS_SYNC_REFRESH.EXECUTE_REFRESH (
    group_id_list IN DBMS_UTILITY.NUMBER_ARRAY);
```

## Parameters

**Table 176-5 EXECUTE\_REFRESH Procedure Parameters**

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| group_id      | The group ID of a sync refresh group.                                             |
| group_id_list | An array of group IDs of the sync refresh groups to be executed for sync refresh. |

## Usage Notes

This procedure also releases the locks placed on the tables in the sync refresh group that were placed on them by the `PREPARE_REFRESH` procedure. See "[PREPARE\\_REFRESH Procedure](#)" for a description of these locks and *Oracle Database Reference* for information regarding the status of the refresh operation after `DBMS_SYNC_REFRESH.EXECUTE_REFRESH`.

## 176.3.5 GET\_ALL\_GROUP\_IDS Function

This function returns the group IDs of all the sync refresh groups in the database.

### Syntax

```
FUNCTION DBMS_SYNC_REFRESH.GET_ALL_GROUP_IDS
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

## Parameters

**Table 176-6 GET\_ALL\_GROUP\_IDS Function Parameter**

| Parameter         | Description                                                           |
|-------------------|-----------------------------------------------------------------------|
| get_all_group_ids | Returns the group IDs of all the sync refresh groups in the database. |

## 176.3.6 GET\_GROUP\_ID Function

This function returns the group ID of a materialized view. The group ID identifies the sync refresh group the table belongs to. A sync refresh group is a group of related tables and their dependent materialized views which must be all refreshed together jointly to ensure consistency and correctness.

### Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID (
    object_name_list IN VARCHAR2)
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

## Parameters

**Table 176-7 GET\_GROUP\_ID Function Parameter**

| Parameter        | Description                                                          |
|------------------|----------------------------------------------------------------------|
| object_name_list | The name of the materialized view. The name can be schema-qualified. |

## 176.3.7 GET\_GROUP\_ID\_LIST Function

This function returns the group IDs of the tables in a given list of objects (materialized views).

### Syntax

```
DBMS_SYNC_REFRESH.GET_GROUP_ID_LIST (  
    object_name_list IN VARCHAR2)  
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

### Parameters

**Table 176-8** GET\_GROUP\_ID\_LIST Function Parameter

| Parameter        | Description                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------|
| object_name_list | A comma-separated list of object names (materialized views). Each name can be schema-qualified. |

## 176.3.8 PREPARE\_REFRESH Procedure

This procedure prepares for refresh the sync refresh groups identified by the group ID in the input.

A sync refresh group consists of a set of related tables and all materialized views dependent on those base tables. Note this procedure will only prepare for refresh those dependent materialized views that have been registered for synchronous refresh.

For more information on how to monitor the status of the two synchronous refresh operations, `PREPARE_REFRESH` and `EXECUTE_REFRESH` and how to troubleshoot errors that might occur using the information in the catalog views, refer to "Trouble-Shooting Synchronous Refresh Operations" in *Oracle Database Data Warehousing Guide*.

### Syntax

```
DBMS_SYNC_REFRESH.PREPARE_REFRESH (  
    group_id IN NUMBER)  
RETURN DBMS_UTILITY.NUMBER_ARRAY;
```

### Parameters

**Table 176-9** PREPARE\_REFRESH Procedure Parameters

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| group_id  | The group ID of the sync refresh group to be prepared for sync refresh. |

### Usage Notes

This procedure plans the three phases of the sync refresh operation and executes the steps associated with the prepare phase itself. These steps include identifying the partitions of the fact tables and materialized views that have been changed, and computing their new values as a result of the changes. The new values of the partitions are stored in tables called outside tables that are exchanged into their corresponding partitions at the time of the `EXECUTE_REFRESH`.

Before running this procedure, the user must run `PREPARE_STAGING_LOG` on all tables in the group. This is required even for staging logs that do not have changes in them. The user must also register any partition operations on the tables in the group using the `REGISTER_PARTITION_OPERATION`.

One of the side effects of this procedure is that the tables being prepared are locked in this sense: the staging logs of the tables will be locked to prevent any DMLs from occurring and the registration of partition operations will be disabled. These locks will be in effect until you issue an `EXECUTE_REFRESH` statement. Alternatively, you can issue an `ABORT_REFRESH` operation to release these locks. Another side effect of this procedure is that it purges from the catalog records of earlier sync refresh operations; if they are older than the retention period, they are purged.

The degree of parallelism of the prepare refresh job is inherited from the session parameters which you can control with an `ALTER SESSION` statement.

The group ID of a table can be found using `GET_GROUP_ID(table_name)`. The group IDs of a list of tables can be found with `GET_GROUP_ID_LIST(table_name_list)`. The group IDs of all the lists of tables can be retrieved with `GET_ALL_GROUP_IDS`.

By default, synchronous refresh does not maintain global indexes belonging to the tables and materialized views in the sync refresh group. If you wish to do so, you can set event 31904, level 64 before executing `PREPARE_REFRESH`. This will cause the partition exchange DDL statements generated by `PREPARE_REFRESH` to have the `UPDATE INDEXES` clause appended to them, and when they are executed by `EXECUTE_REFRESH`, the global indexes will be maintained.

## 176.3.9 PREPARE\_STAGING\_LOG Procedure

This procedure collects statistics on the data in the staging log of the base table and validates the data in the log.

It can be run in several different modes ranging from the enforced mode in which strict checking of the data is done to trusted mode in which no checking is done. You should run this procedure after loading the staging log and before running `PREPARE_REFRESH`.

In the enforced mode, which is the default, this procedure will fill in the missing values of the columns of the rows being deleted or updated. An error is thrown if any violations of the staging-log rules are found. You can query the view `USER_SR_STLOG_EXCEPTIONS` to get details on the exceptions.

The notion of the staging log key is described in *Oracle Database Data Warehousing Guide*.

In the enforced mode, this procedure processes each delete/update row in the staging log as follows:

- It verifies the existence of the row in the base table using the key.
- For the rows being deleted (`DMLTYPE$$` is 'D'), it verifies a row with this key exists in the base table; if non-null non-key values are supplied in the staging log, it verifies the values match the corresponding columns in the base table; else an exception is logged in the exceptions table. If the values of any of the non-key columns are missing, it fills in those values from the row in the base table.
- For the rows being updated (`DMLTYPE$$` is 'UO' or 'UN'), it verifies a row with this key exists in the base table. In the old values row (`DMLTYPE$$` is 'UO'), it makes the same check and does the same processing as with rows being deleted. In the new values row (`DMLTYPE$$` is 'UN'), it checks that at least the value of one the columns differs from its old value; else an exception is logged.

- In the new values row (DMLTYPE\$\$ is 'UN'), a null value in a column is interpreted as having the same value as the old value of the column except if the old value is non-null and the new value is null in which case, the new value of the column is interpreted as being null. This requires that the user must provide the old value of columns which are being updated to NULL.

In the default enforced mode, this procedure verifies that each key is specified for at most once for a delete or update operation. This means that the user, when doing the change consolidation, must consolidate delete-insert of the same row into an update operation with rows 'UO' and 'UN'; multiple updates must be consolidated into a single update; and null changes such as an insert-update-delete of the same row must not appear in the staging log.

The checking done in the enforced mode can be time-consuming. If you are confident in the integrity of the data, you can choose a lower level of checking. You can choose to:

- trust all the insert rows (DMLTYPE\$\$ is 'I') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.INSERT_TRUSTED`
- trust all the delete rows (DMLTYPE\$\$ is 'D') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.DELETE_TRUSTED`
- trust all the update rows (DMLTYPE\$\$ is 'UO' or 'UN') by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.UPDATE_TRUSTED`
- trust all three types of DMLs by choosing the `psl_mode` of `DBMS_SYNC_REFRESH.TRUSTED`.

In addition, you can specify the `psl_mode` as a bitmask of the flags described above. For example, `DBMS_SYNC_REFRESH.INSERT_TRUSTED + DBMS_SYNC_REFRESH.DELETE_TRUSTED` will treat inserts and deletes to be trusted but not updates.

## Syntax

```
DBMS_SYNC_REFRESH.PREPARE_STAGING_LOG (
    schema_name      IN VARCHAR2,
    base_table_name  IN VARCHAR2,
    psl_mode          IN NUMBER DEFAULT
        DBMS_SYNC_REFRESH.ENFORCED);
```

## Parameters

**Table 176-10 PREPARE\_STAGING\_LOG Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schema_name</code>     | The name of the schema of the base table.                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>base_table_name</code> | The name of the base table.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>psl_mode</code>        | <p>The mode in which staging log preparation should be done. The possible values are:</p> <ul style="list-style-type: none"> <li>• <code>DBMS_SYNC_REFRESH.ENFORCED</code> (the default)</li> <li>• <code>DBMS_SYNC_REFRESH.INSERT_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.DELETE_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.UPDATE_TRUSTED</code></li> <li>• <code>DBMS_SYNC_REFRESH.TRUSTED</code></li> </ul> |

## 176.3.10 PURGE\_REFRESH\_STATS Procedure

This procedure purges the refresh history of sync refreshes that took place before the value specified by the `BEFORE_TIMESTAMP` parameter.

This procedure requires the `SYSDBA` privilege in addition to the privilege to execute it.

### Syntax

```
DBMS_SYNC_REFRESH.PURGE_REFRESH_STATS (  
    before_timestamp IN TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 176-11** PURGE\_REFRESH\_STATS Procedure Parameter

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>before_timestamp</code> | Records of sync refreshes saved before this timestamp are purged. If <code>NULL</code> , it uses the purging policy used by automatic purge. The automatic purge deletes all history older than (current time - refresh - history retention). The refresh history retention value can be changed using <code>ALTER_REFRESH_STATS_RETENTION</code> . The default is 31 days. |

## 176.3.11 REGISTER\_MVIEWS

This procedure registers a list of materialized views for synchronous refresh.

It checks each materialized view in the list for eligibility and places it in the sync refresh group it belongs to. A sync refresh group is a set of related tables and materialized views defined on top of them. Two tables are considered related if there is a referential constraint between them.

The eligibility rules of materialized views for synchronous refresh are described in detail in *Oracle Database Data Warehousing Guide*. The principal requirements are that the materialized view must be partitioned and its partition key must be derivable from the partition key of its fact table. The materialized view definition must specify the `USING TRUSTED CONSTRAINTS` clause because sync refresh trusts the foreign key and primary key relationships to perform various refresh optimizations. The materialized view's refresh policy must be specified as `ON DEMAND`.

You have an option to register only some of the materialized views associated with a table, and leave some unregistered. Oracle Corporation does not recommend this, and in such a case, the user has to maintain the unregistered ones using the PCT or complete refresh methods.

A staging table must have been created for each base table of each materialized view in the materialized view list (`mv_list`), or else an error is thrown.

If any of the materialized views are not eligible for sync refresh, an error is thrown and the registration of all materialized views in the materialized view list fails.

### Syntax

```
DBMS_SYNC_REFRESH.REGISTER_MVIEWS (  
    mv_list IN VARCHAR2);
```

## Parameter

**Table 176-12 REGISTER\_MVIEWS Procedure Parameter**

| Parameter | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| mv_list   | A comma-delimited list of materialized views to register. These names are optionally schema-qualified. |

## 176.3.12 REGISTER\_PARTITION\_OPERATION Procedure

This procedure registers a partition-maintenance operation (PMOP) on a partition of a base table.

### Syntax

```
DBMS_SYNC_REFRESH.REGISTER_PARTITION_OPERATION (  
    partition_op          IN VARCHAR2,  
    schema_name           IN VARCHAR2,  
    base_table_name       IN VARCHAR2,  
    partition_name        IN VARCHAR2,  
    outside_partn_table_schema IN VARCHAR2,  
    outside_partn_table_name IN VARCHAR2);
```

### Parameters

**Table 176-13 REGISTER\_PARTITION\_OPERATION Procedure Parameters**

| Parameter                  | Description                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------|
| partition_op               | The name of the partition operation (DROP, EXCHANGE, or TRUNCATE).                                                  |
| schema_name                | The name of the schema of the base table.                                                                           |
| base_table_name            | The name of the base table.                                                                                         |
| partition_name             | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |
| outside_partn_table_schema | The name of the schema of the outside partition table (required for EXCHANGE only).                                 |
| outside_partn_table_name   | The name of the outside partition table (required for EXCHANGE only).                                               |

### Usage Notes

The three kinds of change operations that may be specified on partitions are DROP, TRUNCATE, and EXCHANGE.

If DROP is specified, then the partition will be dropped from the base table at the time of EXECUTE\_REFRESH. If TRUNCATE is specified, then the data from the partition will be deleted but the partition itself will not be dropped. These operations provide a more efficient way of specifying the deletes of all the rows in a partition than specifying them individually in the staging log.

If EXCHANGE is specified, then the contents of the outside table is exchanged with contents of the specified partition of EXECUTE\_REFRESH. This provides an alternative method to the user of providing the changes to the base tables instead of populating the staging log.

## 176.3.13 UNREGISTER\_MVIEWS

This procedure unregisters a list of materialized views from synchronous refresh. Once a materialized view is unregistered, it can be maintained by the user with any of the traditional refresh methods, such as complete or PCT, refresh.

### Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_MVIEWS (  
    mv_list    IN VARCHAR20;
```

### Parameter

**Table 176-14 UNREGISTER\_MVIEWS Parameter**

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| mv_list   | A comma-delimited list of materialized views to unregister. These names are optionally schema-qualified. |

## 176.3.14 UNREGISTER\_PARTITION\_OPERATION Procedure

This procedure unregisters a partition-maintenance operation (PMOP) that had been previously registered with `REGISTER_PARTITION_OPERATION` on a base table. The three kinds of change operations that can be specified on partitions are `DROP`, `TRUNCATE`, and `EXCHANGE`.

### Syntax

```
DBMS_SYNC_REFRESH.UNREGISTER_PARTITION_OPERATION (  
    partition_op    IN VARCHAR2,  
    schema_name     IN VARCHAR2,  
    base_table_name IN VARCHAR2,  
    partition_name  IN VARCHAR2);
```

### Parameters

**Table 176-15 UNREGISTER\_PARTITION\_OPERATION Procedure Parameters**

| Parameter       | Description                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------|
| partition_op    | The name of the partition operation ( <code>DROP</code> , <code>EXCHANGE</code> , or <code>TRUNCATE</code> ).       |
| schema_name     | The name of the schema of the base table.                                                                           |
| base_table_name | The name of the base table.                                                                                         |
| partition_name  | The name of the partition to be changed; either exchanged with the outside partition table or dropped or truncated. |

# DBMS\_TABLE\_DATA

The `DBMS_TABLE_DATA` package provides procedures that can be used to retrieve the byte value of a single column, or a series of columns, in any table. These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the row content for row data on which the hash or user signature is computed.

This chapter contains the following topics:

- [DBMS\\_TABLE\\_DATA Overview](#)
- [DBMS\\_TABLE\\_DATA Security Model](#)
- [Summary of DBMS\\_TABLE\\_DATA Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*

## 177.1 DBMS\_TABLE\_DATA Overview

The `DBMS_TABLE_DATA` package can be used to retrieve the byte value of a single column, or a series of columns, in any table.

These procedures, along with a publicly documented meta-data structure for columns, can be used to retrieve the `row content` for row data on which the hash or user signature is computed.

The procedures provide platform-neutral binary values for columns.

The procedures give you fine-grained control over the scope of a digital signature or cryptographic hash in terms of the columns you extract and the order in which you assemble the results.

## 177.2 DBMS\_TABLE\_DATA Security Model

The `DBMS_TABLE_DATA` package is owned by `SYS` and is installed as part of database installation. The routines in the package are run with invokers' rights (run with the privileges of the current user). The current user needs `SELECT` privileges on the table to extract column data.

## 177.3 Summary of DBMS\_TABLE\_DATA Subprograms

The DBMS\_TABLE\_DATA package uses GET\_BYTES\_FOR\_COLUMN, GET\_BYTES\_FOR\_COLUMNS, and GET\_BYTES\_FOR\_ROW subprograms to perform various functions.

**Table 177-1 DBMS\_TABLE\_DATA Package Subprograms**

| Subprogram                                      | Description                                                                                                                                                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_BYTES_FOR_COLUMN Procedure</a>  | Returns the column_data in bytes for the particular column with name column_name for row_id row in the particular table identified by schema_name.table_name. |
| <a href="#">GET_BYTES_FOR_COLUMNS Procedure</a> | Returns a concatenated array of column byte values in column_data in the order of columns specified in the column_names array.                                |
| <a href="#">GET_BYTES_FOR_ROW Procedure</a>     | Returns a concatenated array of column byte values in column_data in the order of column positions for the particular row identified by row_id.               |

### 177.3.1 GET\_BYTES\_FOR\_COLUMN Procedure

This procedure returns the column\_data in bytes for the particular column with name column\_name for row\_id row in the particular table identified by schema\_name.table\_name.

#### Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMN(  
    schema_name          IN VARCHAR2,  
    table_name           IN VARCHAR2,  
    row_id               IN ROWID,  
    column_name          IN VARCHAR2,  
    column_data          IN OUT BLOB);
```

#### Parameters

**Table 177-2 GET\_BYTES\_FOR\_COLUMN Procedure Parameters**

| Parameter   | Description             |
|-------------|-------------------------|
| schema_name | The name of the schema. |
| table_name  | The name of the table.  |
| row_id      | The row id.             |
| column_name | The column name.        |
| column_data | The data in the column. |

#### Usage Notes

All arguments are required.

## 177.3.2 GET\_BYTES\_FOR\_COLUMNS Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of columns specified in the `column_names` array.

### Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_COLUMNS(  
    schema_name      IN VARCHAR2,  
    table_name       IN VARCHAR2,  
    row_id           IN ROWID,  
    column_names     IN VARCHAR2,  
    column_data      IN OUT BLOB);
```

### Parameters

**Table 177-3** GET\_BYTES\_FOR\_COLUMNS Procedure Parameters

| Parameter                 | Description               |
|---------------------------|---------------------------|
| <code>schema_name</code>  | The name of the schema.   |
| <code>table_name</code>   | The name of the table.    |
| <code>row_id</code>       | The row id.               |
| <code>column_names</code> | The names of the columns. |
| <code>column_data</code>  | The data in the columns.  |

### Usage Notes

All arguments are required.

## 177.3.3 GET\_BYTES\_FOR\_ROW Procedure

This procedure returns a concatenated array of column byte values in `column_data` in the order of column positions for the particular row identified by `row_id`.

### Syntax

```
DBMS_TABLE_DATA.GET_BYTES_FOR_ROW(  
    schema_name      IN VARCHAR2,  
    table_name       IN VARCHAR2,  
    row_id           IN ROWID,  
    column_data      IN OUT BLOB);
```

### Parameters

**Table 177-4** GET\_BYTES\_FOR\_ROW Procedure Parameters

| Parameter                | Description             |
|--------------------------|-------------------------|
| <code>schema_name</code> | The name of the schema. |
| <code>table_name</code>  | The name of the table.  |
| <code>row_id</code>      | The row id.             |
| <code>column_data</code> | The data in the row.    |

### Usage Notes

All arguments are required.

## DBMS\_TDB

The `DBMS_TDB` package reports whether a database can be transported between platforms using the `RMAN CONVERT DATABASE` command.

The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

### See Also:

*Oracle Database Backup and Recovery User's Guide* regarding database transport using `CONVERT DATABASE`

This chapter contains the following topics:

- [Overview](#)
- [DBMS\\_TDB Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TDB Subprograms](#)

### 178.1 DBMS\_TDB Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

## 178.2 DBMS\_TDB Security Model

Use of this package requires the `DBA` privilege.

## 178.3 DBMS\_TDB Constants

The `DBMS_TDB` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, `DBMS_TDB.SKIP_NONE`.

The `DBMS_TDB` package uses the constants shown in [Table 178-1](#).

**Table 178-1 DBMS\_TDB Constants**

| Name                       | Type   | Value | Description                                                                                  |
|----------------------------|--------|-------|----------------------------------------------------------------------------------------------|
| <code>SKIP_NONE</code>     | NUMBER | 0     | Check all files when checking whether a database is ready for transport.                     |
| <code>SKIP_OFFLINE</code>  | NUMBER | 2     | Skip files in offline tablespaces when checking whether a database is ready for transport.   |
| <code>SKIP_READONLY</code> | NUMBER | 3     | Skip files in read-only tablespaces when checking whether a database is ready for transport. |

## 178.4 DBMS\_TDB Views

The `DBMS_TDB` package uses the `V$DB_TRANSPORTABLE_PLATFORM` view.

This view is described in *Oracle Database Reference*.

- `V$DB_TRANSPORTABLE_PLATFORM`, which specifies which combinations of source and target platforms support database transport

## 178.5 DBMS\_TDB Operational Notes

The following notes apply to `DBMS_TDB`.

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

## 178.6 Summary of DBMS\_TDB Subprograms

This table lists the `DBMS_TDB` subprograms and briefly describes them.

**Table 178-2 DBMS\_TDB Package Subprograms**

| Subprogram                              | Description                                                        |
|-----------------------------------------|--------------------------------------------------------------------|
| <a href="#">CHECK_DB Function</a>       | Checks whether a database can be transported to a target platform  |
| <a href="#">CHECK_EXTERNAL Function</a> | Checks whether a database has external tables, directory or BFILES |

## 178.6.1 CHECK\_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

### Syntax

```
DBMS_TDB.CHECK_DB (  
    target_platform_name  IN VARCHAR2,  
    skip_option           IN  NUMBER)  
    RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB (  
    target_platform_name  IN VARCHAR2)  
    RETURN BOOLEAN;
```

```
DBMS_TDB.CHECK_DB  
    RETURN BOOLEAN;
```

### Parameters

**Table 178-3 CHECK\_DB Function Parameters**

| Parameter                         | Description                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>target_platform_name</code> | The name of the destination platform, as it appears in <code>V\$DB_TRANSPORTABLE_PLATFORM</code> .                                                                         |
| <code>skip_option</code>          | Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in <a href="#">Table 178-1</a> . |

### Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns `FALSE`. If the database is ready for transport, returns `TRUE`.

### Usage Notes

- If `SERVEROUTPUT` is `ON`, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 178-4](#).

**Table 178-4 Reasons for CHECK\_DB Function to Return FALSE**

| Cause                                                                                          | Action                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unrecognized target platform name.                                                             | Check V\$DB_TRANSPORTABLE_PLATFORM for recognized platform names.                                                                                                                                                                                                                                         |
| Target platform has a different endian format.                                                 | Conversion is not supported.                                                                                                                                                                                                                                                                              |
| Database is not open read-only.                                                                | Open database read-only and retry.                                                                                                                                                                                                                                                                        |
| There are active or in-doubt transactions in the database.                                     | Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation.<br>This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write. |
| Deferred transaction rollback needs to be done.                                                | Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.                                                                                                                         |
| Database compatibility version is below 10.0.0.                                                | Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.                                                                                                                                                                                 |
| Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher. | Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.                                                                                                                    |

### Examples

This example illustrates the use of CHECK\_DB with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

## 178.6.2 CHECK\_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILES.

### Syntax

```
DBMS_TDB.CHECK_EXTERNAL
RETURN BOOLEAN;
```

### Return Values

If the database has external tables, directories, or BFILES, return **TRUE**. Otherwise, return **FALSE**.

### Usage Notes

- If SERVEROUTPUT is ON, then the function will output the names of the external tables, directories, and BFILES in the database.
- The database must be open read-write.

### Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILES:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    external BOOLEAN;
BEGIN
    external := DBMS_TDB.CHECK_EXTERNAL;
END;
/
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILES exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

# DBMS\_TF

The DBMS\_TF package contains utilities for Polymorphic Table Functions (PTF) implementation. You can use DBMS\_TF subprograms to consume and produce data, and get information about its execution environment.

You must be familiar with the Polymorphic Table Function (PTF) concepts, syntax and semantics.

- [DBMS\\_TF Data Structures](#)
- [Summary of DBMS\\_TF Subprograms](#)

## 179.1 DBMS\_TF Overview

The DBMS\_TF package contains types, constants, and subprograms that can be used by Polymorphic Table Functions (PTFs).

Polymorphic Table Functions (PTFs) need various services from the database to implement their functionality. PTFs need a mechanism to get rows from the database and send back new rows, for instance. The DBMS\_TF package provides these server and client interfaces utilities.

## 179.2 DBMS\_TF Security Model

PUBLIC is granted the EXECUTE privilege on package DBMS\_TF. Its subprograms execute with invoker's rights privileges.

## 179.3 DBMS\_TF Constants

This topic describes useful constants defined in the DBMS\_TF package.

The DBMS\_TF package defines several enumerated constants that should be used for specifying parameter values or types. Enumerated constants must be prefixed with the package name, for example, DBMS\_TF.TYPE\_DATE.

**Table 179-1 DBMS\_TF Supported Types**

| Name               | Description                 |
|--------------------|-----------------------------|
| TYPE_BINARY_DOUBLE | Type code for BINARY_DOUBLE |
| TYPE_BINARY_FLOAT  | Type code for BINARY_FLOAT  |
| TYPE_BLOB          | Type code for BLOB          |
| TYPE_CHAR          | Type code for CHAR          |
| TYPE_CLOB          | Type code for CLOB          |
| TYPE_DATE          | Type code for DATE          |
| TYPE_INTERVAL_DS   | Type code for INTERVAL_DS   |
| TYPE_INTERVAL_YM   | Type code for INTERVAL_YM   |
| TYPE_NUMBER        | Type code for NUMBER        |
| TYPE_ROWID         | Type code for ROWID         |
| TYPE_RAW           | Type code for RAW           |
| TYPE_TIMESTAMP     | Type code for TIMESTAMP     |
| TYPE_TIMESTAMP_TZ  | Type code for TIMESTAMP_TZ  |
| TYPE_VARCHAR2      | Type code for VARCHAR2      |

Additional constants are defined for use with specific subprograms.

## 179.4 DBMS\_TF Operational Notes

These operational notes describe the client and the server-side interfaces, and detail the compilation and execution statement management of Polymorphic Table Functions (PTF).

## 179.4.1 PTF Client Interface

The Polymorphic Table Function (PTF) implementation client interface is a set of subprograms with fixed names that every PTF must provide.

The PTF client interface can have up to four subprograms as follow :

- `DESCRIBE` function (Required)
- `OPEN` procedure (Optional)
- `FETCH_ROWS` procedure (Optional)
- `CLOSE` procedure (Optional)

The function `DESCRIBE` is invoked during SQL cursor compilation.

The procedures `OPEN`, `FETCH_ROWS`, and `CLOSE` are invoked during query execution.

The arguments to the implementation functions must match the PTF function with the following modifications:

1. Arguments of the type `TABLE` and `COLUMNS` are skipped for the execution procedures `OPEN`, `FETCH_ROWS`, and `CLOSE`.
2. The `TABLE` and `COLUMNS` arguments have descriptor types for the `DESCRIBE` function.
3. Scalar arguments that are not available during compilation are passed as `NULL` values (when using bind variables for instance). During execution, the actual values are passed in.

### DESCRIBE Function

The `DESCRIBE` function is invoked to determine the type of rows (row shape) produced by the Polymorphic Table Function (PTF). It returns a `DBMS_TF.DESCRIBE_T` table.

The function `DESCRIBE` is invoked during SQL cursor compilation when a SQL query references a PTF. The SQL compiler locates the `DESCRIBE` function defined in the PTF implementation package. All the argument values from the query calling the PTF are passed to the `DESCRIBE` function. Like any PLSQL function, the `DESCRIBE` function can be overloaded and can have arguments default values.

The arguments of the PTF function and `DESCRIBE` function must match, but with the type of any `TABLE` argument replaced with the `DBMS_TF.TABLE_T` descriptor type, and the type of any `COLUMNS` argument replaced with `DBMS_TF.COLUMN_T` descriptor.

The `DESCRIBE` function indicates which columns must be kept by the database and passed unchanged as the PTF output (Pass-Through columns). In addition, the `DESCRIBE` function indicates any input columns that the PTF will use for its computation (Read columns).

Finally, the `DESCRIBE` function returns the list of any new columns that the PTF will create (or `NULL` if no new columns are being produced) using the `DBMS_TF.DESCRIBE_T` descriptor.

### OPEN Procedure

The `OPEN` procedure purpose is to initialize and allocate any execution specific state. The `OPEN` procedure is most useful when you implement a Table Semantics PTF. The function typically calls the `GET_XID` function to get a unique ID for managing the execution state.

`OPEN` procedure is generally invoked before calling the `FETCH_ROWS` procedure.

## FETCH\_ROWS Procedure

The `FETCH_ROWS` procedure produces an output rowset that it sends to the database. The number of invocations of this function and the size of each rowset are data dependent and determined during query execution.

## CLOSE Procedure

The `CLOSE` procedure is called at the end of the PTF execution. The procedure releases resources associated with the PTF execution state.

### Example 179-1 Noop Polymorphic Table Function Example

This example creates a PTF called `noop`. This PTF returns the input rows as the output rows without any modification or filtering. `Noop` is one of the smallest PTF you can write.

#### Live SQL:

You can view and run this example on Oracle Live SQL at [Noop Polymorphic Table Function](#)

To implement the `noop` PTF, you first create the implementation package `noop_package`.

```
CREATE PACKAGE noop_package AS
    FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
        RETURN DBMS_TF.DESCRIBE_T;

    PROCEDURE fetch_rows;
END noop_package;
```

The `DESCRIBE` function does not produce any new columns and hence, returns `NULL`. Executing `FETCH_ROWS` also results in `NULL`.

```
CREATE PACKAGE BODY noop_package AS
    FUNCTION describe(t IN OUT DBMS_TF.TABLE_T)
        RETURN DBMS_TF.DESCRIBE_T AS
    BEGIN
        RETURN NULL;
    END;

    PROCEDURE fetch_rows AS
    BEGIN
        RETURN;
    END;
END noop_package;
```

The `noop` PTF is defined to execute the `noop_package` when it is invoked.

```
CREATE FUNCTION noop (t TABLE)
    RETURN TABLE PIPELINED ROW POLYMORPHIC USING noop_package;
```

The PTF can be invoked in queries. For example:

```
SELECT *
FROM   NOOP(emp)
WHERE  deptno = 10;
```

|      |        |           |                |      |    |
|------|--------|-----------|----------------|------|----|
| 7782 | CLARK  | MANAGER   | 7839 09-JUN-81 | 2450 | 10 |
| 7839 | KING   | PRESIDENT | 17-NOV-81      | 5000 | 10 |
| 7934 | MILLER | CLERK     | 7782 23-JAN-82 | 1300 | 10 |

```
WITH e
AS (SELECT *
     FROM   emp
          NATURAL JOIN dept
     WHERE  dtype = 'SALES')
SELECT t.*
FROM   NOOP(e) t;
```

|       |             |          |                |      |      |
|-------|-------------|----------|----------------|------|------|
| 30    | 7499 ALLEN  | SALESMAN | 7698 20-FEB-81 | 1600 | 300  |
| SALES | CHICAGO     |          |                |      |      |
| 30    | 7521 WARD   | SALESMAN | 7698 22-FEB-81 | 1250 | 500  |

| SALES | CHICAGO     |          |                |      |      |
| 30    | 7900 JAMES  | CLERK    | 7698 03-DEC-81 | 950  |      |
| SALES | CHICAGO     |          |                |      |      |

### 179.4.1.1 DESCRIBE Only Polymorphic Table Function

A Polymorphic Table Function (PTF) can have a DESCRIBE function only.

A PTF which does not have any runtime methods (Open/Fetch\_Rows/Close) is used only at cursor compilation time with no runtime row source allocated. The explain plan output of a Describe-Only PTF will not show any rows for the PTF.

## 179.4.2 PTF Server Side Interface

The DBMS\_TF package provides the server side interface needed for Polymorphic Table Functions (PTFs) implementation to read and write information in the database.

This topic contains a partial list of types and subprograms used for the PTF server side implementation.

**Table 179-2 Summary of Commonly Used Types and Subprograms in PTF Server Side Interface**

| NAME              | DESCRIPTION              |
|-------------------|--------------------------|
| COLUMN_METADATA_T | Column metadata record   |
| COLUMN_T          | Column descriptor record |
| TABLE_T           | Table descriptor record  |

**Table 179-2 (Cont.) Summary of Commonly Used Types and Subprograms in PTF Server Side Interface**

| NAME                    | DESCRIPTION                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| COLUMNS_T               | Collection containing column names                                                                               |
| COLUMNS_NEW_T           | Collection for new columns                                                                                       |
| TAB_<typ>_T             | Collection for each supported types, where <typ> is described in " <a href="#">Supported Types Collections</a> " |
| ROW_SET_T               | Data for a rowset record                                                                                         |
| GET_COL Procedure       | Fetches data for a specified (input) column                                                                      |
| PUT_COL Procedure       | Returns data for a specified (new) column                                                                        |
| GET_ROW_SET Procedure   | Fetches the input rowset of column values                                                                        |
| PUT_ROW_SET Procedure   | Returns data for ALL (new) columns                                                                               |
| SUPPORTED_TYPE Function | Verifies if a type is supported by DBMS_TF subprograms                                                           |
| GET_XID Function        | Returns a unique execution ID to index PTF state in a session                                                    |

### 179.4.3 Read Columns

Read columns are a set of table columns that the Polymorphic Table Function (PTF) processes when executing the `FETCH_ROWS` procedure.

The PTF indicates the read columns inside `DESCRIBE` by annotating them in the input table descriptor, `TABLE_T`. Only the indicated read columns will be fetched and thus available for processing during `FETCH_ROWS`.

The PTF invocation in a query will typically use the `COLUMNS` operator to indicate which columns the query wants the PTF to read, and this information is passed to the `DESCRIBE` function which then in turn sets the `COLUMN_T.FOR_READ` boolean flag.

Only scalar SQL data types are allowed for the read columns.

The [Echo Polymorphic Table Function Example](#) takes a table and a list of columns and produces new columns with the same values.

### 179.4.4 Pass-Through Columns

Pass-through columns are passed from the input table of the Polymorphic Table Function (PTF) to the output, without any modifications.

The `DESCRIBE` function indicates the pass-through columns by setting the `COLUMN_T.PASS_THROUGH` boolean flag on the input table descriptor, `DBMS_TF.TABLE_T`.

All columns in the `Row Semantics` PTF are marked as pass-through by default. For `Table Semantics` PTF, the default value for pass-through is set to false. For the `Table Semantics` PTF, the partitioning columns are always pass-through and this cannot be changed by the `DESCRIBE` function.

Note, the notions of Pass-Through and Read are orthogonal, and indicating a column as one has no implication for the other.

## 179.4.5 State Management

The database manages the compilation and execution states of the polymorphic table functions (PTF).

The database fulfills the PTF conductor role. As such, it is responsible for the PTF compilation state and execution state.

1. **Compilation State** : This is the immutable state that is generated by `DESCRIBE` which is needed before execution.
2. **Execution State**: This is the state used by the execution time procedures (`OPEN`, `FETCH_ROWS`, and `CLOSE`) of a `Table semantics` PTF.

The most common use of compilation state is to keep track of the columns to be read and the new columns that are to be produced. The PTF Server interface provides functions that can be used to achieve this: `GET_ENV`, and `GET_ROW_SET`. The PTF author who defines, documents, and implements the PTF can rely on the database to manage the PTF states. The PTF author should not attempt to use the session state (such as PL/SQL package global variables) to store any compilation state. Problems can arise because in a given session all cursors using the PTF will share that state, and other sessions executing the PTF cursor will not see the original compilation state.

Since the execution state is session and cursor private, a `Table Semantics` PTF can use package globals for storing execution state, but with the provision that the PTF uses the database provided unique execution ID to identify that state. The `GET_XID` function guarantees to provide an execution unique ID for the PTF's execution procedures, where this ID remains constant for all the execution functions of a PTF.

### 179.4.5.1 CSTORE Compilation State Management

The CSTORE is the PTF compilation state management interface.

The CSTORE enables Polymorphic Table Functions (PTF) to store the compilation state in the SQL cursor.

The CSTORE interface is used to store key-value pairs during cursor compilation through the `DBMS_TF.DESCRIBE_T` record.

The compilation state information is retrieved during execution procedures such as `OPEN`, `FETCH_ROWS` and `CLOSE`.

#### CSTORE Subprograms

The CSTORE interface consists of the following subprograms.

| Name | Description |
|------|-------------|
|------|-------------|

|                        |                                                                                 |
|------------------------|---------------------------------------------------------------------------------|
| CSTORE_GET procedure   | Fetches item of specified type. If not found, the OUT value remains unchanged.  |
| CSTORE_EXISTS function | If an item with the given key exists in the CSTORE, this function returns TRUE. |

### CSTORE Supported Types

The `DBMS_TF.DESCRIBE_T` supports specifying key-value pairs for these scalar types: `VARCHAR2`, `NUMBER`, `DATE`, `BOOLEAN`.

**Table 179-3 DBMS\_TF CSTORE Scalar Supported Types**

| Name                 | Description               |
|----------------------|---------------------------|
| CSTORE_TYPE_VARCHAR2 | CSTORE VARCHAR2 type code |
| CSTORE_TYPE_NUMBER   | CSTORE NUMBER type code   |
| CSTORE_TYPE_DATE     | CSTORE DATE type code     |
| CSTORE_TYPE_BOOLEAN  | CSTORE BOOLEAN type code  |

### Collections For Compilation Storage

These predefined collection types are used for compilation state management.

```
TYPE CSTORE_CHR_T IS TABLE OF VARCHAR2(32767) INDEX BY VARCHAR2(32767);
TYPE CSTORE_NUM_T IS TABLE OF NUMBER INDEX BY VARCHAR2(32767);
TYPE CSTORE_BOL_T IS TABLE OF BOOLEAN INDEX BY VARCHAR2(32767);
TYPE CSTORE_DAT_T IS TABLE OF DATE INDEX BY VARCHAR2(32767);
```

### DBMS\_TF Method Names

The method names are also stored in the `DBMS_TF.DESCRIBE_T` record. These predefined values for the method names can be customized by the PTF author.

See [Method Name Overrides](#) for more information about changing the default method names

**Table 179-4 DBMS\_TF Method Names Constants**

| Name       | Type           | Value        | Description                                            |
|------------|----------------|--------------|--------------------------------------------------------|
| CLOSE      | DBMS_QUOTED_ID | 'CLOSE'      | Predefined index value for the method named CLOSE      |
| FETCH_ROWS | DBMS_QUOTED_ID | 'FETCH_ROWS' | Predefined index value for the method named FETCH_ROWS |
| OPEN       | DBMS_QUOTED_ID | 'OPEN'       | Predefined index value for the method named OPEN       |

## 179.4.5.2 XSTORE Execution State Management

XSTORE is the PTF execution state management interface.

The XSTORE key-value interface simplifies the implementation of Table Semantics PTFs by providing automatic state management capabilities when the keys are strings and values are of commonly used scalar types.

The database automatically manages the deletion of all execution states allocated using this interface.

### XSTORE Subprograms

The execution state management interface consists of the following subprograms.

**Table 179-5 DBMS\_TF XSTORE Subprograms**

| Name                    | Description                                                         |
|-------------------------|---------------------------------------------------------------------|
| XSTORE_CLEAR procedure  | Removes all key-value pairs from the XSTORE execution state         |
| XSTORE_EXISTS function  | Returns TRUE if an item with a given key exists in the XSTORE       |
| XSTORE_GET procedure    | Gets the associated value for a given key stored in the XSTORE      |
| XSTORE_REMOVE procedure | Removes an item associated with the given key and key_type          |
| XSTORE_SET procedure    | Sets the value for the given key for PTF Execution State Management |

### XSTORE Predefined Types

The XSTORE supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, and BOOLEAN.

**Table 179-6 DBMS\_TF XSTORE Scalar Supported Types**

| Name                 | Description               |
|----------------------|---------------------------|
| XSTORE_TYPE_VARCHAR2 | XSTORE VARCHAR2 type code |
| XSTORE_TYPE_NUMBER   | XSTORE NUMBER type code   |
| XSTORE_TYPE_DATE     | XSTORE DATE type code     |
| XSTORE_TYPE_BOOLEAN  | XSTORE BOOLEAN type code  |

## 179.4.6 Method Name Overrides

When multiple polymorphic table function (PTF) implementations are in the same package, you can override the default runtime method names (OPEN, FETCH\_ROWS, and CLOSE) with your PTF specific names.

To override a method name, the application can specify the new method names using DBMS\_TF METHOD\_NAMES collection ( see [DESCRIBE\\_T Record Type](#)).

**See Also:**[Table 179-4](#)**Example 179-2 DBMS\_TF Method Name Overrides**

This example shows how to change the default method name of the noop\_p PTF fetch\_rows method to noop\_fetch.

**Live SQL:**

You can view and run this example on Oracle Live SQL at [DBMS\\_TF Method Name Overrides](#)

Create the PTF implementation package noop\_p.

```
CREATE PACKAGE noop_p AS
    FUNCTION describe(tab IN OUT DBMS_TF.table_t)
        RETURN DBMS_TF.describe_t;
    PROCEDURE noop_fetch;
END noop_p;
```

To provide a method name override, you can specify the new method names using DBMS\_TF.Method\_Names collection. The FETCH\_ROWS method name is changed to 'Noop\_Fetch'. The procedure noop\_fetch to implement this method is defined in the package.

```
CREATE OR replace PACKAGE BODY noop_p
AS
    FUNCTION describe(tab IN OUT DBMS_TF.table_t)
        RETURN DBMS_TF.describe_t AS
        methods DBMS_TF.methods_t := DBMS_TF.methods_t(DBMS_TF.fetch_rows =>
'Noop_Fetch');
    BEGIN
        RETURN DBMS_TF.describe_t(method_names => methods);
    END;
    PROCEDURE noop_fetch AS
    BEGIN
        RETURN;
    END;
END noop_p;
```

The noop PTF is defined to execute the noop\_p when it is invoked.

```
CREATE FUNCTION noop (t TABLE) RETURN TABLE PIPELINED ROW POLYMORPHIC USING
noop_p;
```

The PTF is invoked in the FROM clause of a query block.

```
SELECT *
FROM noop(scott.emp)
WHERE deptno =10;
```

## 179.4.7 Using the COLUMNS Pseudo-Operator

The `COLUMNS` pseudo-operator is an addition to the SQL expression language.

Use the `COLUMNS` pseudo-operator to specify the arguments when invoking a Polymorphic Table Function (PTF) in the FROM clause. The `COLUMNS` pseudo-operator arguments specify the list of column names, or the list of column names with associated types.

### See Also:

*Oracle Database PL/SQL Language Reference* for more information about the `COLUMNS` pseudo-operator syntax and semantics

## 179.4.8 Query Transformations

About predicate, projection and partitioning.

The pass-through columns of a Row Semantics PTF, and the `PARTITION BY` key columns of a Table Semantics PTF can be used for projection and predicate pushdown.

### Example 179-3 Query Transformations

This example illustrates the predicate and projection pushdown for a Row Semantics PTF.

This query calls the `echo` PTF created in [Echo Polymorphic Table Function Example](#).

```
SELECT empno, ename, sal, comm, echo_sal
FROM echo(emp, COLUMNS(sal,comm))
WHERE deptno = 30
      AND echo_sal > 1000;
```

| EMPNO | ENAME  | SAL  | COMM | ECHO_SAL |
|-------|--------|------|------|----------|
| 7499  | ALLEN  | 1600 | 300  | 1600     |
| 7521  | WARD   | 1250 | 500  | 1250     |
| 7654  | MARTIN | 1250 | 1400 | 1250     |
| 7698  | BLAKE  | 2850 |      | 2850     |
| 7844  | TURNER | 1500 | 0    | 1500     |

Conceptually, this query will get rewritten as:

```
WITH t AS (SELECT empno, ename, sal, comm
FROM emp
WHERE deptno=30)
SELECT empno, ename, sal, comm, echo_sal
FROM echo(t, COLUMNS(sal, comm))
WHERE echo_sal > 1000;
```

## 179.4.9 Parallel Execution

A key benefit of Polymorphic Table Functions (PTFs) is that their execution can be parallelized.

Row and table semantic PTFs execute in parallel differently.

### Row Semantics PTF

Under `Row Semantics` PTF, the parallel query executes with the same degree of parallelism (DOP) as it would if the PTF were not present. The DOP is driven by the child row source.

Provided that the DOP on table `emp` has been set to 5, the following is an example that shows this parallelization:

```
EXPLAIN PLAN FOR
SELECT * FROM echo(emp, COLUMNS(ename, job))
WHERE deptno != 20;
-----
| Id | Operation                               | Name          |
-----
| 0  | SELECT STATEMENT                       |               |
| 1  | PX COORDINATOR                         |               |
| 2  | PX SEND QC (RANDOM)                     | :TQ10000     |
| 3  | POLYMORPHIC TABLE FUNCTION           | ECHO          |
| 6  | PX BLOCK ITERATOR                      |               |
|* 7  | TABLE ACCESS FULL                     | EMP           |
-----
Predicate Information (identified by operation id):
-----
5 - filter("EMP"."DEPTNO"<>20)
```

### Table Semantics PTF

`Table Semantics` PTF requires its input table rows to be redistributed using the `PARTITION BY` key. The parallel execution is determined by the `PARTITION BY` clause specified in the query.

## 179.5 DBMS\_TF Execution Flow

Query executions invoking Polymorphic Table Functions (PTF) follow this execution model and data transfers flow.

The PTF execution procedures (`OPEN`, `FETCH_ROWS` and `CLOSE`) are called by the database during query execution.

The PTF execution follows this flow :

1. `OPEN` (if present)
2. `FETCH_ROWS` (can be invoked multiple times)
3. `CLOSE` (if present)

The `FETCH_ROWS` procedure reads the data for a rowset (collection of rows), and produces an output rowset.

Each call to `FETCH_ROWS` is associated with a rowset which is a data collection of input rows that is expected to be processed by the PTF.

The `GET_ROW_SET` or `GET_COL` is used to read the input rowset.

The `PUT_ROW_SET` or `PUT_COL` is used to produce an output rowset, that is written back to the database.

`PUT_ROW_SET` is used to set all the new columns in a single call.

The `ROWSET_T` record holds data for multiple columns. When the PTF algorithm is more suited toward producing a single output column at a time, you can use `PUT_COL` to produce a single column. A given column can only be produced once within a call to `FETCH_ROWS`.

For a Row Semantics PTF, the `FETCH_ROWS` procedure will return the new rows using the PTF Server interface before returning back to the database.

## 179.6 DBMS\_TF Restrictions

These restrictions apply to Polymorphic Table Functions (PTFs) and using the `DBMS_TF` package.

### Type Restrictions

A Polymorphic Table Function (PTF) can operate on a table with columns of any SQL types. However, read and new columns are restricted to scalar types. The read and new columns are used in the `PUT_ROW_SET`, `PUT_COL`, `GET_ROW_SET` and `GET_COL` procedures. All SQL types can be used with pass-through columns. The `DESCRIBE` function can determine the supported types using the `DBMS_TF.SUPPORTED_TYPE` function.

### PTF Invocation and Execution Restrictions

Polymorphic table functions cannot be nested in the `FROM` clause of a query. Nesting PTF is only allowed using `WITH` clause.

Nesting table function with polymorphic table function is only allowed using `CURSOR` expressions. A PTF cannot be specified as an argument of a table function.

You cannot select a rowid from a Polymorphic Table Function (PTF).

The `PARTITION BY` and the `ORDER BY` clause can only be specified on an argument of a Table Semantics PTF.

The PTF execution methods `OPEN`, `FETCH_ROWS`, and `CLOSE` must be invoked in the polymorphic table function execution context only.

You cannot invoke the `DESCRIBE` method directly.

This example shows ten PTF nested invocation.

```
WITH t0
  AS (SELECT /*+ parallel */ *
      FROM   noop(dept)),
  t1
```

```
AS (SELECT *
     FROM   noop(t0)),
t2
AS (SELECT *
     FROM   noop(t1)),
t3
AS (SELECT *
     FROM   noop(t2)),
t4
AS (SELECT *
     FROM   noop(t3)),
t5
AS (SELECT *
     FROM   noop(t4)),
t6
AS (SELECT *
     FROM   noop(t5)),
t7
AS (SELECT *
     FROM   noop(t6)),
t8
AS (SELECT *
     FROM   noop(t7)),
t9
AS (SELECT *
     FROM   noop(t8))
SELECT *
FROM   noop(t9)
WHERE  deptno = 10;
```

## 179.7.1 Echo Polymorphic Table Function Example

The echo PTF takes in a table and a list of columns and produces new columns with same values.

This PTF returns all the columns in the input table tab, and adds to it the columns listed in cols but with the column names prefixed with "ECHO\_".

### Live SQL:

You can view and run this example on Oracle Live SQL at [Echo Polymorphic Table Function](#)

The echo PTF can appear in the FROM clause of the query. The COLUMNS operator is used to specify columns, for example:

```
SELECT *
FROM echo(scott.dept, COLUMNS(dname, loc));
```

| DEPTNO | DNAME      | LOC      | ECHO_DNAME | ECHO_LOC |
|--------|------------|----------|------------|----------|
| 10     | ACCOUNTING | NEW YORK | ACCOUNTING | NEW YORK |
| 20     | RESEARCH   | DALLAS   | RESEARCH   | DALLAS   |
| 30     | SALES      | CHICAGO  | SALES      | CHICAGO  |
| 40     | OPERATIONS | BOSTON   | OPERATIONS | BOSTON   |

A PTF consists of the following :

- PTF implementation package specification : The specification must have the DESCRIBE method. The OPEN, FETCH\_ROWS and CLOSE methods are optional.
- PTF implementation package body: The DESCRIBE method may have a new-columns parameter (the additional columns created by this PTF), which is followed by the PTF functions parameters.
- PTF Function: The PTF function has a reference to the implementation package.

The `echo_package` package specification defines the `DESCRIBE` and `FETCH_ROWS` methods.

```
CREATE PACKAGE echo_package
AS
    prefix DBMS_ID := 'ECHO_';
    FUNCTION describe(
        tab  IN OUT DBMS_TF.TABLE_T,
        cols IN DBMS_TF.COLUMNS_T)
    RETURN DBMS_TF.DESCRIBE_T;
    PROCEDURE fetch_rows;
END echo_package;
```

The `echo_package` package body contains the PTF implementation.

```
CREATE PACKAGE BODY echo_package
AS
    FUNCTION describe(tab  IN OUT DBMS_TF.TABLE_T,
                     cols IN DBMS_TF.COLUMNS_T)
    RETURN DBMS_TF.DESCRIBE_T
    AS
        new_cols DBMS_TF.COLUMNS_NEW_T;
        col_id   PLS_INTEGER := 1;
    BEGIN
        FOR I IN 1 .. tab.COLUMN.COUNT LOOP
            FOR J IN 1 .. cols.COUNT LOOP
                IF ( tab.COLUMN(i).description.name = cols(j) ) THEN
                    IF ( NOT
DBMS_TF.SUPPORTED_TYPE(tab.COLUMN(i).description.TYPE) )
                    THEN
                        RAISE_APPLICATION_ERROR(-20102, 'Unsupported column type ['
||
                        TAB.COLUMN(i).description.TYPE||']');
                    END IF;

                    TAB.COLUMN(i).for_read := TRUE;
                    NEW_COLS(col_id) := TAB.COLUMN(i).description;
                    NEW_COLS(col_id).name := prefix ||
TAB.COLUMN(i).description.name;
                    col_id := col_id + 1;

                    EXIT;
                END IF;
            END LOOP;
        END LOOP;

        /* Verify all columns were found */
        IF ( col_id - 1 != cols.COUNT ) THEN
            RAISE_APPLICATION_ERROR(-20101, 'Column mismatch ['||col_id - 1||'],
['||cols.COUNT||']');
        END IF;

        RETURN DBMS_TF.DESCRIBE_T(new_columns => new_cols);
    END;
    PROCEDURE FETCH_ROWS
```

```

AS
  ROWSET DBMS_TF.ROW_SET_T;
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  DBMS_TF.PUT_ROW_SET(rowset);
END;
END echo_package;

```

The PTF echo references the implementation package echo\_package.

```

CREATE FUNCTION echo(tab TABLE,
                    cols COLUMNS)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING echo_package;

```

#### Example 179-4 Using the Echo PTF in Queries

This example selects all employees in department 20. The resulting rows have three new columns ECHO\_ENAME, ECHO\_HIREDATE, and ECHO\_SAL.

```

SELECT *
FROM   echo(scott.emp, COLUMNS(ename, sal, hiredate))
WHERE  deptno = 20;

```

| EMPNO | ENAME | JOB     | MGR  | HIREDATE  | SAL  | COMM | DEPTNO | ECHO_ENAME | ECHO_HIREDATE | ECHO_SAL |
|-------|-------|---------|------|-----------|------|------|--------|------------|---------------|----------|
| 7369  | SMITH | CLERK   | 7902 | 17-DEC-80 | 800  |      | 20     | SMITH      | 17-DEC-80     | 800      |
| 7566  | JONES | MANAGER | 7839 | 02-APR-81 | 2975 |      | 20     | JONES      | 02-APR-81     | 2975     |
| 7788  | SCOTT | ANALYST | 7566 | 19-APR-87 | 3000 |      | 20     | SCOTT      | 19-APR-87     | 3000     |
| 7876  | ADAMS | CLERK   | 7788 | 23-MAY-87 | 1100 |      | 20     | ADAMS      | 23-MAY-87     | 1100     |
| 7902  | FORD  | ANALYST | 7566 | 03-DEC-81 | 3000 |      | 20     | FORD       | 03-DEC-81     | 3000     |

Using subquery w, display ENAME, ECHO\_LOC and DNAME columns for all employees in department 30 with a salary greater than 1000.

```

WITH w
AS (SELECT e.*,
          dname,
          loc
     FROM   scott.emp e,
           scott.dept d
     WHERE  e.deptno = d.deptno)
SELECT ename,
       echo_loc,
       dname
FROM   echo(w, COLUMNS(sal, dname, loc, hiredate))
WHERE  deptno = 30
       AND echo_sal > 1000;

```

| ENAME  | ECHO_LOC | DNAME |
|--------|----------|-------|
| ALLEN  | CHICAGO  | SALES |
| WARD   | CHICAGO  | SALES |
| MARTIN | CHICAGO  | SALES |

|        |         |       |
|--------|---------|-------|
| BLAKE  | CHICAGO | SALES |
| TURNER | CHICAGO | SALES |

Using subquery w, display ENAME and DNAME columns for all employees with a salary greater than 1000.

```
WITH w
  AS (SELECT e.*,
            dname,
            loc
      FROM   scott.emp e,
            scott.dept d
      WHERE  e.deptno = d.deptno)
SELECT echo_ename,
       dname
FROM   echo(w, COLUMNS(loc, deptno, dname, ename)) e
WHERE  ename IN (SELECT echo_ename
                FROM   echo(scott.emp, COLUMNS(sal, deptno, ename, hiredate))
                WHERE  deptno = e.echo_deptno
                AND    sal > 1000);
```

| ECHO_ENAME | DNAME      |

## 179.8 DBMS\_TF Data Structures

The DBMS\_TF package defines these RECORD types, TABLE types and subtype.

### RECORD Types

- [COLUMN\\_DATA\\_T](#) Record Type
- [COLUMN\\_METADATA\\_T](#) Record Type
- [COLUMN\\_T](#) Record Type
- [DESCRIBE\\_T](#) Record Type
- [ENV\\_T](#) Record Type
- [PARALLEL\\_ENV\\_T](#) Record Type
- [TABLE\\_T](#) Record Type

### TABLE Types

- [Supported Types Collections](#) (TAB\_<typ>\_T)

- [COLUMNS\\_NEW\\_T Table Type](#)
- [COLUMNS\\_T Table Type](#)
- [COLUMNS\\_WITH\\_TYPE\\_T Table Type](#)
- [TABLE\\_COLUMNS\\_T Table Type](#)
- [ROW\\_SET\\_T Table Type](#)

### Types

- [XID\\_T Subtype](#)

### CSTORE and XSTORE Data Structures

The compilation and execution state management interfaces use data structures internally.

See [Collections For Compilation Storage](#) for more information.

## 179.8.1 Supported Types Collections

Each supported type has a corresponding predefined collection defined.

### Syntax

```
TYPE TAB_BOOLEAN_T          IS TABLE OF BOOLEAN          INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_FLOAT_T     IS TABLE OF BINARY_FLOAT     INDEX BY PLS_INTEGER;

TYPE TAB_BINARY_DOUBLE_T    IS TABLE OF BINARY_DOUBLE    INDEX BY PLS_INTEGER;

TYPE TAB_BLOB_T             IS TABLE OF BLOB              INDEX BY PLS_INTEGER;

TYPE TAB_CHAR_T             IS TABLE OF CHAR(32767)       INDEX BY PLS_INTEGER;

TYPE TAB_CLOB_T             IS TABLE OF CLOB              INDEX BY PLS_INTEGER;

TYPE TAB_DATE_T             IS TABLE OF DATE              INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_YM_T      IS TABLE OF YMININTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_INTERVAL_DS_T      IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_NATURALN_T         IS TABLE OF NATURALN          INDEX BY PLS_INTEGER;

TYPE TAB_NUMBER_T           IS TABLE OF NUMBER            INDEX BY PLS_INTEGER;

TYPE TAB_RAW_T              IS TABLE OF RAW(32767)        INDEX BY PLS_INTEGER;

TYPE TAB_ROWID_T            IS TABLE OF ROWID              INDEX BY PLS_INTEGER;

TYPE TAB_VARCHAR2_T         IS TABLE OF VARCHAR2(32767)   INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_T        IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_TZ_T     IS TABLE OF TIMESTAMP_TZ_UNCONSTRAINED INDEX BY PLS_INTEGER;

TYPE TAB_TIMESTAMP_LTZ_T    IS TABLE OF TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY PLS_INTEGER;
```

**See Also:**

[Table 179-1](#) for more information about the DBMS\_TF supported types

# 179.8.2 COLUMN\_DATA\_T Record Type

Data for a single column (variant record).

Exactly one variant field is active in the record. The description includes information about the column type that is active.

See [Table 179-1](#) for the list of supported types.

## Syntax

```
TYPE COLUMN_DATA_T IS RECORD
( description          COLUMN_METADATA_T,
  tab_varchar2         TAB_VARCHAR2_T,
  tab_number           TAB_NUMBER_T,
  tab_date             TAB_DATE_T,
  tab_binary_float     TAB_BINARY_FLOAT_T,
  tab_binary_double    TAB_BINARY_DOUBLE_T,
  tab_raw              TAB_RAW_T,
  tab_char             TAB_CHAR_T,
  tab_clob             TAB_CLOB_T,
  tab_blob            TAB_BLOB_T,
  tab_timestamp        TAB_TIMESTAMP_T,
  tab_timestamp_tz     TAB_TIMESTAMP_TZ_T,
  tab_interval_ym      TAB_INTERVAL_YM_T,
  tab_interval_ds      TAB_INTERVAL_DS_T,
  tab_timestamp_ltz    TAB_TIMESTAMP_LTZ_T,
  tab_rowid            TAB_ROWID_T);
```

## Fields

**Table 179-7** COLUMN\_DATA\_T Fields

| Field             | Description                                                                           |
|-------------------|---------------------------------------------------------------------------------------|
| description       | The tag defines the metadata for the column indicating which variant field is active. |
| tab_varchar2      | Variant field                                                                         |
| tab_number        | Variant field                                                                         |
| tab_date          | Variant field                                                                         |
| tab_binary_float  | Variant field                                                                         |
| tab_binary_double | Variant field                                                                         |
| tab_raw           | Variant field                                                                         |
| tab_char          | Variant field                                                                         |
| tab_clob          | Variant field                                                                         |
| tab_blob          | Variant field                                                                         |
| tab_timestamp     | Variant field                                                                         |
| tab_timestamp_tz  | Variant field                                                                         |

**Table 179-7 (Cont.) COLUMN\_DATA\_T Fields**

| Field             | Description   |
|-------------------|---------------|
| tab_interval_ym   | Variant field |
| tab_interval_ds   | Variant field |
| tab_timestamp_ltz | Variant field |
| tab_rowid         | Variant field |

## 179.8.3 COLUMN\_METADATA\_T Record Type

This type contains metadata about an existing table column or a new column produced by PTF.

### Syntax

```
TYPE COLUMN_METADATA_T IS RECORD
( type                PLS_INTEGER,
  max_len             PLS_integer DEFAULT -1,
  name                VARCHAR2(32767),
  name_len            PLS_INTEGER,
  precision            PLS_INTEGER,
  scale               PLS_INTEGER,
  charsetid            PLS_INTEGER,
  charsetform          PLS_INTEGER,
  collation            PLS_INTEGER );
```

### Fields

**Table 179-8 COLUMN\_METADATA\_T Fields**

| Field       | Description                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type        | Internal Oracle typecode for the column's type                                                                                                                                                                                                                                                                |
| max_len     | Maximum length of a column. If it is less than the maximum allowed length then that value will be used, if it is NULL or zero, zero will be used. If it is less than zero, then maximum allowed length will be used. If types (like date,float), does not care about length, then this value will be ignored. |
| name        | Name of the column                                                                                                                                                                                                                                                                                            |
| name_len    | Length of the name                                                                                                                                                                                                                                                                                            |
| precision   | The precision, or the maximum number of significant decimal digits (for numeric data types)                                                                                                                                                                                                                   |
| scale       | Scale, or the number of digits from the decimal point to the least significant digit (for numeric data types)                                                                                                                                                                                                 |
| charsetid   | Character set id (internal Oracle code, applies to string types)                                                                                                                                                                                                                                              |
| charsetform | Character set form (internal Oracle code, applies to string types)                                                                                                                                                                                                                                            |
| collation   | Collation id (internal Oracle code, applies to string types)                                                                                                                                                                                                                                                  |

## 179.8.4 COLUMN\_T Record Type

The column descriptor record for the type COLUMN\_METADATA\_T that contains PTF specific attributes.

## Syntax

```
TYPE column_t IS RECORD (  
    description          COLUMN_METADATA_T,  
    pass_through         BOOLEAN,  
    for_read             BOOLEAN);
```

## Fields

**Table 179-9 COLUMN\_T Fields**

| Field        | Description                    |
|--------------|--------------------------------|
| description  | Column metadata                |
| pass_through | Is this a pass through column  |
| for_read     | Is this column read by the PTF |

## 179.8.5 DESCRIBE\_T Record Type

The return type from the DESCRIBE method of PTF.

## Syntax

```
TYPE DESCRIBE_T          IS RECORD  
    ( NEW_COLUMNS        COLUMNS_NEW_T DEFAULT COLUMNS_NEW_T(),  
      CSTORE_CHR         CSTORE_CHR_T  DEFAULT CSTORE_CHR_T(),  
      CSTORE_NUM         CSTORE_NUM_T   DEFAULT CSTORE_NUM_T(),  
      CSTORE_BOL         CSTORE_BOL_T   DEFAULT CSTORE_BOL_T(),  
      CSTORE_DAT         CSTORE_DAT_T   DEFAULT CSTORE_DAT_T(),  
      METHOD_NAMES        METHODS_T     DEFAULT METHODS_T());
```

## Fields

**Table 179-10 DESCRIBE\_T Fields**

| Field        | Description                                                             |
|--------------|-------------------------------------------------------------------------|
| NEW_COLUMNS  | New columns description that will be produced by the PTF                |
| CSTORE_CHR   | CStore array key type : VARCHAR2 (optional)                             |
| CSTORE_NUM   | CStore array key type : NUMBER (optional)                               |
| CSTORE_BOL   | CStore array key type : BOOLEAN (optional)                              |
| CSTORE_DAT   | CStore array key type : DATE (optional)                                 |
| METHOD_NAMES | Method names, if user wants to override OPEN, FETCH_ROWS, CLOSE methods |

## 179.8.6 ENV\_T Record Type

This record contains metadata about the polymorphic table function execution state.

## Syntax

```
TYPE ENV_T IS RECORD (  
    get_columns          TABLE_METADATA_T,  
    put_columns          TABLE_METADATA_T,
```

```

ref_put_col      REFERENCED_COLS_T,
parallel_env     PARALLEL_ENV_T,
query_optim      BOOLEAN,
row_count        PLS_INTEGER,
row_replication  BOOLEAN,
row_insertion    BOOLEAN);

```

## Fields

**Table 179-11 ENV\_T Fields**

| Field           | Description                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------|
| get_columns     | Metadata about the columns read by PTF GET_COL procedure                                           |
| put_columns     | Metadata about columns sent back to database by PUT_COL procedure                                  |
| ref_put_col     | TRUE if the put column was referenced in the query                                                 |
| parallel_env    | Parallel execution information (when a query runs in parallel)                                     |
| query_optim     | Is this execution for query optimization?<br>TRUE, if the query was running on behalf of optimizer |
| row_count       | Number of rows in current row set                                                                  |
| row_replication | Is Row Replication Enabled?                                                                        |
| row_insertion   | Is Row Insertion Enabled?                                                                          |

## 179.8.7 PARALLEL\_ENV\_T Record Type

The record contains metadata specific to polymorphic table functions parallel execution.

## Syntax

```

TYPE PARALLEL_ENV_T      IS RECORD
( instance_id             PLS_INTEGER,
  session_id              PLS_INTEGER,
  slave_svr_grp           PLS_INTEGER,
  slave_set_no            PLS_INTEGER,
  no_slocal_slaves        PLS_INTEGER,
  global_slave_no         PLS_INTEGER,
  no_local_slaves         PLS_INTEGER,
  local_slave_no          PLS_INTEGER );

```

## Fields

**Table 179-12 PARALLEL\_ENV\_T Fields**

| Field            | Description                                  |
|------------------|----------------------------------------------|
| instance_id      | QC instance ID                               |
| session_id       | QC session ID                                |
| slave_svr_grp    | Slave server group                           |
| slave_set_no     | Slave server set number                      |
| no_slocal_slaves | Number of sibling slaves (including self)    |
| global_slave_no  | Global slave number (base 0)                 |
| no_local_slaves  | Number of sibling slaves running on instance |

**Table 179-12 (Cont.) PARALLEL\_ENV\_T Fields**

| Field          | Description                 |
|----------------|-----------------------------|
| local_slave_no | Local slave number (base 0) |

## 179.8.8 TABLE\_T Record Type

The DESCRIBE function input table descriptor argument is of TABLE\_T record type.

### Syntax

```
TYPE TABLE_T IS RECORD(  
    column          TABLE_COLUMNS_T,  
    schema_name     DBMS_id,  
    package_name    DBMS_id,  
    ptf_name        DBMS_id);
```

### Fields

**Table 179-13 TABLE\_T Fields**

| Field        | Description                         |
|--------------|-------------------------------------|
| column       | Column information                  |
| schema_name  | The PTF schema name                 |
| package_name | The PTF implementation package name |
| ptf_name     | The PTF name invoked                |

## 179.8.9 COLUMNS\_NEW\_T Table Type

Collection for new columns

### Syntax

```
TYPE COLUMNS_NEW_T IS TABLE OF COLUMN_METADATA_T INDEX BY PLS_INTEGER;
```

## 179.8.10 COLUMNS\_T Table Type

Collection containing column names

### Syntax

```
TYPE COLUMNS_T IS TABLE OF DBMS_QUOTED_ID;
```

## 179.8.11 COLUMNS\_WITH\_TYPE\_T Table Type

Collection containing columns metadata

### Syntax

```
TYPE COLUMNS_WITH_TYPE_T IS TABLE OF COLUMN_METADATA_T;
```

## 179.8.12 TABLE\_COLUMNS\_T Table Type

A collection of columns(COLUMN\_T)

### Syntax

```
TYPE TABLE_COLUMNS_T IS TABLE OF COLUMN_T;
```

## 179.8.13 ROW\_SET\_T Table Type

Data for a rowset

### Syntax

```
TYPE ROW_SET_T IS TABLE OF COLUMN_DATA_T INDEX BY PLS_INTEGER;
```

## 179.8.14 XID\_T Subtype

The XID\_T subtype is defined to store the execution unique ID returned by function GET\_XID.

### Syntax

```
SUBTYPE XID_T IS VARCHAR2(1024);
```

# 179.9 Summary of DBMS\_TF Subprograms

This summary briefly describes the DBMS\_TF package subprograms.

**Table 179-14 DBMS\_TF Subprograms**

| Subprogram                | Description                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------|
| COLUMN_TYPE_NAME Function | Returns the type name of the specified column type                                                             |
| COL_TO_CHAR Function      | Returns the string representation of the specified column                                                      |
| CSTORE_EXISTS Function    | Returns TRUE if an item with a given key exists in the PTF Compilation State management Store                  |
| CSTORE_GET Procedure      | Gets item(s) of specified type from the PTF Compilation State management Store                                 |
| GET_COL Procedure         | Gets read column values                                                                                        |
| GET_ENV Function          | Returns information about the PTF runtime environment                                                          |
| GET_ROW_SET Procedure     | Gets read set of column values in the collection                                                               |
| GET_XID Function          | Returns a unique execution id that can be used by the PTF to index any cursor execution specific runtime state |
| PUT_COL Procedure         | Puts column values in the database                                                                             |
| PUT_ROW_SET Procedure     | Puts the collection read set of column values in the database                                                  |
| ROW_REPLICATION Procedure | Sets the row replication factor                                                                                |

**Table 179-14 (Cont.) DBMS\_TF Subprograms**

| Subprogram              | Description                                                               |
|-------------------------|---------------------------------------------------------------------------|
| ROW_TO_CHAR Function    | Returns the string representation of a row in a rowset                    |
| SUPPORTED_TYPE Function | Returns TRUE if a specified type is supported by PTF infrastructure       |
| TRACE Procedure         | Prints data structures to help development and problem diagnosis          |
| XSTORE_CLEAR Procedure  | Removes all key-value pairs from XStore                                   |
| XSTORE_EXISTS Procedure | Returns TRUE if the key has an associated value                           |
| XSTORE_GET Procedure    | Gets a key-value store for PTF Execution State Management                 |
| XSTORE_REMOVE Procedure | Removes any value associated with the given key                           |
| XSTORE_SET Procedure    | Sets the value for the given key store for PTF Execution State Management |

## 179.9.1 COLUMN\_TYPE\_NAME Function

Returns the type name for the specified column type.

### Syntax

```
FUNCTION COLUMN_TYPE_NAME(
    col COLUMN_METADATA_T)
RETURN VARCHAR2;
```

### Parameters

**Table 179-15 DBMS\_TF.COLUMN\_TYPE\_NAME Function Parameters**

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| col       | The column metadata. See <a href="#">COLUMN_METADATA_T Record Type</a> |

### Return Values

Returns the column type converted as text.

### Example 179-5 DBMS\_TF.COLUMN\_TYPE\_NAME Example

This example shows an application type check that invokes `COLUMN_TYPE_NAME` to compare the column type and raise an application error if the column type is not `VARCHAR2`.

```
FUNCTION describe(
    tab IN OUT DBMS_TF.table_t,
    cols IN DBMS_TF.columns_t)
RETURN DBMS_TF.describe_t
AS
    new_cols DBMS_TF.columns_new_t;
    col_id PLS_INTEGER := 1;
BEGIN
    FOR i IN 1 .. tab.count LOOP
```

```

FOR j IN 1 .. cols.count LOOP
  IF (tab(i).description.name = cols(j)) THEN
    IF (DBMS_TF.column_type_name(tab(i).description.type) != 'VARCHAR2') THEN
      raise_application_error(-20102,
        'Unsupported column type ['||tab(i).description.type||']');
    END IF;
    tab(i).for_read      := true;
    new_cols(col_id)     := tab(i).description;
    new_cols(col_id).name := 'ECHO_'|| tab(i).description.name;
    col_id               := col_id + 1;
    EXIT;
  END IF;
END LOOP;

END LOOP;

-- Verify all columns were found
IF (col_id - 1 != cols.count) THEN
  raise_application_error(-20101,
    'Column mismatch ['||col_id-1||'], ['||cols.count||']');
END IF;

RETURN DBMS_TF.describe_t(new_columns => new_cols);
END;
```

## 179.9.2 COL\_TO\_CHAR Function

Returns the string representation of the specified column.

### Syntax

```

FUNCTION COL_TO_CHAR(
  col   COLUMN_DATA_T,
  rid   PLS_INTEGER,
  quote VARCHAR2 DEFAULT '')
RETURN VARCHAR2;
```

### Parameters

**Table 179-16 DBMS\_TF.COL\_TO\_CHAR Function Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| col       | The column whose value is to be converted    |
| rid       | Row number                                   |
| quote     | Quotation mark to use for non-numeric values |

### Return Values

The string representation of a column data value.

### Example 179-6 DBMS\_TF.COL\_TO\_CHAR Example

```

PROCEDURE Fetch_Rows AS
  rowset DBMS_TF.rROW_SET_T;
  str    VARCHAR2(32000);
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
```

```
        str := DBMS_TF.COL_TO_CHAR(rowset(1), 1)
    END;
```

## 179.9.3 CSTORE\_EXISTS Function

Returns TRUE if an item with a given key exists in the Store PTF Compilation State.

### Syntax

```
FUNCTION CSTORE_EXISTS
  (key          IN VARCHAR2,
   key_type IN PLS_INTEGER default NULL)
  return BOOLEAN;
```

### Parameters

**Table 179-17 CSTORE\_EXISTS Function Parameters**

| Parameter | Description                               |
|-----------|-------------------------------------------|
| key       | A unique character key                    |
| key_type  | The type of key (optional) Default : NULL |

### Return Values

Returns TRUE if the key has an associated value. When the key\_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key\_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

### Example 179-7 DBMS\_TF.CSTORE\_EXISTS Example

This code excerpt checks if an item with the key exists before reading it from the compilation store.

```
IF (DBMS_TF.CSTORE_EXISTS('min'||j)) THEN
    DBMS_TF.CSTORE_GET('min'||j, min_col);
END IF;
```

## 179.9.4 CSTORE\_GET Procedure

You can use the CSTORE\_GET procedure to get the associated value for a given key stored for PTF Compilation State.

CSTORE is the PTF compilation state management interface. The CSTORE interface is used to set and store key-value pairs during cursor compilation through the DBMS\_TF.DESCRIBE function.

You can get the PTF compilation state during runtime procedures such as OPEN, FETCH\_ROWS and CLOSE.

This procedure is overloaded. The DESCRIBE\_T supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 179-3](#) for more information.

Syntax

Get the value associated with the key in the value out variable. The value type returned is one of the supported scalar types.

```
PROCEDURE CSTORE_GET(  
    key    IN    VARCHAR2,  
    value  IN OUT VARCHAR2);
```

```
PROCEDURE CSTORE_GET(  
    key    IN    VARCHAR2,  
    value  IN OUT NUMBER);
```

```
PROCEDURE CSTORE_GET(  
    key    IN    VARCHAR2,  
    value  IN OUT DATE);
```

```
PROCEDURE CSTORE_GET(  
    key    IN    VARCHAR2,  
    value  IN OUT BOOLEAN);
```

When no specific key is passed as an input parameter, the entire collection of key values for that type that exist in the CSTORE is returned.

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_CHR_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_NUM_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_BOL_T);
```

```
PROCEDURE CSTORE_GET(key_value OUT CSTORE_DAT_T);
```

Parameters

Table 179-18 DBMS\_TF.CSTORE\_GET Procedure Parameters

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| key       | A unique character key                             |
| value     | Value corresponding to the key for supported types |
| key_value | Key value                                          |

179.9.5 GET\_COL Procedure

Get Read Column Values

Syntax

```
PROCEDURE GET_COL(  
    columnId NUMBER,  
    collection IN OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the supported types.

See [Table 179-1](#) for the list of supported types.

## Parameters

**Table 179-19 GET\_COL Procedure Parameters**

| Parameter  | Description             |
|------------|-------------------------|
| columnid   | The id for the column   |
| collection | The data for the column |

## Usage Notes

This procedure is used to get the read column values in the collection of scalar type.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same ColumnId, GET\_COL and PUT\_COL may correspond to different column.

### Example 179-8 DBMS\_TF.GET\_COL Example

This example is an excerpt of a fetch\_rows procedure defined in the PTF implementation package.

```
PROCEDURE fetch_rows
IS
    col1 DBMS_TF.TAB_CLOB_T;
    col2 DBMS_TF.TAB_CLOB_T;
    out1 DBMS_TF.TAB_CLOB_T;
    out2 DBMS_TF.TAB_CLOB_T;
BEGIN
    DBMS_TF.GET_COL(1, col1);
    DBMS_TF.GET_COL(2, col2);

    FOR I IN 1 .. col1.COUNT LOOP
        out1(i) := 'ECHO-' || col1(i);
    END LOOP;

    FOR I IN 1 .. col2.COUNT LOOP
        out2(i) := 'ECHO-' || col2(i);
    END LOOP;

    DBMS_TF.PUT_COL(1, out1);
    DBMS_TF.PUT_COL(2, out2);
END;
```

Note, invoking the DBMS\_TF APIs directly is not allowed. An error is raised if an attempt is made to execute these procedures out of context.

```
exec fetch_rows
```

```
ERROR at line 1:
ORA-62562: The API Get_Col can be called only during execution time of a polymorphic
table function.
```

## 179.9.6 GET\_ENV Function

Returns information about the PTF runtime environment

### Syntax

```
FUNCTION GET_ENV  
        RETURN ENV_T;
```

### Return Values

Returns information about the PTF runtime environment.

### Example 179-9 DBMS\_TF.GET\_ENV Example

This line shows how you could initialize a local variable env of type ENV\_T with the PTF execution information in a FETCH\_ROWS implementation procedure.

```
env          DBMS_TF.ENV_T  := DBMS_TF.GET_ENV();
```

## 179.9.7 GET\_ROW\_SET Procedure

Get Read Column Values

The FETCH\_ROW procedure can call the GET\_ROW\_SET procedure to read the input rowset set of column values in the collection of supported scalar type. This procedure is overloaded.

### Syntax

```
PROCEDURE GET_ROW_SET(  
    rowset      OUT NOCOPY ROW_SET_T);  
  
PROCEDURE GET_ROW_SET(  
    rowset      OUT NOCOPY ROW_SET_T,  
    row_count   OUT          PLS_INTEGER);  
  
PROCEDURE GET_ROW_SET(  
    rowset      OUT NOCOPY ROW_SET_T,  
    row_count   OUT          PLS_INTEGER,  
    col_count   OUT          PLS_INTEGER);
```

### Parameters

**Table 179-20 GET\_ROW\_SET Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| rowset    | The collection of data and metadata |
| row_count | The number of rows in the columns   |
| col_count | The number of columns               |

**Example 179-10 DBMS\_TF.GET\_ROW\_SET Example**

This example is an excerpt from a PTF implementation package for demonstration purpose.

```
PROCEDURE fetch_rows(new_name IN VARCHAR2 DEFAULT 'PTF_CONCATENATE')
AS
    rowset          DBMS_TF.ROW_SET_T;
    accumulator DBMS_TF.TAB_VARCHAR2_T;
    row_count       PLS_INTEGER;

    FUNCTION get_value(col PLS_INTEGER,
                      ROW PLS_INTEGER)
    RETURN VARCHAR2
    AS
        col_type PLS_INTEGER := rowset(col).description.TYPE;
    BEGIN
        CASE col_type
            WHEN DBMS_TF.TYPE_VARCHAR2 THEN
                RETURN NVL(rowset(col).TAB_VARCHAR2 (ROW), 'empty');
            ELSE
                RAISE_APPLICATION_ERROR(-20201, 'Non-Varchar Type='||col_type);
            END CASE;
    END;
END;
BEGIN
    DBMS_TF.GET_ROW_SET(rowset, row_count);

    IF ( rowset.count = 0 ) THEN
        RETURN;
    END IF;

    FOR row_num IN 1 .. row_count LOOP
        accumulator(row_num) := 'empty';
    END LOOP;

    FOR col_num IN 1 .. rowset.count LOOP
        FOR row_num IN 1 .. row_count LOOP
            accumulator(row_num) := accumulator(row_num) ||
get_value(col_num, row_num);
        END LOOP;
    END LOOP;
    -- Pushout the accumulator
    DBMS_TF.PUT_COL(1, accumulator);
END;
```

### 179.9.7.1 Stack Polymorphic Table Function Example

The stack PTF example unpivots the non-null values of the specified numeric columns by converting each column value into a new row.

**Example 179-11 Stack Polymorphic Table Function Example** **Live SQL:**

You can view and run this example on Oracle Live SQL at [Stack Polymorphic Table Function](#)

Create the PTF implementation package `stack_p`.

The parameters are :

- `tab` - Input table
- `col` - The names of numeric (input) table columns to stack

```
CREATE PACKAGE stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                      col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t;

    PROCEDURE fetch_rows;

END stack_p;
```

Create the PTF implementation package body `stack_p`.

This PTF produces two new columns, `COLUMN_NAME` and `COLUMN_VALUE`, where the former contains the name of the unpivoted column and the latter contains the numeric value of that column. Additionally, the unpivoted columns are removed from the PTF's output.

```
CREATE PACKAGE BODY stack_p AS

    FUNCTION describe(tab IN OUT dbms_tf.table_t,
                      col      dbms_tf.columns_t)
        RETURN dbms_tf.describe_t AS
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = dbms_tf.type_number) THEN
                    tab.column(i).pass_through := false;
                    tab.column(i).for_read      := true;
                END IF;
            END LOOP;
        END LOOP;

        RETURN dbms_tf.describe_t(
            new_columns => dbms_tf.columns_new_t(
                1 => dbms_tf.column_metadata_t(name => 'COLUMN_NAME',
                                                TYPE => dbms_tf.type_varchar2),
                2 => dbms_tf.column_metadata_t(name => 'COLUMN_VALUE',
                                                TYPE => dbms_tf.type_number)),
            row_replication => true);
    END;
```

```

END;

PROCEDURE fetch_rows AS
    env    dbms_tf.env_t := dbms_tf.get_env();
    rowset dbms_tf.row_set_t;
    colcnt PLS_INTEGER;
    rowcnt PLS_INTEGER;
    repfac dbms_tf.tab_naturaln_t;
    namcol dbms_tf.tab_varchar2_t;
    valcol dbms_tf.tab_number_t;
BEGIN
    dbms_tf.get_row_set(rowset, rowcnt, colcnt);

    FOR i IN 1 .. rowcnt LOOP
        repfac(i) := 0;
    END LOOP;

    FOR r IN 1 .. rowcnt LOOP
        FOR c IN 1 .. colcnt LOOP
            IF rowset(c).tab_number(r) IS NOT NULL THEN
                repfac(r) := repfac(r) + 1;
                namcol(nvl(namcol.last+1,1)) :=
                    INITCAP(regex_replace(env.get_columns(c).name, '^"|"$'));
                valcol(NVL(valcol.last+1,1)) := rowset(c).tab_number(r);
            END IF;
        END LOOP;
    END LOOP;

    dbms_tf.row_replication(replication_factor => repfac);
    dbms_tf.put_col(1, namcol);
    dbms_tf.put_col(2, valcol);

END;

END stack_p;

```

Create the standalone PTF named `stack`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `stack_p`.

```

CREATE FUNCTION stack(tab TABLE,
                      col columns)
    RETURN TABLE
PIPELINED ROW POLYMORPHIC USING stack_p;

```

For all employees in departments 10 and 30, report values of columns `MGR`, `SAL`, and `COMM` ordered by department number and employee name.

```

SELECT deptno, ename, column_name, column_value
FROM    stack(scott.emp, COLUMNS(mgr, sal, comm))
WHERE   deptno IN (10, 30)
ORDER BY deptno, ename;

```

| DEPTNO | ENAME  | COLUMN_NAME | COLUMN_VALUE |
|--------|--------|-------------|--------------|
| 10     | CLARK  | Mgr         | 7839         |
| 10     | CLARK  | Sal         | 2450         |
| 10     | KING   | Sal         | 5000         |

## 179.9.8 GET\_XID Function

Returns a unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

### Syntax

```
FUNCTION GET_XID
RETURN XID_T;
```

### Return Values

A unique execution id that can be used by the PTF to index any cursor-execution specific runtime state.

### Example 179-12 DBMS\_TF.GET\_XID Example

This is an excerpt of code showing an invocation of GET\_XID to initialize a local variable indexed using the execution id to a zero value.

```
PROCEDURE open IS
BEGIN
    xst(DBMS_TF.GET_XID()) := 0;
END;
```

## 179.9.9 PUT\_COL Procedure

Put Column Values

### Syntax

```
PROCEDURE PUT_COL(
    columnid NUMBER,
    collection IN <datatype>);
```

Where *<datatype>* can be any one of the supported types.

See [Table 179-1](#) for the list of supported types.

### Parameters

**Table 179-21 PUT\_COL Procedure Parameters**

| Parameter  | Description             |
|------------|-------------------------|
| columnid   | The id for the column   |
| collection | The data for the column |

### Usage Notes

This procedure is used to put the read column values in the collection of scalar type.

The collection of scalar type should be of supported type only.

The column numbers are in the get column order as created in DESCRIBE method of PTF.

For the same columnid, GET\_COL and PUT\_COL may correspond to different column.

## 179.9.9.1 Rand\_col Polymorphic Table Function Example

The rand\_col PTF appends specified number of random-valued columns to the output.

### Example 179-13 Rand\_col Polymorphic Table Function Example

#### Live SQL:

You can view and run this example on Oracle Live SQL at [Rand\\_col Polymorphic Table Function](#)

This rand\_col PTF example appends col\_count number of random-valued columns to the output. Optionally, the caller can restrict the random values to a numeric range by specifying [low, high]. The new columns are named "RAND\_<n>"

Create the PTF implementation package rand\_col\_p.

The parameters are :

- tab : Input table
- col\_count (optional) : Number of random-valued columns to generate [Default = 1]
- low (optional) : Lower bound for the random numbers [Default = Null]
- high (optional) : Upper bound for the random numbers [Default = Null]

```
CREATE PACKAGE rand_col_p AS
```

```
    FUNCTION describe(tab          IN OUT DBMS_TF.table_t,  
                      col_count    NATURALN DEFAULT 1,  
                      low          NUMBER   DEFAULT NULL,  
                      high         NUMBER   DEFAULT NULL)
```

```

        RETURN DBMS_TF.describe_t;

PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                    low        NUMBER   DEFAULT NULL,
                    high       NUMBER   DEFAULT NULL);

END rand_col_p;

```

Create the PTF implementation package body rand\_col\_p.

The parameter col\_count is a 'shape-determining' parameter and thus must be a constant (no binds, correlations, or expressions). By defining the type of col\_count to be NATURALN, which has an implicit NOT NULL constraint, we guarantee that a cursor with non-constant value for this parameter will get a compilation error.

```

CREATE PACKAGE BODY rand_col_p AS
    col_name_prefix CONSTANT dbms_id := 'RAND_';

    FUNCTION describe(tab          IN OUT DBMS_TF.table_t,
                    col_count      NATURALN DEFAULT 1,
                    low            NUMBER   DEFAULT NULL,
                    high           NUMBER   DEFAULT NULL)
        RETURN DBMS_TF.describe_t
    AS
        cols DBMS_TF.columns_new_t;
    BEGIN
        FOR i IN 1 .. col_count LOOP
            cols(i) := DBMS_TF.column_metadata_t(name=>col_name_prefix||i,
            TYPE=>DBMS_TF.type_number);
        END LOOP;

        RETURN DBMS_TF.describe_t(new_columns => cols);
    END;

    PROCEDURE fetch_rows(col_count NATURALN DEFAULT 1,
                    low        NUMBER   DEFAULT NULL,
                    high       NUMBER   DEFAULT NULL)
    AS
        row_count CONSTANT PLS_INTEGER := DBMS_TF.get_env().row_count;
        col        DBMS_TF.tab_number_t;
    BEGIN
        FOR c IN 1 .. col_count LOOP
            FOR i IN 1 .. row_count LOOP
                col(i) := CASE WHEN (low IS NULL OR high IS NULL)
                            THEN dbms_random.VALUE
                            ELSE dbms_random.VALUE(low,
high)
            END;
            END LOOP;
            DBMS_TF.put_col(c, col);
        END LOOP;
    END;

END rand_col_p;

```

Create the standalone `rand_col` PTF. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `rand_col_p`.

```
CREATE FUNCTION rand_col(tab TABLE,
                        col_count NATURALN DEFAULT 1,
                        low          NUMBER   DEFAULT NULL,
                        high         NUMBER   DEFAULT NULL)
RETURN TABLE
PIPELINED ROW POLYMORPHIC USING rand_col_p;
```

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with one produced `RAND_1` column.

```
SELECT *
FROM rand_col(scott.dept);
```

| DEPTNO | DNAME      | LOC      | RAND_1     |
|--------|------------|----------|------------|
| 10     | ACCOUNTING | NEW YORK | .738666262 |
| 20     | RESEARCH   | DALLAS   | .093256312 |
| 30     | SALES      | CHICAGO  | .992944835 |
| 40     | OPERATIONS | BOSTON   | .397948124 |

Invoke the `rand_col` PTF to display all columns of table `SCOTT.DEPT` with two produced `RAND_1` and `RAND_2` columns.

```
SELECT *
FROM rand_col(scott.dept, col_count => 2);
```

| DEPTNO | DNAME      | LOC      | RAND_1     | RAND_2     |
|--------|------------|----------|------------|------------|
| 10     | ACCOUNTING | NEW YORK | .976521361 | .209802028 |
| 20     | RESEARCH   | DALLAS   | .899577891 | .10050334  |
| 30     | SALES      | CHICAGO  | .277238362 | .110736583 |
| 40     | OPERATIONS | BOSTON   | .989839995 | .164822363 |

For all employees for which their job is not being a `SALESMAN`, display the employee name, job, and produce three `RAND` columns generating random values between  $-10$  and  $10$ .

```
SELECT ename, job, rand_1, rand_2, rand_3
FROM   rand_col(scott.emp, col_count => 3, low => -10, high => +10)
WHERE  job != 'SALESMAN';
```

| ENAME  | JOB       | RAND_1     | RAND_2     | RAND_3     |
|--------|-----------|------------|------------|------------|
| SMITH  | CLERK     | 8.91760464 | 6.67366638 | -9.2789076 |

## 179.9.10 PUT\_ROW\_SET Procedure

Writes a collection of new column values in the database.

You can use this procedure to write all new columns in a collection of rows in the database.

This procedure is overloaded. Rows are not replicated by default. You can use the `ROW_REPLICATION` procedure to set the replication factor.

### Syntax

This syntax is used when rows are not replicated.

```
PROCEDURE PUT_ROW_SET(  
    rowset IN ROW_SET_T);
```

This syntax is used when the replication factor is a constant.

```
PROCEDURE PUT_ROW_SET(  
    rowset          IN    ROW_SET_T,  
    replication_factor IN NATURALN);
```

This syntax is used when the replication factor is specified as an array with multiple values.

```
PROCEDURE PUT_ROW_SET(  
    rowset          IN    ROW_SET_T,  
    replication_factor IN TAB_NATURALN_T);
```

### Parameters

**Table 179-22** PUT\_ROW\_SET Procedure Parameters

| Parameter          | Description                         |
|--------------------|-------------------------------------|
| rowset             | The collection of data and metadata |
| replication_factor | The replication factor per row      |

### Example 179-14 DBMS\_TF.PUT\_ROW\_SET Example

This code excerpt fetches a collection of rows and writes all new columns back to the database without any processing.

```
PROCEDURE fetch_rows  
AS  
    rowset DBMS_TF.ROW_SET_T;  
BEGIN  
    DBMS_TF.GET_ROW_SET(rowset);  
    DBMS_TF.PUT_ROW_SET(rowset);  
END;
```

## 179.9.10.1 Split Polymorphic Table Function Example

The split PTF example splits each row of the input table into specified pieces.

**Example 179-15 Split Polymorphic Table Function Example**

This PTF example splits each row of the input table into cnt pieces dividing the values of the split columns.

**Live SQL:**

You can view and run this example on Oracle Live SQL at [Split Polymorphic Table Function](#)

Create the PTF implementation package split\_p.

The parameters are :

- tab - Input table
- col - The names of numeric (input) table columns to split
- cnt - The number of times each input row is to be split

```
CREATE PACKAGE split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.table_t,
                      col      DBMS_TF.columns_t,
                      cnt      NATURALN)
                      RETURN DBMS_TF.describe_t;

    PROCEDURE fetch_rows(cnt NATURALN);

END split_p;
```

Create the PTF implementation package body split\_p. Each row of the input table is split into cnt pieces dividing the values of the split columns.

```
CREATE PACKAGE BODY split_p AS

    FUNCTION describe(tab IN OUT DBMS_TF.Table_t,
                      col      DBMS_TF.Columns_t,
                      cnt      NATURALN)
                      RETURN DBMS_TF.describe_t
    AS
        new_cols DBMS_TF.columns_new_t;
        col_id   PLS_INTEGER := 1;
    BEGIN
        FOR i IN 1 .. tab.column.count LOOP
            FOR j IN 1 .. col.count LOOP
                IF (tab.column(i).description.name = col(j) AND
                    tab.column(i).description.TYPE = DBMS_TF.type_number) THEN
                    tab.column(i).pass_through := FALSE;
                    tab.column(i).for_read      := TRUE;
                    new_cols(col_id) := tab.column(i).description;
                    col_id := col_id + 1;
                END IF;
            END LOOP;
        END LOOP;
    END LOOP;
```

```

        RETURN DBMS_TF.describe_t(new_columns=>new_cols, row_replication=>true);
    END;
    PROCEDURE fetch_rows(cnt NATURALN)
    AS
        inp_rs DBMS_TF.row_set_t;
        out_rs DBMS_TF.row_set_t;
        rows   PLS_INTEGER;
    BEGIN
        DBMS_TF.get_row_set(inp_rs, rows);

        FOR c IN 1 .. inp_rs.count() LOOP
            FOR r IN 1 .. rows LOOP
                FOR i IN 1 .. cnt LOOP
                    out_rs(c).tab_number((r-1)*cnt+i) := inp_rs(c).tab_number(r)/cnt;
                END LOOP;
            END LOOP;
        END LOOP;

        DBMS_TF.put_row_set(out_rs, replication_factor => cnt);
    END;

END split_p;

```

Create the standalone PTF named `split`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is `split_p`.

```

CREATE FUNCTION split(tab TABLE, col columns, cnt NATURALN)
    RETURN TABLE
PIPELINED ROW POLYMORPHIC USING split_p;

```

For all employees in department 30, display the `ENAME`, `SAL`, and `COMM` columns. Invoke the `split` PTF with the `COLUMNS` pseudo-operator to divide the value of `SAL` and `COMM` by 2 for each replicated row returned by the query. Each row is replicated twice.

```

SELECT ename, sal, comm
FROM   split(scott.emp, COLUMNS(sal, comm), cnt => 2)
WHERE  deptno=30;

```

| ENAME  | SAL   | COMM  |
|--------|-------|-------|
| -----  | ----- | ----- |
| ALLEN  | 800   | 150   |
| ALLEN  | 800   | 150   |
| WARD   | 625   | 250   |
| WARD   | 625   | 250   |
| MARTIN | 625   | 700   |
| MARTIN | 625   | 700   |
| BLAKE  | 1425  |       |
| BLAKE  | 1425  |       |
| TURNER | 750   | 0     |
| TURNER | 750   | 0     |
| JAMES  | 475   |       |
| JAMES  | 475   |       |

## 179.9.11 ROW\_REPLICATION Procedure

Sets the row replication factor either as a fixed value or as a value per row.

This procedure is overloaded. A `Row Semantics` polymorphic table function will either produce a single output row for a given input row (one-to-one), or it can produce more output rows for a given input rows (one-to-many), or it can produce no output rows (one-to-none).

### Syntax

Sets the row replication factor as a fixed value.

```
PROCEDURE ROW_REPLICATION(  
    replication_factor IN NATURALN);
```

Sets the row replication factor as a value per row.

```
PROCEDURE ROW_REPLICATION(  
    replication_factor IN TAB_NATURALN_T);
```

### Parameters

**Table 179-23 ROW\_REPLICATION Procedure Parameters**

| Parameter                       | Description                    |
|---------------------------------|--------------------------------|
| <code>replication_factor</code> | The replication factor per row |

### Example 179-16 Replicate Polymorphic Table Function Example

This example creates a PTF that replicates each input row by the `replication_factor` that is given as a parameter.

#### Live SQL:

You can view and run this example on Oracle Live SQL at [Replicate Polymorphic Table Function](#)

Create the PTF implementation package `replicate_p`.

```
CREATE PACKAGE replicate_p  
AS  
  
    FUNCTION Describe(tab IN OUT DBMS_TF.TABLE_T,  
        replication_factor NATURAL)  
        RETURN DBMS_TF.describe_t;  
  
    PROCEDURE Fetch_Rows(replication_factor NATURALN);  
  
END replicate_p;
```

Create the PTF implementation package body replicate\_p. The PTF replicates each input row by the replication\_factor that is given as a parameter.

```
CREATE PACKAGE body replicate_p
AS

    FUNCTION Describe(tab IN OUT DBMS_TF.Table_t
                     , replication_factor NATURAL)
    RETURN DBMS_TF.describe_t AS
    BEGIN
        RETURN DBMS_TF.describe_t(row_replication => True);
    END;

    PROCEDURE Fetch_Rows(replication_factor NATURALN)
    AS
    BEGIN
        DBMS_TF.ROW_REPLICATION(replication_factor);
    END;
END replicate_p;
```

Create a standalone PTF named replicate. Specify exactly one formal argument of type TABLE, specify the return type of the PTF as TABLE, specify a Row Semantics PTF type, and indicate the PTF implementation package to use is replicate\_p.

```
CREATE FUNCTION replicate(tab TABLE,
                          replication_factor NATURAL)
RETURN TABLE PIPELINED ROW POLYMORPHIC USING replicate_p;
```

This example sets the replication\_factor to 2 which results in doubling the number of rows.

```
SELECT *
FROM replicate(dept, replication_factor => 2);
```

| DEPTNO | DNAME      | LOC      |
|--------|------------|----------|
| 10     | ACCOUNTING | NEW YORK |
| 10     | ACCOUNTING | NEW YORK |
| 20     | RESEARCH   | DALLAS   |
| 20     | RESEARCH   | DALLAS   |
| 30     | SALES      | CHICAGO  |
| 30     | SALES      | CHICAGO  |
| 40     | OPERATIONS | BOSTON   |
| 40     | OPERATIONS | BOSTON   |

This example sets the replication\_factor to zero.

```
SELECT *
FROM replicate(dept, replication_factor => 0);
```

no rows selected

Count the number of employees in each department. Invoke the replicate PTF to report from the SCOTT.EMP table to set the replication\_factor to 1000000.

```
SELECT deptno, COUNT(*)
FROM replicate(scott.emp, 1e6)
GROUP BY deptno;
```

```
DEPTNO    COUNT(*)
-----
      30    6000000
      10    3000000
      20    5000000
```

This sets the replication\_factor to 1000000000.

```
SELECT COUNT(*)
FROM replicate(dual, 1e9);
```

```
COUNT(*)
-----
1000000000
```

## 179.9.12 ROW\_TO\_CHAR Function

The ROW\_TO\_CHAR function converts a row data value to a string representation.

### Syntax

```
FUNCTION ROW_TO_CHAR(
    rowset ROW_SET_T,
    rid    PLS_INTEGER,
    format PLS_INTEGER DEFAULT FORMAT_JSON)
RETURN VARCHAR2;
```

### Parameters

**Table 179-24 DBMS\_TF.ROW\_TO\_CHAR Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| rowset    | The rowset whose value is to be converted  |
| rid       | Row number                                 |
| format    | The string format (default is FORMAT_JSON) |

### Usage Notes

Only the JSON format is supported.

### Return Values

The string representation in JSON format.

### Example 179-17 DBMS\_TF.ROW\_TO\_CHAR Example

```
PROCEDURE Fetch_Rows as
    rowset DBMS_TF.ROW_SET_T;
    str    VARCHAR2(32000);
```

```
BEGIN
  DBMS_TF.GET_ROW_SET(rowset);
  str := DBMS_TF.ROW_TO_CHAR(rowset, 1)
END;
```

## 179.9.13 SUPPORTED\_TYPE Function

This function tests if a specified type is supported with polymorphic table functions.

### Syntax

```
FUNCTION SUPPORTED_TYPE (
  type_id PLS_INTEGER)
RETURN BOOLEAN;
```

### Parameters

**Table 179-25 DBMS\_TF.SUPPORTED\_TYPE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| type_id   | The type    |

### Return Values

Returns TRUE if the type\_id is a scalar supported by PUT\_COL and GET\_COL.

#### See Also:

[Echo Polymorphic Table Function Example](#) for an example of DBMS\_TF.SUPPORTED\_TYPE use.

## 179.9.14 TRACE Procedure

Prints data structures to help development and problem diagnosis.

This procedure is overloaded.

### Syntax

```
PROCEDURE TRACE (
  msg          VARCHAR2,
  with_id      BOOLEAN   DEFAULT FALSE,
  separator    VARCHAR2  DEFAULT NULL,
  prefix       VARCHAR2  DEFAULT NULL);
```

```
PROCEDURE TRACE (
  rowset       IN ROW_SET_T);
```

```
PROCEDURE TRACE (
  env          IN ENV_T);
```

```
PROCEDURE TRACE (
  columns_new  IN COLUMNS_NEW_T);
```

```
PROCEDURE trace (
  cols        IN COLUMNS_T);
```

```
PROCEDURE trace(  
    columns_with_type IN COLUMNS_WITH_TYPE_T);  
  
PROCEDURE trace(  
    tab          IN TABLE_T);  
  
PROCEDURE trace(  
    col          IN COLUMN_METADATA_T);
```

## Parameters

**Table 179-26 TRACE Procedure Parameters**

| Parameter         | Description                                                      |
|-------------------|------------------------------------------------------------------|
| msg               | Custom user tracing message                                      |
| with_id           | Include the unique execution ID in the trace?                    |
| separator         | Specify a string to use to separate values                       |
| prefix            | Specify a string to prefix the actual values                     |
| rowset            | Data for a rowset                                                |
| env               | Metadata about the polymorphic table function execution state    |
| columns_new       | Collection for new columns                                       |
| cols              | Collection containing column names                               |
| columns_with_type | Collection containing columns metadata                           |
| tab               | Table descriptor                                                 |
| col               | Metadata about an existing table column or a new column produced |

## Example 179-18 DBMS\_TF.TRACE Example

This example adds tracing to a fetch\_rows procedure.

```
PROCEDURE fetch_rows  
AS  
    rowset DBMS_TF.ROW_SET_T;  
BEGIN  
    DBMS_TF.TRACE('IDENTITY_PACKAGE.Fetch_Rows()', with_id => TRUE);  
    DBMS_TF.TRACE(rowset);  
    DBMS_TF.GET_ROW_SET(rowset);  
    DBMS_TF.TRACE(rowset);  
    DBMS_TF.PUT_ROW_SET(rowset);  
    DBMS_TF.TRACE(DBMS_TF.GET_ENV);  
END;
```

## 179.9.15 XSTORE\_CLEAR Procedure

Removes all key-value pairs from the XSTORE execution state.

### Syntax

```
PROCEDURE XSTORE_CLEAR;
```

## 179.9.16 XSTORE\_EXISTS Function

Returns TRUE if an item with a given key exists in the XSTORE.

### Syntax

```
FUNCTION XSTORE_EXISTS(  
    key          IN VARCHAR2,  
    key_type IN PLS_INTEGER DEFAULT NULL)  
RETURN BOOLEAN;
```

### Parameters

**Table 179-27** DBMS\_TF.XSTORE\_EXISTS Function Parameters

| Parameter | Description                                |
|-----------|--------------------------------------------|
| key       | A unique character key                     |
| key_type  | The type of key (optional). Default : NULL |

### Return Values

Returns TRUE if the key has an associated value. When the key\_type is NULL (default), it returns TRUE if the key has an associated value of any of the supported type.

When a key\_type parameter value is passed, it returns TRUE if the key and specified type of key has an associated value. Otherwise, it returns FALSE.

#### See Also:

[Table 179-6](#) for more information about supported key types.

## 179.9.17 XSTORE\_GET Procedure

You can use the XSTORE\_GET procedure to get the associated value for a given key stored for PTF Execution State Management.

XStore is the PTF execution state management interface. The XStore interface is used to set and store key-value pairs during PTF execution.

This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

See [Table 179-6](#) for more information about supported key types.

### Syntax

```
PROCEDURE XSTORE_GET(  
    key    IN VARCHAR2,  
    value IN OUT VARCHAR2);  
  
PROCEDURE XSTORE_GET(  
    key    IN VARCHAR2,  
    value IN OUT NUMBER);
```

```
PROCEDURE XSTORE_GET(  
    key    IN VARCHAR2,  
    value  IN OUT DATE);
```

```
PROCEDURE XSTORE_GET(  
    key    IN VARCHAR2,  
    value  IN OUT BOOLEAN);
```

### Parameters

**Table 179-28 DBMS\_TF.XSTORE\_GET Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| key       | A unique character key                             |
| value     | Value corresponding to the key for supported types |

### Usage Notes

If the key is not found, the value is unchanged.

## 179.9.17.1 Row\_num Polymorphic Table Function Example

The row\_num PTF example appends a sequence column to a table.

### Example 179-19 Row\_num Polymorphic Table Function Example

#### Live SQL:

You can view and run this example on Oracle Live SQL at [Row\\_num Polymorphic Table Function](#)

Create the PTF implementation package row\_num\_p.

The parameters are :

- tab - The input table
- ini - The initial value (Default = 1)
- inc - The amount to increment (Default = 1)

```
CREATE PACKAGE row_num_p IS  
    FUNCTION describe(tab IN OUT dbms_tf.table_t,  
        ini NUMBER DEFAULT 1,  
        inc NUMBER DEFAULT 1)  
        RETURN dbms_tf.describe_t;  
  
    PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1);  
END;
```

This PTF accepts any input table and appends the sequence column `ROW_ID` to the table. The sequence values start with the specified value (`ini`) and each time it is incremented by the specified value (`inc`).

```
CREATE PACKAGE BODY row_num_p IS
  FUNCTION describe(tab IN OUT dbms_tf.table_t,
                    ini NUMBER DEFAULT 1,
                    inc NUMBER DEFAULT 1)
    RETURN dbms_tf.describe_t AS
  BEGIN
    RETURN dbms_tf.describe_t(new_columns =>
      dbms_tf.columns_new_t(1 =>
        dbms_tf.column_metadata_t(name => 'ROW_ID',
                                   TYPE => dbms_tf.type_number)));
  END;

  PROCEDURE fetch_rows(ini NUMBER DEFAULT 1, inc NUMBER DEFAULT 1) IS
    row_cnt CONSTANT PLS_INTEGER := dbms_tf.get_env().row_count;
    rid      NUMBER              := ini;
    col      dbms_tf.tab_number_t;
  BEGIN
    dbms_tf.xstore_get('rid', rid);
    FOR i IN 1 .. row_cnt LOOP col(i) := rid + inc*(i-1); END LOOP;
    dbms_tf.put_col(1, col);
    dbms_tf.xstore_set('rid', rid + inc*row_cnt);
  END;

END;
```

Create a standalone polymorphic table function named `row_num`. Specify exactly one formal argument of type `TABLE`, specify the return type of the PTF as `TABLE`, specify a Table Semantics PTF type, and indicate the PTF implementation package to use is `row_num_p`.

```
CREATE FUNCTION row_num(tab TABLE,
                        ini NUMBER DEFAULT 1,
                        inc NUMBER DEFAULT 1)
  RETURN TABLE
PIPELINED TABLE POLYMORPHIC USING row_num_p;
```

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 1 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 1      |
| 20     | RESEARCH   | DALLAS   | 2      |
| 30     | SALES      | CHICAGO  | 3      |
| 40     | OPERATIONS | BOSTON   | 4      |

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 100 and incremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, 100);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 100    |
| 20     | RESEARCH   | DALLAS   | 101    |
| 30     | SALES      | CHICAGO  | 102    |
| 40     | OPERATIONS | BOSTON   | 103    |

The `row_num` PTF invocation reporting from the `SCOTT.DEPT` table produces a new column `ROW_ID` with value starting at 0 and decremented by 1 in the row set.

```
SELECT * FROM row_num(scott.dept, ini => 0, inc => -1);
```

| DEPTNO | DNAME      | LOC      | ROW_ID |
|--------|------------|----------|--------|
| 10     | ACCOUNTING | NEW YORK | 0      |
| 20     | RESEARCH   | DALLAS   | -1     |
| 30     | SALES      | CHICAGO  | -2     |
| 40     | OPERATIONS | BOSTON   | -3     |

The `row_num` PTF invocation reporting from the `SCOTT.EMP` table produces a new column `ROW_ID` with value starting at 0 and incremented by 0.25 in the row set which is partitioned by department number and ordered by employee name.

```
SELECT deptno, ename, job, sal, row_id
FROM   row_num(scott.emp PARTITION BY deptno ORDER BY ename, ini => 0, inc
=> 0.25)
WHERE  deptno IN (10, 30);
```

| DEPTNO | ENAME  | JOB       | SAL  | ROW_ID |
|--------|--------|-----------|------|--------|
| 10     | CLARK  | MANAGER   | 2450 | 0      |
| 10     | KING   | PRESIDENT | 5000 | .25    |
| 10     | MILLER | CLERK     | 1300 | .5     |
| 30     | ALLEN  | SALESMAN  | 1600 | 0      |
| 30     | BLAKE  | MANAGER   | 2850 | .25    |
| 30     | JAMES  | CLERK     | 950  | .5     |
| 30     | MARTIN | SALESMAN  | 1250 | .75    |
| 30     | TURNER | SALESMAN  | 1500 | 1      |
| 30     | WARD   | SALESMAN  | 1250 | 1.25   |

## 179.9.18 XSTORE\_REMOVE Procedure

Removes an item associated with the given key and key\_type.

### Syntax

```
PROCEDURE XSTORE_REMOVE (
    key          IN VARCHAR2,
    key_type     IN PLS_INTEGER DEFAULT NULL);
```

## Parameters

**Table 179-29 DBMS\_TF.XSTORE\_REMOVE Function Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| key       | A unique character key               |
| key_type  | The type of key to remove (optional) |

## Usage Notes

When a key\_type parameter value is passed, it removes the associated item for the key and specified type of key.

## 179.9.19 XSTORE\_SET Procedure

Sets the value for the given key for PTF Execution State Management.

You can use this procedure to store an item key-value pair in the XStore. This procedure is overloaded. The XStore supports specifying key-value pairs for these scalar types: VARCHAR2, NUMBER, DATE, BOOLEAN.

## Syntax

```
PROCEDURE XSTORE_SET (  
    key    IN VARCHAR2,  
    value  IN VARCHAR2);
```

```
PROCEDURE XSTORE_SET (  
    key    IN VARCHAR2,  
    value  IN NUMBER);
```

```
PROCEDURE XSTORE_SET (  
    key    IN VARCHAR2,  
    value  IN DATE);
```

```
PROCEDURE XSTORE_SET (  
    key    IN VARCHAR2,  
    value  IN BOOLEAN);
```

## Parameters

**Table 179-30 DBMS\_TF.XSTORE\_SET Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| key       | A unique character key                             |
| value     | Value corresponding to the key for supported types |

## Usage Notes

If an item for a given key already exists, the value is replaced.

# DBMS\_TNS

The `DBMS_TNS` package provides the `RESOLVE_TNSNAME` function to resolve a TNS name and return the corresponding Oracle Net8 connection string.

This chapter contains the following topics:

- [DBMS\\_TNS Overview](#)
- [DBMS\\_TNS Security Model](#)
- [Summary of DBMS\\_TNS Subprograms](#)

## 180.1 DBMS\_TNS Overview

The `DBMS_TNS` package contains one function, `RESOLVE_TNSNAME`, which returns the resolved connect string from configured sources that have been defined in the `names.directory_path` parameter in the `sqlnet.ora` file.

The `RESOLVE_TNSNAME` function in this package helps you to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.

 **See Also:**

- *Oracle Database Administrator's Guide* for more information about finding database link information
- *Oracle Database Reference* for information about the `ALL_DB_LINKS` data dictionary view

## 180.2 DBMS\_TNS Security Model

You must be granted the `EXECUTE` privilege on the `DBMS_TNS` package.

## 180.3 Summary of DBMS\_TNS Subprograms

This table lists the `DBMS_TNS` subprograms and briefly describes them.

**Table 180-1   DBMS\_TNS Parameters**

| Subprogram                               | Description                                                                                                                                                                            |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">RESOLVE_TNSNAME Function</a> | Returns the resolved connect string from any configured source (tnsnames, LDAP, Easy Connect) as indicated in the <code>sqlnet.ora</code> <code>names.directory_path</code> parameter) |

## 180.3.1 RESOLVE\_TNSNAME Function

This function returns the resolved connect string from any configured source (for example, TNS names, Lightweight Directory Access Protocol (LDAP), or Oracle Easy Connect) as indicated in the `sqlnet.ora` `names.directory_path` parameter.

### Syntax

```
DBMS_TNS.RESOLVE_TNSNAME (  
    tns_name VARCHAR2)  
    RETURN VARCHAR2;
```

### RESOLVE\_TNSNAME Function Parameters

| Parameter             | Description                                      |
|-----------------------|--------------------------------------------------|
| <code>tns_name</code> | Database address for establishing the connection |

### Usage Notes

- Database administrators and system management tools can explicitly call the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve a `tns_name`:
- Because the resolved value can change over time, Oracle does not recommend storing or caching this value, because these kinds of values can become invalid over time.
- You can use the `DBMS_TNS.RESOLVE_TNSNAME` function to resolve TNS names that were referred to by other data dictionary views such as `ALL_DB_LINKS` and `USER_DB_LINKS`. In addition, you can use it to find any TNS name entry in the `tnsnames.ora` file.

### Example

```
SELECT DB_LINK, DBMS_TNS.RESOLVE_TNSNAME(HOST) FROM DBA_DB_LINKS;
```

```
DB_LINK  
-----  
--  
DBMS_TNS.RESOLVE_TNSNAME(HOST)  
-----  
--  
US.EXAMPLE.COM  
(DESCRIPTION=(ADDRESS=(PROTOCOL=ipc) (KEY=may))  
(CONNECT_DATA=(SERVICE_NAME=us.example.com) (CID=(PROGRAM=oracle) (HOST=juno)  
(USER=psmith))  
)
```

# DBMS\_TRACE

The `DBMS_TRACE` package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TRACE Subprograms](#)

## 181.1 DBMS\_TRACE Overview

`DBMS_TRACE` provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

1. (Optional) Limit tracing to specific subprograms and choose a tracing level.  
Tracing all subprograms and exceptions in a large program can produce huge amounts of data that are difficult to manage.
2. Starting PL/SQL tracing in session (`DBMS_TRACE.SET_PLSQL_TRACE`).
3. Running an application to be traced.
4. Stopping PL/SQL tracing in session (`DBMS_TRACE.CLEAR_PLSQL_TRACE`).

After you have collected data with Trace, you can query the database tables that contain the performance data and analyze it in the same way that you analyze the performance data from Profiler.

## 181.2 DBMS\_TRACE Security Model

This package must be created under `SYS`.

## 181.3 DBMS\_TRACE Constants

`DBMS_TRACE` defines constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 181-1 DBMS\_TRACE Event Constants**

| Name                        | Type    | Value | Description                                                                                                                                                                                                                                                                    |
|-----------------------------|---------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRACE_ALL_CALLS             | INTEGER | 1     | Traces calls or returns                                                                                                                                                                                                                                                        |
| TRACE_ENABLED_CALLS         | INTEGER | 2     |                                                                                                                                                                                                                                                                                |
| TRACE_ALL_EXCEPTIONS        | INTEGER | 4     | Traces exceptions                                                                                                                                                                                                                                                              |
| TRACE_ENABLED_EXCEPTIONS    | INTEGER | 8     | Traces exceptions and handlers                                                                                                                                                                                                                                                 |
| TRACE_LIMIT                 | INTEGER | 16    | Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag. |
| TRACE_ALL_SQL               | INTEGER | 32    | Traces SQL statements                                                                                                                                                                                                                                                          |
| TRACE_ENABLED_SQL           | INTEGER | 64    | Traces SQL statements at PL/SQL level. This does not invoke SQL Trace                                                                                                                                                                                                          |
| TRACE_ALL_LINES             | INTEGER | 128   | Traces each line                                                                                                                                                                                                                                                               |
| TRACE_ENABLED_LINES         | INTEGER | 256   |                                                                                                                                                                                                                                                                                |
| TRACE_PAUSE                 | INTEGER | 4096  | Pauses tracing                                                                                                                                                                                                                                                                 |
| TRACE_RESUME                | INTEGER | 8192  | Resume tracing                                                                                                                                                                                                                                                                 |
| TRACE_STOP                  | INTEGER | 16384 | Stops tracing                                                                                                                                                                                                                                                                  |
| NO_TRACE_ADMINISTRATIVE     | INTEGER | 32768 | Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> <li>• PL/SQL Trace Tool started</li> <li>• Trace flags changed</li> <li>• PL/SQL Virtual Machine started</li> <li>• PL/SQL Virtual Machine stopped</li> </ul>                            |
| NO_TRACE_HANDLED_EXCEPTIONS | INTEGER | 65536 | Prevents tracing of handled exceptions                                                                                                                                                                                                                                         |

**Table 181-2 DBMS\_TRACE Version Constants**

| Name                | Type    | Value | Description |
|---------------------|---------|-------|-------------|
| TRACE_MINOR_VERSION | INTEGER | 0     |             |
| TRACE_MAJOR_VERSION | INTEGER | 1     |             |

Oracle recommends using the symbolic form for all these constants.

## 181.4 DBMS\_TRACE Restrictions

You cannot use PL/SQL tracing in a shared server environment.

## 181.5 DBMS\_TRACE Operational Notes

Certain operational notes apply to DBMS\_TRACE.

These are described in the following sections:

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS\\_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

### Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be generated
*/
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

#### Note:

You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including TRACE\_LIMIT in the TRACE\_LEVEL parameter of the SET\_PLSQL\_TRACE procedure.

### Creating Database Tables to Collect DBMS\_TRACE Output

You must create database tables into which the DBMS\_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script TRACETAB.SQL. The tables this script creates are owned by SYS.

### Collecting Trace Data

The PL/SQL features you can trace are described in the script DBMSPBT.SQL. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS\_TRACE also allow pausing and resuming trace, and limiting the output.

### Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.
- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

### Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

### Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

### Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

#### Note:

For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

### Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller is enabled, the caller's name will also be output. If the callee is enabled, the callee's name will also be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled. Enabling `NO_TRACE_HANDLED_EXCEPTIONS` limits data collection to unhandled exceptions

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

### Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level  $n$  changes the record limit to  $1024 * n$ .

Enabling `NO_TRACE_ADMINISTRATIVE` prevents the generation of such administrative event records as PL/SQL Trace Tool started, Trace flags changed, PL/SQL Virtual Machine started, and PL/SQL Virtual Machine stopped.

## 181.6 Summary of DBMS\_TRACE Subprograms

This table lists the `DBMS_TRACE` subprograms and briefly describes them.

**Table 181-3 DBMS\_TRACE Package Subprograms**

| Subprogram                                     | Description                                  |
|------------------------------------------------|----------------------------------------------|
| <a href="#">CLEAR_PLSQL_TRACE Procedure</a>    | Stops trace data dumping in session          |
| <a href="#">GET_PLSQL_TRACE_LEVEL Function</a> | Gets the trace level                         |
| <a href="#">PLSQL_TRACE_VERSION Procedure</a>  | Gets the version number of the trace package |
| <a href="#">SET_PLSQL_TRACE Procedure</a>      | Starts tracing in the current session        |

### 181.6.1 CLEAR\_PLSQL\_TRACE Procedure

This procedure disables trace data collection.

#### Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

## 181.6.2 GET\_PLSQL\_TRACE\_LEVEL Function

This procedure returns the current trace level as the sum of one or more DBMS\_TRACE constants.

See [Table 181-1](#) for a list of the constants.

### Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

## 181.6.3 PLSQL\_TRACE\_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS\_TRACE package.

### Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

### Parameters

**Table 181-4 PLSQL\_TRACE\_VERSION Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| major     | Major version number of DBMS_TRACE. |
| minor     | Minor version number of DBMS_TRACE. |

## 181.6.4 SET\_PLSQL\_TRACE Procedure

This procedure enables PL/SQL trace data collection.

### Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

### Parameters

**Table 181-5 SET\_PLSQL\_TRACE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trace_level | <p>You must supply one or more of the constants as listed in <a href="#">Table 181-1</a>. By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants.</p> <p>Also see <a href="#">DBMS_TRACE Operational Notes: Collecting Trace Data</a> for more information.</p> |

# DBMS\_TRANSACTION

The DBMS\_TRANSACTION package provides access to SQL transaction statements from stored procedures.

 **See Also:**  
*Oracle Database SQL Language Reference*

This chapter contains the following topics:

- [DBMS\\_TRANSACTION Security Model](#)
- [Summary of DBMS\\_TRANSACTION Subprograms](#)

## 182.1 DBMS\_TRANSACTION Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

## 182.2 Summary of DBMS\_TRANSACTION Subprograms

This table lists the DBMS\_TRANSACTION subprograms and briefly describes them.

**Table 182-1 DBMS\_TRANSACTION Package Subprograms**

| Subprogram                                    | Description                                                                                                                                  |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADVISE_COMMIT Procedure</a>       | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE COMMIT                                                                              |
| <a href="#">ADVISE_NOTHING Procedure</a>      | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE NOTHING                                                                             |
| <a href="#">ADVISE_ROLLBACK Procedure</a>     | Equivalent to the SQL statement:<br>ALTER SESSION ADVISE ROLLBACK                                                                            |
| <a href="#">COMMIT Procedure</a>              | Equivalent to the SQL statement:<br>COMMIT                                                                                                   |
| <a href="#">COMMIT_COMMENT Procedure</a>      | Equivalent to the SQL statement:<br>COMMIT COMMENT <text>                                                                                    |
| <a href="#">COMMIT_FORCE Procedure</a>        | Equivalent to the SQL statement:<br>COMMIT FORCE <text>, <number>"                                                                           |
| <a href="#">LOCAL_TRANSACTION_ID Function</a> | Returns the local (to instance) unique identifier for the current transaction                                                                |
| <a href="#">PURGE_LOST_DB_ENTRY Procedure</a> | Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes |

**Table 182-1 (Cont.) DBMS\_TRANSACTION Package Subprograms**

| Subprogram                                     | Description                                                                                                  |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <a href="#">PURGE_MIXED Procedure</a>          | Deletes information about a given mixed outcome transaction                                                  |
| <a href="#">READ_ONLY Procedure</a>            | Equivalent to the SQL statement:<br>SET TRANSACTION READ ONLY                                                |
| <a href="#">READ_WRITE Procedure</a>           | equivalent to the SQL statement:<br>SET TRANSACTION READ WRITE                                               |
| <a href="#">ROLLBACK Procedure</a>             | Equivalent to the SQL statement:<br>ROLLBACK                                                                 |
| <a href="#">ROLLBACK_FORCE Procedure</a>       | Equivalent to the SQL statement:<br>ROLLBACK FORCE <text>                                                    |
| <a href="#">ROLLBACK_SAVEPOINT Procedure</a>   | Equivalent to the SQL statement:<br>ROLLBACK TO SAVEPOINT <savepoint_name>                                   |
| <a href="#">SAVEPOINT Procedure</a>            | Equivalent to the SQL statement:<br>SAVEPOINT <savepoint_name>                                               |
| <a href="#">STEP_ID Function</a>               | Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction |
| <a href="#">USE_ROLLBACK_SEGMENT Procedure</a> | Equivalent to the SQL statement:<br>SET TRANSACTION USE ROLLBACK SEGMENT<br><rb_seg_name>                    |

## 182.2.1 ADVISE\_COMMIT Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT

### Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

## 182.2.2 ADVISE\_NOTHING Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING

### Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

## 182.2.3 ADVISE\_ROLLBACK Procedure

This procedure is equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK

### Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

## 182.2.4 COMMIT Procedure

This procedure is equivalent to the SQL statement: `COMMIT`

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.COMMIT;
```

## 182.2.5 COMMIT\_COMMENT Procedure

This procedure is equivalent to the SQL statement: `COMMIT COMMENT <text>`

### Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmnt VARCHAR2);
```

### Parameters

**Table 182-2** COMMIT\_COMMENT Procedure Parameters

| Parameter | Description                            |
|-----------|----------------------------------------|
| cmnt      | Comment to associate with this commit. |

## 182.2.6 COMMIT\_FORCE Procedure

This procedure is equivalent to the SQL statement: `COMMIT FORCE <text>, <number>`

### Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (  
    xid VARCHAR2,  
    scn VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 182-3** COMMIT\_FORCE Procedure Parameters

| Parameter | Description                     |
|-----------|---------------------------------|
| xid       | Local or global transaction ID. |
| scn       | System change number.           |

## 182.2.7 LOCAL\_TRANSACTION\_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

### Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (  
    create_transaction BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

### Parameters

**Table 182-4 LOCAL\_TRANSACTION\_ID Function Parameters**

| Parameter          | Description                                                       |
|--------------------|-------------------------------------------------------------------|
| create_transaction | If true, then start a transaction if one is not currently active. |

## 182.2.8 PURGE\_LOST\_DB\_ENTRY Procedure

Procedure `PURGE_LOST_DB_ENTRY` purges entries that control database recovery from a local site.

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

### Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (  
    xid VARCHAR2);
```

### Parameters

**Table 182-5 PURGE\_LOST\_DB\_ENTRY Procedure Parameters**

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| xid       | Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table. |

### Usage Notes

#### **WARNING:**

`PURGE_LOST_DB_ENTRY` should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in `DBA_2PC_PENDING` as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the `MIXED` column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is `ORA-02062`). In this case, the DBA may use the procedure `PURGE_LOST_DB_ENTRY` to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

**Table 182-6 PURGE\_LOST\_DB\_ENTRY Procedure States**

| State of Column         | State of Global Transaction | State of Local Transaction | Normal DBA Action | Alternative DBA Action                             |
|-------------------------|-----------------------------|----------------------------|-------------------|----------------------------------------------------|
| Collecting              | Rolled back                 | Rolled back                | None              | <code>PURGE_LOST_DB_ENTRY</code> (See Note 1)      |
| Committed               | Committed                   | Committed                  | None              | <code>PURGE_LOST_DB_ENTRY</code> (See Note 1)      |

| Forced rollback (mixed) | Mixed                       | Rolled back                | (See Note 2)      |                                                    |

 **Note:**

Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

**Note:**

Examine and take any manual action to remove inconsistencies; then use the procedure `PURGE_MIXED`.

## 182.2.9 PURGE\_MIXED Procedure

This procedure deletes information about a given mixed outcome transaction

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome; some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle. However, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

### Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (  
    xid VARCHAR2);
```

### Parameters

**Table 182-7 PURGE\_MIXED Procedure Parameters**

| Parameter | Description                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------|
| xid       | Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table. |

## 182.2.10 READ\_ONLY Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION READ ONLY`.

### Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

## 182.2.11 READ\_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

### Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

## 182.2.12 ROLLBACK Procedure

This procedure is equivalent to the SQL statement `ROLLBACK`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

## 182.2.13 ROLLBACK\_FORCE Procedure

This procedure is equivalent to the SQL statement `ROLLBACK FORCE <text>`.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
    xid VARCHAR2);
```

### Parameters

**Table 182-8 ROLLBACK\_FORCE Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| xid       | Local or global transaction ID. |

## 182.2.14 ROLLBACK\_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `ROLLBACK TO SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

### Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

### Parameters

**Table 182-9 ROLLBACK\_SAVEPOINT Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| savept    | Savepoint identifier. |

## 182.2.15 SAVEPOINT Procedure

This procedure is equivalent to the SQL statement `SAVEPOINT <savepoint_name>`.

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

**Syntax**

```
DBMS_TRANSACTION.SAVEPOINT (  
    savept VARCHAR2);
```

**Parameters****Table 182-10 SAVEPOINT Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| savept    | Savepoint identifier. |

## 182.2.16 STEP\_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

**Syntax**

```
DBMS_TRANSACTION.STEP_ID  
    RETURN NUMBER;
```

## 182.2.17 USE\_ROLLBACK\_SEGMENT Procedure

This procedure is equivalent to the SQL statement `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`.

**Syntax**

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (  
    rb_name VARCHAR2);
```

**Parameters****Table 182-11 USE\_ROLLBACK\_SEGMENT Procedure Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| rb_name   | Name of rollback segment to use. |

# DBMS\_TRANSFORM

The `DBMS_TRANSFORM` package provides an interface to the message format transformation features of Oracle Advanced Queuing.

This chapter contains the following topic:

- [Summary of DBMS\\_TRANSFORM Subprograms](#)

**See Also:**

*Oracle Database Advanced Queuing User's Guide* for more on message format transformations.

## 183.1 Summary of DBMS\_TRANSFORM Subprograms

This table lists the `DBMS_TRANSFORM` subprograms and briefly describes them.

**Table 183-1 DBMS\_TRANSFORM Package Subprograms**

| Subprograms                                     | Description                                                                                          |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">CREATE_TRANSFORMATION Procedure</a> | Creates a transformation that maps an object of the source type to an object of the destination type |
| <a href="#">DROP_TRANSFORMATION Procedure</a>   | Drops the given transformation                                                                       |
| <a href="#">MODIFY_TRANSFORMATION Procedure</a> | Modifies an existing transformation                                                                  |

### 183.1.1 CREATE\_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

**Syntax**

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  from_schema     VARCHAR2(30),
  from_type       VARCHAR2(30),
  to_schema       VARCHAR2(30),
  to_type         VARCHAR2(30),
  transformation   VARCHAR2(4000));
```

## Parameters

**Table 183-2 CREATE\_TRANSFORM Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema         | Specifies the schema of the transformation.                                                                                                                                                                                                                                                                                                                                      |
| name           | Specifies the name of the transformation.                                                                                                                                                                                                                                                                                                                                        |
| from_schema    | Specifies the schema of the source type.                                                                                                                                                                                                                                                                                                                                         |
| from_type      | Specifies the source type.                                                                                                                                                                                                                                                                                                                                                       |
| to_schema      | Specifies the target type schema.                                                                                                                                                                                                                                                                                                                                                |
| to_type        | Specifies the target type.                                                                                                                                                                                                                                                                                                                                                       |
| transformation | Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using <code>MODIFY_TRANSFORM</code> . |

## Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on `DBMS_TRANSFORM`. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form `source.user_data`.
- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

## 183.1.2 DROP\_TRANSFORM Procedure

This procedure drops the given transformation.

### Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORM (
    schema VARCHAR2(30),
    name    VARCHAR2(30));
```

## Parameters

**Table 183-3 DROP\_TRANSFORMATION Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| schema    | Specifies the schema of the transformation. |
| name      | Specifies the name of the transformation.   |

## 183.1.3 MODIFY\_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

### Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (  
    schema          VARCHAR2 (30) ,  
    name            VARCHAR2 (30) ,  
    attribute_number INTEGER,  
    transformation   VARCHAR2 (4000) );
```

## Parameters

**Table 183-4 MODIFY\_TRANSFORMATION Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schema           | Specifies the schema of the transformation.                                                                                                                                                                                                                                                                       |
| name             | Specifies the name of the transformation.                                                                                                                                                                                                                                                                         |
| attribute_number | The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.                                                                                                          |
| transformation   | The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type. |

### Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an attribute\_number of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

# DBMS\_TSDP\_MANAGE

The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

`DBMS_TSDP_MANAGE` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_TSDP\\_MANAGE Subprograms](#)

## Related Topics

- [DBMS\\_TSDP\\_PROTECT](#)

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

### See Also:

*Oracle Database Security Guide*

## 184.1 DBMS\_TSDP\_MANAGE Overview

The `DBMS_TSDP_MANAGE` package lets you manage sensitive columns and sensitive types in the Oracle database.

The identified sensitive columns are classified based on the sensitive types. By Using the [DBMS\\_TSDP\\_PROTECT](#) package to create a policy that protects data for a given class based on a column type rather than the data itself, you can then manage security for these types in a uniform fashion and modify the settings to accommodate changing compliance regulations.

You also can export the policies to other databases, when you perform a full export using Data Pump. You cannot export the policy itself, but an export of the database will include the TSDP policies.

## 184.2 DBMS\_TSDP\_MANAGE Security Model

All procedures are executed with invoker's rights. The `DBMS_TSDP_MANAGE` package is owned by SYS.

The `EXECUTE` privilege on this package should be granted as appropriate. Typically, an application database administrator should be granted the `EXECUTE` privilege for this package, while the [DBMS\\_TSDP\\_PROTECT](#) package would be governed by a security administrator.

## 184.3 Summary of DBMS\_TSDP\_MANAGE Subprograms

This table lists the DBMS\_TSDP\_MANAGE subprograms and briefly describes them.

**Table 184-1 DBMS\_TSDP\_MANAGE Package Subprograms**

| Subprogram                                           | Description                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_SENSITIVE_COLUMN Procedure</a>       | Adds a column to the sensitive column list                                                                                                              |
| <a href="#">ADD_SENSITIVE_TYPE Procedure</a>         | Creates and adds a sensitive column type to the list of sensitive column types in the database                                                          |
| <a href="#">ALTER_SENSITIVE_COLUMN Procedure</a>     | Alters the sensitive type and/or the comment of a column in the sensitive column list.                                                                  |
| <a href="#">DROP_SENSITIVE_COLUMN Procedure</a>      | Removes columns from the sensitive column list                                                                                                          |
| <a href="#">DROP_SENSITIVE_TYPE Procedure</a>        | Drops a sensitive column type from the list sensitive column types in the database                                                                      |
| <a href="#">DROP_SENSITIVE_TYPE_SOURCE Procedure</a> | Drops sensitive column types corresponding to a source from the list sensitive column types in the database                                             |
| <a href="#">IMPORT_DISCOVERY_RESULT Procedure</a>    | Imports sensitive columns from an external source. This can be an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance |
| <a href="#">IMPORT_SENSITIVE_TYPES Procedure</a>     | Imports a list of sensitive column types from a source                                                                                                  |
| <a href="#">REMOVE_DISCOVERY_RESULT Procedure</a>    | Removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.                    |

### 184.3.1 ADD\_SENSITIVE\_COLUMN Procedure

This procedure adds a column to the sensitive column list.

#### Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (  
    schema_name      IN VARCHAR2,  
    table_name       IN VARCHAR2,  
    column_name      IN VARCHAR2,  
    sensitive_type    IN VARCHAR2,  
    user_comment     IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 184-2 ADD\_SENSITIVE\_COLUMN Procedure Parameters**

| Parameter      | Description                             |
|----------------|-----------------------------------------|
| schema_name    | Schema to which the column belongs      |
| table_name     | Table containing the column             |
| column_name    | Sensitive column name                   |
| sensitive_type | Identifier of the sensitive column type |

**Table 184-2 (Cont.) ADD\_SENSITIVE\_COLUMN Procedure Parameters**

| Parameter    | Description                                 |
|--------------|---------------------------------------------|
| user_comment | User comment regarding the sensitive column |

### Examples

Add a column SAL in SCOTT.EMP:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_COLUMN (  
  schema_name    => 'SCOTT',  
  table_name     => 'EMP',  
  column_name    => 'SAL',  
  sensitive_type  => 'SALARY_TYPE',  
  user_comment   => 'Salary column');
```

## 184.3.2 ALTER\_SENSITIVE\_COLUMN Procedure

This procedure alters the Sensitive Type and/or the Comment of a Column in the sensitive column list.

### Syntax

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (  
  schema_name    IN VARCHAR2,  
  table_name     IN VARCHAR2,  
  column_name    IN VARCHAR2,  
  sensitive_type  IN VARCHAR2,  
  user_comment   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 184-3 ALTER\_SENSITIVE\_COLUMN Procedure Parameters**

| Parameter      | Description                                 |
|----------------|---------------------------------------------|
| schema_name    | Schema to which the column belongs          |
| table_name     | Table containing the column                 |
| column_name    | Sensitive column name                       |
| sensitive_type | Identifier of the sensitive column type     |
| user_comment   | User comment regarding the sensitive column |

### Examples

Alter the column SAL in SCOTT.EMP that is listed in the sensitive column list:

```
DBMS_TSDP_MANAGE.ALTER_SENSITIVE_COLUMN (  
  schema_name    => 'SCOTT',  
  table_name     => 'EMP',  
  column_name    => 'SAL',  
  sensitive_type  => 'FINANCE_Type',  
  user_comment   => 'Finance Type. Earlier categorized as Salary Type');
```

## 184.3.3 ADD\_SENSITIVE\_TYPE Procedure

This procedure creates and adds a sensitive column type to the list sensitive column types in the database.

### Syntax

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (  
    sensitive_type    IN  VARCHAR2,  
    user_comment      IN  VARCAHR2 DEFAULT NULL);
```

### Parameters

**Table 184-4** ADD\_SENSITIVE\_TYPE Procedure Parameters

| Parameter      | Description                                 |
|----------------|---------------------------------------------|
| sensitive_type | Name of the sensitive column type           |
| user_comment   | User comment regarding the sensitive column |

### Examples

Add a sensitive column type called SALARY\_TYPE that is intended to be associated with columns containing salary data:

```
DBMS_TSDP_MANAGE.ADD_SENSITIVE_TYPE (  
    sensitive_type    => 'SALARY_TYPE',  
    user_comment      => 'Salary data');
```

## 184.3.4 DROP\_SENSITIVE\_COLUMN Procedure

This procedure removes columns from the sensitive column list.

### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (  
    schema_name      IN VARCHAR2 DEFAULT '%',  
    table_name        IN VARCAHR2 DEFAULT '%',  
    column_name       IN VARCAHR2 DEFAULT '%');
```

### Parameters

**Table 184-5** DROP\_SENSITIVE\_COLUMN Procedure Parameters

| Parameter   | Description                        |
|-------------|------------------------------------|
| schema_name | Schema to which the column belongs |
| table_name  | Table containing the column        |
| column_name | Sensitive column name              |

### Examples

Remove column SAL in SCOTT.EMP from the sensitive column list:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_COLUMN (
  schema_name      => 'SCOTT',
  table_name       => 'EMP',
  column_name      => 'SAL');
```

## 184.3.5 DROP\_SENSITIVE\_TYPE Procedure

This procedure drops a sensitive column type from the list sensitive column types in the database.

### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type    IN VARCHAR2);
```

### Parameters

**Table 184-6** *DROP\_SENSITIVE\_TYPE Procedure Parameters*

| Parameter      | Description                                     |
|----------------|-------------------------------------------------|
| sensitive_type | Name of the sensitive column type to be dropped |

### Examples

To drop SALARY\_TYPE:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE (
  sensitive_type    => 'SALARY_TYPE');
```

## 184.3.6 DROP\_SENSITIVE\_TYPE\_SOURCE Procedure

This procedure drops sensitive column types corresponding to a source from the list sensitive column types in the database.

### Syntax

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source           IN VARCHAR2);
```

### Parameters

**Table 184-7** *DROP\_SENSITIVE\_TYPE\_SOURCE Procedure Parameters*

| Parameter | Description        |
|-----------|--------------------|
| source    | Name of the source |

### Examples

To drop all sensitive column types corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, ADM\_DEMO:

```
DBMS_TSDP_MANAGE.DROP_SENSITIVE_TYPE_SOURCE (
  source           => 'ADM_DEMO');
```

## 184.3.7 IMPORT\_DISCOVERY\_RESULT Procedure

This procedure can be used to import sensitive columns, along with the associated sensitive types, from an external source. The external source can be an Application Data Model (ADM) instance from Oracle Enterprise Manager Cloud Control.

### Syntax

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (  
    discovery_result      IN CLOB,  
    discovery_source      IN VARCHAR2,  
    force                 IN FORCE DEFAULT FALSE);  
  
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (  
    discovery_result      IN XMLTYPE,  
    discovery_source      IN VARCHAR2,  
    force                 IN FORCE DEFAULT FALSE);
```

### Parameters

**Table 184-8** *IMPORT\_DISCOVERY\_RESULT Procedure Parameters*

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| discovery_result | List of sensitive columns, along with the optional list of (the definitions of) the sensitive column types in XML format (possibly as a CLOB).                                                                                                                                                                                                                                                                                                                                                                                         |
| discovery_source | Source of the import. The discovery_sourcename identifies the list of imported sensitive columns. In case of ADM, this should be the ADM name.                                                                                                                                                                                                                                                                                                                                                                                         |
| force            | Specifies if the discovery result should be imported or not when the discovery result contains columns sensitive columns that are already identified as sensitive by another source. <ul style="list-style-type: none"><li>FALSE (default) - the discovery result will not be imported in case of conflicting columns. None of the columns and the sensitive types are imported.</li><li>TRUE - the discovery result is imported and the attributes of the conflicting columns is set based on the incoming discovery result</li></ul> |

### Examples

Import the list of sensitive columns of ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_DISCOVERY_RESULT (  
    discovery_results      => xml_adm_result,  
    discovery_source       => 'ADM_Demo');
```

## 184.3.8 IMPORT\_SENSITIVE\_TYPES Procedure

This procedure imports a list of sensitive column types from a source.

### Syntax

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (  
    sensitive_types      IN CLOB,  
    source                IN VARCHAR2);
```

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types    IN XMLTYPE,
    source             IN VARCHAR2);
```

## Parameters

**Table 184-9** *IMPORT\_SENSITIVE\_TYPES Procedure Parameters*

| Parameter       | Description                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sensitive_types | List of sensitive column types in XML Format (possibly as a CLOB)                                                                                                                                                       |
| source          | Source of the import. The source identifies the list of imported sensitive column types. In case of Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance, this should be the ADM name. |

## Examples

Import the list of sensitive column types of ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.IMPORT_SENSITIVE_TYPES (
    sensitive_types    => xml_adm_result,
    source             => 'ADM_Demo');
```

## 184.3.9 REMOVE\_DISCOVERY\_RESULT Procedure

This procedure removes sensitive columns corresponding to an Application Data Model (ADM) from an Oracle Enterprise Manager Cloud Control instance.

## Syntax

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
    discovery_source    IN VARCHAR2);
```

## Parameters

**Table 184-10** *REMOVE\_DISCOVERY\_RESULT Procedure Parameters*

| Parameter        | Description                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------|
| discovery_source | Source of the import. In case of ADM, this should be the ADM name, the results of which is to be removed. |

## Examples

Remove the sensitive columns corresponding to ADM instance, ADM\_Demo:

```
DBMS_TSDP_MANAGE.REMOVE_DISCOVERY_RESULT (
    discovery_source    => 'ADM_Demo');
```

# DBMS\_TSDP\_PROTECT

The `DBMS_TSDP_PROTECT` package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the `DBMS_TSDP_MANAGE` package.

`DBMS_TSDP_PROTECT` is available with the Enterprise Edition only.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Data Structures](#)
- [Summary of DBMS\\_TSDP\\_PROTECT Subprograms](#)

## Related Topics

- [DBMS\\_TSDP\\_MANAGE](#)  
The `DBMS_TSDP_MANAGE` package provides an interface to import and manage sensitive columns and sensitive column types in the database, and is used in conjunction with the `DBMS_TSDP_PROTECT` package with regard to transparent sensitive data protection (TSDP) policies.

### See Also:

*Oracle Database Security Guide*

## 185.1 DBMS\_TSDP\_PROTECT Overview

Use the `DBMS_TSDP_PROTECT` package to create transparent sensitive data protection policies, configure protection by associating the policies with sensitive types, and to enable and disable the configured protection.

Sensitive types can be added using the [DBMS\\_TSDP\\_MANAGE](#) package.

## 185.2 DBMS\_TSDP\_PROTECT Security Model

All procedures are executed with invoker's rights. Typically, a security administrator should have the `EXECUTE` privilege for this package.

## 185.3 DBMS\_TSDP\_PROTECT Constants

DBMS\_TSDP\_PROTECT defines the TSDP\_PARAM\_MAX constant for use when specifying parameter values.

This constant is described in the following table.

**Table 185-1 DBMS\_TDSP\_PROTECT Constants - Compression Types**

| Constant       | Type    | Value | Description                                                                    |
|----------------|---------|-------|--------------------------------------------------------------------------------|
| TSDP_PARAM_MAX | INTEGER | 4000  | Maximum length of the parameter value that can be specified in FEATURE_OPTIONS |

## 185.4 DBMS\_TSDP\_PROTECT Data Structures

The DBMS\_TSDP\_PROTECT package defines two TABLE types.

### Table Types

- [FEATURE\\_OPTIONS Table Type](#)
- [POLICY\\_CONDITIONS Table Type](#)

### 185.4.1 FEATURE\_OPTIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP\_PARAM\_MAX) that is indexed by VARCHAR2 (M\_IDEN) .

#### Syntax

```
TYPE FEATURE_OPTIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY VARCHAR2 (M_IDEN) ;
```

### 185.4.2 POLICY\_CONDITIONS Table Type

The following type is an associative array of VARCHAR2 (TSDP\_PARAM\_MAX) that is indexed by PLS\_INTEGER.

#### Syntax

```
TYPE POLICY_CONDITIONS IS TABLE OF VARCHAR2 (TSDP_PARAM_MAX)
INDEX BY PLS_INTEGER;
```

## 185.5 Summary of DBMS\_TSDP\_PROTECT Subprograms

This table lists the DBMS\_TSDP\_PROTECT subprograms and briefly describes them.

**Table 185-2 DBMS\_TSDP\_PROTECT Package Subprograms**

| Subprogram                                          | Description                                                                |
|-----------------------------------------------------|----------------------------------------------------------------------------|
| <a href="#">ADD_POLICY Procedure</a>                | Creates a TSDP policy                                                      |
| <a href="#">ALTER_POLICY Procedure</a>              | Alters a TSDP policy                                                       |
| <a href="#">ASSOCIATE_POLICY Procedure</a>          | Associates or disassociates a TSDP policy with a sensitive column type     |
| <a href="#">DISABLE_PROTECTION_COLUMN Procedure</a> | Disables protection for columns                                            |
| <a href="#">DISABLE_PROTECTION_SOURCE Procedure</a> | Disables protection based on the source of truth for the sensitive columns |
| <a href="#">DISABLE_PROTECTION_TYPE Procedure</a>   | Disables protection for a sensitive column type                            |
| <a href="#">DROP_POLICY Procedure</a>               | Removes a TSDP policy                                                      |
| <a href="#">ENABLE_PROTECTION_COLUMN Procedure</a>  | Enables protection for columns                                             |
| <a href="#">ENABLE_PROTECTION_SOURCE Procedure</a>  | Enables protection based on the source of truth for the sensitive columns  |
| <a href="#">ENABLE_PROTECTION_TYPE Procedure</a>    | Enables protection for a sensitive column type                             |

## 185.5.1 ADD\_POLICY Procedure

This procedure creates a TSDP policy.

### Syntax

```
DBMS_TSDP_PROTECT.ADD_POLICY (
    policy_name          IN VARCHAR2,
    security_feature     IN PLS_INTEGER,
    policy_enable_options IN FEATURE_OPTIONS,
    policy_apply_condition IN POLICY_CONDITION DEFAULT TSDP$default_condition);
```

### Parameters

**Table 185-3 ADD\_POLICY Procedure Parameters**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>policy_name</code>           | Name of the policy being created. The maximum length for this identifier is M_IDEN. This follows the Oracle naming convention.                                                                                                                                                                                             |
| <code>security_feature</code>      | Oracle security feature with which the policy is associated. Allowed values: <ul style="list-style-type: none"> <li>DBMS_TSDP_PROTECT.REDACT</li> <li>DBMS_TSDP_PROTECT.VPD</li> <li>DBMS_TSDP_PROTECT.UNIFIED_AUDIT</li> <li>DBMS_TSDP_PROTECT.FINE_GRAINED_AUDIT</li> <li>DBMS_TSDP_PROTECT.COLUMN_ENCRYPTION</li> </ul> |
| <code>policy_enable_options</code> | Initialized with the parameter-value pairs corresponding to the <code>security_feature</code> setting                                                                                                                                                                                                                      |

**Table 185-3 (Cont.) ADD\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy_apply_condition | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> <li>DBMS_TSDP_PROPERTY.DATATYPE</li> <li>DBMS_TSDP_PROPERTY.LENGTH</li> <li>DBMS_TSDP_PROPERTY.PARENT_SCHEMA</li> <li>DBMS_TSDP_PROPERTY.PARENT_TABLE</li> </ul> |

**Usage Notes**

To create the TDSP policy, you must include the procedure in an anonymous block that defines the type of security feature that will use the policy and conditions to test when the policy is enabled. For more information, see *Oracle Database Security Guide*.

**Examples**

Create a policy PARTIAL\_MASK\_POLICY:

```

DECLARE
    redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
    redact_feature_options ('expression') :=
        'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')      = ''APPUSER''';
    redact_feature_options ('function_type')           := 'DBMS_REDACT.PARTIAL';
    redact_feature_options ('function_parameters')      := 'STR, VVVVVVVVV, VVVVVVVVV, *, 1, 6';
    policy_conditions(DBMS_TSDP_PROTECT.DATATYPE)     := 'VARCHAR2';
    DBMS_TSDP_PROTECT.ADD_POLICY
        ('PARTIAL_MASK_POLICY', DBMS_TSDP_PROTECT.REDACT, redact_feature_options,
        policy_conditions);
END;

```

## 185.5.2 ALTER\_POLICY Procedure

This procedure alters an existing TDSP policy

**Syntax**

```

DBMS_TSDP_PROTECT.ALTER_POLICY (
    policy_name           IN VARCHAR2,
    policy_enable_options IN FEATURE_OPTIONS,
    policy_apply_condition IN POLICY_CONDITION default TSDP$default_condition);

```

**Parameters****Table 185-4 ALTER\_POLICY Procedure Parameters**

| Parameter   | Description                 |
|-------------|-----------------------------|
| policy_name | Name of the policy to alter |

**Table 185-4 (Cont.) ALTER\_POLICY Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| policy_enable_options  | Initialized with the parameter-value pairs corresponding to the security feature                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| policy_apply_condition | <p>Initialized with the property-value pairs that must be satisfied in order to apply the corresponding policy_enable_options. This is an associative array with Property as the key (PLS_INTEGER).</p> <p>Example: example_policy_condition(Property)=property_value. Permissible values for Property:</p> <ul style="list-style-type: none"> <li>• DBMS_TSDP_PROPERTY.DATATYPE</li> <li>• DBMS_TSDP_PROPERTY.LENGTH</li> <li>• DBMS_TSDP_PROPERTY.PARENT_SCHEMA</li> <li>• DBMS_TSDP_PROPERTY.PARENT_TABLE</li> </ul> |

#### Usage Notes

- If the policy\_apply\_condition matches an existing condition for the policy, then the corresponding enable options are updated with policy\_enable\_options.
- If the policy\_apply\_condition does not match any existing condition for the policy, the combination of policy\_enable\_options and policy\_apply\_condition is added to the policy.

#### Examples

Add a new combination of policy\_apply\_condition and policy\_enable\_options to an existing policy PARTIAL\_MASK\_POLICY:

```
DECLARE
  redact_feature_options DBMS_TSDP_PROTECT.FEATURE_OPTIONS;
  policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;
BEGIN
  redact_feature_options ('expression') :=
    'SYS_CONTEXT(''USERENV'', ''SESSION_USER'')=''APPUSER''';
  redact_feature_options ('function_type') := 'DBMS_REDACT.PARTIAL';
  redact_feature_options ('function_parameters') := 'STR, VVVVVVVVVV, VVVVVVVVVV, *,
    1, 6';
  policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';
  DBMS_TSDP_PROTECT.ALTER_POLICY ('PARTIAL_MASK_POLICY', redact_feature_options,
    policy_conditions);
END;
```

## 185.5.3 ASSOCIATE\_POLICY Procedure

This procedure associates or disassociates a TSDP policy with a sensitive column type.

#### Syntax

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY (
  policy_name      IN  VARCHAR2,
  sensitive_type   IN  VARCHAR2,
  associate        IN  BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 185-5 ASSOCIATE\_POLICY Procedure Parameters**

| Parameter      | Description                                       |
|----------------|---------------------------------------------------|
| policy_name    | Name of the TDSP policy                           |
| sensitive_type | Name of the sensitive column type:                |
| associate      | Associate or Disassociate. TRUE implies Associate |

## Usage Notes

Both the policy and the sensitive column type should exist in the database.

## Examples

Associate PARTIAL\_MASK\_POLICY with SSN\_TYPE:

```
DBMS_TSDP_PROTECT.ASSOCIATE_POLICY ('PARTIAL_MASK_POLICY', 'SSN_TYPE');
```

## 185.5.4 DISABLE\_PROTECTION\_COLUMN Procedure

This procedure disables protection for columns.

## Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN (  
    schema_name      IN  VARCHAR2 DEFAULT '%',  
    table_name       IN  VARCHAR2 DEFAULT '%',  
    column_name      IN  VARCHAR2 DEFAULT '%',  
    policy_name      IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 185-6 DISABLE\_PROTECTION\_COLUMN Procedure Parameters**

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| schema_name | Name of the schema containing the column                      |
| table_name  | Table containing the column                                   |
| column_name | Column name                                                   |
| policy_name | Optional policy name. If given, only this policy is disabled. |

## Examples

Disable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
EXEC DBMS_TSDP_PROTECT.DISABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

## 185.5.5 DISABLE\_PROTECTION\_SOURCE Procedure

This procedure disables protection based on the source of truth for the sensitive columns.

### Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE (  
    discovery_sourcename      IN VARCHAR2);
```

### Parameters

**Table 185-7** *DISABLE\_PROTECTION\_SOURCE Procedure Parameters*

| Parameter            | Description                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

### Examples

Disable protection for all columns corresponding to ADM\_Demo:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_SOURCE ('ADM_Demo');
```

## 185.5.6 DISABLE\_PROTECTION\_TYPE Procedure

This procedure disables protection for a sensitive column type.

### Syntax

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE (  
    sensitive_type      IN VARCHAR2);
```

### Parameters

**Table 185-8** *DISABLE\_PROTECTION\_TYPE Procedure Parameters*

| Parameter      | Description                       |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

### Examples

Disable protection for all columns identified by SSN\_TYPE:

```
DBMS_TSDP_PROTECT.DISABLE_PROTECTION_TYPE ('SSN_TYPE');
```

## 185.5.7 DROP\_POLICY Procedure

This procedure removes a TDSP policy or one of its condition-enable\_options combinations.

### Syntax

```
DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name      IN VARCHAR2,  
    policy_apply_condition IN POLICY_CONDITIONS);
```

```
DBMS_TSDP_PROTECT.DROP_POLICY (  
    policy_name          IN VARCHAR2);
```

## Parameters

**Table 185-9** *DROP\_POLICY Procedure Parameters*

| Parameter              | Description                                   |
|------------------------|-----------------------------------------------|
| policy_name            | Name of the policy to drop                    |
| policy_apply_condition | To be initialized with the relevant condition |

## Usage Notes

- The combination of `policy_conditions` and `policy_enable_options` can be dropped from a TSDP policy by giving the `policy_apply_condition` parameter. The default condition-default options combination can also be dropped (if it exists for the policy) by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITION`.
- If the condition-enable\_options combination that is being dropped is the last condition-enable\_options combination for the policy, the policy itself is dropped.
- A policy can be completely dropped by using the overloaded of the procedure that takes only `policy_name`.
- A policy or one of its conditions can be dropped only if the policy is not associated with any sensitive column type. This also means that a policy that is being dropped is not enabled on any column (object).

## Examples

Dropping the condition-enable\_options combination based on a specific condition:

```
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;  
BEGIN  
    policy_conditions (DBMS_TSDP_PROTECT.DATATYPE) := 'VARCHAR2';  
    DBMS_TSDP_PROTECT.DROP_POLICY ('PARTIAL_MASK_POLICY', policy_conditions);  
END;
```

The default condition-enable\_options combination can be dropped by passing an empty associative array of type `DBMS_TSDP_PROTECT.POLICY_CONDITIONS` for the `policy_apply_condition` parameter:

```
DECLARE  
    policy_conditions DBMS_TSDP_PROTECT.POLICY_CONDITIONS;  
BEGIN  
    DBMS_TSDP_PROTECT.DROP_POLICY ('redact_partial_cc', policy_conditions);  
END;
```

Dropping a TSDP policy:

```
BEGIN  
    DBMS_TSDP_PROTECT.DROP_POLICY (  
        policy_name => 'PARTIAL_MASK_POLICY');  
END;
```

## 185.5.8 ENABLE\_PROTECTION\_COLUMN Procedure

This procedure enables protection for columns.

### Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN (
  schema_name      IN  VARCHAR2 DEFAULT '%',
  table_name       IN  VARCHAR2 DEFAULT '%',
  column_name      IN  VARCHAR2 DEFAULT '%',
  policy_name      IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 185-10** *ENABLE\_PROTECTION\_COLUMN Procedure Parameters*

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| schema_name | Name of the schema containing the column                     |
| table_name  | Table containing the column                                  |
| column_name | Column name                                                  |
| policy_name | Optional policy name. If given, only this policy is enabled. |

### Usage Notes

- Only a TSDP Policy that is associated with the sensitive column type of the sensitive column can be enabled using this Procedure.
- LIKE condition is used for schema\_name, table\_name and column\_name. AND semantics is followed.

### Examples

Enable TSDP policies associated with the corresponding sensitive column types for columns that reside in schema with name like %PAYROLL%, table name like EMP%, and column name like SAL%:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_COLUMN ('%PAYROLL%', 'EMP%', 'SAL%');
```

## 185.5.9 ENABLE\_PROTECTION\_SOURCE Procedure

This procedure enables protection based on the source of truth for the sensitive columns.

### Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE (
  discovery_sourcename  IN  VARCHAR2);
```

## Parameters

**Table 185-11** *ENABLE\_PROTECTION\_SOURCE Procedure Parameters*

| Parameter            | Description                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| discovery_sourcename | Name of the discovery source. This could be the Application Data Model (ADM) name or the database user. |

## Examples

Enable protection for all columns corresponding to ADM\_Demo:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_SOURCE ('ADM_Demo');
```

## 185.5.10 ENABLE\_PROTECTION\_TYPE Procedure

This procedure enables protection for a sensitive column type.

## Syntax

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE (  
    sensitive_type      IN VARCHAR2);
```

## Parameters

**Table 185-12** *ENABLE\_PROTECTION\_TYPE Procedure Parameters*

| Parameter      | Description                       |
|----------------|-----------------------------------|
| sensitive_type | Name of the sensitive column type |

## Examples

Enable protection for all columns identified by SSN\_TYPE:

```
DBMS_TSDP_PROTECT.ENABLE_PROTECTION_TYPE ('SSN_TYPE');
```

The DBMS\_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

This chapter contains the following topics:

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Summary of DBMS\\_TTS Subprograms](#)

#### See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

## 186.1 DBMS\_TTS Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

## 186.2 DBMS\_TTS Exceptions

The DBMS\_TTS package creates exceptions for missing or invalid transportable tablespaces.

```
ts_not_found EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

## 186.3 DBMS\_TTS Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently.

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.

- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

## 186.4 Summary of DBMS\_TTS Subprograms

The two procedures listed in the table are designed to be called by database administrators.

**Table 186-1 DBMS\_TTS Package Subprograms**

| Subprogram                                    | Description                                                          |
|-----------------------------------------------|----------------------------------------------------------------------|
| <a href="#">DOWNGRADE Procedure</a>           | Downgrades transportable tablespace-related data                     |
| <a href="#">TRANSPORT_SET_CHECK Procedure</a> | Checks if a set of tablespaces (to be transported) is self-contained |

### 186.4.1 DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data in releases earlier than Oracle Database 10g.

#### Syntax

```
DBMS_TTS.DOWNGRADE;
```

#### Note:

This procedure has no effect in Oracle Database 10g and later releases. It is included only for backward compatibility to support references to it in existing scripts.

### 186.4.2 TRANSPORT\_SET\_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

#### Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (  
    ts_list          IN CLOB,  
    incl_constraints IN BOOLEAN DEFAULT FALSE,  
    full_check       IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

**Table 186-2 TRANSPORT\_SET\_CHECK Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ts_list</code>          | List of one or more tablespaces, separated by comma.                                                                                                                                                                                                                                                  |
| <code>incl_constraints</code> | TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The <code>incl_constraints</code> parameter is a default so that <code>TRANSPORT_SET_CHECK</code> will work if it is called with only the <code>ts_list</code> argument.) |

**Table 186-2 (Cont.) TRANSPORT\_SET\_CHECK Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| full_check | Indicates whether a full or partial dependency check is required. If <code>TRUE</code> , treats all <code>IN</code> and <code>OUT</code> pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to <code>TRUE</code> for TSPITR or if a strict version of transportable is desired. By default the parameter is set to <code>FALSE</code> . It will only consider <code>OUT</code> pointers as violations. |

### Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

# DBMS\_TYPES

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Constants](#)
- [Exceptions](#)

## 187.1 DBMS\_TYPES Constants

The `DBMS_TYPES` package defines several constants to use when specifying parameter values.

These constants are listed in following table .

**Table 187-1** *DBMS\_TYPES Constants*

| Constant                              | Description                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NO_DATA</code>                  | Is only relevant if PieceWise is called, for a collection or any dataset. Denotes the end of collection/any dataset when all the elements have been accessed |
| <code>SUCCESS</code>                  | The operation succeeded                                                                                                                                      |
| <code>TYPECODE_BDOUBLE</code>         | A <code>NUMBER</code> type                                                                                                                                   |
| <code>TYPECODE_BFILE</code>           | A <code>BFILE</code> type                                                                                                                                    |
| <code>TYPECODE_BFLOAT</code>          | A <code>NUMBER</code> type                                                                                                                                   |
| <code>TYPECODE_BLOB</code>            | A <code>BLOB</code> type                                                                                                                                     |
| <code>TYPECODE_CFILE</code>           | A <code>CFILE</code> type                                                                                                                                    |
| <code>TYPECODE_CHAR</code>            | A <code>CHAR</code> type                                                                                                                                     |
| <code>TYPECODE_CLOB</code>            | A <code>CLOB</code> type                                                                                                                                     |
| <code>TYPECODE_DATE</code>            | A <code>DATE</code> type                                                                                                                                     |
| <code>TYPECODE_INTERVAL_DS</code>     | An <code>INTERVAL_DS</code> type                                                                                                                             |
| <code>TYPECODE_INTERVAL_YM</code>     | A <code>INTERVAL_YM</code> type                                                                                                                              |
| <code>TYPECODE_MLSLABEL</code>        | An <code>MLSLABEL</code> type                                                                                                                                |
| <code>TYPECODE_NAMEDCOLLECTION</code> | A named collection ( <code>VARRAY</code> /nested table) type                                                                                                 |
| <code>TYPECODE_NCHAR</code>           | A <code>NCHAR</code> type                                                                                                                                    |
| <code>TYPECODE_NCLOB</code>           | A <code>NCLOB</code> type                                                                                                                                    |
| <code>TYPECODE_NUMBER</code>          | A <code>NUMBER</code> type                                                                                                                                   |
| <code>TYPECODE_NVARCHAR2</code>       | A <code>NVARCHAR2</code> type                                                                                                                                |
| <code>TYPECODE_OBJECT</code>          | An <code>OBJECT</code> type                                                                                                                                  |
| <code>TYPECODE_OPAQUE</code>          | An <code>OPAQUE</code> type                                                                                                                                  |

**Table 187-1 (Cont.) DBMS\_TYPES Constants**

| Constant               | Description                    |
|------------------------|--------------------------------|
| TYPECODE_RAW           | A RAW type                     |
| TYPECODE_REF           | A REF type                     |
| TYPECODE_TABLE         | A nested table collection type |
| TYPECODE_TIMESTAMP     | A TIMESTAMP type               |
| TYPECODE_TIMESTAMP_LTZ | A TIMESTAMP_LTZ type           |
| TYPECODE_TIMESTAMP_TZ  | A TIMESTAMP_TZ type            |
| TYPECODE_UROWID        | A UROWID type                  |
| TYPECODE_VARCHAR2      | A VARCHAR2 type                |
| TYPECODE_VARCHAR       | A VARCHAR type                 |
| TYPECODE_VARRAY        | A VARRAY collection type       |

## 187.2 DBMS\_TYPES Exceptions

DBMS\_TYPES throws these exceptions.

- INVALID\_PARAMETERS
- INCORRECT\_USAGE
- TYPE\_MISMATCH

## DBMS\_UNDO\_ADV

The Undo Advisor assists in correctly sizing the undo tablespace and sets the low threshold value of the Undo Retention Period for any Oracle Flashback requirements. The Undo Advisor can also be used to estimate the undo tablespace required for migration from manual to automatic undo management before actually creating the new undo tablespace.

The `DBMS_UNDO_ADVISOR` package provides subprograms to manage the execution of the Undo Advisor feature.

The Undo Advisor relies for its analysis on data collected in the Automatic Workload Repository (AWR). Thus, it is important that the AWR have adequate workload statistics available so that the Undo Advisor can make accurate recommendations. For newly created databases, adequate statistics may not be available immediately. In such cases, continue to use the default auto-extending undo tablespace until at least one workload cycle completes.

This chapter contains the following topic:

- [Summary of DBMS\\_UNDO\\_ADV Subprograms](#)

### 188.1 Summary of DBMS\_UNDO\_ADV Subprograms

This topic lists the `DBMS_UNDO_ADV` subprograms in alphabetical order and briefly describes them.

**Table 188-1 DBMS\_UNDO\_ADV Package Subprograms**

| Subprogram                                       | Description                                                                                                                                                                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BEST_POSSIBLE_RETENTION</a> Function | Returns the best possible value for the <code>undo_retention</code> parameter that the current undo tablespace can satisfy in order to maximize the usage of the current undo tablespace based on the historical information of the given period. |
| <a href="#">LONGEST_QUERY</a> Function           | This function returns the duration of the longest query, in seconds, for a given period.                                                                                                                                                          |
| <a href="#">RBU_MIGRATION</a> Function           | Estimates the undo tablespace needed for migration from manual to automatic undo management.                                                                                                                                                      |
| <a href="#">REQUIRED_RETENTION</a> Function      | Returns the required value for the <code>undo_retention</code> parameter to satisfy the longest query based on undo statistics available for a given period.                                                                                      |
| <a href="#">REQUIRED_UNDO_SIZE</a> Function      | Returns the required undo tablespace size in MB to satisfy a certain undo retention value based on undo statistics available for a given period.                                                                                                  |
| <a href="#">UNDO_ADVISOR</a> Function            | Uses the advisor framework to check if there is any problem with the current instance. It also provides recommendations.                                                                                                                          |
| <a href="#">UNDO_AUTOTUNE</a> Function           | Determines whether auto-tuning of undo retention is enabled for the current undo tablespace.                                                                                                                                                      |

**Table 188-1 (Cont.) DBMS\_UNDO\_ADV Package Subprograms**

| Subprogram                           | Description                                                                                                                                                                                                    |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">UNDO_HEALTH</a> Function | Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem. |
| <a href="#">UNDO_INFO</a> Function   | Retrieves information about the undo tablespace of the current instance.                                                                                                                                       |

## 188.1.1 BEST\_POSSIBLE\_RETENTION Function

This function returns the best possible value for the `undo_retention` parameter that the current undo tablespace can satisfy in order to maximize the usage for the current undo tablespace based on the historical information of a given period.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION()  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(  
    start_time IN DATE,  
    end_time   IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.BEST_POSSIBLE_RETENTION(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 188-2 BEST\_POSSIBLE\_RETENTION Function Parameters**

| Parameter               | Description                                                                                                          |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| <code>start_time</code> | Start time of the given period.                                                                                      |
| <code>end_time</code>   | End time of the given period.                                                                                        |
| <code>begin_snap</code> | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| <code>end_snap</code>   | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.    |

## 188.1.2 RBU\_MIGRATION Function

This function estimates the undo tablespace needed for migration from manual to automatic undo management.

If you are currently using manual undo management (rollback segments) to manage undo space, then Oracle recommends migrating to automatic undo management. You must first create an undo tablespace, before opening a newly upgraded database. The required size of undo tablespace depends on the system workload and Flashback requirements.

### Note:

The `RBU_MIGRATION` function should be called only when `undo_management = manual`.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.RBU_MIGRATION()  
RETURN NUMBER;
```

Viewing the output using the Start Time and End Time:

```
DBMS_UNDO_ADV.RBU_MIGRATION(  
    START_TIME IN DATE,  
    END_TIME   IN DATE)  
RETURN NUMBER;
```

### Parameters

**Table 188-3 RBU\_MIGRATION Function Parameters**

| Parameter  | Description                     |
|------------|---------------------------------|
| START_TIME | Start time of the given period. |
| END_TIME   | End time of the given period.   |

## 188.1.3 LONGEST\_QUERY Function

This function returns the duration of the longest query, in seconds, for a given period.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.LONGEST_QUERY()  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.LONGEST_QUERY(  
    start_time IN DATE,  
    end_time   IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.LONGEST_QUERY(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 188-4 LONGEST\_QUERY Function Parameters**

| Parameter  | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| start_time | Start time for the specified period.                                                                    |
| end_time   | End time for the specified period.                                                                      |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier. |
| end_snap   | End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.    |

## 188.1.4 REQUIRED\_RETENTION Function

This function returns the required value for the `undo_retention` parameter to satisfy the longest query based on undo statistics available for a given period.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION()  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(  
    start_time IN DATE,  
    end_time   IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_RETENTION(  
    begin_snap IN NUMBER,
```

```
    end_snap    IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 188-5** REQUIRED\_RETENTION Function Parameters

| Parameter  | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| start_time | Start time of the given period.                                                                         |
| end_time   | End time of the given period.                                                                           |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier. |
| end_snap   | End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.    |

## 188.1.5 REQUIRED\_UNDO\_SIZE Function

This function returns the required undo tablespace size (in MB) to satisfy certain undo retention value based on undo statistics available for a given period.

### Note:

Zero will be returned if the information about the given period is not available.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER)  
RETURN NUMBER;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER,  
    start_time IN DATE,  
    end_time IN DATE)  
RETURN NUMBER;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.REQUIRED_UNDO_SIZE(  
    retention IN NUMBER,  
    begin_snap IN NUMBER,  
    end_snap IN NUMBER)  
RETURN NUMBER;
```

## Parameters

**Table 188-6** REQUIRED\_UNDO\_SIZE Function Parameters

| Parameter  | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| retention  | Retention value you want to set for the undo_retention init.ora parameter.                              |
| start_time | Start time of the given period.                                                                         |
| end_time   | End time of the given period.                                                                           |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the begin_snap identifier. |
| end_snap   | End snapshot identifier. It is based on historical information in AWR until the end_snap identifier.    |

## 188.1.6 UNDO\_ADVISOR Function

This function uses the advisor framework to check if there is any problem with the current instance and provide recommendations.

### Note:

This function should be used when undo\_management is set to auto.

## Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using start time and end time:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    start_time IN DATE,  
    end_time   IN DATE,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

Viewing the output using begin and end AWR snapshot ID:

```
DBMS_UNDO_ADV.UNDO_ADVISOR(  
    begin_snap IN NUMBER,  
    end_snap   IN NUMBER,  
    instance_id IN NUMBER)  
RETURN VARCHAR2;
```

## Parameters

**Table 188-7 UNDO\_ADVISOR Function Parameters**

| Parameter                | Description                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------|
| <code>start_time</code>  | Start time of the given period.                                                                                      |
| <code>end_time</code>    | End time of the given period.                                                                                        |
| <code>begin_snap</code>  | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier. |
| <code>end_snap</code>    | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.    |
| <code>instance_id</code> | Instance ID of the current instance.                                                                                 |

## 188.1.7 UNDO\_AUTOTUNE Function

This function finds out whether the auto-tuning of undo retention is enabled for the current undo tablespace.

### Syntax

```
DBMS_UNDO_ADV.UNDO_AUTOTUNE(  
    chk OUT BOOLEAN)  
RETURN BOOLEAN;
```

## Parameters

**Table 188-8 UNDO\_AUTOTUNE Function Parameters**

| Parameter        | Description                                                        |
|------------------|--------------------------------------------------------------------|
| <code>chk</code> | TRUE if auto-tuning of undo retention is enabled, FALSE otherwise. |

## 188.1.8 UNDO\_HEALTH Function

Checks whether there is any problem with the current setting of undo retention and undo tablespace size based on the historical information of a given period and provides recommendations to fix the problem.

If the return value is 0, no problem is found. Otherwise, parameter `prob` and `reco` are the problem and recommendation on fixing the problem.

### Syntax

Viewing the output using the historical information in memory:

```
DBMS_UNDO_ADV.UNDO_HEALTH(  
    prob OUT VARCHAR2,  
    reco OUT VARCHAR2,  
    rtn1 OUT VARCHAR2,
```

```

    retn OUT NUMBER,
    utbs OUT NUMBER);

```

Viewing the output using start time and end time:

```

DBMS_UNDO_ADV.UNDO_HEALTH(
    prob OUT VARCHAR2,
    reco OUT VARCHAR2,
    rtnl OUT VARCHAR2,
    retn OUT NUMBER,
    utbs OUT NUMBER)
RETURN NUMBER;

```

Viewing the output using begin and end AWR snapshot ID:

```

DBMS_UNDO_ADV.UNDO_HEALTH(
    begin_snap IN NUMBER,
    end_snap   IN NUMBER,
    prob       OUT VARCHAR2,
    reco       OUT VARCHAR2,
    rtnl       OUT VARCHAR2,
    retn       OUT NUMBER,
    utbs       OUT NUMBER)
RETURN NUMBER;

```

## Parameters

**Table 188-9 UNDO\_HEALTH Function Parameters**

| Parameter  | Description                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| start_time | Start time of the given period.                                                                                                              |
| end_time   | End time of the given period.                                                                                                                |
| begin_snap | Begin snapshot identifier. It is based on historical information in AWR from the <code>begin_snap</code> identifier.                         |
| end_snap   | End snapshot identifier. It is based on historical information in AWR until the <code>end_snap</code> identifier.                            |
| prob       | Problem that is being diagnosed.<br>For example, long running query may fail or undo tablespace cannot satisfy <code>undo_retention</code> . |
| reco       | Recommendation for fixing the problem.                                                                                                       |
| rtnl       | Rationale for the recommendation.                                                                                                            |
| retn       | The numerical value of retention if the recommendation is to change retention.                                                               |
| utbs       | The numerical value of undo tablespace size (in MB) if the recommendation is to change undo tablespace size.                                 |

## 188.1.9 UNDO\_INFO Function

This function retrieves information about the undo tablespace of the current instance.

This function returns the undo tablespace name, maximum possible size for the undo tablespace, current undo retention value, and boolean values to verify if it is auto-extensible or if the undo tablespace has guaranteed undo retention.

### Syntax

```
DBMS_UNDO_ADV.UNDO_INFO(  
    tbs_name      OUT VARCHAR2,  
    tbs_size      OUT NUMBER,  
    tbs_autoextend OUT BOOLEAN,  
    tbs_retention  OUT NUMBER,  
    tbs_guarantee  OUT BOOLEAN)  
RETURN BOOLEAN;
```

### Parameters

**Table 188-10 UNDO\_INFO Function Parameters**

| Parameter      | Description                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tbs_name       | Name of the current undo tablespace the instance is using.                                                                                                                                        |
| tbs_size       | The size of the undo tablespace in MB, if the undo tablespace is <i>fixed-sized</i> . If the tablespace is <i>auto_extensible</i> , it is the maximum possible size of the undo tablespace in MB. |
| tbs_autoextend | TRUE if the undo tablespace is extensible, FALSE otherwise.                                                                                                                                       |
| tbs_retention  | The value of the <code>undo_retentioninit.ora</code> parameter.                                                                                                                                   |
| tbs_guarantee  | TRUE if the undo tablespace has guaranteed retention, FALSE otherwise.                                                                                                                            |

# DBMS\_UMF

The `DBMS_UMF` package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.

## See Also:

*Oracle Database Performance Tuning Guide* for more information about configuring the RMF for an Oracle Database.

This chapter contains the following topic:

- [Summary of DBMS\\_UMF Subprograms](#)

## 189.1 Summary of DBMS\_UMF Subprograms

This topic lists the `DBMS_UMF` subprograms in alphabetical order and briefly describes them.

**Table 189-1 DBMS\_UMF Package Subprograms**

| Subprogram                                           | Description                                                        |
|------------------------------------------------------|--------------------------------------------------------------------|
| <a href="#">CONFIGURE_NODE Procedure</a>             | Configures a node in the RMF topology                              |
| <a href="#">CREATE_LINK Procedure</a>                | Creates a database link between two nodes in the RMF topology      |
| <a href="#">CREATE_TOPOLOGY Procedure</a>            | Creates the RMF topology                                           |
| <a href="#">DROP_LINK Procedure</a>                  | Removes a database link between two nodes in the RMF topology      |
| <a href="#">DROP_TOPOLOGY Procedure</a>              | Deletes the RMF topology                                           |
| <a href="#">ENABLE_SERVICE Procedure</a>             | Enables a service on a node in the RMF topology                    |
| <a href="#">GET_NODE_ID_LOCAL Function</a>           | Returns the node ID of a node in the RMF topology                  |
| <a href="#">GET_NODE_NAME_LOCAL Function</a>         | Returns the node name of a node in the RMF topology                |
| <a href="#">GET_TARGET_ID Function</a>               | Returns the destination ID in the RMF topology                     |
| <a href="#">GET_TOPOLOGY_NAME_LOCAL Function</a>     | Returns the RMF topology name of the local node                    |
| <a href="#">QUERY_LINK_INFO Procedure</a>            | Returns the information about a database link in the RMF topology  |
| <a href="#">QUERY_NODE_INFO Procedures</a>           | Returns the information about a node in the RMF topology           |
| <a href="#">REGISTER_NODE Function and Procedure</a> | Registers a node in the RMF topology                               |
| <a href="#">SWITCH_DESTINATION Procedure</a>         | Designates a source node as a destination node in the RMF topology |

**Table 189-1 (Cont.) DBMS\_UMF Package Subprograms**

| Subprogram                                 | Description                                            |
|--------------------------------------------|--------------------------------------------------------|
| <a href="#">UNCONFIGURE_NODE Procedure</a> | Resets the configuration of a node in the RMF topology |
| <a href="#">UNREGISTER_NODE Procedure</a>  | Removes the registration of a node in the RMF topology |

## 189.1.1 CONFIGURE\_NODE Procedure

This procedure configures a node that needs to be registered with the RMF topology. This procedure must be executed on the node that needs to be configured.

### Syntax

```
DBMS_UMF.CONFIGURE_NODE(  
    node_name          IN VARCHAR2 DEFAULT NULL,  
    dblink_to_target   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 189-2 CONFIGURE\_NODE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_name        | Name of the node.<br><br>Each node in the RMF topology must be assigned a unique name. If a name is not provided for a node in this procedure, then the value of the initialization parameter <code>DB_UNIQUE_NAME</code> is assigned as the name for the node by default. |
| dblink_to_target | Database link from this node to the destination node.                                                                                                                                                                                                                      |

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.2 CREATE\_LINK Procedure

This procedure creates database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

### Syntax

```
DBMS_UMF.CREATE_LINK(  
    topology_name      IN VARCHAR2,  
    node_a_name        IN VARCHAR2,  
    node_b_name        IN VARCHAR2,  
    dblink_a_to_b      IN VARCHAR2,  
    dblink_b_to_a      IN VARCHAR2);
```

## Parameters

**Table 189-3 CREATE\_LINK Procedure Parameters**

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| topology_name | Name of the RMF topology.                             |
| node_a_name   | Name of the first node.                               |
| node_b_name   | Name of the second node.                              |
| dblink_a_to_b | Database link from the first node to the second node. |
| dblink_b_to_b | Database link from the second node to the first node. |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.3 CREATE\_TOPOLOGY Procedure

This procedure creates the RMF topology and designates the node on which it is executed as the destination node for that topology.

## Syntax

```
DBMS_UMF.CREATE_TOPOLOGY(  
    topology_name IN VARCHAR2);
```

## Parameters

**Table 189-4 CREATE\_TOPOLOGY Procedure Parameters**

| Parameter     | Description               |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.4 DROP\_LINK Procedure

This procedure removes the database links between two nodes in the RMF topology. This procedure must be executed only on the destination node.

## Syntax

```
DBMS_UMF.DROP_LINK(  
    topology_name IN VARCHAR2,  
    node_a_name   IN VARCHAR2,  
    node_b_name   IN VARCHAR2);
```

## Parameters

**Table 189-5 DROP\_LINK Procedure Parameters**

| Parameter     | Description               |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |
| node_a_name   | Name of the first node.   |
| node_b_name   | Name of the second node.  |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.5 DROP\_TOPOLOGY Procedure

This procedure deletes the RMF topology. This procedure must be executed only on the destination node.

## Syntax

```
DBMS_UMF.DROP_TOPOLOGY(  
    topology_name IN VARCHAR2);
```

## Parameters

**Table 189-6 DROP\_TOPOLOGY Procedure Parameters**

| Parameter     | Description                     |
|---------------|---------------------------------|
| topology_name | Name of the topology to delete. |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.6 ENABLE\_SERVICE Procedure

This procedure enables a service, such as the AWR service, on a node in the RMF topology. This procedure must be executed only on the destination node.

## Syntax

```
DBMS_UMF.ENABLE_SERVICE(  
    topology_name    IN VARCHAR2,  
    node_name        IN VARCHAR2,  
    service_type     IN NUMBER);
```

## Parameters

**Table 189-7** ENABLE\_SERVICE Procedure Parameters

| Parameter     | Description                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                                                                                                                          |
| node_name     | Name of the node on which a specific service needs to be enabled.                                                                                                  |
| service_type  | Numeric constant identifying the service. The only allowed value for this parameter is UMF_SERVICE_TYPE_AWR, which is Automatic Workload Repository (AWR) service. |

## Security Model

Only the database users SYS and SYS\$UMF can execute this procedure.

## 189.1.7 GET\_NODE\_ID\_LOCAL Function

This function returns the node ID of the node in the RMF topology on which this function is executed.

## Syntax

```
DBMS_UMF.GET_NODE_ID_LOCAL(  
    topology_name IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```

## Parameters

**Table 189-8** GET\_NODE\_ID\_LOCAL Function Parameters

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| topology_name | Name of the RMF topology with which the node is registered. |

## Return Value

Returns the node ID of the node in the RMF topology on which this function is executed.

## Security Model

Only the database users SYS and SYS\$UMF can execute this function.

## 189.1.8 GET\_NODE\_NAME\_LOCAL Function

This function returns the name of the node in the RMF topology on which this function is executed.

### Syntax

```
DBMS_UMF.GET_NODE_NAME_LOCAL RETURN VARCHAR2;
```

### Return Value

Returns the name of the node in the RMF topology on which this function is executed.

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.9 GET\_TARGET\_ID Function

This function returns the ID of the destination node in the RMF topology. This function can be executed on any node in the RMF topology.

### Syntax

```
DBMS_UMF.GET_TARGET_ID(  
    topology_name IN VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 189-9 GET\_TARGET\_ID Function Parameters**

| Parameter                  | Description               |
|----------------------------|---------------------------|
| <code>topology_name</code> | Name of the RMF topology. |

### Return Value

Returns the ID of the destination node in the RMF topology.

### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.10 GET\_TOPOLOGY\_NAME\_LOCAL Function

This function returns the name of the active RMF topology of the node on which this function is executed.

### Syntax

```
DBMS_UMF.GET_TOPOLOGY_NAME_LOCAL RETURN VARCHAR2;
```

**Return Value**

Returns the name of the active RMF topology of the node on which this function is executed.

**Security Model**

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.11 QUERY\_LINK\_INFO Procedure

This procedure returns the name of the database link between two nodes in the RMF topology. This procedure can be executed on any node in the RMF topology.

**Syntax**

```
DBMS_UMF.QUERY_LINK_INFO(  
    topology_name      IN   VARCHAR2,  
    from_node_id       IN   NUMBER,  
    to_node_id         IN   NUMBER,  
    link_name          OUT  VARCHAR2);
```

**Parameters**

**Table 189-10** QUERY\_LINK\_INFO Procedure Parameters

| Parameter     | Description                                                                                 |
|---------------|---------------------------------------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                                                   |
| from_node_id  | Node ID of the first node.                                                                  |
| to_node_id    | Node ID of the second node.                                                                 |
| link_name     | Name of the database link from the first node to the second node returned by the procedure. |

**Security Model**

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.12 QUERY\_NODE\_INFO Procedures

This procedure returns information about a node in the RMF topology. This procedure can be executed on any node in the RMF topology.

**Syntax**

```
DBMS_UMF.QUERY_NODE_INFO(  
    topology_name      IN   VARCHAR2 DEFAULT NULL,  
    node_name          IN   VARCHAR2,  
    node_id            OUT  NUMBER);
```

```
DBMS_UMF.QUERY_NODE_INFO(  
    node_id            IN   NUMBER,
```

```
topology_name      OUT   VARCHAR2,
node_name          OUT   VARCHAR2);
```

## Parameters

**Table 189-11 QUERY\_NODE\_INFO Procedure Parameters**

| Parameter     | Description                                                 |
|---------------|-------------------------------------------------------------|
| topology_name | Name of the RMF topology with which the node is registered. |
| node_name     | Name of the node.                                           |
| node_id       | Identifier of the node.                                     |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.13 REGISTER\_NODE Function and Procedure

This function and procedure registers a node with the RMF topology. This procedure and function must be executed only on the destination node in the RMF topology.

### Syntax

```
DBMS_UMF.REGISTER_NODE(
    topology_name      IN   VARCHAR2,
    node_name          IN   VARCHAR2,
    dblink_to_node     IN   VARCHAR2 DEFAULT NULL,
    dblink_from_node   IN   VARCHAR2 DEFAULT NULL,
    as_source          IN   VARCHAR2 DEFAULT 'TRUE',
    as_candidate_target IN   VARCHAR2 DEFAULT 'FALSE');
```

```
DBMS_UMF.REGISTER_NODE(
    topology_name      IN   VARCHAR2,
    node_name          IN   VARCHAR2,
    dblink_to_node     IN   VARCHAR2 DEFAULT NULL,
    dblink_from_node   IN   VARCHAR2 DEFAULT NULL,
    as_source          IN   VARCHAR2 DEFAULT 'TRUE',
    as_candidate_target IN   VARCHAR2 DEFAULT 'FALSE');
node_id              OUT  VARCHAR2);
```

```
DBMS_UMF.REGISTER_NODE(
    topology_name      IN   VARCHAR2,
    node_name          IN   VARCHAR2,
    dblink_to_node     IN   VARCHAR2 DEFAULT NULL,
    dblink_from_node   IN   VARCHAR2 DEFAULT NULL,
    as_source          IN   VARCHAR2 DEFAULT 'TRUE',
    as_candidate_target IN   VARCHAR2 DEFAULT 'FALSE')
RETURN NUMBER;
```

## Parameters

**Table 189-12 REGISTER\_NODE Function and Procedure Parameters**

| Parameter           | Description                                                             |
|---------------------|-------------------------------------------------------------------------|
| topology_name       | Name of the RMF topology.                                               |
| node_name           | Name of the node to register.                                           |
| dblink_to_node      | Name for the database link from the destination to the node.            |
| dblink_from_node    | Name for the database link from the node to the destination.            |
| as_source           | Set to TRUE, if the node is a source, else set to FALSE.                |
| as_candidate_target | Set to TRUE, if the node is a candidate destination, else set to FALSE. |
| node_id             | Node ID returned by the procedure.                                      |

## Return Value

Returns the node ID of the registered node.

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

## 189.1.14 SWITCH\_DESTINATION Procedure

This procedure makes the candidate destination as the new destination in the RMF topology. This procedure must be executed only on the candidate destination node.

## Syntax

```
DBMS_UMF.SWITCH_DESTINATION(  
    topology_name      IN VARCHAR2,  
    force_switch       IN BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 189-13 SWITCH\_DESTINATION Procedure Parameters**

| Parameter     | Description               |
|---------------|---------------------------|
| topology_name | Name of the RMF topology. |

**Table 189-13 (Cont.) SWITCH\_DESTINATION Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>force_switch</code> | <p>If set to <code>FALSE</code>, the execution of this procedure fails in the following situations:</p> <ul style="list-style-type: none"> <li>• Candidate destination is a read-only database, and hence it cannot become the new destination.</li> <li>• Candidate destination does not have database links to one or more sources in the topology.</li> <li>• Candidate destination is unable to get the latest AWR data from the old destination.</li> </ul> <p>If set to <code>TRUE</code>, the execution of this procedure fails in the following situation:</p> <ul style="list-style-type: none"> <li>• Candidate destination is a read-only database, and hence it cannot become the new destination.</li> </ul> |

#### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

### 189.1.15 UNCONFIGURE\_NODE Procedure

This procedure removes the configuration details of the node on which this procedure is executed.

#### Syntax

```
DBMS_UMF.UNCONFIGURE_NODE;
```

#### Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

### 189.1.16 UNREGISTER\_NODE Procedure

This procedure removes a node for the RMF topology. This procedure must be executed only on the destination node.

#### Syntax

```
DBMS_UMF.UNREGISTER_NODE (
    topology_name    IN VARCHAR2,
    node_name        IN VARCHAR2);
```

## Parameters

**Table 189-14 UNREGISTER\_NODE Procedure Parameters**

| Parameter     | Description                                                   |
|---------------|---------------------------------------------------------------|
| topology_name | Name of the RMF topology.                                     |
| node_name     | Name of the node which needs to be removed from the topology. |

## Security Model

Only the database users `SYS` and `SYS$UMF` can execute this procedure.

# DBMS\_USER\_CERTS

The `DBMS_USER_CERTS` package allows you add and delete certificates.

This chapter contains the following topics:

- [DBMS\\_USER\\_CERTS Overview](#)
- [DBMS\\_USER\\_CERTS Security Model](#)
- [Summary of DBMS\\_USER\\_CERTS Subprograms](#)

## See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database Reference*
- For information on hidden columns in blockchain tables, see *Hidden Columns in Blockchain Tables*

## 190.1 DBMS\_USER\_CERTS Overview

The `DBMS_USER_CERTS` package allows you add and delete certificates.

The `DBMS_USER_CERTS` package allows you to:

- add certificates
- delete certificates

One use case is to attach a digital signature to a row in a blockchain table and be able to verify the digital signature later. A certificate used to sign one or more rows in blockchain tables and which has since expired should remain in the database until all those rows have been deleted from the blockchain tables.

## 190.2 DBMS\_USER\_CERTS Security Model

The `DBMS_USER_CERTS` package is owned by `SYS` and is installed as part of database installation.

- Both `ADD_CERTIFICATE()` and `DROP_CERTIFICATE()` sub-programs can be executed by any database user. The `EXECUTE` privilege on `DBMS_USER_CERTS` package is granted to `PUBLIC` role.
- Using `ADD_CERTIFICATE()`, a database user can add multiple certificates, each one would be identified uniquely using a `GUID`.

- Only SYSDBA or the user who owns the certificate, can drop it using `DROP_CERTIFICATE()`.

## 190.3 Summary of DBMS\_USER\_CERTS Subprograms

The `DBMS_USER_CERTS` package uses `ADD_CERTIFICATE` and `DROP_CERTIFICATE` subprograms to add and delete X.509 certificates which are used for signature verification for blockchain tables by the current user.

**Table 190-1 DBMS\_USER\_CERTS Package Subprograms**

| Subprogram                                 | Description                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------|
| <a href="#">ADD_CERTIFICATE Procedure</a>  | Adds X.509 certificates which are used for signature verification of blockchain tables. |
| <a href="#">DROP_CERTIFICATE Procedure</a> | Drops a certificate that is used for signature verification of blockchain tables.       |

### 190.3.1 ADD\_CERTIFICATE Procedure

This procedure can be used by the current user to add an X.509 certificate that is used for signature verification of blockchain tables.

#### Syntax

```
DBMS_USER_CERTS.ADD_CERTIFICATE(  
    x509_cert          IN BLOB,  
    cert_id            OUT RAW);
```

#### Parameters

**Table 190-2 ADD\_CERTIFICATE Procedure Parameters**

| Parameter              | Description                                                                 |
|------------------------|-----------------------------------------------------------------------------|
| <code>x509_cert</code> | The X.509 certificate used for signature verification of blockchain tables. |
| <code>cert_id</code>   | The Global Unique Identifier (GUID) for the certificate.                    |

### 190.3.2 DROP\_CERTIFICATE Procedure

This procedure can be used by the current user to drop a certificate that is used for signature verification of blockchain tables.

#### Syntax

```
DBMS_USER_CERTS.DROP_CERTIFICATE(  
    cert_id            IN RAW);
```

#### Parameters

**Table 190-3 DROP\_CERTIFICATE Procedure Parameters**

| Parameter            | Description                                             |
|----------------------|---------------------------------------------------------|
| <code>cert_id</code> | The Global Unique Identifier (GUID) of the certificate. |

# DBMS\_UTILITY

The `DBMS_UTILITY` package provides various utility subprograms.

This chapter contains the following topics:

- [DBMS\\_UTILITY Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Data Structures](#)
- [Summary of DBMS\\_UTILITY Subprograms](#)

## 191.1 DBMS\_UTILITY Deprecated Subprograms

These `DBMS_UTILITY` subprograms are deprecated in Oracle Database 12c release 12.2.

**Note:**

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- [GET\\_PARAMETER\\_VALUE Function](#)  
Query `v$_parameter` directly to find the value of an `init.ora` parameter.
- [ANALYZE\\_PART\\_OBJECT Procedure](#)  
Use `DBMS_STATS` to gather statistics.
- [GET\\_DEPENDENCY Procedure](#)  
There is no replacement for this subprogram. However, you can directly query the dictionary views.

There are no replacements for these subprograms.

## 191.2 DBMS\_UTILITY Security Model

`DBMS_UTILITY` runs with the privileges of the calling user for the `NAME_RESOLVE` procedure and the `COMPILE_SCHEMA` procedure. This is necessary so that the SQL works correctly.

The package does not run as `SYS`. The privileges are checked using `DBMS_DDL`.

**Related Topics**

- [NAME\\_RESOLVE Procedure](#)  
This procedure resolves the given name, including synonym translation and authorization checking as necessary.
- [COMPILE\\_SCHEMA Procedure](#)  
This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

## 191.3 DBMS\_UTILITY Constants

The `DBMS_UTILITY` package defines one constant to use when specifying parameter values.

This constant is shown in the following table.

**Table 191-1 DBMS\_UTILITY Constants**

| Name                                   | Type                     | Value | Description                                                                                                                   |
|----------------------------------------|--------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_ERROR_ON_RESTRICTIONS</code> | <code>PLS_INTEGER</code> | 1     | This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram |

## 191.4 DBMS\_UTILITY Exceptions

This table lists the exceptions raised by `DBMS_UTILITY`.

**Table 191-2 Exceptions Raised by DBMS\_UTILITY**

| Exception                             | Error Code | Description                                                                                                                                                                                                                |
|---------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | -24237     | Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code>   | -24238     | Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter                                                                   |
| <code>INV_RESTRICTED_OBJECT</code>    | -24239     | Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened                                                            |

## 191.5 DBMS\_UTILITY Data Structures

The `DBMS_UTILITY` package defines a single `RECORD` type and `TABLE` types.

**Record Types**

- [INSTANCE\\_RECORD Record Type](#)

**Table Types**

- [DBLINK\\_ARRAY TABLE Type](#)

- [INDEX\\_TABLE\\_TYPE Table Type](#)
- [INSTANCE\\_TABLE Table Type](#)
- [LNAME\\_ARRAY Table Type](#)
- [NAME\\_ARRAY Table Type](#)
- [NUMBER\\_ARRAY Table Type](#)
- [UNCL\\_ARRAY Table Type](#)

## 191.5.1 DBMS\_UTILITY INSTANCE\_RECORD Record Type

This type describes a list of active instance number-name pairs.

### Syntax

```
TYPE INSTANCE_RECORD IS RECORD (  
    inst_number    NUMBER,  
    inst_name      VARCHAR2(60));
```

### Fields

**Table 191-3** INSTANCE\_RECORD Record Type Fields

| Field       | Description            |
|-------------|------------------------|
| inst_number | Active instance number |
| inst_name   | Instance name          |

## 191.5.2 DBMS\_UTILITY DBLINK\_ARRAY TABLE Type

This type stores a list of database links.

### Syntax

```
TYPE DBLINK_ARRAY IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

## 191.5.3 DBMS\_UTILITY INDEX\_TABLE\_TYPE Table Type

This type describes the order in which generated objects are returned to a user.

### Syntax

```
TYPE INDEX_TABLE_TYPE IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## 191.5.4 DBMS\_UTILITY INSTANCE\_TABLE Table Type

This type describes a table of `INSTANCE_RECORD` Record Type.

### Syntax

```
TYPE INSTANCE_TABLE IS TABLE OF INSTANCE_RECORD INDEX BY BINARY_INTEGER;
```

### Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is Dense.

**Related Topics**

- [DBMS\\_UTILITY INSTANCE\\_RECORD Record Type](#)  
This type describes a list of active instance number-name pairs.

## 191.5.5 DBMS\_UTILITY LNAME\_ARRAY Table Type

This type stores lists of `LONG NAME` including fully qualified attribute names.

**Syntax**

```
TYPE LNAME_ARRAY IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## 191.5.6 DBMS\_UTILITY NAME\_ARRAY Table Type

This type stores lists of `NAME`.

**Syntax**

```
TYPE NAME_ARRAY IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

## 191.5.7 DBMS\_UTILITY NUMBER\_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

**Syntax**

```
TYPE NUMBER_ARRAY IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

## 191.5.8 DBMS\_UTILITY UNCL\_ARRAY Table Type

This type stores lists of "user"."name"."column"@link

**Syntax**

```
TYPE UNCL_ARRAY IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

## 191.6 Summary of DBMS\_UTILITY Subprograms

This table lists the `DBMS_UTILITY` subprograms and briefly describes them.

**Table 191-4** *DBMS\_UTILITY Package Subprograms*

| Subprogram                                    | Description                                                                                                                                                                                                         |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACTIVE_INSTANCES Procedure</a>    | Returns the active instance                                                                                                                                                                                         |
| <a href="#">ANALYZE_DATABASE Procedure</a>    | Analyzes all the tables, clusters and indexes in a database                                                                                                                                                         |
| <a href="#">ANALYZE_PART_OBJECT Procedure</a> | Analyzes the given tables and indexes<br>This procedure is deprecated from the <code>DBMS_UTILITY</code> package with Oracle Database 12c release 12.2 and later. Use <code>DBMS_STATS</code> to gather statistics. |
| <a href="#">ANALYZE_SCHEMA Procedure</a>      | Analyzes all the tables, clusters and indexes in a schema                                                                                                                                                           |
| <a href="#">CANONICALIZE Procedure</a>        | Canonicalizes a given string                                                                                                                                                                                        |

**Table 191-4 (Cont.) DBMS\_UTILITY Package Subprograms**

| Subprogram                              | Description                                                                                                                                                                                                      |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMA_TO_TABLE Procedures               | Converts a comma-delimited list of names into a PL/SQL table of names                                                                                                                                            |
| COMPILE_SCHEMA Procedure                | Compiles all procedures, functions, packages, views and triggers in the specified schema                                                                                                                         |
| CREATE_ALTER_TYPE_ERROR_TABLE Procedure | Creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement                                                                                                                            |
| CURRENT_INSTANCE Function               | Returns the current connected instance number                                                                                                                                                                    |
| DATA_BLOCK_ADDRESS_BLOCK Function       | Gets the block number part of a data block address                                                                                                                                                               |
| DATA_BLOCK_ADDRESS_FILE Function        | Gets the file number part of a data block address                                                                                                                                                                |
| DB_VERSION Procedure                    | Returns version information for the database                                                                                                                                                                     |
| EXEC_DDL_STATEMENT Procedure            | Executes the DDL statement in <code>parse_string</code>                                                                                                                                                          |
| EXPAND_SQL_TEXT Procedure               | Recursively replaces any view references in the input SQL query with the corresponding view subquery                                                                                                             |
| FORMAT_CALL_STACK Function              | Formats the current call stack                                                                                                                                                                                   |
| FORMAT_ERROR_BACKTRACE Function         | Formats the backtrace from the point of the current error to the exception handler where the error has been caught                                                                                               |
| FORMAT_ERROR_STACK Function             | Formats the current error stack                                                                                                                                                                                  |
| GET_CPU_TIME Function                   | Returns the current CPU time in 100th's of a second                                                                                                                                                              |
| GET_DEPENDENCY Procedure                | Shows the dependencies on the object passed in.<br>This procedure is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. There is no replacement for this subprogram.      |
| GET_ENDIANNESS Function                 | Gets the endianness of the database platform                                                                                                                                                                     |
| GET_HASH_VALUE Function                 | Computes a hash value for the given string                                                                                                                                                                       |
| GET_PARAMETER_VALUE Function            | Gets the value of specified init.ora parameter.<br>This function is deprecated from the DBMS_UTILITY package with Oracle Database 12c release 12.2 and later. You can query <code>v\$_parameter</code> directly. |
| GET_SQL_HASH Function                   | Computes a hash value for the given string using MD5 algorithm                                                                                                                                                   |
| GET_TIME Function                       | Returns the current time in 100th's of a second                                                                                                                                                                  |
| GET_TZ_TRANSITIONS Procedure            | Returns time zone transitions by <code>regionid</code> from the <code>timezone.dat</code> file                                                                                                                   |
| INVALIDATE Procedure                    | Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings                                                                                                                   |
| IS_BIT_SET Function                     | Checks the bit setting for the given bit in the given RAW value                                                                                                                                                  |
| IS_CLUSTER_DATABASE Function            | Determines if the database is running in cluster database mode                                                                                                                                                   |
| MAKE_DATA_BLOCK_ADDRESS Function        | Creates a data block address given a file number and a block number                                                                                                                                              |
| NAME_RESOLVE Procedure                  | Resolves the given name                                                                                                                                                                                          |
| NAME_TOKENIZE Procedure                 | Calls the parser to parse the given name                                                                                                                                                                         |

**Table 191-4 (Cont.) DBMS\_UTILITY Package Subprograms**

| Subprogram                                   | Description                                                                                                                                                                    |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">OLD_CURRENT_SCHEMA Function</a>  | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')                                                                                                       |
| <a href="#">OLD_CURRENT_USER Function</a>    | Returns the session value from SYS_CONTEXT ('USERENV', 'CURRENT_USER')                                                                                                         |
| <a href="#">PORT_STRING Function</a>         | Returns a string that uniquely identifies the version of Oracle and the operating system                                                                                       |
| <a href="#">SQLID_TO_SQLHASH Function</a>    | Converts a SQL ID into a hash value                                                                                                                                            |
| <a href="#">TABLE_TO_COMMA Procedures</a>    | Converts a PL/SQL table of names into a comma-delimited list of names                                                                                                          |
| <a href="#">VALIDATE Procedure</a>           | Makes invalid database objects valid                                                                                                                                           |
| <a href="#">WAIT_ON_PENDING_DML Function</a> | Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back |

## 191.6.1 ACTIVE\_INSTANCES Procedure

This procedure returns the active instance.

### Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
    instance_table OUT INSTANCE_TABLE,
    instance_count OUT NUMBER);
```

### Parameters

**Table 191-5 ACTIVE\_INSTANCES Procedure Parameters**

| Procedure      | Description                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------|
| instance_table | Contains a list of the active instance numbers and names. When no instance is up, the list is empty. |
| instance_count | Number of active instances                                                                           |

## 191.6.2 ANALYZE\_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

### Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
    method          IN  VARCHAR2,
    estimate_rows   IN  NUMBER DEFAULT NULL,
    estimate_percent IN  NUMBER DEFAULT NULL,
    method_opt      IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 191-6 ANALYZE\_DATABASE Procedure Parameters**

| Parameter        | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| method           | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.           |
| estimate_rows    | Number of rows to estimate                                                                                               |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.                                     |
| method_opt       | Method options of the following format:<br>[ FOR TABLE ]<br>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]<br>[ FOR ALL INDEXES ] |

## Exceptions

ORA-20000: Insufficient privileges for some object in this database

## 191.6.3 ANALYZE\_PART\_OBJECT Procedure

This procedure is equivalent to SQL: "ANALYZE TABLE|INDEX [<schema>.<object\_name> PARTITION <pname> [<command\_type>] [<command\_opt>] [<sample\_clause>]

### Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can use [DBMS\\_STATS](#) to gather statistics.

## Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (  
    schema          IN VARCHAR2 DEFAULT NULL,  
    object_name     IN VARCHAR2 DEFAULT NULL,  
    object_type     IN CHAR      DEFAULT 'T',  
    command_type    IN CHAR      DEFAULT 'E',  
    command_opt     IN VARCHAR2 DEFAULT NULL,  
    sample_clause   IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

## Parameters

**Table 191-7 ANALYZE\_PART\_OBJECT Procedure Parameters**

| Parameter   | Description                                        |
|-------------|----------------------------------------------------|
| schema      | Schema of the object_name                          |
| object_name | Name of object to be analyzed, must be partitioned |
| object_type | Type of object, must be T (table) or I (index)     |

**Table 191-7 (Cont.) ANALYZE\_PART\_OBJECT Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| command_type  | Must be V (validate structure)                                                                                                                                                                                                         |
| command_opt   | Other options for the command type.<br>For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T. |
| sample_clause | Sample clause to use when command_type is 'E'                                                                                                                                                                                          |

**Usage Notes**

For each partition of the object, run in parallel using job queues.

## 191.6.4 ANALYZE\_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

**Syntax**

```
DBMS_UTILITY.ANALYZE_SCHEMA (  
    schema          IN  VARCHAR2,  
    method          IN  VARCHAR2,  
    estimate_rows   IN  NUMBER DEFAULT NULL,  
    estimate_percent IN  NUMBER DEFAULT NULL,  
    method_opt      IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 191-8 ANALYZE\_SCHEMA Procedure Parameters**

| Parameter        | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| schema           | Name of the schema                                                                                                       |
| method           | One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.           |
| estimate_rows    | Number of rows to estimate                                                                                               |
| estimate_percent | Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.                                     |
| method_opt       | Method options of the following format:<br>[ FOR TABLE ]<br>[ FOR ALL [INDEXED] COLUMNS] [SIZE n]<br>[ FOR ALL INDEXES ] |

**Exceptions**

ORA-20000: Insufficient privileges for some object in this schema

## 191.6.5 CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

### Syntax

```
DBMS_UTILITY.CANONICALIZE (
    name          IN   VARCHAR2,
    canon_name     OUT  VARCHAR2,
    canon_len      IN   BINARY_INTEGER);
```

### Parameters

**Table 191-9 CANONICALIZE Procedure Parameters**

| Parameter  | Description                                     |
|------------|-------------------------------------------------|
| name       | String to be canonicalized                      |
| canon_name | Canonicalized string                            |
| canon_len  | Length of the string (in bytes) to canonicalize |

### Return Values

Returns the first `canon_len` bytes in `canon_name`.

### Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS\_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS\_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after `a[.b]*` will be ignored.
- The procedure does not handle cases like 'A B.'

### Examples

- `a` becomes `A`
- `"a"` becomes `a`
- `"a".b` becomes `"a". "B"`
- `"a".b,c.f` becomes `"a". "B"` with `,c.f` ignored.

## 191.6.6 COMMA\_TO\_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (  
    list    IN VARCHAR2,  
    tablen  OUT BINARY_INTEGER,  
    tab     OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (  
    list    IN VARCHAR2,  
    tablen  OUT BINARY_INTEGER,  
    tab     OUT lname_array);
```

### Parameters

**Table 191-10 COMMA\_TO\_TABLE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| list      | Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c ]][ @ d ] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted). |
| tablen    | Number of tables in the PL/SQL table                                                                                                                                                                                                                                |
| tab       | PL/SQL table which contains list of names                                                                                                                                                                                                                           |

### Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

### Usage Notes

- The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.
- Entries in the comma-delimited list cannot include multibyte characters.
- The values in `tab` are copied from the original list, with no transformations.
- The procedure fails if the string between separators is longer than 30 bytes.

## 191.6.7 COMPILE\_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

### Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (  
    schema          IN VARCHAR2,  
    compile_all     IN BOOLEAN DEFAULT TRUE,  
    reuse_settings  IN BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 191-11** COMPILE\_SCHEMA Procedure Parameters

| Parameter      | Description                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| schema         | Name of the schema                                                                                                                        |
| compile_all    | If TRUE, will compile everything within the schema regardless of whether it is VALID<br>If FALSE, will compile only INVALID objects       |
| reuse_settings | Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead |

## Exceptions

**Table 191-12** COMPILE\_SCHEMA Procedure Exceptions

| Exception | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| ORA-20000 | Insufficient privileges for some object in this schema                  |
| ORA-20001 | Cannot recompile SYS objects                                            |
| ORA-20002 | Maximum iterations exceeded. Some objects may not have been recompiled. |

## Usage Notes

- Note that this subprogram is a wrapper for the [RECOMP\\_SERIAL Procedure](#) included with the [UTL\\_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

## 191.6.8 CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

### Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
  schema_name  IN    VARCHAR2,  
  table_name   IN    VARCHAR2);
```

## Parameters

**Table 191-13 CREATE\_ALTER\_TYPE\_ERROR\_TABLE Procedure Parameters**

| Parameter   | Description               |
|-------------|---------------------------|
| schema_name | Name of the schema        |
| table_name  | Name of the table created |

## Exceptions

An error is returned if the table already exists.

## 191.6.9 CURRENT\_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

### Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
    RETURN NUMBER;
```

## 191.6.10 DATA\_BLOCK\_ADDRESS\_BLOCK Function

This function gets the block number part of a data block address.

### Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
    RETURN NUMBER;
```

## Parameters

**Table 191-14 DATA\_BLOCK\_ADDRESS\_BLOCK Function Parameters**

| Parameter | Description        |
|-----------|--------------------|
| dba       | Data block address |

## Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

## Return Values

Block offset of the block.

## Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

## 191.6.11 DATA\_BLOCK\_ADDRESS\_FILE Function

This function gets the file number part of a data block address.

### Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
    dba NUMBER)
RETURN NUMBER;
```

### Parameters

**Table 191-15 DATA\_BLOCK\_ADDRESS\_FILE Function Parameters**

| Parameter | Description        |
|-----------|--------------------|
| dba       | Data block address |

### Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

### Return Values

File that contains the block.

### Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

## 191.6.12 DB\_VERSION Procedure

This procedure returns version information for the database.

### Syntax

```
DBMS_UTILITY.DB_VERSION (
    version OUT VARCHAR2,
    compatibility OUT VARCHAR2);
```

### Parameters

**Table 191-16 DB\_VERSION Procedure Parameters**

| Parameter     | Description                                                                                                                                                                           |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version       | A string which represents the internal software version of the database (for example, 7.1.0.0.0).<br>The length of this string is variable and is determined by the database version. |
| compatibility | The compatibility setting of the database determined by the "compatible" init.ora parameter.<br>If the parameter is not specified in the init.ora file, then NULL is returned.        |

## 191.6.13 EXEC\_DDL\_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

### Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (  
    parse_string IN VARCHAR2);
```

### Parameters

**Table 191-17 EXEC\_DDL\_STATEMENT Procedure Parameters**

| Parameter                 | Description                  |
|---------------------------|------------------------------|
| <code>parse_string</code> | DDL statement to be executed |

## 191.6.14 EXPAND\_SQL\_TEXT Procedure

This procedure recursively replaces any view references in the input SQL query with the corresponding view subquery.

### Syntax

```
DBMS_UTILITY.EXPAND_SQL_TEXT (  
    input_sql_text    IN          CLOB,  
    output_sql_text   OUT NOCOPY CLOB);
```

### Parameters

**Table 191-18 EXPAND\_SQL\_TEXT Procedure Parameters**

| Parameter                    | Description              |
|------------------------------|--------------------------|
| <code>input_sql_text</code>  | Input SQL query text     |
| <code>output_sql_text</code> | View-expanded query text |

### Exceptions

**Table 191-19 EXPAND\_SQL\_TEXT Procedure Exceptions**

| Exception | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| ORA-00942 | Current user does not have select privileges on all the views and tables recursively referenced in the <code>input_sql_text</code> |
| ORA-24251 | <code>input_sql_text</code> is not a <code>SELECT</code> statement                                                                 |
| ORA-00900 | Input is not valid                                                                                                                 |
| ORA-29477 | Input LOB size exceeds maximum size of 4GB -1                                                                                      |

### Usage Notes

The expanded and merged SQL statement text is copied to `output_sql_text` on successful completion. The resulting query text only contains references to underlying tables and is semantically equivalent with some caveats:

- If there are invoker rights functions called from any of the views, they may be called as a different user in the resulting query text if the view owner is different from the user who will eventually compile/run the expanded SQL text.
- The VPD policy expands differently if there is a function supplied to generate the dynamic `WHERE` clause. This function would return differently, for example, if the `userid` caused the expansion to be different.
- If there are references to remote objects, results are undetermined.

## 191.6.15 FORMAT\_CALL\_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

### Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

### Return Values

This returns the call stack, up to 2000 bytes.

## 191.6.16 FORMAT\_ERROR\_BACKTRACE Function

This function displays the call stack at the point where an exception was raised, even if the subprogram is called from an exception handler in an outer scope.

The output is similar to the output of the `SQLERRM` function, but not subject to the same size limitation.

### Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE  
RETURN VARCHAR2;
```

### Return Values

The backtrace string. A `NULL` string is returned if no error is currently being handled.

### Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS  
  g_start_pos integer := 1;  
  g_end_pos   integer;  
  
  FUNCTION Output_One_Line RETURN BOOLEAN IS  
  BEGIN
```

```

        g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

        CASE g_end_pos > 0
            WHEN true THEN
                DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
                    g_end_pos-g_start_pos ) );
                g_start_pos := g_end_pos+1;
                RETURN TRUE;

            WHEN FALSE THEN
                DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
                    (Length(i_buff)-g_start_pos)+1 ) );
                RETURN FALSE;
            END CASE;
        END Output_One_Line;

BEGIN
    WHILE Output_One_Line() LOOP NULL;
    END LOOP;
END Log_Errors;
/

```

## 191.6.17 FORMAT\_ERROR\_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

### Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
RETURN VARCHAR2;
```

### Return Values

This returns the error stack, up to 2000 bytes.

## 191.6.18 GET\_CPU\_TIME Function

This function returns a measure of current CPU processing time in hundredths of a second. The difference between the times returned from two calls measures the CPU processing time (not the total elapsed time) between those two points.

### Syntax

```
DBMS_UTILITY.GET_CPU_TIME
RETURN NUMBER;
```

### Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

### Usage Notes

The amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

## 191.6.19 GET\_DEPENDENCY Procedure

This **deprecated procedure** shows the dependencies on the object passed in.

### Note:

This subprogram has been deprecated and replaced in Oracle Database 12c release 12.2 and later. Oracle recommends that you do not use deprecated subprograms. It is maintained only for purposes of backward compatibility.

### Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
type      IN      VARCHAR2,
schema    IN      VARCHAR2,
name      IN      VARCHAR2);
```

### Parameters

**Table 191-20 GET\_DEPENDENCY Procedure Parameters**

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| type      | Type of the object, for example if the object is a table give the type as 'TABLE' |
| schema    | Schema name of the object                                                         |
| name      | Name of the object                                                                |

### Usage Notes

This procedure uses the [DBMS\\_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

## 191.6.20 GET\_ENDIANNES Function

This function gets the endianness of the database platform.

### Syntax

```
DBMS_UTILITY.GET_ENDIANNES
RETURN NUMBER;
```

### Return Values

A `NUMBER` value indicating the endianness of the database platform: 1 for big-endian or 2 for little-endian.

## 191.6.21 GET\_HASH\_VALUE Function

This function computes a hash value for the given string.

### Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
  name      VARCHAR2,
  base      NUMBER,
  hash_size NUMBER)
RETURN NUMBER;
```

## Parameters

**Table 191-21 GET\_HASH\_VALUE Function Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| name      | String to be hashed.                                     |
| base      | Base value for the returned hash value at which to start |
| hash_size | Desired size of the hash table                           |

## Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

## Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash\_size value. Using a power of 2 for the hash\_size parameter works best.

## 191.6.22 GET\_PARAMETER\_VALUE Function

This deprecated function gets the value of specified `init.ora` parameter.

### Note:

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, you can query `v$_parameter` directly.

## Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam      IN      VARCHAR2,
    intval      IN OUT   BINARY_INTEGER,
    strval      IN OUT   VARCHAR2,
    listno      IN      BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

## Parameters

**Table 191-22 GET\_PARAMETER\_VALUE Function Parameters**

| Parameter | Description                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parnam    | Parameter name                                                                                                                                                                   |
| intval    | Value of an integer parameter or the value length of a string parameter                                                                                                          |
| strval    | Value of a string parameter                                                                                                                                                      |
| listno    | List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter. |

## Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

## Usage Notes

- To execute the this function, you must have the `SELECT` privilege on the `V$PARAMETER` dynamic view.

## Examples

```
DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
    ELSE
        dbms_output.put_line(intval);
    END IF;
    IF partyp = 1 THEN
        dbms_output.put('parameter value length is: ');
        dbms_output.put_line(intval);
    END IF;
    dbms_output.put('parameter type is: ');
    IF partyp = 1 THEN
        dbms_output.put_line('string');
    ELSE
        dbms_output.put_line('integer');
    END IF;
END;
```

## 191.6.23 GET\_SQL\_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

### Syntax

```
Dbms_utility.get_sql_hash (
    name          IN   VARCHAR2,
    hash          OUT  RAW,
    pre10ihash    OUT  NUMBER)
RETURN NUMBER;
```

### Pragmas

Pragma Restrict\_references(Get\_sql\_hash, Wnds, Rnds, Wnps, Rnps);

## Parameters

**Table 191-23 GET\_SQL\_HASH Procedure Parameters**

| Parameter  | Description                                    |
|------------|------------------------------------------------|
| name       | String to be hashed                            |
| hash       | Stores all 16 bytes of returned hash value     |
| pre10ihash | Stores the pre 10i database version hash value |

## Return Values

A hash value (last 4 bytes) based on the input string. the MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. Use the `hash` parameter to get all 16 bytes and `pre10i` hash parameter to store the pre 10i hash value of 4 bytes.

## 191.6.24 GET\_TIME Function

This function determines the current time in hundredths of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

## Syntax

```
DBMS_UTILITY.GET_TIME
RETURN NUMBER;
```

## Return Values

Time is the number of hundredths of a second from the point in time at which the subprogram is invoked.

## Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

## 191.6.25 GET\_TZ\_TRANSITIONS Procedure

This procedure returns time zone transitions by `regionid` from the `timezone.dat` file.

## Syntax

```
DBMS_UTILITY.GET_TZ_TRANSITIONS
regionid      IN      NUMBER,
transitions   OUT     MAXRAW);
```

## Parameters

**Table 191-24 GET\_TZ\_TRANSITIONS Procedure Parameters**

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| regionid    | Number corresponding to the region                |
| transitions | Raw bytes from the <code>timezone.dat</code> file |

## Exceptions

**Table 191-25 GET\_TZ\_TRANSITIONS Procedure Exceptions**

| Exception                                | Description                          |
|------------------------------------------|--------------------------------------|
| ORA-6502: PL/SQL: NUMERIC OR VALUE ERROR | For an invalid <code>regionid</code> |

## 191.6.26 INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

### Syntax

```
DBMS_UTILITY.INVALIDATE (  
    p_object_id          NUMBER,  
    p_plsql_object_settings VARCHAR2 DEFAULT NULL,  
    p_option_flags        PLS_INTEGER DEFAULT 0);
```

## Parameters

**Table 191-26 INVALIDATE Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| p_object_id | ID number of object to be invalidated. This is the same as the value of the <code>OBJECT_ID</code> column from <code>ALL_OBJECTS</code> . If the <code>object_id</code> argument is <code>NULL</code> or invalid then the exception <code>inv_not_exist_or_no_priv</code> is raised. The caller of this procedure must have <code>create</code> privileges on the object being invalidated else the <code>inv_not_exist_or_no_priv</code> exception is raised. |

**Table 191-26 (Cont.) INVALIDATE Procedure Parameters**

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>p_plsql_object_settings</code> | Optional parameter that ignored if the object specified by <code>p_object_id</code> is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to <code>REUSE SETTINGS</code> . If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else <code>inv_malformed_settings</code> exception will be raised. The setting values are changed only for the object specified by <code>p_object_id</code> and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and <code>REUSE SETTINGS</code> is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and <code>REUSE SETTINGS</code> was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment. |
| <code>p_option_flags</code>          | Optional parameter defaults to zero (no flags). Option flags supported by <code>invalidate</code> . <ul style="list-style-type: none"> <li><code>inv_error_on_restrictions</code> (see <a href="#">Constants</a>): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by <code>p_object_id</code> cannot be a table. By default, <code>invalidate</code> quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception <code>inv_restricted_object</code> is raised.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Exceptions

**Table 191-27 INVALIDATE Exceptions**

| Exception                             | Description                                                                                                                                                                      |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>INV_NOT_EXIST_OR_NO_PRIV</code> | Raised when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated |
| <code>INV_MALFORMED_SETTINGS</code>   | Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter                                                                   |
| <code>INV_RESTRICTED_OBJECT</code>    | Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened                                                            |

## Usage Notes

The object type (`object_type` column from `ALL_OBJECTS`) of the object specified by `p_object_id` must be a `PROCEDURE`, `FUNCTION`, `PACKAGE`, `PACKAGE BODY`, `TRIGGER`, `TYPE`, `TYPE BODY`, `LIBRARY`, `VIEW`, `OPERATOR`, `SYNONYM`, or `JAVA CLASS`. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of `STANDARD`, `DBMS_STANDARD`, or specification or body of `DBMS_UTILITY` and the flag

`inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

## Examples

### Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the HR schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

### Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the OE schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

### Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the OE schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

## 191.6.27 IS\_BIT\_SET Function

This function checks the bit setting for the given bit in the given RAW value.

### Syntax

```
DBMS_UTILITY.IS_BIT_SET (
    r      IN RAW,    n      IN NUMBER)
RETURN NUMBER;
```

### Parameters

**Table 191-28 IS\_BET\_SET Function Parameters**

| Parameter | Description |
|-----------|-------------|
| r         | RAW source  |

**Table 191-28 (Cont.) IS\_BET\_SET Function Parameters**

| Parameter | Description       |
|-----------|-------------------|
| n         | Bit in r to check |

**Return Values**

This function returns 1 if bit n in raw r is set, zero otherwise. Bits are numbered high to low with the lowest bit being bit number 1.

## 191.6.28 IS\_CLUSTER\_DATABASE Function

This function finds out if this database is running in cluster database mode.

**Syntax**

```
DBMS_UTILITY.IS_CLUSTER_DATABASE  
RETURN BOOLEAN;
```

**Return Values**

This function returns `TRUE` if this instance was started in cluster database mode; `FALSE` otherwise.

## 191.6.29 MAKE\_DATA\_BLOCK\_ADDRESS Function

This function creates a data block address given a file number and a block number.

A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

**Syntax**

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (  
    file NUMBER,  
    block NUMBER)  
RETURN NUMBER;
```

**Parameters****Table 191-29 MAKE\_DATA\_BLOCK\_ADDRESS Function Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| file      | File that contains the block                                     |
| block     | Offset of the block within the file in terms of block increments |

**Pragmas**

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

**Return Values**

Data block address.

## 191.6.30 NAME\_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

### Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
    name          IN  VARCHAR2,
    context       IN  NUMBER,
    schema        OUT VARCHAR2,
    part1         OUT VARCHAR2,
    part2         OUT VARCHAR2,
    dblink        OUT VARCHAR2,
    part1_type    OUT NUMBER,
    object_number OUT NUMBER);
```

### Parameters

**Table 191-30 NAME\_RESOLVE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | <p>Name of the object.</p> <p>This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p> |
| context   | <p>Must be an integer between 0 and 9.</p> <ul style="list-style-type: none"> <li>0 - table</li> <li>1 - PL/SQL (for 2 part names)</li> <li>2 - sequences</li> <li>3 - trigger</li> <li>4 - Java Source</li> <li>5 - Java resource</li> <li>6 - Java class</li> <li>7 - type</li> <li>8 - Java shared data</li> <li>9 - index</li> </ul>                                                                                                                                                    |
| schema    | <p>Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| part1     | <p>First part of the name. The type of this name is specified part1_type (synonym or package).</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| part2     | <p>If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.</p>                                                                                                                                                                                                                                                                            |
| dblink    | <p>If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.</p>                                                                                                                                                                                         |

**Table 191-30 (Cont.) NAME\_RESOLVE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| part1_type    | Type of part1 is: <ul style="list-style-type: none"><li>• 5 - synonym</li><li>• 7 - procedure (top level)</li><li>• 8 - function (top level)</li><li>• 9 - package</li></ul> |
| object_number | Object identifier                                                                                                                                                            |

### Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

## 191.6.31 NAME\_TOKENIZE Procedure

This procedure calls the parser to parse the given name as a [. b [. c ]][@ dblink ].

It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

### Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (  
    name      IN  VARCHAR2,  
    a         OUT VARCHAR2,  
    b         OUT VARCHAR2,  
    c         OUT VARCHAR2,  
    dblink    OUT VARCHAR2,  
    nextpos   OUT BINARY_INTEGER);
```

### Parameters

**Table 191-31 NAME\_RESOLVE Procedure Parameters**

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| name      | Input name, consisting of SQL identifiers (for example, scott.foo@dblink) |
| a         | Output for the first token of the name                                    |
| b         | Output for the second token of the name (if applicable)                   |
| c         | Output for the third token of the name (if applicable)                    |
| dblink    | Output for the dblink of the name                                         |
| nextpos   | Next position after parsing the input name                                |

## 191.6.32 OLD\_CURRENT\_SCHEMA Function

This function returns the session value from `sys_context('userenv', 'current_schema')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
RETURN VARCHAR2;
```

## 191.6.33 OLD\_CURRENT\_USER Function

This function returns the session value from `sys_context('userenv', 'current_user')`.

### Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
RETURN VARCHAR2;
```

## 191.6.34 PORT\_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

### Syntax

```
DBMS_UTILITY.PORT_STRING
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

## 191.6.35 SQLID\_TO\_SQLHASH Function

This function converts a SQL ID into a hash value.

### Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
    sql_id IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 191-32 SQLID\_TO\_SQLHASH Function Parameters**

| Parameter           | Description                                                    |
|---------------------|----------------------------------------------------------------|
| <code>sql_id</code> | SQL ID of a SQL statement. Must be <code>VARCHAR2(13)</code> . |

## 191.6.36 TABLE\_TO\_COMMA Procedures

This procedure converts a PL/SQL table of names into a comma-delimited list of names.

This takes a PL/SQL table, 1..n, terminated with n+1 null. The second version supports fully-qualified attribute names.

### Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab      IN UNCL_ARRAY,
    tablen   OUT BINARY_INTEGER,
    list     OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (
    tab      IN lname_array,
    tablen   OUT BINARY_INTEGER,
    list     OUT VARCHAR2);
```

### Parameters

**Table 191-33 TABLE\_TO\_COMMA Procedure Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| tab       | PL/SQL table which contains list of table names |
| tablen    | Number of tables in the PL/SQL table            |
| list      | Comma separated list of tables                  |

### Return Values

A comma-delimited list and the number of elements found in the table.

## 191.6.37 VALIDATE Procedure

This procedure makes invalid database objects valid.

### Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id      NUMBER);
```

```
DBMS_UTILITY.VALIDATE (
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,  edition_name  := SYS_CONTEXT ('USERENV',
'CURRENT_EDITION'));
```

### Parameters

**Table 191-34 VALIDATE Procedure Parameters**

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| owner     | Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS. |

**Table 191-34 (Cont.) VALIDATE Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| objname      | Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| namespace    | <p>Namespace of the object. Same as the namespace field in obj\$.</p> <p>Equivalent numeric values are as follows:</p> <ul style="list-style-type: none"> <li>• 1 — TABLE/PROCEDURE/TYPE</li> <li>• 2 — BODY</li> <li>• 3 — TRIGGER</li> <li>• 4 — INDEX</li> <li>• 5 — CLUSTER</li> <li>• 8 — LOB</li> <li>• 9 — DIRECTORY</li> <li>• 10 — QUEUE</li> <li>• 11 — REPLICATION OBJECT GROUP</li> <li>• 12 — REPLICATION PROPAGATOR</li> <li>• 13 — JAVA SOURCE</li> <li>• 14 — JAVA RESOURCE</li> <li>• 58 — (Data Mining) MODEL</li> </ul> |
| edition_name | [Note: Currently not operable. Reserved for future use]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

#### Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.
- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its object\_id. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to INVALIDATE will not actualize the object in the current edition.

## 191.6.38 WAIT\_ON\_PENDING\_DML Function

This function waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified scn have either committed or been rolled back.

#### Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables      IN      VARCHAR2,
    timeout     IN      BINARY_INTEGER,
    scn         IN OUT  NUMBER)
RETURN BOOLEAN;
```

## Parameters

**Table 191-35** WAIT\_ON\_PENDING\_DML Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tables    | Comma-separated list of one or more table names. The list must be valid for <a href="#">COMMA_TO_TABLE Procedures</a> , and each item valid to the <a href="#">NAME_RESOLVE Procedure</a> . Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.              |
| timeout   | Maximum number of seconds to wait, totalled across all tables/ transactions. A <code>NULL</code> or negative value will cause a very long wait.                                                                                                                                                                                                                           |
| scn       | SCN prior to which transactions must have begun to be considered relevant to this request. If the value is <code>NULL</code> or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output. |

## Return Values

`TRUE` if all relevant transactions have committed or been rolled back, `FALSE` if the timeout occurred prior to all relevant transactions committing or being rolled back

# DBMS\_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_WARNING Subprograms](#)

## 192.1 DBMS\_WARNING Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

## 192.2 Summary of DBMS\_WARNING Subprograms

This table lists the `DBMS_WARNING` subprograms and briefly describes them.

**Table 192-1    *DBMS\_WARNING Package Subprograms***

| Subprogram                                           | Description                                                                                                                                 |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_WARNING_SETTING_CAT Procedure</a>    | Modifies the current <code>session</code> or <code>system</code> warning settings of the <code>warning_category</code> previously supplied  |
| <a href="#">ADD_WARNING_SETTING_NUM Procedure</a>    | Modifies the current <code>session</code> or <code>system</code> warning settings of the or <code>warning_number</code> previously supplied |
| <a href="#">GET_CATEGORY Function</a>                | Returns the category name, given the message number                                                                                         |
| <a href="#">GET_WARNING_SETTING_CAT Function</a>     | Returns the specific warning category in the session                                                                                        |
| <a href="#">GET_WARNING_SETTING_NUM Function</a>     | Returns the specific warning number in the session                                                                                          |
| <a href="#">GET_WARNING_SETTING_STRING Function</a>  | Returns the entire warning string for the current session                                                                                   |
| <a href="#">SET_WARNING_SETTING_STRING Procedure</a> | Replaces previous settings with the new value                                                                                               |

## 192.2.1 ADD\_WARNING\_SETTING\_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied in this procedure. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category    IN    VARCHAR2,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

### Parameters

**Table 192-2 ADD\_WARNING\_SETTING\_CAT Procedure Parameters**

| Parameter                     | Description                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>warning_category</code> | Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.                                             |
| <code>warning_value</code>    | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.                                                           |
| <code>scope</code>            | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

## 192.2.2 ADD\_WARNING\_SETTING\_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied in this procedure. If the value was already set, you will override the existing value.

The effect of calling this function is same as adding the qualifier (`ENABLE / DISABLE/ ERROR`) on the category specified to the end of the current session or system setting.

### Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
    warning_number      IN    NUMBER,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

### Parameters

**Table 192-3 ADD\_WARNING\_SETTING\_NUM Procedure Parameters**

| Parameter                   | Description                                                            |
|-----------------------------|------------------------------------------------------------------------|
| <code>warning_number</code> | The warning number. Allowed values are all valid warning numbers.      |
| <code>warning_value</code>  | Value for the category. Allowed values are ENABLE, DISABLE, and ERROR. |

**Table 192-3 (Cont.) ADD\_WARNING\_SETTING\_NUM Procedure Parameters**

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| scope     | Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM. |

**Example 192-1 Enabling the Deprecation Warnings**

This example shows how to enable the DEPRECATE pragma warnings using the DBMS\_WARNING package for the session.

```
BEGIN
  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6019,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6020,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6021,
                                         'ENABLE',
                                         'SESSION');

  DBMS_WARNING.ADD_WARNING_SETTING_NUM (6022,
                                         'ENABLE',
                                         'SESSION');

END;
```

## 192.2.3 GET\_CATEGORY Function

This function returns the category name, given the message number.

**Syntax**

```
DBMS_WARNING.GET_CATEGORY (
  warning_number IN pls_integer)
RETURN VARCHAR2;
```

**Parameters****Table 192-4 GET\_CATEGORY Function Parameters**

| Parameter      | Description                 |
|----------------|-----------------------------|
| warning_number | The warning message number. |

## 192.2.4 GET\_WARNING\_SETTING\_CAT Function

This function returns the specific warning category setting for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category    IN    VARCHAR2)  
RETURN warning_value;
```

### Parameters

**Table 192-5** GET\_WARNING\_SETTING\_CAT Function Parameters

| Parameter        | Description                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------|
| warning_category | Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE). |

## 192.2.5 GET\_WARNING\_SETTING\_NUM Function

This function returns the specific warning number setting for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number      IN    NUMBER)  
RETURN warning_value;
```

### Parameters

**Table 192-6** GET\_WARNING\_SETTING\_NUM Function Parameters

| Parameter      | Description                                                   |
|----------------|---------------------------------------------------------------|
| warning_number | Warning number. Allowed values are all valid warning numbers. |

## 192.2.6 GET\_WARNING\_SETTING\_STRING Function

This function returns the entire warning string for the current session.

### Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN VARCHAR2;
```

### Usage Notes

Use this function when you do not have `SELECT` or `READ` privilege on `v$parameter` or `v$paramater2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

## 192.2.7 SET\_WARNING\_SETTING\_STRING Procedure

This procedure replaces previous settings with the new value.

The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL\_WARNINGS command. This will have same effect as ALTER SESSION or ALTER SYSTEM command.

### Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value IN VARCHAR2,  
    scope        IN VARCHAR2);
```

### Parameters

**Table 192-7 SET\_WARNING\_SETTING\_STRING Procedure Parameters**

| Parameter     | Description                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|
| warning_value | The new string that will constitute the new value.                                                                               |
| scope         | This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM. |

## DBMS\_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

For a complete description of this package, see `DBMS_WM` in the *Oracle Database Workspace Manager Developer's Guide*.

# DBMS\_WORKLOAD\_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

Replay of this capture is implemented by way of the `DBMS_WORKLOAD_REPLAY` package.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_WORKLOAD\\_CAPTURE Subprograms](#)

## See Also:

*Oracle Database Testing Guide* for more information about database replay

## 194.1 DBMS\_WORKLOAD\_CAPTURE Overview

Since the capture infrastructure is instance wide (and also within an Oracle Real Application Clusters (Oracle RAC)), only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms.

## 194.2 DBMS\_WORKLOAD\_CAPTURE Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_CAPTURE`.

The following code describes the minimal set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrctl on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

## 194.3 Summary of DBMS\_WORKLOAD\_CAPTURE Subprograms

This table lists the DBMS\_WORKLOAD\_CAPTURE package subprograms in alphabetical order.

**Table 194-1 DBMS\_WORKLOAD\_CAPTURE Package Subprograms**

| Subprogram                                    | Description                                                                                                                                                                                                                                 |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_FILTER Procedures</a>         | Adds a specified filter                                                                                                                                                                                                                     |
| <a href="#">DECRYPT_CAPTURE Procedure</a>     | This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.                                                                                |
| <a href="#">DELETE_CAPTURE_INFO Procedure</a> | Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID                                                                                                              |
| <a href="#">DELETE_FILTER Procedure</a>       | Deletes a specified filter                                                                                                                                                                                                                  |
| <a href="#">ENCRYPT_CAPTURE Procedure</a>     | This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256.                                                                                                   |
| <a href="#">EXPORT_AWR Procedure</a>          | Exports the AWR snapshots associated with a given capture ID                                                                                                                                                                                |
| <a href="#">FINISH_CAPTURE Procedure</a>      | Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured                                                                                           |
| <a href="#">GET_CAPTURE_INFO Function</a>     | Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID |
| <a href="#">IMPORT_AWR Function</a>           | Imports the AWR snapshots associated with a given capture ID                                                                                                                                                                                |
| <a href="#">REPORT Function</a>               | Returns a report on the workload capture under consideration using one or more different sources                                                                                                                                            |
| <a href="#">START_CAPTURE Procedure</a>       | Initiates workload capture on all instances                                                                                                                                                                                                 |

### 194.3.1 ADD\_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

#### Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN  VARCHAR2 NOT NULL,
    fattribute     IN  VARCHAR2 NOT NULL,
    fvalue         IN  VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
    fname          IN   VARCHAR2 NOT NULL,
    fattribute      IN   VARCHAR2 NOT NULL,
    fvalue         IN   NUMBER NOT NULL);
```

## Parameters

**Table 194-2 ADD\_FILTER Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fname      | Name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)                                                                                                                                                                                                                                                                                |
| fattribute | Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> <li>• INSTANCE_NUMBER - type NUMBER</li> <li>• USER - type STRING</li> <li>• MODULE - type STRING</li> <li>• ACTION - type STRING</li> <li>• PROGRAM - type STRING</li> <li>• SERVICE - type STRING</li> <li>• PDB_NAME - type STRING</li> </ul> |
| fvalue     | Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory).                        |

## Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START\\_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that affects the next workload capture, and whether the filters are considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START\\_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START\\_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.
- You can capture the workload for a particular PDB by specifying a filter of PDB type.

## Examples

- By default, a capture works in an `INCLUSION` mode, which records everything except for those requests that satisfy conditions of specified filters. For example, if you want to exclude all requests from `SCOTT`, you can add the following filter before starting a capture.

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user1', 'USER', 'SCOTT');
```

- Multiple filters are evaluated according to the logical disjunction operator `OR`. Therefore, if you want to record workload for both `SCOTT` and `JOHN`, you add an additional filter:

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter user2', 'USER', 'JOHN');
```

- In a CDB, you exclude the workload of a particular PDB by the filter:  

```
EXEC DBMS_WORKLOAD_CAPTURE.ADD_FILTER ('filter pdb workload', 'PDB_NAME',  
'CDB1_PDB1');
```
- To use [DBMS\\_APPLICATION\\_INFO](#) to identify workload that is issued to the database:  

```
DBMS_APPLICATION_INFO.SET_MODULE('ORDER_ENTRY', NULL);  
-- run some SQL here  
DBMS_APPLICATION_INFO.SET_ACTION('ORDER_ENTRY_LOG');  
-- run logging SQL
```
- If having captured workload, you want to exclude the logging SQL from the captured, specify a filter for capture:  

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter logging operations', 'ACTION',  
'ORDER_ENTRY_LOG');
```
- To filter out the full order entry transaction, define a filter:  

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER('filter order entry', 'MODULE', 'ORDER_ENTRY');
```

## 194.3.2 DECRYPT\_CAPTURE Procedure

This procedure decrypts sensitive data in workload capture that was encrypted using various advanced encryption standards such as AES128, AES192, or AES256.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DECRYPT_CAPTURE (  
    src_dir          IN   VARCHAR2,  
    dst_dir          IN   VARCHAR2);
```

### Parameters

**Table 194-3 DECRYPT\_CAPTURE Procedure Parameters**

| Parameter | Description                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir   | A directory object pointing to the workload capture to be decrypted.<br>This parameter is case sensitive.                                                                |
| dst_dir   | A directory object pointing to an OS path that has write permissions. The decrypted capture files will be written to this directory<br>This parameter is case sensitive. |

### Usage Notes

This procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

## 194.3.3 DELETE\_CAPTURE\_INFO Procedure

This procedure deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO  
  capture_id      IN    NUMBER);
```

### Parameters

**Table 194-4** DELETE\_CAPTURE\_INFO Procedure Parameters

| Parameter  | Description                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------|
| capture_id | ID of the workload capture that needs to be deleted. Corresponds to <code>DBA_WORKLOAD_CAPTURES.ID</code> . (Mandatory) |

### Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

## 194.3.4 DELETE\_FILTER Procedure

This procedure deletes a specified filter.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (  
  filter_name      IN    VARCHAR2(40) NOT NULL);
```

### Parameters

**Table 194-5** DELETE\_FILTER Procedure Parameters

| Parameter   | Description          |
|-------------|----------------------|
| filter_name | Filter to be deleted |

### Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD\\_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

## 194.3.5 ENCRYPT\_CAPTURE Procedure

This procedure encrypts sensitive data in workload capture using various advanced encryption standards such as AES128, AES192, or AES256. To encrypt capture on the fly, use encryption parameter in START\_CAPTURE procedure.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.ENCRIPT_CAPTURE
  src_dir      IN VARCHAR2,
  dst_dir      IN VARCHAR2,
  encryption   IN VARCHAR2 DEFAULT 'AES256');
```

### Parameters

**Table 194-6 ENCRYPT\_CAPTURE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| src_dir    | A directory object pointing to the workload capture to be encrypted. The parameter value is case sensitive.                                                                    |
| dst_dir    | A directory object pointing to an OS path that has write permissions.<br>The encrypted capture files will be written to this directory. The parameter value is case sensitive. |
| encryption | Specifies if sensitive data in workload capture is encrypted or not.<br>The possible values are: AES128, AES192, and AES256.<br>The default value is AES256.                   |

### Usage Notes

For encrypted capture, the ENCRYPT\_CAPTURE Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).

## 194.3.6 EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
  capture_id   IN NUMBER);
```

### Parameters

**Table 194-7 EXPORT\_AWR Procedure Parameters**

| Parameter  | Description                                                              |
|------------|--------------------------------------------------------------------------|
| capture_id | ID of the capture whose AWR snapshots are to be exported.<br>(Mandatory) |

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_CAPTURES` was not created by calling the [GET\\_CAPTURE\\_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

194.3.7 FINISH\_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
  timeout      IN  NUMBER DEFAULT 30
  reason       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 194-8 FINISH\_CAPTURE Procedure Parameters

| Parameter | Description                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeout   | Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds |
| reason    | Specifies a reason for calling the procedure. The reason appears in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .                                                                        |

Usage Notes

- By default, `FINISH_CAPTURE` waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and does not send it's acknowledgement to `FINISH_CAPTURE`.  
  
To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

## 194.3.8 GET\_CAPTURE\_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`

### Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 194-9 GET\_CAPTURE\_INFO Function Parameters**

| Parameter | Description                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------|
| dir       | Name of the <code>DIRECTORY</code> object (case sensitive) where all the workload capture files are located (Mandatory) |

### Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in `DBA_WORKLOAD_CAPTURES`, the [GET\\_CAPTURE\\_INFO Function](#) simply returns that row's `DBA_WORKLOAD_CAPTURES.ID`. If no existing row matches the capture present in the stipulated directory a new row is inserted to `DBA_WORKLOAD_CAPTURES` and that row's `ID` is returned.

## 194.3.9 IMPORT\_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the `EXPORT_AWR` procedure.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN  NUMBER,
  staging_schema   IN  VARCHAR2,
  force_cleanup    IN  BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

### Parameters

**Table 194-10 IMPORT\_AWR Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_id     | ID of the capture whose AWR snapshots should be imported. (Mandatory)                                                                                                                                                                                              |
| staging_schema | Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the <code>SYS AWR</code> schema. The <code>SYS</code> schema is not a valid input. (Mandatory, Case sensitive). |

**Table 194-10 (Cont.) IMPORT\_AWR Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| force_cleanup | <p>Values:</p> <ul style="list-style-type: none"> <li>TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import. This typically is equivalent to dropping all tables returned by the following SQL:</li> </ul> <pre>SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_\$%';</pre> <p>Use this option only if you are sure that there are no important data in any such tables in the staging_schema.</p> <ul style="list-style-type: none"> <li>FALSE - (default) no tables dropped from the staging_schema prior to the import operation</li> </ul> |

### Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR\_DBID column in the DBA\_WORKLOAD\_CAPTURES view.

### Usage Notes

IMPORT\_AWR fails if the staging\_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$\_SNAPSHOT or WRH\$\_PARAMETER. Please drop any such tables in the staging\_schema before invoking IMPORT\_AWR.

### Related Topics

- [EXPORT\\_AWR Procedure](#)  
This procedure exports the AWR snapshots associated with a given capture ID.

## 194.3.10 REPORT Function

This function generates a report on the stipulated workload capture.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
    capture_id      IN    NUMBER,
    format          IN    VARCHAR2)
RETURN CLOB;
```

## Parameters

**Table 194-11 REPORT Function Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_id | ID of the workload capture whose capture report is required.<br>(Mandatory)<br><br>This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture. |
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)                                                                                                                                                                                           |

## Return Values

The report body in the desired format returned as a CLOB.

**Table 194-12 Constants Used by Report Function**

| Constant  | Type         | Value  | Description                                                                     |
|-----------|--------------|--------|---------------------------------------------------------------------------------|
| TYPE_HTML | VARCHAR2 (4) | 'HTML' | Generates the HTML version of the report                                        |
| TYPE_TEXT | VARCHAR2 (4) | 'TEXT' | Used as input to the format argument to generate the text version of the report |

## 194.3.11 START\_CAPTURE Procedure

This procedure initiates workload capture on all instances.

### Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name          IN  VARCHAR2,
  dir           IN  VARCHAR2,
  duration      IN  NUMBER   DEFAULT NULL,
  default_action IN  VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN DEFAULT TRUE,
  capture_sts   IN  BOOLEAN  DEFAULT FALSE,
  sts_cap_interval IN NUMBER  DEFAULT 300,
  plsql_mode    IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
  encryption    IN  VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 194-13 START\_CAPTURE Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| dir              | Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| duration         | Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| default_action   | Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> <li>If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.)</li> <li>If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the <a href="#">ADD_FILTER Procedures</a> are treated as INCLUSION filters, determining the workload that is captured.</li> </ul> |
| auto_unrestrict  | Can be either TRUE or FALSE. <ul style="list-style-type: none"> <li>If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT)</li> <li>If FALSE, no database instance is automatically unrestricted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| capture_sts      | If this parameter is TRUE, a SQL tuning set capture is also started in parallel with workload capture. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the AWR data. Currently, parallel STS capture is not supported in an Oracle RAC environment, so this parameter has no effect if used in that context. Capture filters defined using the DBMS_WORKLOAD_REPLAY interface do not apply to the SQL tuning set capture. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET').<br><br>If starting SQL set capture fails, workload capture is stopped. The reason is stored in DBA_WORKLOAD_CAPTURES.ERROR_MESSAGE. The default value is FALSE.                                                                                                                                                                                                                                                               |
| sts_cap_interval | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 194-13 (Cont.) START\_CAPTURE Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>plsql_mode</code> | Specifies the PL/SQL capture mode: <ul style="list-style-type: none"> <li>• <code>TOP_LEVEL</code> — only top-level PL/SQL calls are captured</li> <li>• <code>EXTENDED</code> — both top-level PL/SQL calls and SQL called from PL/SQL are captured</li> </ul>                                                                                                                                                                                                           |
| <code>encryption</code> | Specify if sensitive data in workload capture is encrypted or not. The possible values are: <ul style="list-style-type: none"> <li>• <code>NULL</code> — capture files are not encrypted</li> <li>• <code>AES128</code> — capture files are encrypted using AES128</li> <li>• <code>AES192</code> — capture files are encrypted using AES192</li> <li>• <code>AES256</code> — capture files is encrypted using AES256</li> </ul> The default value is <code>NULL</code> . |

#### Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` are recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture lasts indefinitely until the [FINISH\\_CAPTURE Procedure](#) is executed.
- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD\\_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS\\_SCHEDULER](#) package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.
- For encrypted capture, the `START_CAPTURE` Procedure relies on a software keystore. The identifier is `oracle.rat.database_replay.encryption` (case-sensitive).
- You must configure a software keystore in `auto-login` mode. Otherwise, if the database is bounced during capture, the capture is automatically terminated.

# DBMS\_WORKLOAD\_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides a interface to replay a workload capture.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_WORKLOAD\\_REPLAY Subprograms](#)

## See Also:

*Oracle Database Testing Guide* for more information about database replay

## 195.1 DBMS\_WORKLOAD\_REPLAY Overview

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package.

Typically, the `DBMS_WORKLOAD_CAPTURE` package is used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package is subsequently used in a test system to replay the captured production workload for testing purposes.

### Related Topics

- [DBMS\\_WORKLOAD\\_CAPTURE](#)  
The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data.

## 195.2 DBMS\_WORKLOAD\_REPLAY Security Model

The security model describes the privileges needed for using `DBMS_WORKLOAD_REPLAY`.

The following code sample shows the minimum set of privileges required to:

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (`wrc someuser/somepassword` or `wrc USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;  
CREATE USER rom1 IDENTIFIED BY rom1;
```

```
GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;  
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;
```

```
GRANT CREATE SESSION TO roml;
GRANT CREATE ANY DIRECTORY TO roml;
GRANT SELECT_CATALOG_ROLE TO roml;
GRANT BECOME USER TO roml;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. The Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running.

The replay client is a multithreaded program (an executable named `wrc` located in the `$ORACLE_HOME/bin` directory) where each thread submits a workload from a captured session. The OS user performing the replay must be able to execute `wrc` on hosts that are used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

## 195.3 Summary of DBMS\_WORKLOAD\_REPLAY Subprograms

This table lists the `DBMS_WORKLOAD_REPLAY` package subprograms in alphabetical order.

**Table 195-1 DBMS\_WORKLOAD\_REPLAY Package Subprograms**

| Subprogram                                         | Description                                                                                                                                                       |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_CAPTURE Function</a>               | Adds the given capture to the current schedule                                                                                                                    |
| <a href="#">ADD_FILTER Procedure</a>               | Adds a filter to replay only a subset of the captured workload                                                                                                    |
| <a href="#">ADD_SCHEDULE_ORDERING Function</a>     | Adds a schedule order between two captures                                                                                                                        |
| <a href="#">ASSIGN_GROUP_TO_INSTANCE Procedure</a> | Modifies the view <code>DBA_WORKLOAD_GROUP_ASSIGNMENTS</code>                                                                                                     |
| <a href="#">BEGIN_REPLAY_SCHEDULE Procedure</a>    | Initiates the creation of a reusable replay schedule                                                                                                              |
| <a href="#">CALIBRATE Function</a>                 | Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload     |
| <a href="#">CANCEL_REPLAY Procedure</a>            | Cancels the workload replay in progress                                                                                                                           |
| <a href="#">COMPARE_PERIOD_REPORT Procedure</a>    | Generates a report comparing a replay to its capture or to another replay of the same capture                                                                     |
| <a href="#">COMPARE_SQLSET_REPORT Function</a>     | Generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture |
| <a href="#">CREATE_FILTER_SET Procedure</a>        | Uses the replay filters added to create a set of filters to use against the replay in <code>replay_dir</code>                                                     |
| <a href="#">DELETE_FILTER Procedure</a>            | Deletes the named filter                                                                                                                                          |
| <a href="#">DELETE_REPLAY_INFO Procedure</a>       | Deletes the rows in <code>DBA_WORKLOAD_REPLAYS</code> that corresponds to the given workload replay ID                                                            |
| <a href="#">END_REPLAY_SCHEDULE Procedure</a>      | Wraps up the creation of the current schedule                                                                                                                     |
| <a href="#">EXPORT_AWR Procedure</a>               | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                       |
| <a href="#">GENERATE_CAPTURE_SUBSET Procedure</a>  | Creates a new capture from an existing workload capture                                                                                                           |

Table 195-1 (Cont.) DBMS\_WORKLOAD\_REPLAY Package Subprograms

| Subprogram                                               | Description                                                                                                                                                                                                  |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_DIVERGING_STATEMENT Function</a>         | Exports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                                                                  |
| <a href="#">GET_REPLAY_DIRECTORY Function</a>            | Returns the current replay directory set by the <a href="#">SET_REPLAY_DIRECTORY Procedure</a> .                                                                                                             |
| <a href="#">GET_REPLAY_INFO Function</a>                 | Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory                                                                              |
| <a href="#">GET_REPLAY_TIMEOUT Procedure</a>             | Retrieves the replay timeout setting                                                                                                                                                                         |
| <a href="#">IMPORT_AWR Function</a>                      | Imports the Automatic Workload Repository (AWR) snapshots associated with a given replay ID                                                                                                                  |
| <a href="#">INITIALIZE_CONSOLIDATED_REPLAY Procedure</a> | Puts the database state in <code>INIT</code> for a multiple-capture replay                                                                                                                                   |
| <a href="#">INITIALIZE_REPLAY Procedure</a>              | Initializes replay, and loads specific data produced during processing into the database                                                                                                                     |
| <a href="#">IS_REPLAY_PAUSED Function</a>                | Reports whether the replay is currently paused                                                                                                                                                               |
| <a href="#">LOAD_LONG_SQLTEXT Procedure</a>              | Loads the captured SQL statements that are longer than 1000 characters to the <code>DBA_WORKLOAD_LONG_SQLTEXT</code> view                                                                                    |
| <a href="#">PAUSE_REPLAY Procedure</a>                   | Pauses the in-progress workload replay                                                                                                                                                                       |
| <a href="#">POPULATE_DIVERGENCE Procedure</a>            | Precomputes the divergence information for the given call, stream, or the whole replay so that the <a href="#">GET_DIVERGING_STATEMENT Function</a> returns as quickly as possible for the precomputed calls |
| <a href="#">PREPARE_CONSOLIDATED_REPLAY Procedure</a>    | Puts the database in a special "Prepare" mode for a multiple-capture replay                                                                                                                                  |
| <a href="#">PREPARE_REPLAY Procedure</a>                 | Puts the database in a special "Prepare" mode                                                                                                                                                                |
| <a href="#">PROCESS_CAPTURE Procedure</a>                | Processes the workload capture found in <code>capture_dir</code> in place                                                                                                                                    |
| <a href="#">REMAP_CONNECTION Procedure</a>               | Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay                                                                    |
| <a href="#">REMOVE_CAPTURE Procedure</a>                 | Removes the given capture from the current schedule                                                                                                                                                          |
| <a href="#">REMOVE_SCHEDULE_ORDERING Procedure</a>       | Removes an existing schedule order from the current replay schedule                                                                                                                                          |
| <a href="#">REPORT Function</a>                          | Generates a report on the given workload replay                                                                                                                                                              |
| <a href="#">RESUME_REPLAY Procedure</a>                  | Resumes a paused workload replay                                                                                                                                                                             |
| <a href="#">REUSE_REPLAY_FILTER_SET Procedure</a>        | Reuses filters in the specified filter set as if each were added using the <a href="#">ADD_SCHEDULE_ORDERING Function</a>                                                                                    |
| <a href="#">SET_ADVANCED_PARAMETER Procedure</a>         | Sets an advanced parameter for replay besides the ones used with the <a href="#">PREPARE_REPLAY Procedure</a>                                                                                                |
| <a href="#">SET_REPLAY_DIRECTORY Procedure</a>           | Sets a directory that contains multiple workload captures as the current replay directory                                                                                                                    |
| <a href="#">SET_REPLAY_TIMEOUT Procedure</a>             | Sets the replay timeout setting                                                                                                                                                                              |
| <a href="#">SET_SQL_MAPPING Procedure</a>                | Specifies SQL statements to be skipped or replaced during a database replay operation                                                                                                                        |

**Table 195-1 (Cont.) DBMS\_WORKLOAD\_REPLAY Package Subprograms**

| Subprogram                                          | Description                                                                                                                             |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_USER_MAPPING Procedure</a>          | Sets a new schema or user name to be used during replay instead of the captured user                                                    |
| <a href="#">START_CONSOLIDATED_REPLAY Procedure</a> | Starts the replay of a multiple-capture capture                                                                                         |
| <a href="#">START_REPLAY Procedure</a>              | Starts the workload replay                                                                                                              |
| <a href="#">USE_FILTER_SET Procedure</a>            | Uses the given filter set that has been created by calling the <a href="#">CREATE_FILTER_SET Procedure</a> to filter the current replay |

## 195.3.1 ADD\_CAPTURE Function

This function adds the given capture to the current schedule. The directory has to be a valid capture processed in the current database's version. It returns a unique ID that identifies this capture within this schedule.

### Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name    IN    VARCHAR2,
    start_delay_seconds IN    NUMBER DEFAULT 0,
    stop_replay         IN    BOOLEAN FALSE,
    take_begin_snapshot IN    BOOLEAN TRUE,
    take_end_snapshot   IN    BOOLEAN TRUE,
    query_only          IN    BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPLAY.ADD_CAPTURE (
    capture_dir_name    IN    VARCHAR2,
    start_delay_seconds IN    NUMBER DEFAULT 0,
    stop_replay         IN    BOOLEAN FALSE,
    take_begin_snapshot IN    BOOLEAN TRUE,
    take_end_snapshot   IN    BOOLEAN TRUE,
    query_only          IN    VARCHAR2 DEFAULT 'N')
RETURN NUMBER;
```

### Parameters

**Table 195-2 ADD\_CAPTURE Function Parameters**

| Parameter           | Description                                                                          |
|---------------------|--------------------------------------------------------------------------------------|
| capture_dir_name    | Name of the OS directory containing the capture under the replay top-level directory |
| start_delay_seconds | Delay time in seconds before the replay of this capture starts                       |
| stop_replay         | Stop the replay after it finishes                                                    |
| take_begin_snapshot | Take an AWR snapshot when the replay of this capture starts                          |
| take_end_snapshot   | Take an AWR snapshot when the replay of this capture finishes                        |
| query_only          | Replay only the read-only queries of this workload capture                           |

## Usage Notes

The [SET\\_REPLAY\\_DIRECTORY Procedure](#) must have already been called.

## 195.3.2 ADD\_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the [CREATE\\_FILTER\\_SET Procedure](#). This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to `CREATE_FILTER_SET` when creating the filter set.

## Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute      IN VARCHAR2,
    fvalue          IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
    fname          IN VARCHAR2,
    fattribute      IN VARCHAR2,
    fvalue          IN NUMBER);
```

## Parameters

**Table 195-3 ADD\_FILTER Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fname      | (Mandatory) Name of the filter. Can be used to delete the filter later if it is not required.                                                                                                                                                                                                                                                                                                                                       |
| fattribute | (Mandatory) Specifies the attribute on which the filter is defined as one of the following values of type <code>STRING</code> : <ul style="list-style-type: none"> <li>• <code>USER</code></li> <li>• <code>MODULE</code></li> <li>• <code>ACTION</code></li> <li>• <code>PROGRAM</code></li> <li>• <code>SERVICE</code></li> <li>• <code>CONNECTION_STRING</code></li> </ul>                                                       |
| fvalue     | (Mandatory) Specifies the value to which the given 'attribute' must be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type <code>STRING</code> . Currently all the listed values of <code>fattribute</code> are of type <code>STRING</code> .<br><code>INSTANCE_NUMBER</code> is a <code>NUMBER</code> attribute. It is currently only supported for capture. |

## 195.3.3 ADD\_SCHEDULE\_ORDERING Function

This function adds a schedule order between two captures.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD\\_SCHEDULE\\_ORDERING Function](#). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waiting_for_capture_id` finishes.

## Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_SCHEDULE_ORDERING (
    schedule_capture_id    IN VARCHAR2,
    waitfor_capture_id     IN VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 195-4 ADD\_SCHEDULE\_ORDERING Function Parameters**

| Parameter           | Description                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schedule_capture_id | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, its replay will not start until the replay of another capture specified by waitfor_capture_id runs to completion.          |
| waitfor_capture_id  | Points to a capture that has been added to the current replay schedule. According to the new schedule ordering added by this subprogram, the replay of capture specified by schedule_capture_id will not start until the replay of this capture runs to completion. |

## Return Values

Returns a non-zero error code if the constraint cannot be added

## Usage Notes

The two captures must have already been added to the replay schedule.

## 195.3.4 ASSIGN\_GROUP\_TO\_INSTANCE Procedure

This procedure modifies the view DBA\_WORKLOAD\_GROUP\_ASSIGNMENTS.

## Syntax

```
DBMS_WORKLOAD_REPLAY.ASSIGN_GROUP_TO_INSTANCE (
    group_id          IN INTEGER,
    instance_number   IN INTEGER);
```

## Parameters

**Table 195-5 ASSIGN\_GROUP\_TO\_INSTANCE Procedure Parameters**

| Parameter       | Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------|
| group_id        | The identifier of the specified group of capture files                                                       |
| instance_number | The number used for instance registration.<br>It is equivalent to the INSTANCE_NUMBER column in V\$INSTANCE. |

**See Also:**

- `DBA_WORKLOAD_GROUP_ASSIGNMENTS` in *Oracle Database Reference*
- `V$INSTANCE` in *Oracle Database Reference*

## 195.3.5 BEGIN\_REPLAY\_SCHEDULE Procedure

This procedure initiates the creation of a reusable replay schedule.

### Syntax

```
DBMS_WORKLOAD_REPLAY.BEGIN_REPLAY_SCHEDULE (
    replay_dir_obj    IN    VARCHAR2,
    schedule_name     IN    VARCHAR2);
```

### Parameters

**Table 195-6 BEGIN\_REPLAY\_SCHEDULE Procedure Parameters**

| Parameter                   | Description                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>replay_dir_obj</code> | Directory object that points to the replay directory that contains all the capture directories involved in the schedule |
| <code>schedule_name</code>  | Name of the schedule to be replayed                                                                                     |

### Usage Notes

- Only one schedule can be in creation mode at a time. Calling the subprogram again before `end_replay_schedule` will raise an error.
- Prerequisites:
  - The workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
  - The user must have copied the capture directory appropriately.
  - The database is not in replay mode.
  - The [SET\\_REPLAY\\_DIRECTORY Procedure](#) has already been called.

## 195.3.6 CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML `CLOB`.

### Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
    capture_dir        IN VARCHAR2,
    process_per_cpu    IN BINARY_INTEGER DEFAULT 4,
    threads_per_process IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

## Parameters

**Table 195-7 CALIBRATE Function Parameters**

| Parameter           | Description                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| capture_dir         | Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data |
| process_per_cpu     | Maximum number of processes allowed for each CPU (default is 4)                                                    |
| threads_per_process | Maximum number of threads allowed for each process (default is 50)                                                 |

## Return Values

Returns a CLOB formatted as XML that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

## Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

## 195.3.7 CANCEL\_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

## Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 195-8 CANCEL\_REPLAY Procedure Parameters**

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| error_msg | An optional reason for cancelling the replay can be passed which is recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. |

## Usage Notes

Prerequisite: A call to the [INITIALIZE\\_REPLAY Procedure](#), or [PREPARE\\_REPLAY Procedure](#), or [START\\_REPLAY Procedure](#) was already issued.

## 195.3.8 COMPARE\_PERIOD\_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
    replay_id1    IN    NUMBER,
    replay_id2    IN    NUMBER,
    format        IN    VARCHAR2,
    result        OUT   CLOB );
```

### Parameters

**Table 195-9 COMPARE\_PERIOD\_REPORT Procedure Parameters**

| Parameter  | Description                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------|
| replay_id1 | First ID of the workload replay whose report is requested                                                                  |
| replay_id2 | Second ID of the workload replay whose report is requested. If this is NULL, then the comparison is done with the capture. |
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.          |
| result     | Output of the report (CLOB)                                                                                                |

## 195.3.9 COMPARE\_SQLSET\_REPORT Function

This procedure generates a report comparing a sqlset captured during replay to one captured during workload capture or to one captured during another replay of the same capture.

### Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_SQLSET_REPORT (
    replay_id1    IN NUMBER,
    replay_id2    IN NUMBER,
    format        IN VARCHAR2,
    r_level       IN VARCHAR2 DEFAULT 'ALL',
    r_sections    IN VARCHAR2 DEFAULT 'ALL',
    result        OUT CLOB )
RETURN VARCHAR2;
```

### Parameters

**Table 195-10 COMPARE\_SQLSET\_REPORT Function Parameters**

| Parameter  | Description                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------|
| replay_id1 | First ID of the workload replay after a change                                                                   |
| replay_id2 | Second ID of the workload replay before a change. If this is NULL, then the comparison is done with the capture. |

**Table 195-10 (Cont.) COMPARE\_SQLSET\_REPORT Function Parameters**

| Parameter  | Description                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| format     | Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML, DBMS_WORKLOAD_CAPTURE.TYPE_XML and DBMS_WORKLOAD_CAPTURE.TYPE_TEXT. |
| r_level    | See level parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the <a href="#">DBMS_SQLPA</a> package                                 |
| r_sections | See section parameter in the <a href="#">REPORT_ANALYSIS_TASK Function</a> in the <a href="#">DBMS_SQLPA</a> package                               |
| result     | Output of the report (CLOB)                                                                                                                        |

## 195.3.10 CREATE\_FILTER\_SET Procedure

This procedure creates a new filter set for the replays at `replay_dir`.

It includes all the replay filters that have already been added by the [ADD\\_FILTER Procedure](#). After the procedure has completed and replay initiated, the newly-created filter set can be used to filter the replay in `replay_dir` by calling the [USE\\_FILTER\\_SET Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
    replay_dir      IN  VARCHAR2,
    filter_set      IN  VARCHAR2,
    default_action  IN  VARCHAR2 DEFAULT 'INCLUDE');
```

### Parameters

**Table 195-11 CREATE\_FILTER\_SET Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_dir     | Object directory of the replay to be filtered                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| filter_set     | Name of the filter set to create (to use in <a href="#">USE_FILTER_SET Procedure</a> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| default_action | <p>Can be either <code>INCLUDE</code> or <code>EXCLUDE</code>. Determines whether, by default, every captured call must be replayed or not. Also determines whether the workload filters specified must be considered as <code>INCLUSION</code> filters or <code>EXCLUSION</code> filters.)</p> <p>If it is <code>INCLUDE</code>, then by default all captured calls are replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_SCHEDULE_ORDERING Function</a> are treated as <code>EXCLUSION</code> filters, and will determine the workload that will not be replayed.</p> <p>If it is <code>EXCLUDE</code>, then by default no captured call to the database is replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the <a href="#">ADD_SCHEDULE_ORDERING Function</a> are treated as <code>INCLUSION</code> filters, and will determine the workload that is replayed.</p> <p>Default: <code>INCLUDE</code> and all the filters specified are assumed to be <code>EXCLUSION</code> filters</p> |

### Usage Notes

This operation must be invoked when no replay is initialized, prepared, or in progress.

## 195.3.11 DELETE\_FILTER Procedure

This procedure deletes the named filter.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(  
    fname      IN  VARCHAR2);
```

### Parameters

**Table 195-12** DELETE\_FILTER Procedure Parameters

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| fname     | (Mandatory) Name of the filter that must be deleted |

### Usage Notes

The `DELETE_FILTER` Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the [ADD\\_FILTER Procedures](#) after any capture has been completed. Filters that have been added using `ADD_FILTER` before a `START_CAPTURE` and `FINISH_CAPTURE` cannot be deleted anymore using this subprogram.

## 195.3.12 DELETE\_REPLAY\_INFO Procedure

This procedure deletes the rows in `DBA_WORKLOAD_REPLAYS` that correspond to the given workload replay ID.

### Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (  
    replay_id  IN  NUMBER);
```

### Parameters

**Table 195-13** DELETE\_REPLAY\_INFO Procedure Parameters

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| replay_id | (Mandatory) ID of the workload replay that must be deleted.<br>Corresponds to <code>DBA_WORKLOAD_REPLAYS.ID</code> |

### 195.3.13 END\_REPLAY\_SCHEDULE Procedure

This procedure wraps up the creation of the current schedule. The schedule is now saved and associated with the replay directory and can be used for a replay.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.END_REPLAY_SCHEDULE;
```

#### Usage Notes

The [BEGIN\\_REPLAY\\_SCHEDULE Procedure](#) must have already been called.

### 195.3.14 EXPORT\_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (  
    replay_id    IN    NUMBER);
```

#### Parameters

**Table 195-14** EXPORT\_AWR Function Parameters

| Parameter | Description                                                         |
|-----------|---------------------------------------------------------------------|
| replay_id | (Mandatory) ID of the replay whose AWR snapshots are to be exported |

#### Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic `EXPORT_AWR` invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in `DBA_WORKLOAD_REPLAYS` was not created by calling the [GET\\_REPLAY\\_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

### 195.3.15 GENERATE\_CAPTURE\_SUBSET Procedure

This procedure creates a new capture from an existing workload capture.

#### Syntax

```
DBMS_WORKLOAD_REPLAY.GENERATE_CAPTURE_SUBSET (  
    input_capture_dir    IN    VARCHAR2,  
    output_capture_dir   IN    VARCHAR2,  
    new_capture_name     IN    VARCHAR2,  
    begin_time           IN    NUMBER,  
    begin_include_incomplete IN    BOOLEAN DEFAULT TRUE,  
    end_time             IN    NUMBER,  
    end_include_incomplete IN    BOOLEAN DEFAULT FALSE,  
    parallel_level       IN    NUMBER DEFAULT NULL);
```

## Parameters

**Table 195-15** GENERATE\_CAPTURE\_SUBSET Procedure Parameters

| Parameter                | Description                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| input_capture_dir        | (Mandatory) Name of the directory object that points to an existing workload capture                                                                                                                                                                |
| output_capture_dir       | (Mandatory) Name of the directory object that points to the new capture                                                                                                                                                                             |
| new_capture_name         | (Mandatory) Name of new capture                                                                                                                                                                                                                     |
| begin_time               | Start of the time range - time offset in seconds from the start of a workload capture                                                                                                                                                               |
| begin_include_incomplete | Column to include incomplete calls caused by begin_time                                                                                                                                                                                             |
| end_time                 | End of the time range - time offset in seconds from the start of a workload capture. If end_time is zero or end_time is less or equal than begin_time, the time range is invalid. The new capture will use the whole duration of the input capture. |
| end_include_incomplete   | Column to include incomplete calls caused by end_time                                                                                                                                                                                               |
| parallel_level           | Number of Oracle processes used to process the input captures in a parallel fashion. The NULL default value will auto-compute the parallelism level based on number of CPUs, whereas a value of 1 will enforce serial execution.                    |

## 195.3.16 GET\_DIVERGING\_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (  
    replay_id    IN NUMBER,  
    stream_id    IN NUMBER,  
    call_counter IN NUMBER)  
RETURN CLOB;
```

## Parameters

**Table 195-16** GET\_DIVERGING\_STATEMENT Function Parameters

| Parameter    | Description                                  |
|--------------|----------------------------------------------|
| replay_id    | ID of the replay in which that call diverged |
| stream_id    | Stream ID of the diverging call              |
| call_counter | Call counter of the diverging call           |

### Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID

- SQL Text
- Bind information: position, name and value
- This function will silently invoke the [POPULATE\\_DIVERGENCE Procedure](#) to read the information from the capture files. Therefore, if divergence has not been populated, then the first call to this function for a particular diverging call might take longer, especially in very large captures.

## 195.3.17 GET\_REPLAY\_DIRECTORY Function

This function returns the current replay directory set by the SET\_REPLAY\_DIRECTORY Procedure. It returns NULL if no replay directory has been set.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_DIRECTORY
RETURN VARCHAR2;
```

### Related Topics

- [SET\\_REPLAY\\_DIRECTORY Procedure](#)  
This procedure sets a directory that contains multiple workload captures as the current replay directory.

## 195.3.18 GET\_REPLAY\_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    replay_dir    IN VARCHAR2,
    load_details  IN BOOLEAN DEFAULT FALSE)
RETURN NUMBER;
```

### Parameters

**Table 195-17 GET\_REPLAY\_INFO Function Parameters**

| Parameter    | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| replay_dir   | (Mandatory) Name of the workload replay directory object (case sensitive). |
| load_details | Load the divergence and tracked commits data. The default value is FALSE.  |

### Return Values

The procedure returns the CAPTURE\_ID, which can be associated with both DBA\_WORKLOAD\_CAPTURES.ID and DBA\_WORKLOAD\_REPLAYS.CAPTURE\_ID to access the imported information.

### Usage Notes

- The procedure first imports a row into `DBA_WORKLOAD_CAPTURES` which will contain information about the capture. It then imports a row for every replay attempt retrieved from the given replay directory into `DBA_WORKLOAD_REPLAYS`.
- The procedure will not insert new rows to `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_REPLAYS` if these views already contain rows describing the capture and replay history present in the given directory.

## 195.3.19 GET\_REPLAY\_TIMEOUT Procedure

This procedure gets the replay timeout setting.

### Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_TIMEOUT (
    enabled          OUT  BOOLEAN,
    min_delay        OUT  NUMBER,
    max_delay        OUT  NUMBER,
    delay_factor     OUT  NUMBER);
```

### Parameters

**Table 195-18 GET\_REPLAY\_TIMEOUT Procedure Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>enabled</code>      | TRUE if the timeout action is enabled, FALSE otherwise.                                                                                                                                                                                                 |
| <code>min_delay</code>    | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than <code>min_delay</code> .                                                                                                              |
| <code>max_delay</code>    | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than <code>max_delay</code> .                                                                                                                          |
| <code>delay_factor</code> | Factor for the call delay that is between <code>min_delay</code> and <code>max_delay</code> . The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and <code>delay_factor</code> . |

### Usage Notes

This procedure can be called anytime during replay.

## 195.3.20 IMPORT\_AWR Function

This procedure imports the AWR snapshots from a given replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id        IN    NUMBER,
    staging_schema    IN    VARCHAR2)
RETURN NUMBER;
```

## Parameters

**Table 195-19 IMPORT\_AWR Function Parameters**

| Parameter      | Description                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id      | (Mandatory) ID of the replay whose AWR snapshots must be imported                                                                                                                                                      |
| staging_schema | (Mandatory) Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. |

## Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR\_DBID column in the DBA\_WORKLOAD\_REPLAYS view.

## Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT\\_AWR Procedure](#).
- IMPORT\_AWR will fail if the staging\_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$\_SNAPSHOT or WRH\$\_PARAMETER. Drop any such tables in the staging\_schema before invoking IMPORT\_AWR.

## 195.3.21 INITIALIZE\_CONSOLIDATED\_REPLAY Procedure

This procedure puts the database state in INIT for a multiple-capture replay.

It uses the replay\_dir which has already been defined by the [SET\\_REPLAY\\_DIRECTORY Procedure](#), pointing to a directory that contains all the capture directories involved in the schedule. It reads data about schedule schedule\_name from the directory, and loads required connection data into the replay system.

## Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_CONSOLIDATED_REPLAY (
    replay_name      IN    VARCHAR2,
    schedule_name    IN    VARCHAR2,
    plsqli_mode      IN    VARCHAR2 DEFAULT 'TOP_LEVEL');
```

## Parameters

**Table 195-20 INITIALIZE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter     | Description                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_name   | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.                                                      |
| schedule_name | Name of the schedule to be replayed. It must have been created through the <a href="#">BEGIN_REPLAY_SCHEDULE Procedure</a> for the replay directory replay_dir. |

**Table 195-20 (Cont.) INITIALIZE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plsql_mode | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> <li>• TOP_LEVEL — only top-level PL/SQL calls are replayed</li> <li>• EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.</li> </ul> |

**Usage Notes****Prerequisites:**

- Workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
- Database state has been logically restored to what it was at the beginning of the original workload capture.
- The [SET\\_REPLAY\\_DIRECTORY Procedure](#) has been called.

## 195.3.22 INITIALIZE\_REPLAY Procedure

This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the `PAUSE_REPLAY Procedure`).

**Syntax**

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2,
    plsql_mode       IN  VARCHAR2 DEFAULT 'TOP_LEVEL',
    rac_inst_list    IN  VARCHAR2 DEFAULT NULL);
```

**Parameters****Table 195-21 INITIALIZE\_REPLAY Procedure Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_name | (Mandatory) Name of the workload replay. Every replay of a processed workload capture can be given a name.                                                                                                                                                                                                                                             |
| replay_dir  | Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data                                                                                                                                                                                                                                     |
| plsql_mode  | Specifies the replay options for PL/SQL calls: <ul style="list-style-type: none"> <li>• TOP_LEVEL — only top-level PL/SQL calls are replayed</li> <li>• EXTENDED — SQL executed from PL/SQL or top-level SQL PL/SQL if there is no SQL recorded inside the PL/SQL are replayed. All captures must have been done in 'EXTENDED' PL/SQL mode.</li> </ul> |

**Table 195-21 (Cont.) INITIALIZE\_REPLAY Procedure Parameters**

| Parameter                  | Description                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>rac_inst_list</code> | Specifies a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay. The parameter is a string of instance numbers that are separated by commas. For example:<br><br><code>rac_inst_list='1,3,5'</code> |

### Usage Notes

- Prerequisites:
  - Workload capture was already processed using the [PROCESS\\_CAPTURE Procedure](#) in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the [PAUSE\\_REPLAY Procedure](#).

For instance, during capture the user may record the connection string each session used to connect to the server. The [INITIALIZE\\_REPLAY Procedure](#) loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the [PROCESS\\_CAPTURE Procedure](#), the user could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the [REMAP\\_CONNECTION Procedure](#).

- For encrypted capture, the [INITIALIZE\\_REPLAY Procedure](#) relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encrypted` (case-sensitive).

### Related Topics

- [PAUSE\\_REPLAY Procedure](#)  
This procedure pauses the in-progress workload replay.
- [INITIALIZE\\_REPLAY Procedure](#)  
This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the [PAUSE\\_REPLAY Procedure](#)).
- [PROCESS\\_CAPTURE Procedure](#)  
This procedure processes the workload capture found in `capture_dir` in place.
- [REMAP\\_CONNECTION Procedure](#)  
This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

## 195.3.23 IS\_REPLAY\_PAUSED Function

This function reports whether the replay is currently paused.

### Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED  
    RETURN BOOLEAN;
```

### Return Values

Returns `TRUE` if the [PAUSE\\_REPLAY Procedure](#) has been called successfully and the [RESUME\\_REPLAY Procedure](#) has not been called yet.

### Usage Notes

A call to the [START\\_REPLAY Procedure](#) must have already been issued as a prerequisite.

## 195.3.24 LOAD\_LONG\_SQLTEXT Procedure

This procedure loads the captured SQL statements that are longer than 1000 characters to the `DBA_WORKLOAD_LONG_SQLTEXT` view.

### Syntax

```
DBMS_WORKLOAD_REPLAY.LOAD_LONG_SQLTEXT (  
    capture_id      IN  NUMBER);
```

### Parameters

**Table 195-22** LOAD\_LONG\_SQLTEXT Procedure Parameters

| Parameter  | Description                           |
|------------|---------------------------------------|
| capture_id | Internal key for the workload capture |

#### Note:

This procedure is available starting with Oracle Database Release 18c.

#### See Also:

`DBA_WORKLOAD_LONG_SQLTEXT` in *Oracle Database Reference*

## 195.3.25 PAUSE\_REPLAY Procedure

This procedure pauses the in-progress workload replay.

All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME\\_REPLAY Procedure](#) is issued or the replay is cancelled.

## Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

## Usage Notes

- Prerequisite: A call to the [START\\_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when this procedure was invoked are allowed to run to completion. Only subsequent user calls, when issued, are paused.

## 195.3.26 POPULATE\_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream, or the whole replay so that the GET\_DIVERGING\_STATEMENT Function returns as quickly as possible for the precomputed calls.

## Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
    replay_id      IN    NUMBER,
    stream_id      IN    NUMBER DEFAULT NULL,
    call_counter   IN    NUMBER DEFAULT NULL);
```

## Parameters

**Table 195-23 POPULATE\_DIVERGENCE Procedure Parameters**

| Parameter    | Description                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| replay_id    | ID of the replay                                                                                                                                 |
| stream_id    | Stream ID of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given replay.    |
| call_counter | Call counter of the diverging call. If NULL is provided, then divergence information is precomputed for all diverging calls in the given stream. |

## Related Topics

- [GET\\_DIVERGING\\_STATEMENT Function](#)  
This function retrieves information about a diverging call, including the statement text, the SQL ID, and the binds. If the replay of a recorded user call has data or error divergence, it is a diverging call.

## 195.3.27 PREPARE\_CONSOLIDATED\_REPLAY Procedure

Similar to the PREPARE\_REPLAY Procedure, this procedure puts the database in a special "Prepare" mode for a multiple-capture replay. The difference is that this subprogram should be used only for consolidated replays.

## Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
    synchronization      IN BOOLEAN,
    connect_time_scale    IN NUMBER    DEFAULT 100,
    think_time_scale      IN NUMBER    DEFAULT 100,
    think_time_auto_correct IN BOOLEAN  DEFAULT TRUE,
    capture_sts           IN BOOLEAN  DEFAULT FALSE,
```

```

sts_cap_interval          IN NUMBER    DEFAULT 300);

DBMS_WORKLOAD_REPLAY.PREPARE_CONSOLIDATED_REPLAY (
  synchronization          IN VARCHAR2  DEFAULT 'SCN',
  connect_time_scale       IN NUMBER    DEFAULT 100,
  think_time_scale         IN NUMBER    DEFAULT 100,
  think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
  capture_sts              IN BOOLEAN   DEFAULT FALSE,
  sts_cap_interval         IN NUMBER    DEFAULT 300);

```

## Parameters

**Table 195-24 PREPARE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| synchronization         | <p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <li>'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time).</li> <li>'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</li> <li>'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.</li> </ul> <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> <li>TRUE means 'SCN'</li> <li>FALSE means 'TIME'</li> </ul> |
| connect_time_scale      | <p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "<a href="#">Example 195-1</a>".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| think_time_scale        | <p>Scales the time elapsed between two successive user calls "<a href="#">Example 195-1</a>" from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See "<a href="#">Example 195-2</a>".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| think_time_auto_correct | <p>Auto corrects the think time between calls appropriately when user calls takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See "<a href="#">Example 195-3</a>".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 195-24 (Cont.) PREPARE\_CONSOLIDATED\_REPLAY Procedure Parameters**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| capture_sts      | If this parameter is <code>TRUE</code> , then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the Automatic Workload Repository (AWR) data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is <code>FALSE</code> . |
| sts_cap_interval | Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Usage Notes**

A consolidated replay replays multiple captures in one replay. Each capture records different system change number (SCN) values. For this reason SCN-based sync is not supported for consolidated replays. Consolidated replays only support non-sync mode and the Object-ID based synchronization, and SCN-based synchronization is currently not supported.

## 195.3.28 PREPARE\_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization          IN BOOLEAN,
    connect_time_scale       IN NUMBER    DEFAULT 100,
    think_time_scale         IN NUMBER    DEFAULT 100,
    think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
    scale_up_multiplier      IN NUMBER    DEFAULT 1,
    capture_sts              IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval         IN NUMBER    DEFAULT 300,
    rac_mode                 IN NUMBER    DEFAULT GLOBAL_SYNC,
    query_only               IN BOOLEAN   DEFAULT FALSE);
```

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization          IN VARCHAR2  DEFAULT 'SCN',
    connect_time_scale       IN NUMBER    DEFAULT 100,
    think_time_scale         IN NUMBER    DEFAULT 100,
    think_time_auto_correct  IN BOOLEAN   DEFAULT TRUE,
    scale_up_multiplier      IN NUMBER    DEFAULT 1,
    capture_sts              IN BOOLEAN   DEFAULT FALSE,
    sts_cap_interval         IN NUMBER    DEFAULT 300),
    rac_mode                 IN NUMBER    DEFAULT GLOBAL_SYNC,
    query_only               IN BOOLEAN   DEFAULT FALSE);
```

## Parameters

**Table 195-25 PREPARE\_REPLAY Procedure Parameters**

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| synchronization         | <p>Sets the synchronization mode for replay:</p> <ul style="list-style-type: none"> <li>'TIME' — The synchronization will be based on the time the action took place during capture (clock-based time).</li> <li>'SCN' — The synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</li> <li>'OBJECT_ID' — Every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.</li> </ul> <p>This value is deprecated.</p> <p>For compatibility, an overloaded version of this procedure uses BOOLEAN for this parameter:</p> <ul style="list-style-type: none"> <li>TRUE means 'SCN'</li> <li>FALSE means 'TIME'</li> </ul> |
| connect_time_scale      | <p>Scales the time elapsed between the instant the workload capture was started and the session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See <a href="#">"Example 195-1"</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| think_time_scale        | <p>Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See <a href="#">"Example 195-2"</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| think_time_auto_correct | <p>Auto corrects the think time between calls appropriately when a user call takes longer to complete during replay than during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See <a href="#">"Example 195-3"</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| scale_up_multiplier     | <p>Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the <code>scale_up_multiplier</code>. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| capture_sts             | <p>If this parameter is TRUE, then a SQL tuning set capture is also started in parallel with workload replay. The resulting SQL tuning set can be exported using the <a href="#">EXPORT_AWR Procedure</a> along with the AWR data. Currently, parallel SQL tuning set (STS) capture is not supported in an Oracle RAC environment. So, this parameter has no effect in that context. The calling user must have the appropriate privileges ('ADMINISTER SQL TUNING SET'). The default value is FALSE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| sts_cap_interval        | <p>Specifies the capture interval of the SQL set capture from the cursor cache in seconds. The default value is 300.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 195-25 (Cont.) PREPARE\_REPLAY Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rac_mode   | Specifies replay options in an Oracle Real Application Cluster (Oracle RAC) environment. This parameter accepts the following values: <ul style="list-style-type: none"> <li>GLOBAL_SYNC — Synchronization across all Oracle RAC instances. This is the default value.</li> <li>PER_INSTANCE_CLIENT — Synchronization is global and each WRC client handles part of the workload that is sent to only one instance.</li> <li>PER_INSTANCE_SYNC — Synchronization is local (within each instance only) and each WRC client handles part of the workload that is sent to only one instance</li> </ul> |
| query_only | Replays only the read-only queries of the workload capture. The default value is FALSE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the [INITIALIZE\\_REPLAY Procedure](#).
  - Any capture time connection strings that require remapping have been already done using the [REMAP\\_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.
- With regard to `scale_up_multiplier`:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual.
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database is skipped. `SELECT FOR UPDATE` statements are also skipped.
  - Read-only calls from the scale-up are synchronized appropriately and obey the timings defined by `think_time_scale`, `connect_time_scale`, and `think_time_auto_correct`. Also, the queries are made to wait for the appropriate commits.
  - No replay data or error divergence records are generated for the scale-up sessions.
  - All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

### Example 195-1 Application of the `connect_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
```

```
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

### Example 195-2 Application of the `think_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
       previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
       call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
       call
12:35 : Third user call completes in 9m (takes a minute longer)
```

### Example 195-3 Application of the `think_time_auto_correct` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 100 and the `think_time_auto_correct` is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
       call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
       call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

## 195.3.29 PROCESS\_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

### Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
  capture_dir      IN   VARCHAR2,
  parallel_level   IN   NUMBER DEFAULT NULL,
  synchronization  IN   VARCHAR2 DEFAULT 'SCN',
  plsql_mode       IN   VARCHAR2 DEFAULT 'TOP_LEVEL');
```

### Parameters

**Table 195-26 PROCESS\_CAPTURE Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>capture_dir</code>     | (Mandatory) Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files are added to this directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>parallel_level</code>  | Number of Oracle processes used to process the capture in parallel. The <code>NULL</code> default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>synchronization</code> | <p>Determines the synchronization mode that the user will be able to use for replay:</p> <ul style="list-style-type: none"> <li>• <code>'TIME'</code> — When <code>'TIME'</code> is selected, the replay can use <code>'TIME'</code> synchronization mode only.<br/>When <code>'TIME'</code> synchronization mode is used for replay, the synchronization will be based on the time the action took place during capture (clock-based time).</li> <li>• <code>'SCN'</code> — When <code>'SCN'</code> is selected, the replay can use the <code>'TIME'</code> or <code>'SCN'</code> synchronization mode. This is the default.<br/>When <code>'SCN'</code> synchronization mode is used for replay, the synchronization will be based on the capture-time commits; the commit order will be preserved during replay. This is the default mode.</li> <li>• <code>'OBJECT_ID'</code> — When <code>'OBJECT_ID'</code> is selected, replay can use the <code>'TIME'</code>, <code>'SCN'</code>, or <code>'OBJECT_ID'</code> synchronization mode.<br/>When <code>'OBJECT_ID'</code> synchronization mode is used for replay, every replayed action will be executed only <i>after</i> the relevant commits have finished execution. The relevant commits are those that were issued before the given action in the captured workload and that modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This synchronization mode makes sure that any replay action will see the same data that the action saw during capture, but allows greater concurrency for the actions that do not touch the same objects/tables.<br/>This synchronization mode is deprecated.</li> </ul> |

**Table 195-26 (Cont.) PROCESS\_CAPTURE Procedure Parameters**

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| plsql_mode | Specifies the processing mode for PL/SQL: <ul style="list-style-type: none"> <li>'TOP_LEVEL' — metadata is generated for top-level PL/SQL calls only; 'TOP_LEVEL' will be the only option for replay.</li> <li>'EXTENDED' — metadata is generated for both top-level PL/SQL calls and the SQL called from PL/SQL. A new directory ppe_X.X.X.X (where the Xs represent the current Oracle version) is created under the capture root directory. Capture must have been done with this same value for the plsql_mode parameter. Replay can use either 'TOP_LEVEL' or 'EXTENDED'.</li> </ul> |

### Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the `capture_dir` can be used as input to the [INITIALIZE\\_REPLAY Procedure](#) in order to replay the captured workload present in `capture_dir`.
- Before a workload capture can be replayed in a particular database version, the capture must be processed using `PROCESS_CAPTURE` in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload must be processed in version 11.1.0.1. The following procedure must be executed in an 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many times as required.

- For encrypted capture, the `PROCESS_CAPTURE` procedure relies on Oracle wallet. The identifier is `oracle.rat.database_replay.encrypted` (case-sensitive).

## 195.3.30 REMAP\_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    connection_id      IN  NUMBER,
    replay_connection  IN  VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
    capture_number     IN  VARCHAR2,
```

```

connection_id      IN  NUMBER,
replay_connection  IN  VARCHAR2);

```

### Parameters

**Table 195-27 REMAP\_CONNECTION Procedure Parameters**

| Parameter         | Description                                                                              |
|-------------------|------------------------------------------------------------------------------------------|
| capture_number    | Pointing to a capture of the current replay schedule                                     |
| connection_id     | ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID. |
| replay_connection | New connection string to be used during replay                                           |

### Usage Notes

- Prior to calling `REMAP_CONNECTION` all replay connection strings are set to `NULL` by default. If a `replay_connection` is `NULL`, then the replay sessions will connect as determined by the replay client's runtime environment. For example, if the environment variable `TNS_ADMIN` is defined and the user does not call the [REMAP\\_CONNECTION Procedure](#), then the `wrc` executable will connect to the server specified in the `tnsnames.ora` file pointed to by `TNS_ADMIN`.
- A valid `replay_connection` must specify a connect identifier or a service point. See the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that are used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

## 195.3.31 REMOVE\_CAPTURE Procedure

This procedure removes the given capture from the current schedule.

### Syntax

```

DBMS_WORKLOAD_REPLAY.REMOVE_CAPTURE (
    schedule_capture_number  IN  NUMBER);

```

### Parameters

**Table 195-28 REMOVE\_CAPTURE Procedure Parameters**

| Parameter               | Description                                                 |
|-------------------------|-------------------------------------------------------------|
| schedule_capture_number | Unique ID that identifies this capture within this schedule |

## 195.3.32 REMOVE\_SCHEDULE\_ORDERING Procedure

This procedure removes an existing schedule order from the current replay schedule.

Together, `schedule_capture_id` and `waitfor_capture_id` form a schedule ordering that previously added by the [ADD\\_SCHEDULE\\_ORDERING Function](#) (`schedule_capture_id`, `waitfor_capture_id`). The order is that replay of capture indicated by `schedule_capture_id` will not start unless the replay of capture indicated by `waitfor_capture_id` finishes.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REMOVE_SCHEDULE_ORDERING (  
    schedule_capture_id    IN          NUMBER,  
    waitfor_capture_id     IN          NUMBER);
```

### Parameters

**Table 195-29 REMOVE\_SCHEDULE\_ORDERING Procedure Parameters**

| Parameter                        | Description                                                                                         |
|----------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>schedule_capture_id</code> | Points to a capture that has been added to the current replay schedule (see procedure description). |
| <code>waitfor_capture_id</code>  | Points to a capture that has been added to the current replay schedule.                             |

### Usage Notes

Prerequisites:

- The [BEGIN\\_REPLAY\\_SCHEDULE Procedure](#) must have been called.
- The replay schedule order should have already been added using the [ADD\\_SCHEDULE\\_ORDERING Function](#).

## 195.3.33 REPORT Function

This function generates a report on the stipulated workload replay.

### Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (  
    replay_id      IN NUMBER,  
    format         IN VARCHAR2)  
RETURN CLOB;
```

### Parameters

**Table 195-30 REPORT Function Parameters**

| Parameter              | Description                                                                    |
|------------------------|--------------------------------------------------------------------------------|
| <code>replay_id</code> | (Mandatory) Specifies the ID of the workload replay whose report is requested. |

**Table 195-30 (Cont.) REPORT Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | (Mandatory) Specifies the report format. Valid values: <ul style="list-style-type: none"><li>HTML - Generates the HTML version of the report</li><li>XML - Generates the XML version of the report</li><li>TEXT - Generates the text version of the report</li></ul> |

**Return Values**

The report body in the desired format returned as a CLOB

## 195.3.34 RESUME\_REPLAY Procedure

This procedure resumes a paused workload replay.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

**Usage Notes**

Prerequisite: A call to the [PAUSE\\_REPLAY Procedure](#) must have already been issued.

## 195.3.35 REUSE\_REPLAY\_FILTER\_SET Procedure

This procedure reuses filters in the specified filter set as if each were added using the [ADD\\_SCHEDULE\\_ORDERING Function](#).

Each call adds one filter set, which is a collection of individual filters on various attributes. Also, a new filter rule can be added, and an existing filter can be deleted before invoking the [CREATE\\_FILTER\\_SET Procedure](#) to create a new filter set.

**Syntax**

```
DBMS_WORKLOAD_REPLAY.REUSE_REPLAY_FILTER_SET(  
    replay_dir  IN VARCHAR2,  
    filter_set  IN VARCHAR2);
```

**Parameters****Table 195-31 REUSE\_REPLAY\_FILTER\_SET Procedure Parameters**

| Parameter  | Description                                                       |
|------------|-------------------------------------------------------------------|
| replay_dir | Capture ID of the existing filter set with which it is associated |
| filter_set | Name of the filter set to be reused                               |

**Related Topics**

- [ADD\\_SCHEDULE\\_ORDERING Function](#)  
This function adds a schedule order between two captures.

## 195.3.36 SET\_ADVANCED\_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE\_REPLAY Procedure.

The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(  
    pname    IN    VARCHAR2,  
    pvalue   IN    VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(  
    pname    IN    VARCHAR2,  
    pvalue   IN    NUMBER);
```

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(  
    pname    IN    VARCHAR2,  
    pvalue   IN    BOOLEAN);
```

### Parameters

**Table 195-32 SET\_ADVANCED\_PARAMETER Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| pname     | Name of the parameter (case insensitive) |
| pvalue    | Value of the parameter                   |

### Usage Notes

The current parameters and values that can be used are:

'DO\_NO\_WAIT\_COMMITS': (default: FALSE)

This parameter controls whether the COMMIT issued by replay sessions is NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE, then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

### Related Topics

- [PREPARE\\_REPLAY Procedure](#)  
This procedure puts the database state in PREPARE FOR REPLAY mode.

## 195.3.37 SET\_REPLAY\_DIRECTORY Procedure

This procedure sets a directory that contains multiple workload captures as the current replay directory.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_DIRECTORY (
    replay_dir    IN    VARCHAR2);
```

### Parameters

**Table 195-33 SET\_REPLAY\_DIRECTORY Procedure Parameters**

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| replay_dir | Name of the OS directory containing the captures for a workload consolidation |

## 195.3.38 SET\_REPLAY\_TIMEOUT Procedure

This procedure sets the replay timeout setting. The purpose is to abort user calls that might make the replay much slower or even cause a replay hang.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_REPLAY_TIMEOUT (
    enabled      OUT  BOOLEAN DEFAULT TRUE,
    min_delay    OUT  NUMBER DEFAULT 10,
    max_delay    OUT  NUMBER DEFAULT 120,
    delay_factor OUT  NUMBER DEFAULT 8);
```

### Parameters

**Table 195-34 SET\_REPLAY\_TIMEOUT Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enabled      | TRUE to enable the timeout action, and FALSE to disable.                                                                                                                                                                    |
| min_delay    | Lower bound of call delay in minutes. The replay action is activated only when the delay is equal to or more than min_delay. Default = 10.                                                                                  |
| max_delay    | Upper bound of call delay in minutes. The timeout action throws ORA-15569 when the delay is more than max_delay. Default = 120.                                                                                             |
| delay_factor | Factor for the call delay that is between min_delay and max_delay. The timeout action throws ORA-15569 when the current replay elapsed time is more than the product of capture elapsed time and delay_factor. Default = 8. |

### Usage Notes

- This procedure can be called anytime during replay.
- Call delay is defined as the difference between replay and capture if replay elapsed time is longer than call elapsed time.

- Once a replay timeout action is enabled, a user call will exit with `ORA-15569` if it has been delayed more than the condition specified by the replay action. The call and its error are reported as error divergence.
- Replay timeout operates as follows:
  - The timeout action has no effect if it is not enabled.
  - If the call delay in minutes is less than a lower bound specified by parameter `min_delay`, then the timeout action is non-operational.
  - If the delay in minutes is more than an upper bound specified by parameter `max_delay`, the timeout action will abort the user call and throw `ORA-15569`.
  - For delay that is between the lower bound and upper bound, the user call will abort with `ORA-15569` only when the current replay elapsed time is more than the product of capture elapsed time and parameter `delay_factor`.

### 195.3.39 SET\_SQL\_MAPPING Procedure

This procedure specifies SQL statements to be skipped or replaced during a database replay operation.

#### Syntax

```
PROCEDURE SET_SQL_MAPPING (
    schedule_cap_id      IN NUMBER,
    sql_id               IN VARCHAR2,
    operation            IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);

PROCEDURE SET_SQL_MAPPING (
    sql_id               IN VARCHAR2,
    operation            IN VARCHAR2,
    replacement_sql_text IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

**Table 195-35 SET\_SQL\_MAPPING Procedure Parameters**

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>schedule_cap_id</code> | ID of a capture in the schedule                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>sql_id</code>          | SQL identifier of the SQL statement at the time of capture                                                                                                                                                                                                                                                                                                                                                               |
| <code>operation</code>       | Directs that one of the following actions be performed for the specified statement during database replay: <ul style="list-style-type: none"> <li>• <code>'SKIP'</code> — Skip the SQL statement identified by <code>sql_id</code></li> <li>• <code>'REPLACE'</code> — Replace this SQL statement identified by <code>sql_id</code> with the SQL statement in the <code>replacement_sql_text</code> parameter</li> </ul> |

#### Usage Notes

- `replacement_sql_text`: When `'SKIP'` is specified for the `operation` parameter, this parameter is `NULL`. When `'REPLACE'` is specified for the `operation` parameter, this parameter's value is the SQL statement to be used.

- `schedule_cap_id` is used for consolidated replay.

## 195.3.40 SET\_USER\_MAPPING Procedure

This procedure sets a new schema or user name to be used during replay instead of the captured user.

### Syntax

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    schedule_cap_id      IN NUMBER,
    capture_user         IN VARCHAR2,
    replay_user          IN VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.SET_USER_MAPPING (
    capture_user         IN VARCHAR2,
    replay_user          IN VARCHAR2);
```

### Parameters

**Table 195-36 SET\_USER\_MAPPING Procedure Parameters**

| Parameter                    | Description                                                 |
|------------------------------|-------------------------------------------------------------|
| <code>schedule_cap_id</code> | ID of the a capture in the schedule                         |
| <code>capture_user</code>    | User name during the time of the workload capture           |
| <code>replay_user</code>     | User name to which captured user is remapped during replay. |

### Usage Notes

- A `schedule_cap_id` of `NULL` is used for regular non-consolidate replay.
- The replay must be initialized but not prepared in order to use this subprogram.
- If `replay_user` is set to `NULL`, then the mapping is disabled.
- After multiple calls with the same `capture_user`, the last call always takes effect.
- To list all the mappings that will be in effect during the subsequent replay execute the following:
 

```
SELECT * FROM DBA_WORKLOAD_ACTIVE_USER_MAP
```
- The overloaded version without the `schedule_cap_id` calls the one with the `schedule_cap_id` argument by passing in `NULL`.
- Mappings are stored in a table made public through the view `DBA_WORKLOAD_USER_MAP`. To remove old mappings execute
 

```
DELETE * FROM DBA_WORKLOAD_USER_MAP
```

## 195.3.41 START\_CONSOLIDATED\_REPLAY Procedure

This procedure starts the replay of a multiple-capture capture. It should be used only for consolidated replays.

### Syntax

```
DBMS_WORKLOAD_REPLAY.START_CONSOLIDATED_REPLAY;
```

## Usage Notes

### Prerequisites:

- The call to the [PREPARE\\_REPLAY Procedure](#) was already issued.
- A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using V\$WORKLOAD\_REPLAY\_CLIENTS.

## 195.3.42 START\_REPLAY Procedure

This procedure starts the workload replay.

All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified, and those replay clients (WRC) will begin issuing the captured workload. It should only be used for consolidated replays.

## Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

## Usage Notes

- Prerequisites:
  - The call to the [PREPARE\\_REPLAY Procedure](#) was already issued.
  - A sufficient number of external replay clients (WRC) that can faithfully replay the captured workload already started. The status of such external replay clients can be monitored using V\$WORKLOAD\_REPLAY\_CLIENTS.
- Use the WRC's CALIBRATE mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:
 

```
$ wrc mode=calibrate replaydir=.
```

## 195.3.43 USE\_FILTER\_SET Procedure

This procedure applies a filter set to a capture in the current replay schedule.

The filter set must have been created by calling the [CREATE\\_FILTER\\_SET Procedure](#).

## Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
    capture_number IN VARCHAR2,
    filter_set      IN   VARCHAR2);
```

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
    filter_set      IN   VARCHAR2);
```

## Parameters

**Table 195-37 USE\_FILTER\_SET Procedure Parameters**

| Parameter      | Description                                          |
|----------------|------------------------------------------------------|
| capture_number | Pointing to a capture of the current replay schedule |

**Table 195-37 (Cont.) USE\_FILTER\_SET Procedure Parameters**

| Parameter  | Description            |
|------------|------------------------|
| filter_set | Name of the filter set |

**Usage Notes**

The filter set must have been created by calling the [CREATE\\_FILTER\\_SET Procedure](#).

# DBMS\_WORKLOAD\_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Automatic Workload Repository (AWR) by performing operations, such as, managing snapshots and baselines.

The chapter contains the following topics:

- [Examples](#)
- [Data Structures](#)
- [Summary of DBMS\\_WORKLOAD\\_REPOSITORY Subprograms](#)

## See Also:

*Oracle Database Performance Tuning Guide* for more information about the Automatic Workload Repository

## 196.1 DBMS\_WORKLOAD\_REPOSITORY Examples

This example shows how to generate an AWR text report with the `DBMS_WORKLOAD_REPOSITORY` package for database ID 1557521192, instance ID 1, snapshot IDs 5390 and 5391, and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the `DBMS_WORKLOAD_REPOSITORY` packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

## 196.2 DBMS\_WORKLOAD\_REPOSITORY Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table types.

### OBJECT Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE](#) Object Type

### TABLE Types

- [AWR\\_BASELINE\\_METRIC\\_TYPE\\_TABLE](#) Table Type
- [AWRRPT\\_INSTANCE\\_LIST\\_TYPE](#) Table Type

## 196.2.1 DBMS\_WORKLOAD\_REPOSITORY AWR\_BASELINE\_METRIC\_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

### Syntax

```
TYPE awr_baseline_metric_type AS OBJECT (
    baseline_name      VARCHAR2(64),
    dbid               NUMBER NOT NULL,
    instance_number    NUMBER NOT NULL,
    beg_time           DATE NOT NULL,
    end_time           DATE NOT NULL,
    metric_id          NUMBER NOT NULL,
    metric_name        VARCHAR2(64) NOT NULL,
    metric_unit        VARCHAR2(64) NOT NULL,
    num_interval       NUMBER NOT NULL,
    interval_size      NUMBER NOT NULL,
    average            NUMBER NOT NULL,
    minimum            NUMBER NOT NULL,
    maximum            NUMBER NOT NULL);
```

### Fields

**Table 196-1 AWR\_BASELINE\_METRIC\_TYPE Fields**

| Field           | Description                               |
|-----------------|-------------------------------------------|
| baseline_name   | Name of the Baseline                      |
| dbid            | Database ID for the snapshot              |
| instance_number | Instance number for the snapshot          |
| beg_time        | Begin time of the interval                |
| end_time        | End time of the interval                  |
| metric_id       | Metric ID                                 |
| metric_name     | Metric name                               |
| metric_unit     | Unit of measurement                       |
| num_interval    | Number of intervals observed              |
| interval_size   | Interval size (in hundredths of a second) |
| average         | Average over the period                   |
| minimum         | Minimum value observed                    |
| maximum         | Maximum value observed                    |

## 196.2.2 DBMS\_WORKLOAD\_REPOSITORY AWR\_BASELINE\_METRIC\_TYPE\_TABLE Table Type

This type is used by the SELECT\_BASELINE\_METRIC Function.

### Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

**Related Topics**

- [SELECT\\_BASELINE\\_METRIC Function](#)  
This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

## 196.2.3 DBMS\_WORKLOAD\_REPOSITORY AWRRPT\_INSTANCE\_LIST\_TYPE Table Type

This type provides an alternative to a comma-separated list.

**Syntax**

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

## 196.3 Summary of DBMS\_WORKLOAD\_REPOSITORY Subprograms

This table lists the DBMS\_WORKLOAD\_REPOSITORY subprograms and briefly describes them.

**Table 196-2 DBMS\_WORKLOAD\_REPOSITORY Package Subprograms**

| Subprogram                                            | Description                                                                                        |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COLORED_SQL Procedure</a>             | Adds a colored SQL ID                                                                              |
| <a href="#">ASH_GLOBAL_REPORT_HTML Function</a>       | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format. |
| <a href="#">ASH_GLOBAL_REPORT_TEXT Function</a>       | Displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in Text format. |
| <a href="#">ASH_REPORT_ANALYTICS Function</a>         | Displays the ASH Analytics active report                                                           |
| <a href="#">ASH_REPORT_HTML Function</a>              | Displays the ASH report in HTML                                                                    |
| <a href="#">ASH_REPORT_TEXT Function</a>              | Displays the ASH report in text                                                                    |
| <a href="#">AWR_DIFF_REPORT_HTML Function</a>         | Displays the AWR Diff-Diff report in HTML                                                          |
| <a href="#">AWR_DIFF_REPORT_TEXT Function</a>         | Displays the AWR Diff-Diff report in text                                                          |
| <a href="#">AWR_GLOBAL_DIFF_REPORT_HTML Functions</a> | Displays the Global AWR Compare Periods Report in HTML                                             |
| <a href="#">AWR_GLOBAL_DIFF_REPORT_TEXT Functions</a> | Displays the Global AWR Compare Periods Report in text                                             |
| <a href="#">AWR_EXP Procedure</a>                     | Extracts AWR data from the AWR schema into a dump file.                                            |
| <a href="#">AWR_GLOBAL_REPORT_HTML Functions</a>      | Displays the Global AWR report in HTML                                                             |
| <a href="#">AWR_GLOBAL_REPORT_TEXT Functions</a>      | Displays the Global AWR report in text                                                             |
| <a href="#">AWR_IMP Procedure</a>                     | Loads the AWR data from a dump file into the SYS schema.                                           |
| <a href="#">AWR_REPORT_HTML Function</a>              | Displays the AWR report in HTML                                                                    |
| <a href="#">AWR_REPORT_TEXT Function</a>              | Displays the AWR report in text                                                                    |

Table 196-2 (Cont.) DBMS\_WORKLOAD\_REPOSITORY Package Subprograms

| Subprogram                                                    | Description                                                                                                                                                                                            |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">AWR_SET_REPORT_THRESHOLD S Procedure</a>          | Configures specified report thresholds, including the number of rows in the report                                                                                                                     |
| <a href="#">AWR_SQL_REPORT_HTML Function</a>                  | Displays the AWR SQL Report in HTML format                                                                                                                                                             |
| <a href="#">AWR_SQL_REPORT_TEXT Function</a>                  | Displays the AWR SQL Report in text format                                                                                                                                                             |
| <a href="#">CONTROL_RESTRICTED_SNAPSHOT Procedure</a>         | Controls the AWR snapshot creation for a database in the <i>restricted session</i> mode.                                                                                                               |
| <a href="#">CREATE_BASELINE Functions &amp; Procedures</a>    | Creates a single baseline                                                                                                                                                                              |
| <a href="#">CREATE_BASELINE_TEMPLATE Procedures</a>           | Creates a baseline template                                                                                                                                                                            |
| <a href="#">CREATE_REMOTE_SNAPSHOT Function and Procedure</a> | Creates a manual <i>remote</i> snapshot immediately using the Remote Management Framework (RMF)                                                                                                        |
| <a href="#">CREATE_SNAPSHOT Function and Procedure</a>        | Creates a manual <i>local</i> snapshot immediately                                                                                                                                                     |
| <a href="#">DROP_BASELINE Procedure</a>                       | Drops a previously-defined baseline                                                                                                                                                                    |
| <a href="#">DROP_BASELINE_TEMPLATE Procedure</a>              | Removes a baseline template that is no longer needed                                                                                                                                                   |
| <a href="#">DROP_SNAPSHOT_RANGE Procedure</a>                 | Drops a range of snapshots                                                                                                                                                                             |
| <a href="#">LOCAL_AWR_DBID Function</a>                       | Returns the database identifier for the local AWR database                                                                                                                                             |
| <a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a>         | Modifies the window size for the Default Moving Window Baseline                                                                                                                                        |
| <a href="#">MODIFY_SNAPSHOT_SETTINGS Procedures</a>           | Modifies the snapshot settings                                                                                                                                                                         |
| <a href="#">PURGE_SQL_DETAILS Procedure</a>                   | Purges SQL details, specifically rows from <code>WRH\$_SQLTEXT</code> and <code>WRH\$_SQL_PLAN</code> that do not have corresponding rows (DBID, <code>SQL_ID</code> ) in <code>WRH\$_SQLSTAT</code> . |
| <a href="#">REGISTER_REMOTE_DATABASE Procedures</a>           | Registers a remote database in the AWR using the Remote Management Framework (RMF)                                                                                                                     |
| <a href="#">REMOVE_COLORED_SQL Procedure</a>                  | Removes a colored SQL ID                                                                                                                                                                               |
| <a href="#">RENAME_BASELINE Procedure</a>                     | Renames a baseline                                                                                                                                                                                     |
| <a href="#">SELECT_BASELINE_DETAILS Function</a>              | Shows the values of the metrics corresponding to a baseline for a range of snapshots                                                                                                                   |
| <a href="#">SELECT_BASELINE_METRIC Function</a>               | Shows the values of the metrics corresponding to a baseline for all the snapshots                                                                                                                      |
| <a href="#">UNREGISTER_REMOTE_DATABASE Procedures</a>         | Removes all the statistics, metadata, and partitions of a remote database from the AWR using the Remote Management Framework (RMF)                                                                     |
| <a href="#">UPDATE_DATAFILE_INFO Procedure</a>                | Updates the data file and tablespace information stored in the AWR with the current information in the database                                                                                        |
| <a href="#">UPDATE_OBJECT_INFO Procedure</a>                  | Updates rows of <code>WRH\$_SEG_STAT_OBJ</code> table that represent objects in the local database                                                                                                     |

## 196.3.1 ADD\_COLORED\_SQL Procedure

This procedure adds a colored SQL ID.

If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time. To uncolor the SQL, invoke the [REMOVE\\_COLORED\\_SQL Procedure](#).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ADD_COLORED_SQL(
    sql_id          IN VARCHAR2,
    dbid            IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 196-3** *ADD\_COLORED\_SQL Procedure Parameters*

| Parameter | Description                           |
|-----------|---------------------------------------|
| sql_id    | 13-character external SQL ID          |
| dbid      | Optional DBID, defaults to Local DBID |

## 196.3.2 ASH\_GLOBAL\_REPORT\_HTML Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in HTML format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
    l_dbid          IN NUMBER,
    l_inst_num      IN VARCHAR2(1023),
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER DEFAULT 0,
    l_slot_width    IN NUMBER DEFAULT 0,
    l_sid           IN NUMBER DEFAULT NULL,
    l_sql_id        IN VARCHAR2 DEFAULT NULL,
    l_wait_class    IN VARCHAR2 DEFAULT NULL,
    l_service_hash  IN NUMBER DEFAULT NULL,
    l_module        IN VARCHAR2 DEFAULT NULL,
    l_action        IN VARCHAR2 DEFAULT NULL,
    l_client_id     IN VARCHAR2 DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2 DEFAULT NULL,
    l_data_src      IN NUMBER DEFAULT 0,
    l_container     IN VARCHAR2 DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

## Parameters

**Table 196-4** *ASH\_GLOBAL\_REPORT\_HTML Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>         | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>l_inst_num</code>     | List of instances (such as '1,2,3'), or NULL to report on all instances in the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <code>l_data_src</code>     | Ignored since the report works off of data on disk only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>l_container</code>    | <p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> <li>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

## Return Values

The output will be one column of VARCHAR2(1500).

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL

statement, such as SQL\_ID 'abcdefghij123 ' pass that sql\_id value to the l\_sql\_id argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

**Table 196-5 ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

| Argument Name  | Comment                                                                          | Wildcard Allowed |
|----------------|----------------------------------------------------------------------------------|------------------|
| l_sid          | Session ID (for example, V\$SESSION.SID)                                         | No               |
| l_sql_id       | SQL ID (for example, V\$SQL.SQL_ID)                                              | Yes              |
| l_wait_class   | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)                          | Yes              |
| l_service_hash | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)                    | No               |
| l_module       | Module name (for example, V\$SESSION.MODULE)                                     | Yes              |
| l_action       | Action name (for example, V\$SESSION.ACTION)                                     | Yes              |
| l_client_id    | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER) | Yes              |
| l_data_src     | Wildcards are not allowed for l_data_src as it is of numeric datatype            | No               |

### 196.3.3 ASH\_GLOBAL\_REPORT\_TEXT Function

This table function displays a global or Oracle Real Application Clusters (Oracle RAC) ASH Spot report in text format.

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
  l_dbid          IN VARCHAR2(1023),
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER      DEFAULT 0,
  l_slot_width    IN NUMBER      DEFAULT 0,
  l_sid           IN NUMBER      DEFAULT NULL,
  l_sql_id        IN VARCHAR2    DEFAULT NULL,
  l_wait_class    IN VARCHAR2    DEFAULT NULL,
  l_service_hash  IN NUMBER      DEFAULT NULL,
  l_module        IN VARCHAR2    DEFAULT NULL,
  l_action        IN VARCHAR2    DEFAULT NULL,
  l_client_id     IN VARCHAR2    DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2    DEFAULT NULL,
  l_data_src      IN NUMBER      DEFAULT 0,
  l_container     IN VARCHAR2    DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-6** *ASH\_GLOBAL\_REPORT\_TEXT Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>         | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>l_inst_num</code>     | List of instances (such as '1,2,3'), or NULL to report on all instances in the database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>l_data_src</code>     | Ignored since the report works off of data on disk only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>l_container</code>    | <p>Name of the container for which report activity is limited. Valid values other than NULL (default) should be taken from container names in V\$CONTAINERS. Behavior is as follows:</p> <ul style="list-style-type: none"> <li>• If NULL: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not NULL: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as NULL value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

## Return Values

The output will be one column of VARCHAR2(320).

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL

statement, such as SQL\_ID 'abcdefghij123 ' pass that SQL\_ID value to the l\_sql\_id argument:

```
l_sql_id => 'abcdefghij123'
```

**Table 196-7 ASH\_GLOBAL\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

| Argument Name  | Comment                                                                          | Wildcard Allowed |
|----------------|----------------------------------------------------------------------------------|------------------|
| l_sid          | Session ID (for example, V\$SESSION.SID)                                         | No               |
| l_sql_id       | SQL ID (for example, V\$SQL.SQL_ID)                                              | Yes              |
| l_wait_class   | Wait class name (for example, V\$EVENT_NAME.WAIT_CLASS)                          | Yes              |
| l_service_hash | Service name hash (for example, V\$ACTIVE_SERVICES.NAME_HASH)                    | No               |
| l_module       | Module name (for example, V\$SESSION.MODULE)                                     | Yes              |
| l_action       | Action name (for example, V\$SESSION.ACTION)                                     | Yes              |
| l_client_id    | Client ID for end-to-end backtracing (for example, V\$SESSION.CLIENT_IDENTIFIER) | Yes              |
| l_plsql_entry  | PL/SQL entry point (for example, "SYS.DBMS_LOB.*")                               | Yes              |
| l_data_src     | Wildcards are not allowed for l_data_src as it is of numeric datatype            | No               |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

## 196.3.4 ASH\_REPORT\_ANALYTICS Function

This function returns the ASH Analytics active report.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_ANALYTICS (
  dbid          IN NUMBER DEFAULT NULL,
  inst_id       IN NUMBER DEFAULT NULL,
  begin_time    IN DATE,
  end_time      IN DATE,
  report_level  IN VARCHAR2 DEFAULT NULL,
  filter_list   IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

## Parameters

**Table 196-8 ASH\_REPORT\_ANALYTICS Parameters**

| Parameter    | Description                                                                                                                                                                             |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid         | Database identifier. If its value is set to NULL, then the database identifier for the local database is used. Its default value is NULL.                                               |
| inst_id      | Instance number of the database for which the statistics are required. If its value is set to NULL, then the statistics for the local database are returned. Its default value is NULL. |
| begin_time   | The start time of the interval for which the ASH report is required.                                                                                                                    |
| end_time     | The end time of the interval for which the ASH report is required.                                                                                                                      |
| report_level | Describes the list of components to build.                                                                                                                                              |
| filter_list  | Describes the list of filters to apply. Its default value is NULL (no filters to apply).                                                                                                |

## Return Values

Returns the ASH Analytics active report.

## 196.3.5 ASH\_REPORT\_HTML Function

This table function displays the ASH Spot report in HTML.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML (
    l_dbid          IN NUMBER,
    l_inst_num      IN NUMBER,
    l_btime         IN DATE,
    l_etime         IN DATE,
    l_options       IN NUMBER    DEFAULT 0,
    l_slot_width    IN NUMBER    DEFAULT 0,
    l_sid           IN NUMBER    DEFAULT NULL,
    l_sql_id        IN VARCHAR2  DEFAULT NULL,
    l_wait_class    IN VARCHAR2  DEFAULT NULL,
    l_service_hash  IN NUMBER    DEFAULT NULL,
    l_module        IN VARCHAR2  DEFAULT NULL,
    l_action        IN VARCHAR2  DEFAULT NULL,
    l_client_id     IN VARCHAR2  DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
    l_data_src      IN NUMBER    DEFAULT 0,
    l_container     IN VARCHAR2  DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

## Parameters

**Table 196-9 ASH\_REPORT\_HTML Parameters**

| Parameter  | Description         |
|------------|---------------------|
| l_dbid     | Database identifier |
| l_inst_num | Instance number     |

**Table 196-9 (Cont.) ASH\_REPORT\_HTML Parameters**

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_data_src</code>     | Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>• 1 =&gt; memory (<code>V\$ACTIVE_SESSION_HISTORY</code>)</li> <li>• 2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>• 0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                    |
| <code>l_container</code>    | Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> <li>• If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>• If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

**Return Values**

The output will be one column of `VARCHAR2(500)`.

**Usage Notes**

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For

example, to generate an ASH report on all rows between `l_btime` and `l_etime` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123 '` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

**Table 196-10 ASH\_REPORT\_HTML: Wildcards Allowed (or Not) in Arguments**

| Argument Name               | Comment                                                                                        | Wildcard Allowed |
|-----------------------------|------------------------------------------------------------------------------------------------|------------------|
| <code>l_sid</code>          | Session ID (for example, <code>V\$SESSION.SID</code> )                                         | No               |
| <code>l_sql_id</code>       | SQL ID (for example, <code>V\$SQL.SQL_ID</code> )                                              | Yes              |
| <code>l_wait_class</code>   | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )                          | Yes              |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )                    | No               |
| <code>l_module</code>       | Module name (for example, <code>V\$SESSION.MODULE</code> )                                     | Yes              |
| <code>l_action</code>       | Action name (for example, <code>V\$SESSION.ACTION</code> )                                     | Yes              |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> ) | Yes              |

### 196.3.6 ASH\_REPORT\_TEXT Function

This table function displays the ASH Spot report in text.

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(  
  l_dbid          IN NUMBER,  
  l_inst_num      IN NUMBER,  
  l_btime         IN DATE,  
  l_etime         IN DATE,  
  l_options       IN NUMBER    DEFAULT 0,  
  l_slot_width    IN NUMBER    DEFAULT 0,  
  l_sid           IN NUMBER    DEFAULT NULL,  
  l_sql_id        IN VARCHAR2  DEFAULT NULL,
```

```

    l_wait_class    IN VARCHAR2    DEFAULT NULL,
    l_service_hash  IN NUMBER      DEFAULT NULL,
    l_module        IN VARCHAR2    DEFAULT NULL,
    l_action        IN VARCHAR2    DEFAULT NULL,
    l_client_id     IN VARCHAR2    DEFAULT NULL,
    l_plsql_entry   IN VARCHAR2    DEFAULT NULL,
    l_data_src      IN NUMBER      DEFAULT 0,
    l_container     IN VARCHAR2    DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;

```

## Parameters

**Table 196-11** *ASH\_REPORT\_TEXT Parameters*

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>         | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <code>l_wait_class</code>   | Wait class name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>l_service_hash</code> | Service name hash (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>l_module</code>       | Module name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_action</code>       | Action name (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>l_plsql_entry</code>  | PL/SQL entry point (see Usage Notes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>l_data_src</code>     | Can be used to specify a data source (see Usage Notes) <ul style="list-style-type: none"> <li>1 =&gt; memory (<code>V\$ACTIVE_SESSION_HISTORY</code>)</li> <li>2 =&gt; disk (<code>DBA_HIST_ACTIVE_SESS_HISTORY</code>)</li> <li>0 =&gt; both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                      |
| <code>l_container</code>    | Name of the container for which report activity is limited. Valid values other than <code>NULL</code> (default) should be taken from container names in <code>V\$CONTAINERS</code> . Behavior is as follows: <ul style="list-style-type: none"> <li>If <code>NULL</code>: When connected to a root container the report is on all containers. When connected to a PDB the report is on only that PDB.</li> <li>If not <code>NULL</code>: When connected to a root container the report is on activity from the specified container. When connected to a PDB the report is the same as <code>NULL</code> value for <code>l_container</code> regarding the connected PDB.</li> </ul> <p>Note: If while connected to a PDB you request information from another PDB this produces an empty report.</p> |

## Return Values

The output will be one column of VARCHAR2 (80).

## Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpti.sql` script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (`l_btime` and `l_etime`, respectively) to find all rows in that time range either from memory, or disk, or both. However, using `l_data_src`, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between `l_btime` and `l_etime` found in memory, use

```
l_data_src => 1
```

Similarly, to generate a report on samples found only on disk, use

```
l_data_src => 2
```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghij123'` pass that `SQL_ID` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghij123'
```

**Table 196-12 ASH\_REPORT\_TEXT: Wildcards Allowed (or Not) in Arguments**

| Argument Name               | Comment                                                                                        | Wildcard Allowed |
|-----------------------------|------------------------------------------------------------------------------------------------|------------------|
| <code>l_sid</code>          | Session ID (for example, <code>V\$SESSION.SID</code> )                                         | No               |
| <code>l_sql_id</code>       | SQL ID (for example, <code>V\$SQL.SQL_ID</code> )                                              | Yes              |
| <code>l_wait_class</code>   | Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code> )                          | Yes              |
| <code>l_service_hash</code> | Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code> )                    | No               |
| <code>l_module</code>       | Module name (for example, <code>V\$SESSION.MODULE</code> )                                     | Yes              |
| <code>l_action</code>       | Action name (for example, <code>V\$SESSION.ACTION</code> )                                     | Yes              |
| <code>l_client_id</code>    | Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code> ) | Yes              |
| <code>l_plsql_entry</code>  | PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code> )                               | Yes              |
| <code>l_data_src</code>     | Wildcards are not allowed for <code>l_data_src</code> as it is of numeric datatype             | No               |

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

## 196.3.7 AWR\_DIFF\_REPORT\_HTML Function

This table function displays the AWR Compare Periods report in HTML.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(  
    dbid1      IN NUMBER,  
    inst_num1  IN NUMBER,  
    bid1       IN NUMBER,  
    eid1       IN NUMBER,  
    dbid2      IN NUMBER,  
    inst_num2  IN NUMBER,  
    bid2       IN NUMBER,  
    eid2       IN NUMBER)  
RETURN awrrdpt_text_type_table PIPELINED;
```

### Parameters

**Table 196-13** *AWR\_DIFF\_REPORT\_HTML Parameters*

| Parameter | Description               |
|-----------|---------------------------|
| dbid1     | 1st database identifier   |
| inst_num1 | 1st instance number       |
| bid1      | 1st beginning snapshot ID |
| eid1      | 1st ending snapshot ID    |
| dbid2     | 2nd database identifier   |
| inst_num2 | 2nd instance number       |
| bid2      | 2nd beginning snapshot ID |
| eid2      | 2nd ending snapshot ID    |

### Return Values

The output will be one column of `VARCHAR2(500)`.

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrrdpt.sql` script which prompts users for the required information.

## 196.3.8 AWR\_DIFF\_REPORT\_TEXT Function

This table function displays the AWR Compare Periods report in text.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(  
    dbid1      IN NUMBER,  
    inst_num1  IN NUMBER,  
    bid1       IN NUMBER,  
    eid1       IN NUMBER,  
    dbid2      IN NUMBER,
```

```
inst_num2 IN NUMBER,
bid2      IN NUMBER,
eid2      IN NUMBER)
RETURN awrrpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-14** *AWR\_DIFF\_REPORT\_TEXT Parameters*

| Parameter | Description               |
|-----------|---------------------------|
| dbid1     | 1st database identifier   |
| inst_num1 | 1st instance number       |
| bid1      | 1st beginning snapshot ID |
| eid1      | 1st ending snapshot ID    |
| dbid2     | 2nd database identifier   |
| inst_num2 | 2nd instance number       |
| bid2      | 2nd beginning snapshot ID |
| eid2      | 2nd ending snapshot ID    |

## Return Values

The output will be one column of VARCHAR2 (500).

## Usage Notes

You can call the function directly but Oracle recommends you use the `awrrdrpt.sql` script which prompts users for the required information.

# 196.3.9 AWR\_EXP Procedure

This procedure extracts AWR data from the AWR schema and dump the information into a file. You can specify the snapshot range for the data that you want to extract.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_EXP (
  dmpfile      IN  VARCHAR2  DEFAULT 'awrdat',
  dmpdir       IN  VARCHAR2  DEFAULT 'DATA_PUMP_DIR',
  dbid         IN  NUMBER    DEFAULT NULL,
  bid          IN  NUMBER    DEFAULT 1,
  eid         IN  NUMBER    DEFAULT 1000000);
```

## Parameters

**Table 196-15** *AWR\_EXP Procedure Parameters*

| Parameter | Description                                                                                                                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dmpfile   | The prefix for the name of the extract dump file and log file. The name of the dump file where all the data from the AWR table will be written is <code>dmpfile.dmp</code> . The <code>dmpfile.log</code> log file shows the status of the export job. The default value for the prefix is <code>awrdat</code> . |

**Table 196-15 (Cont.) AWR\_EXP Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dmpdir    | <p>Name of the Directory Object for the file system directory where the extract dump file will be written.</p> <p>The list of Directory Objects can be queried using the DBA_DIRECTORIES view, and a new directory object can be created using the following command: <code>create directory dmpdir as '/directory/path'</code>.</p> <p>The default value is DATA_PUMP_DIR.</p> |
| dbid      | <p>The database ID for the snapshots that you want to export. The default value is NULL, for the local database ID.</p>                                                                                                                                                                                                                                                         |
| bid       | <p>The begin snapshot ID for snapshots to be exported.</p> <p>The default value is 1.</p>                                                                                                                                                                                                                                                                                       |
| eid       | <p>The end Snapshot Id for snapshots to be exported.</p> <p>The default value is 10000000.</p>                                                                                                                                                                                                                                                                                  |

## 196.3.10 AWR\_GLOBAL\_DIFF\_REPORT\_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awrrpt_html_type_table PIPELINED;
```

## Parameters

**Table 196-16** *AWR\_GLOBAL\_DIFF\_REPORT\_HTML Function Parameters*

| Parameter | Description                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid1     | 1st database identifier                                                                                                                                                                                                                  |
| inst_num1 | 1st list of instance numbers. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.                          |
| bid1      | 1st beginning snapshot ID                                                                                                                                                                                                                |
| eid1      | 1st ending snapshot ID                                                                                                                                                                                                                   |
| dbid2     | 2nd database identifier                                                                                                                                                                                                                  |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2      | 2nd beginning snapshot ID                                                                                                                                                                                                                |
| eid2      | 2nd ending snapshot ID                                                                                                                                                                                                                   |

## Return Values

The output will be one column of `VARCHAR2(1500)`.

## 196.3.11 AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      AWRPT_INSTANCE_LIST_TYPE,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      AWRPT_INSTANCE_LIST_TYPE,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
    dbid1      IN      NUMBER,
    inst_num1  IN      VARCHAR2,
    bid1       IN      NUMBER,
    eid1       IN      NUMBER,
    dbid2      IN      NUMBER,
    inst_num2  IN      VARCHAR2,
    bid2       IN      NUMBER,
    eid2       IN      NUMBER)
RETURN awdrpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-17 AWR\_GLOBAL\_DIFF\_REPORT\_TEXT Functions Parameters**

| Parameter | Description                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dbid1     | 1st database identifier                                                                                                                                                                                                                  |
| inst_num1 | 1st list of instance numbers. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.                          |
| bid1      | 1st beginning snapshot ID                                                                                                                                                                                                                |
| eid1      | 1st ending snapshot ID                                                                                                                                                                                                                   |
| dbid2     | 2nd database identifier                                                                                                                                                                                                                  |
| inst_num2 | 2nd list of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| bid2      | 2nd beginning snapshot ID                                                                                                                                                                                                                |
| eid2      | 2nd ending snapshot ID                                                                                                                                                                                                                   |

## Return Values

The output will be one column of `VARCHAR2(320)`.

## 196.3.12 AWR\_GLOBAL\_REPORT\_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN      NUMBER,
    l_inst_num  IN      AWRREP_INSTANCE_LIST_TYPE,
    l_bid       IN      NUMBER,
    l_eid       IN      NUMBER,
    l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
    l_dbid      IN      NUMBER,
    l_inst_num  IN      VARCHAR2,
    l_bid       IN      NUMBER,
    l_eid       IN      NUMBER,
    l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

## Parameters

**Table 196-18** *AWR\_GLOBAL\_REPORT\_HTML Function Parameters*

| Parameter               | Description                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                                  |
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                                |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                                   |
| <code>l_options</code>  | Report level (currently not used)                                                                                                                                                                                                    |

## Return Values

The output will be one column of `VARCHAR2(1500)`.

## 196.3.13 AWR\_GLOBAL\_REPORT\_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT (
    l_dbid          IN    NUMBER,

    l_options       IN    NUMBER DEFAULT 0)
RETURN awrd rpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-19** *AWR\_GLOBAL\_REPORT\_TEXT Function Parameters*

| Parameter               | Description                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                                  |
| <code>l_inst_num</code> | List of instance numbers to be included in report. If set to <code>NULL</code> , all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report. |

**Table 196-19 (Cont.) AWR\_GLOBAL\_REPORT\_TEXT Function Parameters**

| Parameter              | Description                                                                 |
|------------------------|-----------------------------------------------------------------------------|
| <code>l_bid</code>     | Beginning snapshot ID                                                       |
| <code>l_eid</code>     | Ending snapshot ID                                                          |
| <code>l_options</code> | A flag to specify to control the output of the report. Currently, not used. |

**Return Values**

The output will be one column of `VARCHAR2 (320)`.

## 196.3.14 AWR\_IMP Procedure

This procedure loads the AWR data from a dump file into the `SYS` schema.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_IMP(  
    dmpfile          IN    VARCHAR2    DEFAULT 'awrdat',  
    dmpdir           IN    VARCHAR2    DEFAULT 'DATA_PUMP_DIR',  
    new_dbid         IN    NUMBER      DEFAULT NULL);
```

**Parameters****Table 196-20 AWR\_IMP Procedure Parameters**

| Parameter             | Description                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dmpfile</code>  | The prefix for the name of the dump file and log file. This file will be the source of the imported AWR data.<br>The default value is <code>awrdat</code> . |
| <code>dmpdir</code>   | The name of the Directory Object for the file system directory where the load dump file is located.<br>The default value is <code>DATA_PUMP_DIR</code> .    |
| <code>new_dbid</code> | The database ID to be used instead of existing database ID.                                                                                                 |

## 196.3.15 AWR\_REPORT\_HTML Function

This table function displays the AWR report in HTML.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(  
    l_dbid          IN    NUMBER,  
    l_inst_num      IN    NUMBER,  
    l_bid           IN    NUMBER,  
    l_eid           IN    NUMBER,  
    l_options       IN    NUMBER DEFAULT 0)  
RETURN awrrpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-21** *AWR\_REPORT\_HTML Parameters*

| Parameter               | Description                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                                                                                                                                                                                                                                                                   |
| <code>l_inst_num</code> | Instance number                                                                                                                                                                                                                                                                                                       |
| <code>l_bid</code>      | Beginning snapshot ID                                                                                                                                                                                                                                                                                                 |
| <code>l_eid</code>      | Ending snapshot ID                                                                                                                                                                                                                                                                                                    |
| <code>l_options</code>  | A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"><li><code>l_options = 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li></ul> |

## Return Values

The output will be one column of `VARCHAR2(1500)`.

## Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## 196.3.16 AWR\_REPORT\_TEXT Function

This table function displays the AWR report in text.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(  
    l_dbid          IN    NUMBER,  
    l_inst_num      IN    NUMBER,  
    l_bid           IN    NUMBER,  
    l_eid           IN    NUMBER,  
    l_options       IN    NUMBER DEFAULT 0)  
RETURN awrrpt_text_type_table PIPELINED;
```

## Parameters

**Table 196-22** *AWR\_REPORT\_TEXT Parameters*

| Parameter               | Description           |
|-------------------------|-----------------------|
| <code>l_dbid</code>     | Database identifier   |
| <code>l_inst_num</code> | Instance number       |
| <code>l_bid</code>      | Beginning snapshot ID |
| <code>l_eid</code>      | Ending snapshot ID    |

**Table 196-22 (Cont.) AWR\_REPORT\_TEXT Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_options</code> | <p>A flag to specify to control the output of the report. Currently, Oracle supports one value:</p> <ul style="list-style-type: none"> <li><code>l_options = 8</code>. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.</li> </ul> |

**Return Values**

The output will be one column of `VARCHAR2(80)`.

**Usage Notes**

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

## 196.3.17 AWR\_SET\_REPORT\_THRESHOLDS Procedure

This procedure configure specified report thresholds, including the number of rows in the report.

**Syntax**

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (
    top_n_events          IN  NUMBER DEFAULT NULL,
    top_n_files           IN  NUMBER DEFAULT NULL,
    top_n_segments       IN  NUMBER DEFAULT NULL,
    top_n_services       IN  NUMBER DEFAULT NULL,
    top_n_sql            IN  NUMBER DEFAULT NULL,
    top_n_sql_max        IN  NUMBER DEFAULT NULL,
    top_sql_pct          IN  NUMBER DEFAULT NULL,
    shmem_threshold      IN  NUMBER DEFAULT NULL,
    versions_threshold   IN  NUMBER DEFAULT NULL,
    top_n_disks          IN  NUMBER DEFAULT NULL,
    outlier_pct          IN  NUMBER DEFAULT NULL,
    outlier_cpu_pct      IN  NUMBER DEFAULT NULL);
```

**Parameters****Table 196-23 AWR\_SET\_REPORT\_THRESHOLDS Procedure Parameters**

| Parameter                   | Description                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------|
| <code>top_n_events</code>   | Number of most significant wait events to be included                                                                |
| <code>top_n_files</code>    | Number of most active files to be included                                                                           |
| <code>top_n_segments</code> | Number of most active segments to be included                                                                        |
| <code>top_n_services</code> | Number of most active services to be included                                                                        |
| <code>top_n_sql</code>      | Number of most significant SQL statements to be included                                                             |
| <code>top_n_sql_max</code>  | Number of SQL statements to be included if their activity is greater than that specified by <code>top_sql_pct</code> |

**Table 196-23 (Cont.) AWR\_SET\_REPORT\_THRESHOLDS Procedure Parameters**

| Parameter          | Description                                                                    |
|--------------------|--------------------------------------------------------------------------------|
| top_sql_pct        | Significance threshold for SQL statements between top_n_sql and top_n_sql_max  |
| shmem_threshold    | Shared memory low threshold                                                    |
| versions_threshold | Plan version count low threshold                                               |
| top_n_disks        | Number of cell disks with most I/O                                             |
| outlier_pct        | Percentage of maximum capacity before displaying outliers for Exadata sections |
| outlier_cpu_pct    | Threshold for mean percentage CPU to display outliers                          |

#### User Notes

- The effect of each setting depends on the type of report being generated as well as on the underlying AWR data. Not all settings are meaningful for each report type. Invalid settings (such as negative numbers) are ignored.
- Settings are effective only in the context of the session that executes the AWR\_SET\_REPORT\_THRESHOLDS procedure. For example, to get a report that lists top 12 segments as compared to the default, one can invoke as follows:

```
DBMS_WORKLOAD_REPOSITORY.AWR_SET_REPORT_THRESHOLDS (top_n_segments=>12);
```

## 196.3.18 AWR\_SQL\_REPORT\_HTML Function

This table function displays the AWR SQL Report in HTML format.

#### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML (
    l_dbid      IN      NUMBER,
    l_inst_num  IN      NUMBER,
    l_bid       IN      NUMBER,
    l_eid       IN      NUMBER,
    l_sqlid     IN      VARCHAR2,
    l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

#### Parameters

**Table 196-24 AWR\_SQL\_REPORT\_HTML Parameters**

| Parameter  | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| l_dbid     | Database identifier                                                         |
| l_inst_num | Instance number                                                             |
| l_bid      | Beginning snapshot ID                                                       |
| l_eid      | Ending snapshot ID                                                          |
| l_sqlid    | SQL ID of statement to be analyzed                                          |
| l_options  | A flag to specify to control the output of the report. Currently, not used. |

### Return Values

The output will be one column of `VARCHAR2(500)`.

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

## 196.3.19 AWR\_SQL\_REPORT\_TEXT Function

This table function displays the AWR SQL Report in text format.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(  
    l_dbid          IN    NUMBER,  
    l_inst_num      IN    NUMBER,  
    l_bid           IN    NUMBER,  
    l_eid           IN    NUMBER,  
    l_sqlid         IN    VARCHAR2,  
    l_options       IN    NUMBER DEFAULT 0)  
RETURN awrrpt_text_type_table PIPELINED;
```

### Parameters

**Table 196-25** *AWR\_SQL\_REPORT\_TEXT Parameters*

| Parameter               | Description                                                               |
|-------------------------|---------------------------------------------------------------------------|
| <code>l_dbid</code>     | Database identifier                                                       |
| <code>l_inst_num</code> | Instance number                                                           |
| <code>l_bid</code>      | Beginning snapshot ID                                                     |
| <code>l_eid</code>      | Ending snapshot ID                                                        |
| <code>l_sqlid</code>    | SQL ID of statement to be analyzed                                        |
| <code>l_options</code>  | Flag to specify to control the output of the report. Currently, not used. |

### Return Values

The output will be one column of `VARCHAR2(120)`.

### Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

## 196.3.20 CONTROL\_REstricted\_SNAPSHOT Procedure

This procedure controls the AWR snapshot creation for a database in the *restricted session* mode. If this procedure is not used, then by default, the AWR snapshots cannot be created for

a database in the *restricted session* mode. This procedure affects the local database on which it is executed.

#### Note:

To enable AWR snapshot creation for an Oracle RAC in the *restricted session* mode, this procedure must be executed on every database instance in the Oracle RAC.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CONTROL_RESTRICTED_SNAPSHOT(
    allow IN BOOLEAN);
```

### Parameters

**Table 196-26 CONTROL\_RESTRICTED\_SNAPSHOT Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allow     | This parameter can have one of the following values: <ul style="list-style-type: none"> <li>TRUE: AWR snapshots can be created for the database in the <i>restricted session</i> mode.</li> <li>FALSE: AWR snapshots cannot be created for the database in the <i>restricted session</i> mode.</li> </ul> |

## 196.3.21 CREATE\_BASELINE Functions and Procedures

This function and procedure creates a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
    start_snap_id    IN    NUMBER,
    end_snap_id      IN    NUMBER,
    baseline_name     IN    VARCHAR2,
    dbid              IN    NUMBER DEFAULT NULL,
    expiration        IN    NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(

expiration       IN  NUMBER DEFAULT NULL);
RETURN NUMBER;

```

### Parameters

**Table 196-27 CREATE\_BASELINE Function & Procedure Parameters**

| Parameter     | Description                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| start_snap_id | Start snapshot sequence number for the baseline.                                                                                          |
| end_snap_id   | End snapshot sequence number for the baseline.                                                                                            |
| start_time    | Start time for the baseline.                                                                                                              |
| end_time      | End time for the baseline.                                                                                                                |
| baseline_name | Name of baseline.                                                                                                                         |
| dbid          | Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.                   |
| expiration    | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL. |

### Exceptions

- An error will be returned if this baseline name already exists in the system.
- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

### Examples

This example creates a baseline (named 'oltp\_peakload\_bl') between snapshots 105 and 107 for the local database:

```

EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
                                                    end_snap_id   => 107,
                                                    baseline_name => 'oltp_peakload_bl');

```

If you query the DBA\_HIST\_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

## 196.3.22 CREATE\_BASELINE\_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

### Syntax

Specifies a template for generating a baseline for a single time period in the future.

```

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  template_name   IN VARCHAR2,
  expiration      IN NUMBER,
  dbid            IN NUMBER DEFAULT NULL);

```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE (
    day_of_week      IN VARCHAR2,
    hour_in_day      IN NUMBER,
    duration         IN NUMBER,
    start_time       IN DATE,
    end_time         IN DATE,
    baseline_name_prefix IN VARCHAR2,
    template_name    IN VARCHAR2,
    expiration       IN NUMBER,
    dbid             IN NUMBER   DEFAULT NULL);
```

## Parameters

**Table 196-28 CREATE\_BASELINE\_TEMPLATE Procedure Parameters**

| Parameter            | Description                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| start_time           | Start Time for the baseline to be created'                                                                                                           |
| end_time             | End Time for the baseline to be created                                                                                                              |
| baseline_name        | Name of baseline to be created                                                                                                                       |
| template_name        | Name for the template                                                                                                                                |
| expiration           | Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL             |
| dbid                 | Database ID for which the baseline template needs to be used. If NULL, this takes the database identifier of the local database. Defaults to NULL.   |
| day_of_week          | Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY. |
| hour_in_day          | Value of 0-23 to specify the Hour in the Day the baseline should start                                                                               |
| duration             | Duration (in number of hours) after hour in the day that the baseline should last                                                                    |
| baseline_name_prefix | Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.                |

## 196.3.23 CREATE\_REMOTE\_SNAPSHOT Function and Procedure

This function and procedure create a remote snapshot using the Remote Management Framework (RMF). The function returns the snapshot ID.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_id      IN NUMBER,
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT');
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_id      IN NUMBER,
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT')
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT (
    node_name      IN VARCHAR2,
```

```
topology_name IN VARCHAR2 DEFAULT NULL,  
flush_level   IN VARCHAR2 DEFAULT 'BESTFIT');  
  
DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(  
    node_name      IN VARCHAR2,  
    topology_name  IN VARCHAR2 DEFAULT NULL,  
    flush_level    IN VARCHAR2 DEFAULT 'BESTFIT')  
RETURN NUMBER;
```

Parameters

Table 196-29 CREATE\_REMOTE\_SNAPSHOT Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_id       | RMF node identifier of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| node_name     | RMF node name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| topology_name | RMF topology name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| flush_level   | The flush level can be one of the following: <ul style="list-style-type: none"><li>BESTFIT:<br/>Uses the default value depending on the type of snapshot being taken.</li><li>LITE:<br/>Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container.</li><li>TYPICAL:<br/>Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database.</li><li>ALL:<br/>Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.</li></ul> |

Examples

This example creates a remote snapshot of the database having the RMF node identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_REMOTE_SNAPSHOT(10);
```

If you query the DBA\_HIST\_SNAPSHOT view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

196.3.24 CREATE\_SNAPSHOT Function and Procedure

This function and procedure create a snapshot. The function returns the snapshot ID. If both, the database ID and the database name are not specified in this subprogram, then the snapshot is created for the local database on which the subprogram is executed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(  
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
```

```

        dbid          IN NUMBER    DEFAULT NULL,
        source_name IN VARCHAR2    DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
    flush_level IN VARCHAR2 DEFAULT 'BESTFIT',
    dbid        IN NUMBER    DEFAULT NULL,
    source_name IN VARCHAR2    DEFAULT NULL)
RETURN NUMBER;
```

## Parameters

**Table 196-30 CREATE\_SNAPSHOT Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flush_level | <p>The flush level can be one of the following:</p> <ul style="list-style-type: none"> <li><b>BESTFIT:</b><br/>Uses the default value depending on the type of snapshot being taken.</li> <li><b>LITE:</b><br/>Lightweight snapshot. Only the most important statistics are collected. This is default for a pluggable database (PDB) and application container.</li> <li><b>TYPICAL:</b><br/>Regular snapshot. Most of the statistics are collected. This is default for a container database root (CDB root) and non-CDB database.</li> <li><b>ALL:</b><br/>Heavyweight snapshot. All the possible statistics are collected. This consumes a considerable amount of disk space and takes a long time to create.</li> </ul> |
| dbid        | Database ID of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| source_name | Name of the database for which the snapshot needs to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Examples

This example creates a snapshot of the local database with the flush level of `ALL`:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT('ALL');
```

If you query the `DBA_HIST_SNAPSHOT` view after executing the above procedure, you will see a new snapshot record added to the Automatic Workload Repository (AWR).

## 196.3.25 DROP\_BASELINE Procedure

This procedure drops a previously-defined baseline.

### Syntax

```

DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
    baseline_name IN VARCHAR2,
    cascade       IN BOOLEAN  DEFAULT FALSE,
    dbid          IN NUMBER    DEFAULT NULL);
```

## Parameters

**Table 196-31 DROP\_BASELINE Parameters**

| Parameter     | Description                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------|
| baseline_name | Name of baseline to drop from the system                                                                                   |
| cascade       | If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed. |
| dbid          | Database ID for which the baseline needs to be dropped (defaults to local DBID).                                           |

## Examples

This example drops the baseline 'oltp\_peakload\_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (  
    baseline_name => 'oltp_peakload_bl');
```

If you query the DBA\_HIST\_BASELINE view after the DROP\_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA\_HIST\_SNAPSHOT view to find that the underlying snapshots are left intact.

## 196.3.26 DROP\_BASELINE\_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(  
    template_name    IN VARCHAR2,  
    dbid             IN NUMBER    DEFAULT NULL);
```

## Parameters

**Table 196-32 DROP\_BASELINE\_TEMPLATE Procedure Parameters**

| Parameter     | Description                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| template_name | Name of the template to remove                                                                                                                        |
| dbid          | Database ID for which the baseline template needs to be dropped. If NULL, this takes the database identifier of the local database. Defaults to NULL. |

## 196.3.27 DROP\_SNAPSHOT\_RANGE Procedure

This procedure drops a range of snapshots.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(  
    low_snap_id      IN    NUMBER,  
    high_snap_id     IN    NUMBER,  
    dbid             IN    NUMBER    DEFAULT NULL);
```

## Parameters

**Table 196-33 DROP\_SNAPSHOT\_RANGE Procedure Parameters**

| Parameter    | Description                            |
|--------------|----------------------------------------|
| low_snap_id  | Low snapshot id of snapshots to drop.  |
| high_snap_id | High snapshot id of snapshots to drop. |
| dbid         | Database id (defaults to local DBID).  |

## Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

## 196.3.28 LOCAL\_AWR\_DBID Function

This function returns the database identifier for the local AWR database.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.LOCAL_AWR_DBID()  
RETURN NUMBER;
```

## 196.3.29 MODIFY\_BASELINE\_WINDOW\_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(  
    window_size    IN    NUMBER,  
    dbid           IN    NUMBER    DEFAULT NULL);
```

## Parameters

**Table 196-34 MODIFY\_BASELINE\_WINDOW\_SIZE Procedure Parameters**

| Parameter   | Description                                                                |
|-------------|----------------------------------------------------------------------------|
| window_size | New Window size for the default Moving Window Baseline, in number of days. |
| dbid        | Database ID (defaults to local DBID).                                      |

## Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY\\_SNAPSHOT\\_SETTINGS Procedures](#) can be used to adjust the retention setting. A moving window can be set to a maximum of 13 weeks.

# 196.3.30 MODIFY\_SNAPSHOT\_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

## Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (  
    retention          IN  NUMBER      DEFAULT NULL,  
    interval           IN  NUMBER      DEFAULT NULL,  
    topnsql            IN  NUMBER      DEFAULT NULL,  
    dbid               IN  NUMBER      DEFAULT NULL,  
    tablespace_name    IN  VARCHAR2    DEFAULT NULL);
```

## Parameters

**Table 196-35    MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retention | <p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the <a href="#">MODIFY_BASELINE_WINDOW_SIZE Procedure</a> can be used to adjust the window size.</p> |
| interval  | <p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range <code>MIN_INTERVAL</code> (10 minutes) to <code>MAX_INTERVAL</code> (1 year).</p> <p>If <code>ZERO</code> is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the current value is preserved.</p>                                                                                                                                                                                                                                                      |

**Table 196-35 (Cont.) MODIFY\_SNAPSHOT\_SETTINGS Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| topnsql         | <ul style="list-style-type: none"> <li>If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting.</li> <li>If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.</li> </ul> |
| dbid            | Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| tablespace_name | Specify a user-defined tablespace for storing AWR data (snapshot data). If this parameter is not used, then AWR data is stored in the SYSAUX tablespace by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
    interval => 60,
    retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

## 196.3.31 PURGE\_SQL\_DETAILS Procedure

This procedure purges SQL details, specifically rows from `WRH$_SQLTEXT`, `WRH$_SQL_PLAN`, and `WRH$_SQL_BIND_METADATA` that do not have corresponding rows (`DBID`, `SQL_ID`) in `WRH$_SQLSTAT`.

The subprogram calls for the `DBID` for which to run the purge. If the `DBID` is not specified, the database `DBID` is used. You can constrain runtime by specifying the maximum number of rows to purge per table. If no maximum is specified, the subprograms tries to purge all applicable rows.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.PURGE_SQL_DETAILS(
    numrows IN NUMBER DEFAULT NULL,
    dbid    IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 196-36 PURGE\_SQL\_DETAILS Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| numrows   | Number of rows                      |
| dbid      | Database ID (default to local DBID) |

## 196.3.32 REGISTER\_REMOTE\_DATABASE Procedures

This procedure registers a remote database in the Automatic Workload Repository (AWR) using the Remote Management Framework (RMF).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(  
    node_id IN NUMBER);
```

```
DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(  
    node_name      IN VARCHAR2,  
    topology_name  IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 196-37 REGISTER\_REMOTE\_DATABASE Parameters**

| Parameter     | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| node_id       | RMF node identifier of the database that needs to be registered in the AWR. |
| node_name     | RMF node name of the database that needs to be registered in the AWR.       |
| topology_name | RMF topology name of the database that needs to be registered in the AWR.   |

### Examples

This example registers the remote database having the RMF node identifier of 10 in the AWR:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.REGISTER_REMOTE_DATABASE(10);
```

## 196.3.33 REMOVE\_COLORED\_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.REMOVE_COLORED_SQL(  
    sql_id      IN VARCHAR2,  
    dbid        IN NUMBER DEFAULT NULL);
```

## Parameters

**Table 196-38** *REMOVE\_COLORED\_SQL Procedure Parameters*

| Parameter | Description                           |
|-----------|---------------------------------------|
| sql_id    | 13-character external SQL ID          |
| dbid      | Optional dbid, defaults to Local DBID |

## 196.3.34 RENAME\_BASELINE Procedure

This procedure renames a baseline.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(  
    old_baseline_name    IN  VARCHAR2,  
    new_baseline_name    IN  VARCHAR2,  
    dbid                 IN  NUMBER    DEFAULT NULL);
```

## Parameters

**Table 196-39** *RENAME\_BASELINE Procedure Parameters*

| Parameter         | Description                                                                      |
|-------------------|----------------------------------------------------------------------------------|
| old_baseline_name | Old baseline name.                                                               |
| new_baseline_name | New baseline name.                                                               |
| dbid              | Database ID for which the baseline needs to be renamed (defaults to local DBID). |

## 196.3.35 SELECT\_BASELINE\_DETAILS Function

This table function shows the values of the metrics corresponding to a baseline for a range of snapshots.

This table function returns an object of [AWR\\_BASELINE\\_METRIC\\_TYPE Object Type](#).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_DETAILS(  
    l_baseline_id    IN  NUMBER,  
    l_begin_snap     IN  NUMBER DEFAULT NULL,  
    l_end_snap       IN  NUMBER DEFAULT NULL,  
    l_dbid           IN  NUMBER DEFAULT NULL)  
RETURN awrbl_details_type_table PIPELINED;
```

## Parameters

**Table 196-40 SELECT\_BASELINE\_DETAILS Function Parameters**

| Parameter                  | Description                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_baseline_id</code> | ID of the baseline for which the statistics need to be retrieved. Specifying the value 0 returns the statistics for the moving window baseline.                                        |
| <code>l_begin_snap</code>  | Start snapshot sequence number for the baseline.                                                                                                                                       |
| <code>l_end_snap</code>    | End snapshot sequence number for the baseline.                                                                                                                                         |
| <code>l_dbid</code>        | Database identifier for the baseline. If its value is set to <code>NULL</code> , then the database identifier for the local database is used. Its default value is <code>NULL</code> . |

## 196.3.36 SELECT\_BASELINE\_METRIC Function

This table function shows the values of the metrics corresponding to a baseline for all the snapshots.

This table function returns an object of [AWR\\_BASELINE\\_METRIC\\_TYPE Object Type](#).

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRIC(
    l_baseline_name    IN VARCHAR2,
    l_dbid             IN NUMBER DEFAULT NULL,
    l_instance_num     IN NUMBER DEFAULT NULL)
RETURN awr_metric_type_table PIPELINED;
```

## Parameters

**Table 196-41 SELECT\_BASELINE\_METRIC Function Parameters**

| Parameter                    | Description                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>l_baseline_name</code> | Name of the baseline for which the metrics need to be viewed.                                                                                                                |
| <code>l_dbid</code>          | Database identifier for the baseline. If set to <code>NULL</code> , the database identifier for the local database is used. Default is <code>NULL</code> .                   |
| <code>l_instance_num</code>  | The instance number for which the metrics need to be viewed. If set to <code>NULL</code> , metrics for the local database instance are shown. Default is <code>NULL</code> . |

## 196.3.37 UNREGISTER\_REMOTE\_DATABASE Procedures

This procedure removes all the statistics, metadata, partitions, and so on of a remote database from the Automatic Workload Repository (AWR). After executing this procedure, the remote database cannot be used for any AWR operations, such as creating remote snapshots.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_id           IN NUMBER,
    remote_check      IN BOOLEAN DEFAULT TRUE);
```

```
DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE (
    node_name      IN VARCHAR2,
    topology_name  IN VARCHAR2 DEFAULT NULL,
    remote_check   IN BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 196-42 UNREGISTER\_REMOTE\_DATABASE Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_id       | Identifier of the remote database whose data needs to be removed from the AWR.                                                                                                                                                                                                                                                                                                                                            |
| node_name     | Name of the remote database whose data needs to be removed from the AWR.                                                                                                                                                                                                                                                                                                                                                  |
| topology_name | RMF topology name of the remote database.                                                                                                                                                                                                                                                                                                                                                                                 |
| remote_check  | If set to <b>TRUE</b> , the remote database's metadata is validated before removing its data from the AWR. This option requires the remote database to be available.<br><br>If set to <b>FALSE</b> , the remote database's data is removed from the AWR without validating its metadata. This option must be selected to unregister a remote database that is not available (it is offline or there is a network outage). |

### Examples

This example removes the AWR data related to the remote database having the database identifier of 10:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.UNREGISTER_REMOTE_DATABASE(10);
```

## 196.3.38 UPDATE\_DATAFILE\_INFO Procedure

This procedure updates the data file and tablespace information stored in the Automatic Workload Repository (AWR) with the current information in the database. This procedure is useful when a data file or a tablespace has been moved or renamed. As this change is not always captured in the next snapshot, AWR report may not show the most current information.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_DATAFILE_INFO();
```

## 196.3.39 UPDATE\_OBJECT\_INFO Procedure

This procedure updates rows of `WRH$_SEG_STAT_OBJ` table that represent objects in the local database. It attempts to determine the current names for all object belonging to the local database, except those with 'MISSING' and/or 'TRANSIENT' values in the name columns.

The amount of work performed at each invocation of this routine may be controlled by setting the input parameter.

### Syntax

```
DBMS_WORKLOAD_REPOSITORY.UPDATE_OBJECT_INFO(
    maxrows IN NUMBER DEFAULT 0);
```

## Parameters

**Table 196-43 UPDATE\_OBJECT\_INFO Procedure Parameters**

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| maxrows   | Maximum number of rows to be updated. Default= 0, meaning there is no limit. |

## DBMS\_XA

The `DBMS_XA` package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL\*Plus sessions or processes using PL/SQL.

The chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Data Structures](#)
- [Summary of DBMS\\_XA Subprograms](#)

### See Also:

*Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

## 197.1 DBMS\_XA Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

## 197.2 DBMS\_XA Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`. Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` or `READ` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

`FORCE ANY TRANSACTION` privilege is required for users who need to manipulate XA transactions created by other users.

## 197.3 DBMS\_XA Constants

The `DBMS_XA` package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in [Table 197-1](#) for use in the flag field of the `XA_START` Function and the `XA_END` Function.

**Table 197-1 DBMS\_XA Constants for Flag Field of XA\_START & XA\_END Functions**

| Name      | Type        | Value                                      | Description                                                       |
|-----------|-------------|--------------------------------------------|-------------------------------------------------------------------|
| TMNOFLAGS | PLS_INTEGER | 00000000                                   | Indicates no flag value is selected.                              |
| TMSUCCESS | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('04000000') | Dissociates caller from transaction branch                        |
| TMJOIN    | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('00200000') | Caller is joining existing transaction branch.                    |
| TMSUSPEND | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('02000000') | Caller is suspending, not ending, association                     |
| TMRESUME  | PLS_INTEGER | UTL_RAW.CAST_TO_BINARY_INTEGER('08000000') | Caller is resuming association with suspended transaction branch. |

The `DBMS_XA` package uses the constants shown in [Table 197-2](#) for Possible Return Values

**Table 197-2 DBMS\_XA Constants for Possible Return Values**

| Name           | Type        | Value       | Description                                                         |
|----------------|-------------|-------------|---------------------------------------------------------------------|
| XA_RBBASE      | PLS_INTEGER | 100         | Inclusive lower bound of the rollback codes                         |
| XA_RBROLLBACK  | PLS_INTEGER | XA_RBBASE   | Rollback was caused by an unspecified reason                        |
| XA_RBCOMMFAIL  | PLS_INTEGER | XA_RBBASE+1 | Rollback was caused by a communication failure                      |
| XA_RBDEADLOCK  | PLS_INTEGER | XA_RBBASE+2 | Deadlock was detected                                               |
| XA_RBINTEGRITY | PLS_INTEGER | XA_RBBASE+3 | Condition that violates the integrity of the resources was detected |
| XA_RBOTHER     | PLS_INTEGER | XA_RBBASE+4 | Resource manager rolled back the transaction for an unlisted reason |
| XA_RBPROTO     | PLS_INTEGER | XA_RBBASE+5 | Protocol error occurred in the resource manager                     |
| XA_RBTIMEOUT   | PLS_INTEGER | XA_RBBASE+6 | transaction branch took long                                        |
| XA_RBTRANSIENT | PLS_INTEGER | XA_RBBASE+7 | May retry the transaction branch                                    |

**Table 197-2 (Cont.) DBMS\_XA Constants for Possible Return Values**

| Name         | Type        | Value          | Description                                                                            |
|--------------|-------------|----------------|----------------------------------------------------------------------------------------|
| XA_RBEND     | PLS_INTEGER | XA_RBTRANSIENT | Inclusive upper bound of the rollback codes                                            |
| XA_NOMIGRATE | PLS_INTEGER | 9              | Transaction branch may have been heuristically completed                               |
| XA_HEURHAZ   | PLS_INTEGER | 8              | Transaction branch may have been heuristically completed                               |
| XA_HEURCOM   | PLS_INTEGER | 7              | Transaction branch has been heuristically committed                                    |
| XA_HEURRB    | PLS_INTEGER | 6              | Transaction branch has been heuristically rolled back                                  |
| XA_HEURMIX   | PLS_INTEGER | 5              | Some of the transaction branches have been heuristically committed, others rolled back |
| XA_RETRY     | PLS_INTEGER | 4              | Routine returned with no effect and may be re-issued                                   |
| XA_RDONLY    | PLS_INTEGER | 3              | Transaction was read-only and has been committed                                       |
| XA_OK        | PLS_INTEGER | 0              | Normal execution                                                                       |
| XAER_ASYNC   | PLS_INTEGER | -2             | Asynchronous operation already outstanding                                             |
| XAER_RMERR   | PLS_INTEGER | -3             | Resource manager error occurred in the transaction branch                              |
| XAER_NOTA    | PLS_INTEGER | -4             | XID is not valid                                                                       |
| XAER_INVAL   | PLS_INTEGER | -5             | Invalid arguments were given                                                           |
| XAER_PROTO   | PLS_INTEGER | -6             | Routine invoked in an improper context                                                 |
| XAER_RMFAIL  | PLS_INTEGER | -7             | Resource manager unavailable                                                           |
| XAER_DUPID   | PLS_INTEGER | -8             | XID already exists                                                                     |
| XAER_OUTSIDE | PLS_INTEGER | -9             | Resource manager doing work outside global transaction                                 |

## 197.4 DBMS\_XA Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been called so that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple

connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

## 197.5 DBMS\_XA Data Structures

The DBMS\_XA package uses this OBJECT type and associated TABLE type.

### OBJECT Types

- [DBMS\\_XA\\_XID Object Type](#)

### TABLE Types

- [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

### 197.5.1 DBMS\_XA DBMS\_XA\_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

#### Note:

For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

### Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
    formatid      NUMBER,
    gtrid         RAW(64),
    bqual         RAW(64),
    constructor function DBMS_XA_XID(
        gtrid      IN  NUMBER)
        RETURN SELF AS RESULT,
    constructor function DBMS_XA_XID (
        gtrid      IN  RAW,
        bqual      IN  RAW)
        RETURN SELF AS RESULT,
    constructor function DBMS_XA_XID(
        formatid   IN  NUMBER,
        gtrid      IN  RAW,
        bqual      IN  RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
        RETURN SELF AS RESULT)
```

## Attributes

**Table 197-3 DBMS\_XA\_XID Object Type**

| Attribute | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| formatid  | Format identifier, a number identifying different transaction managers (TM)                                    |
| gtrid     | Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes |
| bqual     | Branch qualifier, of which the maximum size is 64 bytes                                                        |

## 197.5.2 DBMS\_XA DBMS\_XA\_XID\_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

### Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

## 197.6 Summary of DBMS\_XA Subprograms

This table lists the DBMS\_XA subprograms and briefly describes them.

**Table 197-4 DBMS\_XA Package Subprograms**

| Subprogram                              | Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <a href="#">DIST_TXN_SYNC Procedure</a> | Used in recovery of synchronization when utilizing Oracle Real Application Clusters (Oracle RAC)                      |
| <a href="#">XA_COMMIT Function</a>      | Commits the global transaction specified by <code>xid</code>                                                          |
| <a href="#">XA_END Function</a>         | Disassociates the current session from the transaction branch specified by <code>xid</code>                           |
| <a href="#">XA_FORGET Function</a>      | Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.             |
| <a href="#">XA_GETLASTOER Function</a>  | Obtains the last Oracle error code, in case of failure of previous XA calls.                                          |
| <a href="#">XA_PREPARE Function</a>     | Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible |
| <a href="#">XA_RECOVER Function</a>     | Obtains a list of prepared or heuristically completed transaction branches from a resource manager                    |
| <a href="#">XA_ROLLBACK Function</a>    | Informs the resource manager to roll back work done on behalf of a transaction branch                                 |
| <a href="#">XA_SETTIMEOUT Function</a>  | Sets the transaction timeout in seconds for the current session                                                       |
| <a href="#">XA_START Function</a>       | Associates the current session with the transaction branch specified by <code>xid</code>                              |

## 197.6.1 DIST\_TXN\_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (Oracle RAC) instances fails.

### Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

## 197.6.2 XA\_COMMIT Function

This function commits the global transaction specified by `xid`.

### Syntax

```
DBMS_XA.XA_COMMIT (  
    xid          IN  DBMS_XA_XID,  
    onePhase     IN  BOOLEAN)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-5** XA\_COMMIT Function Parameters

| Parameter             | Description                                      |
|-----------------------|--------------------------------------------------|
| <code>xid</code>      | See <a href="#">DBMS_XA_XID Object Type</a>      |
| <code>onePhase</code> | If <code>TRUE</code> , apply single phase commit |

### Return Values

See [Table 197-2](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

### Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

## 197.6.3 XA\_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

### Syntax

```
DBMS_XA.XA_END (  
    xid    IN  DBMS_XA_XID,  
    flag   IN  PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-6** *XA\_END Function Parameters*

| Parameter         | Description                                 |
|-------------------|---------------------------------------------|
| <code>xid</code>  | See <a href="#">DBMS_XA_XID Object Type</a> |
| <code>flag</code> | See <a href="#">Table 197-1</a> .           |

### Return Values

See [Table 197-2](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVAL`, `XAER_PROTO`, or `XA_RB*`.

### Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session.

## 197.6.4 XA\_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

### Syntax

```
DBMS_XA.XA_FORGET (  
    xid          IN  DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-7** XA\_FORGET Function Parameters

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| xid       | See <a href="#">DBMS_XA_XID Object Type</a> |

### Return Values

See [Table 197-2](#). Possible return values are XA\_OK, XAER\_RMERR, XAER\_RMFAIL, XAER\_NOTA, XAER\_INVAL, or XAER\_PROTO.

## 197.6.5 XA\_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

### Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

### Return Values

The return value carries the last Oracle error code.

## 197.6.6 XA\_PREPARE Function

This function prepares the transaction branch specified in xid for committing the transaction subsequently if possible.

### Syntax

```
DBMS_XA.XA_PREPARE (  
    xid  IN  DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-8** XA\_PREPARE Function Parameters

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| xid       | See <a href="#">DBMS_XA_XID Object Type</a> |

### Return Values

See [Table 197-2](#). Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

### Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

## 197.6.7 XA\_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

### Syntax

```
DBMS_XA.XA_RECOVER  
RETURN DBMS_XA_XID_ARRAY;
```

### Return Values

See [DBMS\\_XA\\_XID\\_ARRAY Table Type](#)

### Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

## 197.6.8 XA\_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

### Syntax

```
DBMS_XA.XA_ROLLBACK (  
    xid          IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-9** XA\_ROLLBACK Function Parameters

| Parameter        | Description                                 |
|------------------|---------------------------------------------|
| <code>xid</code> | See <a href="#">DBMS_XA_XID Object Type</a> |

### Return Values

See [Table 197-2](#). Possible return values are: XA\_OK, XA\_RB\*, XA\_HEURHAZ, XA\_HEURCOM, XA\_HEURRB, or XA\_HEURMIX.

### Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege `FORCE ANY TRANSACTION` must be granted to the user.

## 197.6.9 XA\_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

### Syntax

```
DBMS_XA.XA_SETTIMEOUT (  
    seconds IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 197-10** XA\_SETTIMEOUT Function Parameters

| Parameter | Description                                                                                                                                                                                                      |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| seconds   | The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds. |

### Return Values

See [Table 197-2](#). Possible return values are XA\_OK, XAER\_RMERR, XAER\_RMFAIL, or XAER\_INVAL.

### Usage Notes

Only if return value is XA\_OK, is the timeout value successfully set.

## 197.6.10 XA\_START Function

This function associates the current session with a transaction branch specified by the `xid`.

### Syntax

```
DBMS_XA.XA_START (  
    xid IN DBMS_XA_XID,    flag IN PLS_INTEGER) RETURN PLS_INTEGER;
```

### Parameters

**Table 197-11** XA\_START Function Parameters

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| xid       | See <a href="#">DBMS_XA_XID Object Type</a> |
| flag      | See <a href="#">Table 197-1</a> .           |

## Return Values

See [Table 197-2](#)

## Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in flag, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in flag, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVALID`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations. Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

## DBMS\_XDB

The `DBMS_XDB` package supports the following features:

The `DBMS_XDB` package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- [DBMS\\_XDB Overview](#)
- [DBMS\\_XDB Security Model](#)
- [DBMS\\_XDB Constants](#)
- [Summary of DBMS\\_XDB Subprograms](#)

### See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

## 198.1 DBMS\_XDB Overview

`DBMS_XDB` provides a range of management functions.

The `DBMS_XDB` package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), and [CREATEFOLDER Function](#) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), and [CHANGEPRIVILEGES Function](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB\\_TABLESPACE Function](#) and the

DBMS\_XDB\_ADMIN.MOVEXDB\_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

## 198.2 DBMS\_XDB Security Model

Owned by XDB, the DBMS\_XDB package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is SYS or XDB, or the current user has the XDBADMIN or DBA role.

## 198.3 DBMS\_XDB Constants

All constants described in the following table are deprecated in Oracle Release 12c.

They are relocated to either the DBMS\_XDB\_CONFIG package or the DBMS\_XDB\_REPOS package. The specifics of transference in each case are detailed in the **Relocated** column.

Oracle recommends that you do not use constants in their DBMS\_XDB context in new applications. Support for deprecated features is for backward compatibility only and may be terminated in future releases.

**Table 198-1 DBMS\_XDB Constants**

| Constant                      | Type        | Value   | Description                                                                             | Relocated       |
|-------------------------------|-------------|---------|-----------------------------------------------------------------------------------------|-----------------|
| DELETE_RESOURCE               | NUMBER      | 1       | Deletes a resource; fails if the resource has children.                                 | DBMS_XDB_REPOS  |
| DELETE_RECURSIVE              | NUMBER      | 2       | Deletes a resource and its children, if any.                                            | DBMS_XDB_REPOS  |
| DELETE_FORCE                  | NUMBER      | 3       | Deletes the resource, even if the object it contains is invalid.                        | DBMS_XDB_REPOS  |
| DELETE_RECURSIVE_FORCE        | NUMBER      | 4       | Deletes a resource and its children, if any, even if the object it contains is invalid. | DBMS_XDB_REPOS  |
| DELETE_RES_METADATA_CASCADE   | NUMBER      | 1       | Deletes the corresponding row in the metadata table                                     | DBMS_XDB_REPOS  |
| DELETE_RES_METADATA_NOCASCADE | NUMBER      | 2       | Does not delete the row in the metadata table                                           | DBMS_XDB_REPOS  |
| DEFAULT_LOCK_TIMEOUT_CONSTANT | PLS_INTEGER | (60*60) | Default time (in seconds) after which lock will expire                                  | DBMS_XDB_REPOS  |
| LINK_TYPE_HARD                | NUMBER      | 1       | Type of link to be created (default)                                                    | DBMS_XDB_REPOS  |
| LINK_TYPE_WEAK                | NUMBER      | 2       | Type of link to be created                                                              | DBMS_XDB_REPOS  |
| LINK_TYPE_SYMBOLIC            | NUMBER      | 3       | Type of link to be created                                                              | DBMS_XDB_REPOS  |
| ON_DENY_NEXT_CUSTOM           | NUMBER      | 1       | If access denied, the next custom authorization is tried                                | DBMS_XDB_CONFIG |
| ON_DENY_BASIC                 | NUMBER      | 2       | If access denied, basic authentication is used                                          | DBMS_XDB_CONFIG |

## 198.4 Summary of DBMS\_XDB Subprograms

This table lists the DBMS\_XDB subprograms and briefly describes them.

**Table 198-2 DBMS\_XDB Package Subprograms**

| Subprogram                                           | Description                                                                                                                                     |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACLCHECKPRIVILEGES Function</a>          | Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter. |
| <a href="#">APPENDRESOURCEMETADATA Procedure</a>     | Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource                                     |
| <a href="#">CHANGEOWNER Procedure</a>                | Changes the owner of the resource/s to the specified owner.                                                                                     |
| <a href="#">CHANGEPRIVILEGES Function</a>            | Adds a specified ACE to a specified resource's ACL                                                                                              |
| <a href="#">CHECKPRIVILEGES Function</a>             | Checks access privileges granted to the current user on the specified resource                                                                  |
| <a href="#">CREATEFOLDER Function</a>                | Creates a new folder resource in the hierarchy                                                                                                  |
| <a href="#">CREATEOIDPATH Function</a>               | Creates a virtual path to the resource based on object ID                                                                                       |
| <a href="#">CREATERESOURCE Functions</a>             | Creates a new resource                                                                                                                          |
| <a href="#">DELETERESOURCE Procedure</a>             | Deletes a resource from the hierarchy                                                                                                           |
| <a href="#">DELETERESOURCEMETADATA Procedures</a>    | Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)                                                     |
| <a href="#">ENABLEDIGESTAUTHENTICATION Procedure</a> | Enables digest authentication                                                                                                                   |
| <a href="#">EXISTSRESOURCE Function</a>              | Determines if a resource is the hierarchy, based on its absolute path                                                                           |
| <a href="#">GETACLDOCUMENT Function</a>              | Retrieves ACL document that protects resource given its path name                                                                               |
| <a href="#">GETCONTENTBLOB Function</a>              | Retrieves the contents of a resource returned as a BLOB                                                                                         |
| <a href="#">GETCONTENTCLOB Function</a>              | Retrieves the contents of a resource returned as a CLOB                                                                                         |
| <a href="#">GETCONTENTVARCHAR2 Function</a>          | Retrieves the contents of a resource returned as a string                                                                                       |
| <a href="#">GETCONTENTXMLREF Function</a>            | Retrieves the contents of a resource returned as a a REF to an XMLTYPE                                                                          |
| <a href="#">GETCONTENTXMLTYPE Function</a>           | Retrieves the contents of a resource returned as an XMLTYPE                                                                                     |
| <a href="#">GETHTTPREQUESTHEADER Function</a>        | Gets the values of the passed header                                                                                                            |
| <a href="#">GETLOCKTOKEN Procedure</a>               | Returns that resource's lock token for the current user given a path to a resource                                                              |
| <a href="#">GETPRIVILEGES Function</a>               | Gets all privileges granted to the current user on a specified resource                                                                         |
| <a href="#">GETRESOID Function</a>                   | Returns the object ID of the resource from its absolute path                                                                                    |
| <a href="#">GETXDB_TABLESPACE Function</a>           | Returns the current tablespace of the XDB (user)                                                                                                |
| <a href="#">HASBLOBCONTENT Function</a>              | Returns TRUE if the resource has BLOB content                                                                                                   |

**Table 198-2 (Cont.) DBMS\_XDB Package Subprograms**

| Subprogram                                        | Description                                                             |
|---------------------------------------------------|-------------------------------------------------------------------------|
| <a href="#">HASCHARCONTENT Function</a>           | Returns TRUE if the resource has character content                      |
| <a href="#">HASXMLCONTENT Function</a>            | Returns TRUE if the resource has XML content                            |
| <a href="#">HASXMLREFERENCE Function</a>          | Returns TRUE if the resource has REF to XML content                     |
| <a href="#">ISFOLDER Function</a>                 | Returns TRUE if the resource is a folder or container                   |
| <a href="#">LINK Procedures</a>                   | Creates a link to an existing resource                                  |
| <a href="#">LOCKRESOURCE Function</a>             | Gets a WebDAV-style lock on that resource given a path to that resource |
| <a href="#">PROCESSLINKS Procedure</a>            | Processes document links in the specified resource                      |
| <a href="#">PURGERESOURCEMETADATA Procedure</a>   | Deletes all user metadata from a resource                               |
| <a href="#">RENAMERESOURCE Procedure</a>          | Renames the XDB resource                                                |
| <a href="#">SETACL Procedure</a>                  | Sets the ACL on a specified resource                                    |
| <a href="#">SPLITPATH Procedure</a>               | Splits the path into a parentpath and childpath                         |
| <a href="#">TOUCHRESOURCE Procedure</a>           | Changes the modification time of the resource to the current time       |
| <a href="#">UNLOCKRESOURCE Function</a>           | Unlocks the resource given a lock token and resource path               |
| <a href="#">UPDATERESOURCEMETADATA Procedures</a> | Updates metadata for a resource                                         |

## 198.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [ACLCHECKPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(  
  acl_path IN VARCHAR2,  
  owner    IN VARCHAR2,  
  privs    IN xmltype)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 198-3 ACLCHECKPRIVILEGES Function Parameters**

| Parameter             | Description                                     |
|-----------------------|-------------------------------------------------|
| <code>acl_path</code> | Absolute path in the Hierarchy for ACL document |

**Table 198-3 (Cont.) ACLCHECKPRIVILEGES Function Parameters**

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner     | Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution                                                      |
| privs     | An XMLType instance of the privilege element specifying the requested set of access privileges. See description for <a href="#">CHECKPRIVILEGES Function</a> . |

## 198.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a [REF](#) to [XMLTYPE](#) or an [XMLTYPE](#) and adds it to the desired resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [APPENDRESOURCEMETADATA Procedure](#).

### Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (  
  abspath   IN  VARCHAR2,  
  metadata  IN  XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (  
  abspath   IN  VARCHAR2,  
  metadata  IN  REF SYS.XMLTYPE);
```

### Parameters

**Table 198-4 APPENDRESOURCEMETADATA Procedure**

| Parameter | Description                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                                                      |
| metadata  | Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table. |

### Usage Notes

- In the case in which a [REF](#) is passed in, the procedure stores the [REF](#) in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the [RESID](#) column for the metadata table. Note that the [REF](#) passed in must be unique. In other words, there must not be a [REF](#) with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a [REF](#) that already exists.
- In the case where the [XMLTYPE](#) is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

## 198.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner. This procedure is deprecated in Release 12c.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHANGEOWNER Procedure](#).

### Syntax

```
DBMS_XDB.CHANGEOWNER(  
    abspath    IN    VARCHAR2,  
    owner      IN    VARCHAR2,  
    recurse    IN    BOOLEAN := FALSE);
```

### Parameters

**Table 198-5** CHANGEOWNER Procedure Parameters

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                         |
| owner     | New owner for the resource                                            |
| recurse   | If TRUE, recursively change owner of all resources in the folder tree |

## 198.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL. This procedure is deprecated in Release 12c.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHANGEPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(  
    res_path    IN    VARCHAR2,  
    ace         IN    xmltype)  
RETURN PLS_INTEGER;
```

## Parameters

**Table 198-6 CHANGEPRIVILEGES Function Parameters**

| Parameter | Description                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------|
| res_path  | Path name of the resource for which privileges need to be changed                                                          |
| ace       | An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges |

## Return Values

A positive integer if the ACL was successfully modified.

## Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

## 198.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CHECKPRIVILEGES Function](#).

## Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
    res_path  IN  VARCHAR2,
    privs     IN  xmltype)
RETURN PLS_INTEGER;
```

## Parameters

**Table 198-7 CHECKPRIVILEGES Function Parameters**

| Parameter | Description                                                                                    |
|-----------|------------------------------------------------------------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource                                                    |
| privs     | An XMLType instance of the privilege element specifying the requested set of access privileges |

## Return Values

A positive integer if all requested privileges granted.

## 198.4.6 CREATEFOLDER Function

This deprecated function creates a new folder resource in the hierarchy.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATEFOLDER Function](#).

### Syntax

```
DBMS_XDB.CREATEFOLDER(  
    path    IN  VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 198-8 CREATEFOLDER Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| path      | Path name for the new folder |

### Return Values

TRUE if operation successful; FALSE, otherwise.

### Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

## 198.4.7 CREATEOIDPATH Function

This deprecated function creates a virtual path to the resource based on object ID.

### Note:

This function is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATEOIDPATH Function](#).

### Syntax

```
DBMS_XDB.CREATEOIDPATH(  
    oid    IN  RAW)  
RETURN VARCHAR2;
```

## Parameters

**Table 198-9 CREATEOIDPATH Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| oid       | Object ID of the resource |

## 198.4.8 CREATERESOURCE Functions

The deprecated function creates a new resource. The description of the overload options precede each version of the syntax

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [CREATERESOURCE Functions](#).

## Syntax

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    datarow      IN  REF SYS.XMLTYPE,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BLOB,
    csid         IN  NUMBER :=0,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0,
    createfolders IN  BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  CLOB,
```

```
    createfolders IN BOOLEAN := FALSE)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN VARCHAR2,
    schemaurl    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB.CREATERESOURCE (
    abspath      IN VARCHAR2,
    data         IN SYS.XMLTYPE,
    schemaurl    IN VARCHAR2 := NULL,
    elem         IN VARCHAR2 := NULL)
RETURN BOOLEAN;
```

## Parameters

**Table 198-10 CREATERESOURCE Function Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath       | Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| data          | String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| datarow       | REF to an XMLType row to be used as the contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| csid          | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.<br><br>If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> <li>From the abspath extension, determine the resource's MIME type.</li> <li>If the MIME type is <code>*/*xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</li> <li>Otherwise, it is defaulted to the database character set.</li> </ul> |
| createfolders | If TRUE, create the parent folders if they do not exist                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| schemaurl     | For XML data, schema URL data conforms to (default NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| elem          | Element name (default NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Return Values

TRUE if operation successful; FALSE, otherwise.

## 198.4.9 DELETERESOURCE Procedure

This **deprecated procedure** deletes a resource from the hierarchy.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [DELETERESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.DELETERESOURCE(  
    path          IN      VARCHAR2,  
    delete_option IN      PLS_INTEGER);
```

### Parameters

**Table 198-11 DELETERESOURCE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path          | Path name of the resource to delete                                                                                                                                                                                                               |
| delete_option | The option that controls how a resource is deleted; defined in <a href="#">Table 198-1</a> : <ul style="list-style-type: none"><li>• DELETE_RESOURCE</li><li>• DELETE_RECURSIVE</li><li>• DELETE_FORCE</li><li>• DELETE_RECURSIVE_FORCE</li></ul> |

## 198.4.10 DELETERESOURCEMETADATA Procedures

This **deprecated procedure** takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [DELETERESOURCEMETADATA Procedures](#).

### Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN  VARCHAR2,
    metadata         IN  REF SYS.XMLTYPE,
    delete_option   IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
    abspath          IN  VARCHAR2,
    metadatans       IN  VARCHAR2,
    metadataname     IN  VARCHAR2,
    delete_option   IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 198-12 DELETERESOURCEMETADATA Procedure Parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath       | Absolute path of the resource                                                                                                                                                                                                                                                                        |
| metadata      | REF to the piece of metadata (schema based) to be deleted                                                                                                                                                                                                                                            |
| mettadatans   | Namespace of the metadata fragment to be removed                                                                                                                                                                                                                                                     |
| mettadataname | Local name of the metadata fragment to be removed                                                                                                                                                                                                                                                    |
| delete_option | Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"><li>DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</li><li>DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</li></ul> |

198.4.11 ENABLEDIGESTAUTHENTICATION Procedure

This deprecated procedure enabling digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_CONFIG](#) package - the [ENABLEDIGESTAUTHENTICATION Procedure](#).

Syntax

```
DBMS_XDB.ENABLEDIGESTAUTHENTICATION;
```

## 198.4.12 EXISTSRESOURCE Function

This deprecated function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [EXISTSRESOURCE Function](#).

### Syntax

```
DBMS_XDB.EXISTSRESOURCE(  
    abspath    IN    VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 198-13** EXISTSRESOURCE Function Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

### Return Values

TRUE if the resource is found.

## 198.4.13 GETACLDOCUMENT Function

This deprecated function retrieves ACL document that protects resource given its path name.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETACLDOCUMENT Function](#).

### Syntax

```
DBMS_XDB.GETACLDOCUMENT(  
    abspath IN VARCHAR2)  
RETURN sys.xmltype;
```

## Parameters

**Table 198-14 GETACLDOCUMENT Function Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

## Return Values

The XMLType for ACL document.

## 198.4.14 GETCONTENTBLOB Function

This deprecated function retrieves the contents of a resource returned as a BLOB.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTBLOB Function](#).

## Syntax

```
DBMS_XDB.GETCONTENTBLOB (
    abspath    IN    VARCHAR2,
    csid       OUT   PLS_INTEGER,
    locksrc    IN    BOOLEAN := FALSE)
RETURN BLOB;
```

## Parameters

**Table 198-15 GETCONTENTBLOB Function Parameters**

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                              |
| csid      | If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy. |
| locksrc   | Contents of the resource as a BLOB                                         |

## Return Values

The contents of the resource as a BLOB.

## 198.4.15 GETCONTENTCLOB Function

This deprecated function gets the contents of a resource returned as a CLOB.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTCLOB Function](#).

### Syntax

```
DBMS_XDB.GETCONTENTCLOB (  
    abspath      IN      VARCHAR2,  
    RETURN CLOB;
```

### Parameters

**Table 198-16** GETCONTENTCLOB Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

### Return Values

The contents of the resource as a CLOB.

## 198.4.16 GETCONTENTVARCHAR2 Function

This deprecated function gets the contents of a resource returned as a string.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTVARCHAR2 Function](#).

### Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2 (  
    abspath      IN      VARCHAR2,  
    RETURN BLOB;
```

## Parameters

**Table 198-17 GETCONTENTVARCHAR2 Function Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a string.

## 198.4.17 GETCONTENTXMLREF Function

This deprecated function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTXMLREF Function](#).

## Syntax

```
DBMS_XDB.GETCONTENTXMLREF (
    abspath    IN    VARCHAR2,
    RETURN SYS.XMLTYPE;
```

## Parameters

**Table 198-18 GETCONTENTXMLREF Function Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

## 198.4.18 GETCONTENTXMLTYPE Function

This deprecated function retrieves the contents of a resource returned as an `XMLTYPE`.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETCONTENTXMLTYPE Function](#).

### Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

### Parameters

**Table 198-19** GETCONTENTXMLTYPE Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

### Return Values

The contents of the resource as an `XMLTYPE`.

## 198.4.19 GETHTTPREQUESTHEADER Function

This deprecated function, if called during an HTTP request serviced by XDB, returns the values of the passed header. It is used by routines that implement custom authentication.

### Note:

This procedure is deprecated in Release 12c.

### Syntax

```
DBMS_XDB.GETHTTPREQUESTHEADER(  
    header_name    IN    VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 198-20** GETHTTPREQUESTHEADER Function Parameters

| Parameter   | Description   |
|-------------|---------------|
| header_name | Passed header |

### Return Values

Returns `NULL` in case the header is not present in the request, or for `AUTHENTICATION`, for security reasons.

## 198.4.20 GETLOCKTOKEN Procedure

Given a path to a resource, this deprecated procedure returns that resource's lock token for the current user.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETLOCKTOKEN Procedure](#).

### Syntax

```
DBMS_XDB.GETLOCKTOKEN (  
    path          IN      VARCHAR2,  
    locktoken     OUT     VARCHAR2);
```

### Parameters

**Table 198-21 GETLOCKTOKEN Procedure Parameters**

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| path      | Path name to the resource                    |
| locktoken | Logged-in user's lock token for the resource |

### Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

## 198.4.21 GETPRIVILEGES Function

This deprecated function gets all privileges granted to the current user on a specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETPRIVILEGES Function](#).

### Syntax

```
DBMS_XDB.GETPRIVILEGES (  
    res_path      IN      VARCHAR2)  
RETURN sys.xmltype;
```

## Parameters

**Table 198-22 GETPRIVILEGES Function Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| res_path  | Absolute path in the hierarchy of the resource |

## Return Values

An `XMLType` instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

## 198.4.22 GETRESOID Function

This deprecated procedure returns the object ID of the resource from its absolute path.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETRESOID Function](#).

## Syntax

```
DBMS_XDB.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

## Parameters

**Table 198-23 GETRESOID Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

`NULL` if the resource is not present.

## 198.4.23 GETXDB\_TABLESPACE Function

This deprecated function returns the current tablespace of the XDB (user).

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [GETXDB\\_TABLESPACE Function](#).

## Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
RETURN VARCHAR2;
```

## 198.4.24 HASBLOBCONTENT Function

This deprecated function returns `TRUE` if the resource has BLOB content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASBLOBCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASBLOBCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 198-24 HASBLOBCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has BOB content.

## 198.4.25 HASCHARCONTENT Function

This deprecated function returns `TRUE` if the resource has character content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASCHARCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASCHARCONTENT
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 198-25 HASCHARCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has character content.

## 198.4.26 HASXMLCONTENT Function

This deprecated function returns `TRUE` if the resource has XML content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASXMLCONTENT Function](#).

## Syntax

```
DBMS_XDB.HASXMLCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

## Parameters

**Table 198-26 HASXMLCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has XML content.

## 198.4.27 HASXMLREFERENCE Function

This deprecated function returns `TRUE` if the resource has a `REF` to XML content.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [HASXMLREFERENCE Function](#).

## Syntax

```
DBMS_XDB.HASXMLREFERENCE
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 198-27 HASXMLREFERENCE Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

`TRUE` resource has a `REF` to XML content.

# 198.4.28 ISFOLDER Function

This deprecated function returns `TRUE` if the resource is a folder or container.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [ISFOLDER Function](#).

## Syntax

```
DBMS_XDB.ISFOLDER
    abspath IN VARCHAR2)
RETURN BOOLEAN;
```

## Parameters

**Table 198-28 DBMS\_XDB.ISFOLDER Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

`TRUE` if the resource is a folder or container.

## 198.4.29 LINK Procedures

This deprecated procedure creates a link from a specified folder to a specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [LINK Procedures](#).

### Syntax

```
DBMS_XDB.LINK(  
    srcpath      IN   VARCHAR2,  
    linkfolder   IN   VARCHAR2,  
    linkname     IN   VARCHAR2);  
  
DBMS_XDB.LINK(  
    srcpath      IN   VARCHAR2,  
    linkfolder   IN   VARCHAR2,  
    linkname     IN   VARCHAR2,  
    linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

### Parameters

**Table 198-29 LINK Procedure Parameters**

| Parameter  | Description                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srcpath    | Path name of the resource to which a link is created                                                                                                                                    |
| linkfolder | Folder in which the new link is placed                                                                                                                                                  |
| linkname   | Name of the new link                                                                                                                                                                    |
| linktype   | Type of link to be created: <ul style="list-style-type: none"><li>• DBMS_XDB.LINK_TYPE_HARD (default)</li><li>• DBMS_XDB.LINK_TYPE_WEAK</li><li>• DBMS_XDB.LINK_TYPE_SYMBOLIC</li></ul> |

## 198.4.30 LOCKRESOURCE Function

Given a path to a resource, this deprecated function gets a WebDAV-style lock on that resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [LOCKRESOURCE Function](#).

## Syntax

```
DBMS_XDB.LOCKRESOURCE(  
    path      IN  VARCHAR2,  
    depthzero IN  BOOLEAN,  
    shared    IN  boolean)  
RETURN BOOLEAN;
```

## Parameters

**Table 198-30** LOCKRESOURCE Function Parameters

| Parameter | Description                              |
|-----------|------------------------------------------|
| path      | Path name of the resource to lock.       |
| depthzero | Currently not supported                  |
| shared    | Passing TRUE obtains a shared write lock |

## Return Values

TRUE if successful.

## Usage Notes

The user must have UPDATE privileges on the resource.

## 198.4.31 PROCESSLINKS Procedure

This deprecated procedure processes document links in the specified resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [PROCESSLINKS Procedure](#).

## Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(  
    abspath IN  VARCHAR2,  
    recurse IN  BOOLEAN := FALSE);
```

## Parameters

**Table 198-31** PROCESSLINKS Procedure Parameters

| Parameter | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| abspath   | Absolute path of the resource. If the path is a folder, use the recurse flag. |

**Table 198-31 (Cont.) PROCESSLINKS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recurse   | Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only. |

## 198.4.32 PURGERESOURCEMETADATA Procedure

This deprecated procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [PURGERESOURCEMETADATA Procedure](#).

### Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(  
  abspath IN VARCHAR2);
```

### Parameters

**Table 198-32 PURGERESOURCEMETADATA Procedure Parameters**

| Parameter            | Description                   |
|----------------------|-------------------------------|
| <code>abspath</code> | Absolute path of the resource |

## 198.4.33 RENAMERESOURCE Procedure

This deprecated procedure renames the XDB resource.

**Note:**

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [RENAMERESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.RENAMERESOURCE(  
  srcpath   IN VARCHAR2,  
  destfolder IN VARCHAR2,  
  newname   IN VARCHAR2);
```

## Parameters

**Table 198-33 RENAMERESOURCE Procedure Parameters**

| Parameter  | Description                                                               |
|------------|---------------------------------------------------------------------------|
| srcpath    | Absolute path in the Hierarchy for the source resource destination folder |
| destfolder | Absolute path in the Hierarchy for the destination folder                 |
| newname    | Name of the child in the destination folder                               |

## 198.4.34 SETACL Procedure

This deprecated procedure set the ACL on a specified resource to be the ACL specified by path.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [SETACL Procedure](#).

## Syntax

```
DBMS_XDB.SETACL(
    res_path    IN  VARCHAR2,
    acl_path    IN  VARCHAR2);
```

## Parameters

**Table 198-34 SETACL Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource |
| acl_path  | Absolute path in the Hierarchy for ACL      |

## Usage Notes

The user must have `<write-acl>` privileges on the resource.

## 198.4.35 SPLITPATH Procedure

This deprecated procedure splits the path into a parentpath and childpath.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [SPLITPATH Procedure](#).

### Syntax

```
DBMS_XDB.SPLITPATH(  
    abspath      IN  VARCHAR2,  
    parentpath   OUT VARCHAR2,  
    childpath     OUT VARCHAR2);
```

### Parameters

**Table 198-35 SPLITPATH Procedure Parameters**

| Parameter  | Description               |
|------------|---------------------------|
| abspath    | Absolute path to be split |
| parentpath | Parentpath                |
| childpath  | Childpath                 |

## 198.4.36 TOUCHRESOURCE Procedure

This **deprecated procedure** changes the modification time of the resource to the current time.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [TOUCHRESOURCE Procedure](#).

### Syntax

```
DBMS_XDB.TOUCHRESOURCE  
    abspath      IN  VARCHAR2);
```

### Parameters

**Table 198-36 DBMS\_XDB.TOUCHRESOURCE Procedure Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## 198.4.37 UNLOCKRESOURCE Function

This deprecated function unlocks the resource given a lock token and a path to the resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [UNLOCKRESOURCE Function](#).

### Syntax

```
DBMS_XDB.UNLOCKRESOURCE(  
    path      IN  VARCHAR2,  
    deltoken  IN  VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 198-37 UNLOCKRESOURCE Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| path      | Path name to the resource |
| deltoken  | Lock token to be removed  |

### Return Values

TRUE if operation successful.

### Usage Notes

The user must have `UPDATE` privileges on the resource.

## 198.4.38 UPDATERESOURCEMETADATA Procedures

This deprecated procedure updates metadata for a resource.

### Note:

This procedure is deprecated in Release 12c. This functionality is replaced by a subprogram of the same name in the [DBMS\\_XDB\\_REPOS](#) package - the [UPDATERESOURCEMETADATA Procedures](#).

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its `REF`. It replaces that piece of metadata with user-defined metadata which is either in the form of a `REF` to `XMLTYPE` or an `XMLTYPE`.

## Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN REF SYS.XMLTYPE);
```

## Parameters

**Table 198-38 UPDATERESOURCEMETADATA Procedure Parameters**

| Parameter   | Description                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------|
| abspath     | Absolute path of the resource                                                                                  |
| oldmetadata | REF to the old of metadata                                                                                     |
| newmetadata | REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload) |
| oldns       | Namespace identifying old metadata                                                                             |
| oldname     | Local name identifying old metadata                                                                            |

## Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

## DBMS\_XDB\_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the Oracle XML DB repository.

This chapter contains the following topics:

- [DBMS\\_XDB\\_ADMIN Security Model](#)
- [Summary of DBMS\\_XDB\\_ADMIN Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide* for information about Oracle XML DB Repository

### 199.1 DBMS\_XDB\_ADMIN Security Model

Owned by `XDB`, the `DBMS_XDB_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

### 199.2 Summary of DBMS\_XDB\_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

**Table 199-1 DBMS\_XDB\_ADMIN Package Subprograms**

| Subprogram                                         | Description                                                         |
|----------------------------------------------------|---------------------------------------------------------------------|
| <a href="#">CREATENONCEKEY Procedure</a>           | Generates a nonce value for use in digest authentication            |
| <a href="#">INSTALLDEFAULTWALLET Procedure</a>     | Installs the default XDB wallet in the default XDB wallet directory |
| <a href="#">MOVEXDB_TABLESPACE Procedure</a>       | Moves the XDB (user) to the specified tablespace                    |
| <a href="#">REBUILDHIERARCHICALINDEX Procedure</a> | Rebuilds the hierarchical index after import or export operations   |

#### 199.2.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

#### Syntax

```
DBMS_XDB_ADMIN.CREATE_NONCEKEY;
```

## 199.2.2 INSTALLDEFAULTWALLET Procedure

This procedure installs the default XDB wallet in the default XDB wallet directory.

The directory name where the XDB wallet is stored is prefixed either by `ORACLE_BASE` when it is defined, or `ORACLE_HOME`. It is then followed by `/admin/db_name/xdb_wallet` where *db\_name* is the unique database name.

### Syntax

```
DBMS_XDB_ADMIN.INSTALLDEFAULTWALLET;
```

### Usage Notes

Only `SYS` can install or replace the default wallet.

## 199.2.3 MOVEXDB\_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

### Syntax

```
DBMS_XDB_ADMIN.MOVEXDB_TABLESPACE(  
    new_tablespace IN VARCHAR2);
```

### Parameters

**Table 199-2 MOVEXDB\_TABLESPACE Procedure Parameters**

| Parameter                   | Description                                      |
|-----------------------------|--------------------------------------------------|
| <code>new_tablespace</code> | Name of the tablespace to where the XDB is moved |

### Usage Notes

- This operation waits for all concurrent XDB sessions to exit.
- If `MOVEXDB_TABLESPACE` fails, the user should restart the database before issuing any further command. Failure to do so will result into unexpected behavior from the database.
- The XDB repository by default resides in the `SYSAUX` tablespace. Using this procedure it can be moved to another tablespace. As a best practice we recommend to create a dedicated tablespace for the XDB repository only and not share it with other objects (such as tables). The tablespace containing the XDB repository should never be set to `READ ONLY` because this might affect various XML operations being executed.

## 199.2.4 REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

### Syntax

```
DBMS_XDB_ADMIN.REBUILDHIERARCHICALINDEX;
```

# DBMS\_XDB\_CONFIG

The `DBMS_XDB_CONFIG` package provides an interface for configuring Oracle XML DB and its repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDB\\_CONFIG Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 200.1 DBMS\_XDB\_CONFIG Overview

PL/SQL package `DBMS_XDB_CONFIG` is the Oracle XML DB resource application program interface (API) for PL/SQL for DBAs to configure their system. This API provides functions and procedures to access and manage Oracle XML DB Repository resources using PL/SQL. It includes methods for managing resource security and Oracle XML DB configuration.

Oracle XML DB Repository is modeled on XML, and provides a database file system for any data. The repository maps path names (or URLs) onto database objects of XMLType and provides management facilities for these objects.

PL/SQL package `DBMS_XDB_CONFIG` is an API that you can use to manage all of the following:

- Oracle XML DB resources
- Oracle XML DB security based on access control lists (ACLs). An ACL is a list of access control entries (ACEs) that determines which principals (users and roles) have access to which resources.
- Oracle XML DB configuration

## 200.2 DBMS\_XDB\_CONFIG Security Model

Owned by `XDB`, the `DBMS_XDB_CONFIG` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 200.3 DBMS\_XDB\_CONFIG Constants

The `DBMS_XDB_CONFIG` package defines several enumerated constants that should be used for specifying parameter values.

These constants are shown in the following table.

**Table 200-1 DBMS\_XDB\_CONFIG Constants**

| Constant                         | Type   | Value | Description                               |
|----------------------------------|--------|-------|-------------------------------------------|
| <code>XDB_ENDPOINT_HTTP</code>   | NUMBER | 1     | Defining listener for first HTTP port     |
| <code>XDB_ENDPOINT_HTTP2</code>  | NUMBER | 2     | Defining listener for second HTTP port    |
| <code>XDB_ENDPOINT_RHTTP</code>  | NUMBER | 3     | Defining listener for a remote HTTP port  |
| <code>XDB_ENDPOINT_RHTTPS</code> | NUMBER | 4     | Defining listener for a remote HTTPS port |
| <code>XDB_PROTOCOL_TCP</code>    | NUMBER | 1     | Defining listener for HTTP protocol       |
| <code>XDB_PROTOCOL_TCPS</code>   | NUMBER | 2     | Defining listener for HTTPS protocol      |

## 200.4 Summary of DBMS\_XDB\_CONFIG Subprograms

The `DBMS_XDB_CONFIG` package uses subprograms for configuring Oracle XML DB and its repository.

These subprograms are listed in the following table.

**Table 200-2 DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                                     | Description                                                                                                                                                          |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDHTTPEXPIREMAPPING Procedure</a> | Adds to <code>XDB\$CONFIG</code> a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.             |
| <a href="#">ADDMIMEMAPPING Procedure</a>       | Adds a mime mapping to XDB configuration                                                                                                                             |
| <a href="#">ADDSCHEMALOCMAPPING Procedure</a>  | Adds a schema location mapping to the XDB configuration                                                                                                              |
| <a href="#">ADDSERVLET Procedure</a>           | Adds a servlet to XDB configuration                                                                                                                                  |
| <a href="#">ADDSERVLETMAPPING Procedure</a>    | Adds a servlet mapping to XDB configuration                                                                                                                          |
| <a href="#">ADDSERVLETSECROLE Procedure</a>    | Adds a security role <code>REF</code> to a specified servlet in XDB configuration                                                                                    |
| <a href="#">ADDXMLEXTENSION Procedure</a>      | Adds adds the following XML extension to the XDB configuration under <code>&lt;xml-extensions&gt;</code> : <code>&lt;extension&gt;extension&lt;/extension&gt;</code> |
| <a href="#">CFG_GET Function</a>               | Retrieves the session's configuration information as an <code>XMLType</code> instance                                                                                |
| <a href="#">CFG_REFRESH Procedure</a>          | Refreshes the session's configuration information to the latest configuration                                                                                        |
| <a href="#">CFG_UPDATE Procedure</a>           | Updates the configuration information and commits the change.                                                                                                        |

**Table 200-2 (Cont.) DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                                           | Description                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DELETEHTTPEXPIREMAPPING Procedure</a>    | Deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date                                                                                                                                                                                                                |
| <a href="#">DELETEMIMEMAPPING Procedure</a>          | Deletes the mime mapping for a specified extension from the XDB configuration                                                                                                                                                                                                                 |
| <a href="#">DELETESCHEMALOCMAPPING Procedure</a>     | Deletes the schema location mapping for a specified schema URL from the XDB configuration                                                                                                                                                                                                     |
| <a href="#">DELETESERVLET Procedure</a>              | Deletes a servlet from the XDB configuration                                                                                                                                                                                                                                                  |
| <a href="#">DELETESERVLETMAPPING Procedure</a>       | Deletes the servlet mapping for a specified servlet name from the XDB configuration                                                                                                                                                                                                           |
| <a href="#">DELETESERVLETSECRULE Procedure</a>       | Deletes the specified role from a servlet in the XDB configuration                                                                                                                                                                                                                            |
| <a href="#">DELETXMLEXTENSION Procedure</a>          | Deletes the specified XML extension from the XDB configuration                                                                                                                                                                                                                                |
| <a href="#">ENABLEDIGESTAUTHENTICATION Procedure</a> | Enables enables digest authentication                                                                                                                                                                                                                                                         |
| <a href="#">GETFTPSPORT Function</a>                 | Gets the value of the current FTP port                                                                                                                                                                                                                                                        |
| <a href="#">GETHTTPSPORT Function</a>                | Gets the value of the current HTTP port                                                                                                                                                                                                                                                       |

| <a href="#">SETHTTPSPORT Procedure</a>               | Sets the HTTPS port to a new value                                                                                                                                                                                                                                                            |
| <a href="#">SETLISTENERENDPOINT Procedure</a>        | Sets the parameters of a listener end point corresponding to the XML DB HTTP server                                                                                                                                                                                                           |
| <a href="#">SETLISTENERLOCALACCESS Procedure</a>     | Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when <code>l_access</code> is set to <code>TRUE</code> ) or to listen on both localhost and non-localhost interfaces (when <code>l_access</code> is set to <code>FALSE</code> ) |
| <a href="#">SETREMOTEHTTPSPORT Procedure</a>         | Sets the remote HTTP port to a new value                                                                                                                                                                                                                                                      |
| <a href="#">SETREMOTEHTTPSPORT Procedure</a>         | Sets the remote HTTPS port to a new value                                                                                                                                                                                                                                                     |

**Table 200-2 (Cont.) DBMS\_XDB\_CONFIG Package Subprograms**

| Subprogram                         | Description                                                                                   |
|------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">USEDPORT Procedure</a> | Obtains the port numbers used by other pluggable databases in the same consolidation database |

## 200.4.1 ADDHTTPEXPIREMAPPING Procedure

This procedure adds to XDB\$CONFIG a mapping of the URL pattern to an expiration date. This will control the Expire headers for URLs matching the pattern.

### Syntax

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    pattern    IN    VARCHAR2,
    expire     IN    VARCHAR2);
```

### Parameters

**Table 200-3 ADDHTTPEXPIREMAPPING Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pattern   | URL pattern (only * accepted as wildcards)                                                                                                                                                                                        |
| expire    | Expiration directive, follows the ExpireDefault in Apache's mod_expires:<br><br>base [plus] (num type)*<br>-- base: now   modification<br>-- type: year years month months week weeks day days <br>minute minutess second seconds |

### Examples

```
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING ('/public/test1/*', 'now plus 4 weeks');
DBMS_XDB_REPOS.ADDHTTPEXPIREMAPPING (
    '/public/test2/*', 'modification plus 1 day 30 seconds');
```

## 200.4.2 ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDMIMEMAPPING (
    extension  IN    VARCHAR2,
    mimetype   IN    VARCHAR2);
```

## Parameters

**Table 200-4** *ADDMIMEMAPPING Procedure Parameters*

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| extension | Extension for which a mime type is being added |
| mimetype  | Mime type                                      |

## 200.4.3 ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSCHEMALOCMAPPING (
  namespace    IN    VARCHAR2,
  element      IN    VARCHAR2,
  schemaURL    IN    VARCHAR2);
```

## Parameters

**Table 200-5** *ADDSCHEMALOCMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|-------------|
| namespace | Namespace   |
| element   | Element     |
| schemaURL | Schema URL  |

## 200.4.4 ADDSERVLET Procedure

This procedure adds a servlet to XDB configuration.

IT adds the following servlet:

```
<servlet>
  <servlet-name>name</servlet-name>      <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSERVLET (
  name         IN    VARCHAR2,
  language     IN    VARCHAR2,
  dispname     IN    VARCHAR2,
```

```

icon      IN  VARCHAR2 := NULL,
descript  IN  VARCHAR2 := NULL,
class     IN  VARCHAR2 := NULL,
jspfile   IN  VARCHAR2 := NULL,
plsql     IN  VARCHAR2 := NULL,
schema    IN  VARCHAR2 := NULL);

```

## Parameters

**Table 200-6 ADDSERVLET Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Servlet name                                                                                                                                                                                                                                                                           |
| language  | Must be one of "C", "Java", "PL/SQL"                                                                                                                                                                                                                                                   |
| dispname  | Display name                                                                                                                                                                                                                                                                           |
| icon      | Icon                                                                                                                                                                                                                                                                                   |
| descript  | Description                                                                                                                                                                                                                                                                            |
| class     | The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.                                                                                                                     |
| jspfile   | This parameter is not supported. Always provide NULL value for this parameter. System throws an error if the value is not NULL.                                                                                                                                                        |
| plsql     | The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.                                                                                                                     |
| schema    | Schema is used to specify <code>servlet-schema</code> xml element name in <code>xdbconfig.xml</code> . It indicates the Oracle schema in which the Java class is loaded.<br><br>If you do not specify any value, then the schema is searched using the default resolver specification. |

## 200.4.5 ADDSERVLETMAPPING Procedure

This procedure adds a servlet mapping to XDB configuration.

It adds the following servlet mapping:

```

<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>

```

## Syntax

```

DBMS_XDB_CONFIG.ADDSERVLETMAPPING(
  pattern  IN  VARCHAR2,      name      IN  VARCHAR2);

```

## Parameters

**Table 200-7 ADDSERVLETMAPPING Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| pattern   | Sservlet pattern |
| name      | Servlet name     |

## 200.4.6 ADDSERVLETSECROLE Procedure

This procedure adds the security role `REF` to a specified servlet in XDB configuration.

It adds the following security role as shown in the following:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDSERVLETSECROLE(
    servname    IN  VARCHAR2,    rolename    IN  VARCHAR2,    rolelink    IN
    VARCHAR2,    descript    IN  VARCHAR2 := NULL);
```

### Parameters

**Table 200-8    ADDSERVLETSECROLE Procedure Parameters**

| Parameter             | Description   |
|-----------------------|---------------|
| <code>servname</code> | Sservlet name |
| <code>rolename</code> | Role name     |
| <code>rolelink</code> | Role link     |
| <code>descript</code> | Description   |

## 200.4.7 ADDXMLEXTENSION Procedure

This procedure adds an XML extension to the XDB configuration under `<xml-extensions>`.

It adds the following XML extension to the XDB configuration, under `<xml-extensions>`:

```
<extension>extension</extension>
```

### Syntax

```
DBMS_XDB_CONFIG.ADDXMLEXTENSION(
    extension    IN  VARCHAR2);
```

### Parameters

**Table 200-9    ADDXMLEXTENSION Procedure Parameters**

| Parameter              | Description               |
|------------------------|---------------------------|
| <code>extension</code> | XML extension to be added |

## 200.4.8 CFG\_GET Function

This function retrieves the session's configuration information as an XMLType instance.

### Syntax

```
DBMS_XDB_CONFIG.CFG_GET
RETURN SYS.XMLType;
```

## 200.4.9 CFG\_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

### Syntax

```
DBMS_XDB_CONFIG.CFG_REFRESH;
```

## 200.4.10 CFG\_UPDATE Procedure

This procedure updates the configuration information and commits the change.

### Syntax

```
DBMS_XDB_CONFIG.CFG_UPDATE (
    xdbconfig IN SYS.XMLTYPE);
```

### Parameters

**Table 200-10** CFG\_UPDATE Procedure Parameters

| Parameter | Description                |
|-----------|----------------------------|
| xdbconfig | The new configuration data |

## 200.4.11 DELETEHTTPEXPIREMAPPING Procedure

This procedure deletes from XDB\$CONFIG all mappings of the URL pattern to an expiration date.

### Syntax

```
DBMS_XDB_REPOS.DELETEHTTPEXPIREMAPPING (
    pattern IN VARCHAR2);
```

### Parameters

**Table 200-11** DELETEHTTPEXPIREMAPPING Procedure Parameters

| Parameter | Description                                |
|-----------|--------------------------------------------|
| pattern   | URL pattern (only * accepted as wildcards) |

## 200.4.12 DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETEMIMEMAPPING(  
    extension    IN    VARCHAR2);
```

### Parameters

**Table 200-12** *DELETEMIMEMAPPING Procedure Parameters*

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| extension | Extension for which a mime type is to be deleted |

## 200.4.13 DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESCHEMALOCMAPPING(  
    schemaURL    IN    VARCHAR2);
```

### Parameters

**Table 200-13** *DELETESCHEMALOCMAPPING Procedure Parameters*

| Parameter | Description |
|-----------|-------------|
| schemaURL | Schema URL  |

## 200.4.14 DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLET(  
    name          IN    VARCHAR2);
```

### Parameters

**Table 200-14** *DELETESERVLET Procedure Parameters*

| Parameter | Description  |
|-----------|--------------|
| name      | Servlet name |

## 200.4.15 DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETMAPPING (
    name          IN   VARCHAR2);
```

### Parameters

**Table 200-15** *DELETESERVLETMAPPING Procedure Parameters*

| Parameter | Description  |
|-----------|--------------|
| name      | Servlet name |

## 200.4.16 DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETESERVLETSECROLE (
    servname      IN   VARCHAR2,    rolename      IN   VARCHAR2);
```

### Parameters

**Table 200-16** *DELETESERVLETSECROLE Procedure Parameters*

| Parameter | Description                    |
|-----------|--------------------------------|
| servname  | Servlet name                   |
| rolename  | Name of the role to be deleted |

## 200.4.17 DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

### Syntax

```
DBMS_XDB_CONFIG.DELETEXMLEXTENSION (
    extension     IN   VARCHAR2);
```

### Parameters

**Table 200-17** *DELETEXMLEXTENSION Procedure Parameters*

| Parameter | Description                 |
|-----------|-----------------------------|
| extension | XML extension to be deleted |

## 200.4.18 ENABLEDIGESTAUTHENTICATION Procedure

This procedure enables digest authentication. It will list digest as the first authentication mechanism to be used by the XML DB HTTP server.

### Syntax

```
DBMS_XDB_CONFIG.ENABLEDIGESTAUTHENTICATION;
```

## 200.4.19 GETFTPSPORT Function

This procedure gets the value of the current FTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETFTPSPORT  
RETURN NUMBER;
```

## 200.4.20 GETHTTPCONFIGREALM Function

This function gets the realm name. Definition of a realm is referenced in IETF's RFC2617.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPCONFIGREALM  
RETURN VARCHAR2;
```

## 200.4.21 GETHTTPSPORT Function

This function gets the value of the current HTTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT  
RETURN NUMBER;
```

## 200.4.22 GETHTTPSPORT Function

This procedure gets the value of the current HTTPS port.

### Syntax

```
DBMS_XDB_CONFIG.GETHTTPSPORT  
RETURN NUMBER;
```

### Usage Notes

Returns `NULL` if no port has been configured

## 200.4.23 GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

### Syntax

```
DBMS_XDB_CONFIG.GETLISTENERENDPOINT (
    endpoint IN    NUMBER,
    host     OUT   VARCHAR2,    port     OUT   NUMBER,
    protocol OUT   NUMBER);
```

### Parameters

**Table 200-18 GETLISTENERENDPOINT Procedure Parameters**

| Parameter | Description                                                                          |
|-----------|--------------------------------------------------------------------------------------|
| endpoint  | End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2. |
| host      | Interface on which the listener end point listens                                    |
| port      | Port on which the listener end point listens                                         |
| protocol  | Transport protocol accepted by the listener end point                                |

## 200.4.24 GETREMOTEHTTPPORT Function

This function gets the value of a remote HTTP port.

### Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPPORT
RETURN NUMBER;
```

## 200.4.25 GETREMOTEHTTPSPORT Function

This function gets the value of a remote HTTPS port.

### Syntax

```
DBMS_XDB_CONFIG.GETREMOTEHTTPSPORT
RETURN NUMBER;
```

## 200.4.26 ISGLOBALPORTENABLED Function

This procedure returns the value of the GlobalPortEnabled setting.

### Syntax

```
DBMS_XDB_CONFIG.ISGLOBALPORTENABLED RETURN BOOLEAN;
```

**Usage Notes**

- This procedure returns `TRUE` if `GlobalPortEnabled` has been set to `TRUE`; otherwise it returns `FALSE`.
- In a multitenant environment, you can execute this function in both the CDB root and PDBs.

## 200.4.27 SETFTPSPORT Procedure

This procedure sets the FTP port to a new value.

**Syntax**

```
DBMS_XDB_CONFIG.SETFTPSPORT(  
    new_port IN NUMBER);
```

**Parameters**

**Table 200-19 SETFTPSPORT Procedure Parameters**

| Parameter             | Description                        |
|-----------------------|------------------------------------|
| <code>new_port</code> | Value to which the FTP port is set |

## 200.4.28 SETGLOBALPORTENABLED Procedure

This procedure enables Oracle Enterprise Manager Database Express (EM Express) clients to use a single port (called a global port), for the session rather than using a port dedicated to the PDB.

**Syntax**

```
DBMS_XDB_CONFIG.SETGLOBALPORTENABLED (  
    isenabled IN BOOLEAN);
```

**Parameters**

**Table 200-20 SETGLOBALPORTENABLED Procedure Parameters**

| Parameter              | Description                                                                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>isenabled</code> | <code>TRUE</code> enables the EM Express client to use a global port for the session rather than using the PDB that allocated the port.<br><code>FALSE</code> enables the port ID to determine the PDB to use.<br>The default is <code>TRUE</code> for PDBs but <code>FALSE</code> for the CDB root. |

**Usage Notes**

- Use the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure if you use EM Express to manage database ports in a multitenant environment.
- To use a global port, you must enable it in both the CDB and the PDB. PDBs have it enabled by default. For CDBs, you must run the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` procedure in the CDB root.

- After you set `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to `TRUE`, then you must specify a PDB to use for the global port. You can do so by specifying the PDB name in the **Container Name** field of the EM Express login page. For example, if you enter `hr_pdb`, then the EM Express URL becomes `http://server_name:5500/hr_pdb/em`. This example uses the port 5500 in the CDB root, which in turn routes messages to the EM Express in the PDB `hr_pdb`. The port can be an HTTP or HTTPS port.
- The PDB that you specify in the EM Express login page must be open in read/write mode before you can run `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED`. You can check the read/write mode status of a PDB by connecting to the PDB and then querying the `OPEN_MODE` column of the `V$PDBS` dynamic view.
- The `DBMS_XDB_CONFIG.ISGLOBALPORTENABLED` function returns the value of the `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` setting.
- You can use the `XDB_PROTOCOLS` lockdown profile to control the security for the global port.

#### See Also:

- *Oracle Database 2 Day DBA* for information about using `DBMS_XDB_CONFIG.SETGLOBALPORTENABLED` to start EM Express for a PDB
- *Oracle Database Security Guide* for information about lockdown profiles

## 200.4.29 SETHHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETHHTTPPORT(
    new_port IN NUMBER);
```

### Parameters

**Table 200-21 SETHHTTPPORT Procedure Parameters**

| Parameter             | Description                         |
|-----------------------|-------------------------------------|
| <code>new_port</code> | Value to which the HTTP port is set |

## 200.4.30 SETHHTTPCONFIGREALM Procedure

This procedure modifies the realm value.

### Syntax

```
DBMS_XDB_CONFIG.SETHHTTPCONFIGREALM(
    realm IN VARCHAR2);
```

## Parameters

**Table 200-22 SETHTTPSPORT Procedure Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| realm     | Realm as defined in IETF's RFC2617 |

## 200.4.31 SETHTTPSPORT Procedure

This procedure sets the HTTPS port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETHTTPSPORT(  
    new_port IN NUMBER);
```

## Parameters

**Table 200-23 SETHTTPSPORT Procedure Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| new_port  | Value to which the HTTPS port is set |

## 200.4.32 SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server.

Both HTTP and HTTP2 end points can be set by invoking this procedure.

### Syntax

```
DBMS_XDB_CONFIG.SETLISTENERENDPOINT (  
    endpoint IN NUMBER,  
    host     IN VARCHAR2,    port     IN NUMBER,  
    protocol IN NUMBER);
```

## Parameters

**Table 200-24 SETLISTENERENDPOINT Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| endpoint  | End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.                                                                                                                                                                                                                                                                        |
| host      | Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces. |
| port      | Port on which the listener end point is to listen                                                                                                                                                                                                                                                                                                     |

**Table 200-24 (Cont.) SETLISTENERENDPOINT Procedure Parameters**

| Parameter | Description                                                                                                         |
|-----------|---------------------------------------------------------------------------------------------------------------------|
| protocol  | Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS |

## 200.4.33 SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

### Syntax

```
DBMS_XDB_CONFIG.SETLISTENERLOCALACCESS (
    l_access    BOOLEAN);
```

### Parameters

**Table 200-25 SETLISTENERLOCALACCESS Procedure Parameters**

| Parameter              | Description                               |
|------------------------|-------------------------------------------|
| <code>l_access.</code> | <code>TRUE</code> or <code>FALSE</code> . |

## 200.4.34 SETREMOTEHTTPPORT Procedure

This procedure sets a remote HTTP port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPPORT (
    new_port    IN    NUMBER);
```

### Parameters

**Table 200-26 SETREMOTEHTTPPORT Procedure Parameters**

| Parameter             | Description                                |
|-----------------------|--------------------------------------------|
| <code>new_port</code> | Value to which the remote HTTP port is set |

## 200.4.35 SETREMOTEHTTPSPORT Procedure

This procedure sets a remote HTTPS port to a new value.

### Syntax

```
DBMS_XDB_CONFIG.SETREMOTEHTTPSPORT (
    new_port    IN    NUMBER);
```

## Parameters

**Table 200-27 SETREMOTEHTTPSPORT Procedure Parameters**

| Parameter             | Description                                 |
|-----------------------|---------------------------------------------|
| <code>new_port</code> | Value to which the remote HTTPS port is set |

## 200.4.36 USEDPORT Function

This function obtains the port numbers used by other pluggable databases in the same consolidation database.

### Syntax

```
DBMS_XDB_CONFIG.USEDPORT RETURN XMLTYPE;
```

# DBMS\_XDB\_CONSTANTS

The `DBMS_XDB_CONSTANTS` package provides an interface to commonly used constants. Users should use constants instead of dynamic strings to avoid typographical errors.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_XDB\\_CONSTANTS Subprograms](#)

## 201.1 DBMS\_XDB\_CONSTANTS Security Model

Owned by `XDB`, the `DBMS_XDB_CONSTANTS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 201.2 Summary of DBMS\_XDB\_CONSTANTS Subprograms

This table lists the `DBMS_XDB_CONSTANTS` subprograms and briefly describes them.

**Table 201-1 DBMS\_XDB\_CONSTANTS Package Subprograms**

| Subprograms                                        | Description                                           |
|----------------------------------------------------|-------------------------------------------------------|
| <a href="#">ENCODING_DEFAULT Function</a>          | Returns 'AL32UTF8'                                    |
| <a href="#">ENCODING_ISOLATIN1 Function</a>        | Returns 'WE8ISO8859P1'                                |
| <a href="#">ENCODING_UTF8 Function</a>             | Returns 'AL32UTF8'                                    |
| <a href="#">ENCODING_WIN1252 Function</a>          | Returns 'WE8MSWIN1252'                                |
| <a href="#">NAMESPACE_ACL Function</a>             | Returns 'http://xmlns.oracle.com/xdb/acl.xsd'         |
| <a href="#">NAMESPACE_METADATA Function</a>        | Returns 'http://xmlns.oracle.com/xdbuserMetaData'     |
| <a href="#">NAMESPACE_ORACLE Function</a>          | Returns 'http://xmlns.oracle.com'                     |
| <a href="#">NAMESPACE_ORACLE_XDB Function</a>      | Returns 'http://xmlns.oracle.com/xdb'                 |
| <a href="#">NAMESPACE_RESOURCE Function</a>        | Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd' |
| <a href="#">NAMESPACE_RESOURCE_EVENT Function</a>  | Returns 'http://xmlns.oracle.com/resourceEvent'       |
| <a href="#">NAMESPACE_RESOURCE_CONFIG Function</a> | Returns 'http://xmlns.oracle.com/XDBResConfig.xsd'    |
| <a href="#">NAMESPACE_XDBSCHEMA Function</a>       | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'   |

| <a href="#">NAMESPACE_XMLINSTANCE Function</a>     | Returns 'http://www.w3.org/2001/XMLSchema-instance'   |

**Table 201-1 (Cont.) DBMS\_XDB\_CONSTANTS Package Subprograms**

| Subprograms                                           | Description                                                                                   |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">NAMESPACE_XMLSCHEMA Function</a>          | Returns 'http://www.w3.org/2001/XMLSchema'                                                    |
| <a href="#">NSPREFIX_ACL_ACL Function</a>             | Returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'                                         |
| <a href="#">NSPREFIX_RESCONFIG_RC Function</a>        | Returns 'xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"'                             |
| <a href="#">NSPREFIX_RESOURCE_R Function</a>          | Returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd'                                    |
| <a href="#">NSPREFIX_XDB_XDB Function</a>             | Returns 'http://xmlns.oracle.com/xdb'                                                         |
| <a href="#">NSPREFIX_XMLINSTANCE_XSI Function</a>     | Returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'                               |
| <a href="#">NSPREFIX_XMLDIFF_XD Function</a>          | Returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'                                    |
| <a href="#">NSPREFIX_XMLSCHEMA_XSD Function</a>       | Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"'                                        |
| <a href="#">SCHEMAURL_ACL Function</a>                | Returns 'http://xmlns.oracle.com/xdb/acl.xsd'                                                 |
| <a href="#">SCHEMAELEM_RES_ACL Function</a>           | Returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'                                             |
| <a href="#">SCHEMAELEM_RESCONTENT_BINARY Function</a> | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'                                    |
| <a href="#">SCHEMAELEM_RESCONTENT_TEXT Function</a>   | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'                                      |
| <a href="#">SCHEMAURL_RESOURCE Function</a>           | Returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'                                         |
| <a href="#">SCHEMAURL_XDBSCHEMA Function</a>          | Returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'                                           |
| <a href="#">XDBSCHEMA_PREFIXES Function</a>           | Returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/xdb' |
| <a href="#">XSD_ATTRIBUTE Function</a>                | Returns 'attribute'                                                                           |
| <a href="#">XSD_COMPLEX_TYPE Function</a>             | Returns 'complexType'                                                                         |
| <a href="#">XSD_ELEMENT Function</a>                  | Returns 'element'                                                                             |
| <a href="#">XSD_GROUP Function</a>                    | Returns 'group'                                                                               |

## 201.2.1 ENCODING\_DEFAULT Function

This function returns 'AL32UTF8'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_DEFAULT
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'AL32UTF8'

## 201.2.2 ENCODING\_ISOLATIN1 Function

This function returns 'WE8ISO8859P1'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_ISOLATIN1  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'WE8ISO8859P1'

## 201.2.3 ENCODING\_UTF8 Function

This function returns 'AL32UTF8'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_UTF8  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'AL32UTF8'

## 201.2.4 ENCODING\_WIN1252 Function

This function returns 'WE8MSWIN1252'.

### Syntax

```
DBMS_XDB_CONSTANTS.ENCODING_WIN1252  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'WE8MSWIN1252'

## 201.2.5 NAMESPACE\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

## 201.2.6 NAMESPACE\_METADATA Function

This function returns 'http://xmlns.oracle.com/xduserMetaData'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_METADATA  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xduserMetaData'

## 201.2.7 NAMESPACE\_ORACLE Function

This function returns 'http://xmlns.oracle.com'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com'

## 201.2.8 NAMESPACE\_ORACLE\_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_ORACLE_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb'

## 201.2.9 NAMESPACE\_RESOURCE Function

This function returns '/XDBResource.xsd'

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

## 201.2.10 NAMESPACE\_RESOURCE\_EVENT Function

This function returns 'http://xmlns.oracle.com/resourceEvent'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_EVENT  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/resourceEvent'

## 201.2.11 NAMESPACE\_RESOURCE\_CONFIG Function

This function returns 'http://xmlns.oracle.com/XDBResConfig.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_RESOURCE_CONFIG  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/XDBResConfig.xsd'

## 201.2.12 NAMESPACE\_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

## 201.2.13 NAMESPACE\_XMLDIFF Function

This function returns 'http://xmlns.oracle.com/xdb/xdiff.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLDIFF  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/xdiff.xsd'

## 201.2.14 NAMESPACE\_XMLINSTANCE Function

This function returns 'http://www.w3.org/2001/XMLSchema-instance'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLINSTANCE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://www.w3.org/2001/XMLSchema-instance'

## 201.2.15 NAMESPACE\_XMLSCHEMA Function

This function returns 'http://www.w3.org/2001/XMLSchema'.

### Syntax

```
DBMS_XDB_CONSTANTS.NAMESPACE_XMLSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://www.w3.org/2001/XMLSchema'

## 201.2.16 NSPREFIX\_ACL\_ACL Function

This function returns 'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_ACL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:acl= 'http://xmlns.oracle.com/acs.xsd'

## 201.2.17 NSPREFIX\_RESCONFIG\_RC Function

This function returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"''.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESCONFIG_RC  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

Returns ''xmlns:rc="http://xmlns.oracle.com/xdb/XDBResConfig.xsd"''

## 201.2.18 NSPREFIX\_RESOURCE\_R Function

This function returns 'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_RESOURCE_R  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:r="http://xmlns.oracle.com/XDBResource.xsd"'

## 201.2.19 NSPREFIX\_XDB\_XDB Function

This function returns 'http://xmlns.oracle.com/xdb'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XDB_XDB  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb'

## 201.2.20 NSPREFIX\_XMLINSTANCE\_XSI Function

This function returns 'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLINSTANCE_XSI  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"'

## 201.2.21 NSPREFIX\_XMLDIFF\_XD Function

This function returns 'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLDIFF_XD  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xd="http://xmlns.oracle.com/xdb/xdiff.xsd"'

## 201.2.22 NSPREFIX\_XMLSCHEMA\_XSD Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '.

### Syntax

```
DBMS_XDB_CONSTANTS.NSPREFIX_XMLSCHEMA_XSD  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" '

## 201.2.23 SCHEMAURL\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd'

## 201.2.24 SCHEMAELEM\_RES\_ACL Function

This function returns 'http://xmlns.oracle.com/xdb/acl.xsd#acl'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RES_ACL  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/acl.xsd#acl'

## 201.2.25 SCHEMAELEM\_RESCONTENT\_BINARY Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_BINARY  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#binary'

## 201.2.26 SCHEMAELEM\_RESCONTENT\_TEXT Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAELEM_RESCONTENT_TEXT  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd#text'

## 201.2.27 SCHEMAURL\_RESOURCE Function

This function returns 'http://xmlns.oracle.com/xdb/XDBResource.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_RESOURCE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBResource.xsd'

## 201.2.28 SCHEMAURL\_XDBSCHEMA Function

This function returns 'http://xmlns.oracle.com/xdb/XDBSchema.xsd'.

### Syntax

```
DBMS_XDB_CONSTANTS.SCHEMAURL_XDBSCHEMA  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'http://xmlns.oracle.com/xdb/XDBSchema.xsd'

## 201.2.29 XDBSCHEMA\_PREFIXES Function

This function returns 'xmlns:xsd="http://www.w3.org/2001/XMLSchema"  
xmlns:xdb="http://xmlns.oracle.com/xdb".'

### Syntax

```
DBMS_XDB_CONSTANTS.XDBSCHEMA_PREFIXES  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xdb="http://xmlns.oracle.com/  
xdb"'

## 201.2.30 XSD\_ATTRIBUTE Function

This function returns 'attribute'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_ATTRIBUTE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'attribute'

## 201.2.31 XSD\_COMPLEX\_TYPE Function

This function returns 'complexType'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_COMPLEX_TYPE  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'complexType'

## 201.2.32 XSD\_ELEMENT Function

This function returns 'element'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_ELEMENT  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'element'

## 201.2.33 XSD\_GROUP Function

This function returns 'group'.

### Syntax

```
DBMS_XDB_CONSTANTS.XSD_GROUP  
RETURN VARCHAR2 DETERMINISTIC;
```

### Return Value

'group'

# DBMS\_XDB\_REPOS

The `DBMS_XDB_REPOS` package provides an interface to operate on the Oracle XML database Repository.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDB\\_REPOS Subprograms](#)

## See Also:

Oracle XML DB Developer's Guide for more information regarding:

- Using and managing repository resources
- ACL-based security management (controlling access to repository resources)
- Managing XLink and XInclude links
- Loading documents into the repository
- Creating, deleting, and managing resource metadata

## 202.1 DBMS\_XDB\_REPOS Overview

The `DBMS_XDB_REPOS` package lets you operate on the Oracle XML DB Repository to create, modify and delete resources, including managing security based on access control lists (ACLs). The interface provides both query and DML functions.

Using a combination of PL/SQL packages - `DBMS_XDB_REPOS`, [DBMS\\_XDBZ](#), and [DBMS\\_XDB\\_VERSION](#) - you can create, delete, and rename documents and folders, move a file or folder within the folder hierarchy, set and change the access permissions on a file or folder, and initiate and manage versioning.

## 202.2 DBMS\_XDB\_REPOS Security Model

Owned by XDB, the `DBMS_XDB_REPOS` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user. Subprograms that operate on the XDB Configuration will succeed only if the current user is `SYS` or `XDB`, or the current user has the `XDBADMIN` or `DBA` role.

## 202.3 DBMS\_XDB\_REPOS Constants

The `DBMS_XDB_REPOS` package defines several constants that can be used for specifying parameter values.

These constants are shown in the following table.

**Table 202-1 DBMS\_XDB\_REPOS Constants**

| Constant                                        | Type        | Value   | Description                                                                            |
|-------------------------------------------------|-------------|---------|----------------------------------------------------------------------------------------|
| <code>DELETE_RESOURCE</code>                    | NUMBER      | 1       | Deletes a resource; fails if the resource has children.                                |
| <code>DELETE_RECURSIVE</code>                   | NUMBER      | 2       | Deletes a resource and its children, if any.                                           |
| <code>DELETE_FORCE</code>                       | NUMBER      | 3       | Deletes the resource, even if the object it contains is invalid                        |
| <code>DELETE_RECURSIVE_FORCE</code>             | NUMBER      | 4       | Deletes a resource and its children, if any, even if the object it contains is invalid |
| <code>DELETE_RES_METADATA_CA<br/>SCADE</code>   | NUMBER      | 1       | Deletes the row in the metadata                                                        |
| <code>DELETE_RES_METADATA_NO<br/>CASCADE</code> | NUMBER      | 2       | Does not delete the row                                                                |
| <code>DEFAULT_LOCK_TIMEOUT</code>               | PLS_INTEGER | (60*60) | Timeout value (in seconds) of the webdav lock                                          |
| <code>LINK_TYPE_HARD</code>                     | NUMBER      | 1       | Hard link of a folder to a resource                                                    |
| <code>LINK_TYPE_WEAK</code>                     | NUMBER      | 2       | Weak link of a folder to a resource                                                    |
| <code>LINK_TYPE_SYMBOLIC</code>                 | NUMBER      | 3       | Symbolic link of a folder to a resource                                                |

## 202.4 Summary of DBMS\_XDB\_REPOS Subprograms

This table lists the `DBMS_XDB_REPOS` subprograms and briefly describes them.

**Table 202-2 DBMS\_XDB\_REPOS Package Subprograms**

| Subprogram                                       | Description                                                                                                                                        |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ACLCHECKPRIVILEGES Function</a>      | Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.    |
| <a href="#">APPENDRESOURCEMETADATA Procedure</a> | Takes in user-defined metadata either as a <code>REF</code> to <code>XMLTYPE</code> or an <code>XMLTYPE</code> and adds it to the desired resource |
| <a href="#">CHANGEOWNER Procedure</a>            | Changes the owner of the resource/s to the specified owner.                                                                                        |
| <a href="#">CHANGEPRIVILEGES Function</a>        | Adds a specified ACE to a specified resource's ACL                                                                                                 |
| <a href="#">CHECKPRIVILEGES Function</a>         | Checks access privileges granted to the current user on the specified resource                                                                     |
| <a href="#">CREATEFOLDER Function</a>            | Creates a new folder resource in the hierarchy                                                                                                     |
| <a href="#">CREATEOIDPATH Function</a>           | Creates a virtual path to the resource based on object ID                                                                                          |

**Table 202-2 (Cont.) DBMS\_XDB\_REPOS Package Subprograms**

| Subprogram                        | Description                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------|
| CREATERESOURCE Functions          | Creates a new resource                                                                      |
| DELETERESOURCE Procedure          | Deletes a resource from the hierarchy                                                       |
| DELETERESOURCEMETADATA Procedures | Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata) |
| EXISTSRESOURCE Function           | Determines if a resource is in the hierarchy, based on its absolute path                    |
| GETACLDOCUMENT Function           | Retrieves ACL document that protects resource given its path name                           |
| GETCONTENTBLOB Function           | Retrieves the contents of a resource returned as a BLOB                                     |
| GETCONTENTCLOB Function           | Retrieves the contents of a resource returned as a CLOB                                     |
| GETCONTENTVARCHAR2 Function       | Retrieves the contents of a resource returned as a string                                   |
| GETCONTENTXMLREF Function         | Retrieves the contents of a resource returned as a REF to an XMLTYPE                        |
| GETCONTENTXMLTYPE Function        | Retrieves the contents of a resource returned as an XMLTYPE                                 |
| GETLOCKTOKEN Procedure            | Returns that resource's lock token for the current user given a path to a resource          |
| GETPRIVILEGES Function            | Gets all privileges granted to the current user on a specified resource                     |
| GETRESOID Function                | Returns the object ID of the resource from its absolute path                                |
| GETXDB_TABLESPACE Function        | Returns the current tablespace of the XDB (user)                                            |
| HASBLOBCONTENT Function           | Returns TRUE if the resource has BLOB content                                               |
| HASCHARCONTENT Function           | Returns TRUE if the resource has character content                                          |
| HASXMLCONTENT Function            | Returns TRUE if the resource has XML content                                                |
| HASXMLREFERENCE Function          | Returns TRUE if the resource has REF to XML content                                         |
| ISFOLDER Function                 | Returns TRUE if the resource is a folder or container                                       |
| LINK Procedures                   | Creates a link to an existing resource                                                      |
| LOCKRESOURCE Function             | Gets a WebDAV-style lock on that resource given a path to that resource                     |
| PROCESSLINKS Procedure            | Processes document links in the specified resource                                          |
| PURGERESOURCEMETADATA Procedure   | Deletes all user metadata from a resource                                                   |
| RENAMERESOURCE Procedure          | Renames the XDB resource                                                                    |
| SETACL Procedure                  | Sets the ACL on a specified resource                                                        |
| SPLITPATH Procedure               | Splits the path into a parentpath and childpath                                             |
| TOUCHRESOURCE Procedure           | Changes the modification time of the resource to the current time                           |
| UNLOCKRESOURCE Function           | Unlocks the resource given a lock token and resource path                                   |
| UPDATERESOURCEMETADATA Procedures | Updates metadata for a resource                                                             |

## 202.4.1 ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the `OWNER` of the resource. Returns positive integer if all privileges are granted.

### Syntax

```
DBMS_XDB_REPOS.ACLCHECKPRIVILEGES (  
    acl_path IN VARCHAR2,  
    owner    IN VARCHAR2,  
    privs    IN xmltype)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 202-3** *ACLCHECKPRIVILEGES Function Parameters*

| Parameter             | Description                                                                                                                                                                 |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>acl_path</code> | Absolute path in the Hierarchy for ACL document                                                                                                                             |
| <code>owner</code>    | Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution                                                                   |
| <code>privs</code>    | An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges. See description for <a href="#">CHECKPRIVILEGES Function</a> . |

## 202.4.2 APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource.

### Syntax

```
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (  
    abspath IN VARCHAR2,  
    metadata IN XMLTYPE);  
  
DBMS_XDB_REPOS.APPENDRESOURCEMETADATA (  
    abspath IN VARCHAR2,  
    metadata IN REF SYS.XMLTYPE);
```

### Parameters

**Table 202-4** *APPENDRESOURCEMETADATA Procedure*

| Parameter             | Description                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------|
| <code>abspath</code>  | Absolute path of the resource                                                                      |
| <code>metadata</code> | Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table. |

### Usage Notes

- In the case in which a `REF` is passed in, the procedure stores the `REF` in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the `RESID` column for the metadata table. Note that the `REF` passed in must be unique. In

other words, there must not be a `REF` with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a `REF` that already exists.

- In the case where the `XMLTYPE` is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

## 202.4.3 CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

### Syntax

```
DBMS_XDB_REPOS.CHANGEOWNER (
    abspath    IN   VARCHAR2,
    owner      IN   VARCHAR2,
    recurse    IN   BOOLEAN := FALSE);
```

### Parameters

**Table 202-5 CHANGEOWNER Procedure Parameters**

| Parameter            | Description                                                                         |
|----------------------|-------------------------------------------------------------------------------------|
| <code>abspath</code> | Absolute path of the resource                                                       |
| <code>owner</code>   | New owner for the resource                                                          |
| <code>recurse</code> | If <code>TRUE</code> , recursively change owner of all resources in the folder tree |

## 202.4.4 CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

### Syntax

```
DBMS_XDB_REPOS.CHANGEPRIVILEGES (
    res_path  IN   VARCHAR2,
    ace       IN   xmltype)
RETURN PLS_INTEGER;
```

### Parameters

**Table 202-6 CHANGEPRIVILEGES Function Parameters**

| Parameter             | Description                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>res_path</code> | Path name of the resource for which privileges need to be changed                                                                                                                                 |
| <code>ace</code>      | An <code>XMLType</code> instance of the <code>&lt;ace&gt;</code> element which specifies the <code>&lt;principal&gt;</code> , the operation <code>&lt;grant&gt;</code> and the list of privileges |

### Return Values

A positive integer if the ACL was successfully modified.

### Usage Notes

If no ACE with the same principal and the same operation (*grant/deny*) already exists in the ACL, the new ACE is added at the end of the ACL.

## 202.4.5 CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

### Syntax

```
DBMS_XDB_REPOS.CHECKPRIVILEGES(  
    res_path  IN  VARCHAR2,  
    privs     IN  xmltype)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 202-7 CHECKPRIVILEGES Function Parameters**

| Parameter | Description                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource                                                                 |
| privs     | An <code>XMLType</code> instance of the privilege element specifying the requested set of access privileges |

### Return Values

A positive integer if all requested privileges granted.

## 202.4.6 CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

### Syntax

```
DBMS_XDB_REPOS.CREATEFOLDER(  
    path  IN  VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-8 CREATEFOLDER Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| path      | Path name for the new folder |

### Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

### Usage Notes

The given path name's parent folder must already exist in the hierarchy: if  `'/folder1/folder2'` is passed as the path parameter, then  `'/folder1'` must already exist.

## 202.4.7 CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

### Syntax

```
DBMS_XDB_REPOS.CREATEOIDPATH (
    oid      IN   RAW)
RETURN VARCHAR2;
```

### Parameters

**Table 202-9 CREATEOIDPATH Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| oid       | Object ID of the resource |

## 202.4.8 CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

### Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN   VARCHAR2,
    data         IN   VARCHAR2)
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN   VARCHAR2,
    data         IN   SYS.XMLTYPE)
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN   VARCHAR2,
    datarow      IN   REF SYS.XMLTYPE)
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN   VARCHAR2,
    data         IN   BLOB,
    csid         IN   NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  BFILE,
    csid         IN  NUMBER :=0)
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  CLOB)
RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  VARCHAR2,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB_REPOS.CREATERESOURCE (
    abspath      IN  VARCHAR2,
    data         IN  SYS.XMLTYPE,
    schemaurl    IN  VARCHAR2 := NULL,
    elem         IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

## Parameters

**Table 202-10** CREATERESOURCE Function Parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath   | Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| data      | String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| datarow   | REF to an XMLType row to be used as the contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| csid      | Character set id of the document. Must be a valid Oracle ID; otherwise returns an error.<br><br>If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> <li>From the abspath extension, determine the resource's MIME type.</li> <li>If the MIME type is <code>*/*xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at <a href="http://www.w3.org/TR/2000/REC-xml-20001006">http://www.w3.org/TR/2000/REC-xml-20001006</a>;</li> <li>Otherwise, it is defaulted to the database character set.</li> </ul> |
| schemaurl | For XML data, schema URL data conforms to (default NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| elem      | Element name (default NULL)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Return Values

TRUE if operation successful; FALSE, otherwise.

## 202.4.9 DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

### Syntax

```
DBMS_XDB_REPOS.DELETERESOURCE (
    path          IN      VARCHAR2,
    delete_option IN      PLS_INTEGER);
```

### Parameters

**Table 202-11 DELETERESOURCE Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path          | Path name of the resource to delete                                                                                                                                                                   |
| delete_option | The option that controls how a resource is deleted: <ul style="list-style-type: none"> <li>DELETE_RESOURCE</li> <li>DELETE_RECURSIVE</li> <li>DELETE_FORCE</li> <li>DELETE_RECURSIVE_FORCE</li> </ul> |

## 202.4.10 DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

### Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath      IN  VARCHAR2,
    metadata     IN  REF SYS.XMLTYPE,
    delete_option IN  pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB_REPOS.DELETERESOURCEMETADATA (
    abspath      IN  VARCHAR2,
    metadatans   IN  VARCHAR2,
    metadataname IN  VARCHAR2,
    delete_option IN pls_integer := DBMS_XDB_REPOS.DELETE_RESOURCE_METADATA_CASCADE);
```

## Parameters

**Table 202-12 DELETERESOURCEMETADATA Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath       | Absolute path of the resource                                                                                                                                                                                                                                                                        |
| metadata      | REF to the piece of metadata (schema based) to be deleted                                                                                                                                                                                                                                            |
| mettadatans   | Namespace of the metadata fragment to be removed                                                                                                                                                                                                                                                     |
| mettadataname | Local name of the metadata fragment to be removed                                                                                                                                                                                                                                                    |
| delete_option | Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"><li>DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table</li><li>DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table</li></ul> |

## 202.4.11 EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. It matches the resource by a string that represents its absolute path.

### Syntax

```
DBMS_XDB_REPOS.EXISTSRESOURCE(  
    abspath    IN    VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-13 EXISTSRESOURCE Function Parameters**

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

### Return Values

TRUE if the resource is found.

## 202.4.12 GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

### Syntax

```
DBMS_XDB_REPOS.GETACLDOCUMENT(  
    abspath    IN    VARCHAR2)  
RETURN sys.xmltype;
```

## Parameters

**Table 202-14** GETACLDOCUMENT Function Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| abspath   | Path name of the resource whose ACL document is required |

## Return Values

The XMLType for ACL document.

## 202.4.13 GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTBLOB(  
    abspath    IN    VARCHAR2,  
    csid       OUT   PLS_INTEGER,  
    locksrc    IN    BOOLEAN := FALSE)  
RETURN BLOB;
```

## Parameters

**Table 202-15** GETCONTENTBLOB Function Parameters

| Parameter | Description                                                                |
|-----------|----------------------------------------------------------------------------|
| abspath   | Absolute path of the resource                                              |
| csid      | If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy. |
| locksrc   | Contents of the resource as a BLOB                                         |

## Return Values

The contents of the resource as a BLOB.

## 202.4.14 GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTCLOB(  
    abspath    IN    VARCHAR2,  
    RETURN CLOB;
```

## Parameters

**Table 202-16** GETCONTENTCLOB Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a CLOB.

## 202.4.15 GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTVARCHAR2(  
    abspath IN VARCHAR2,  
    RETURN BLOB;
```

## Parameters

**Table 202-17** GETCONTENTVARCHAR2 Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a string.

## 202.4.16 GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a `REF` to an `XMLTYPE`.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLREF(  
    abspath IN VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

## Parameters

**Table 202-18** GETCONTENTXMLREF Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## Return Values

The contents of the resource as a `REF` to an `XMLTYPE`.

## 202.4.17 GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an `XMLTYPE`.

### Syntax

```
DBMS_XDB_REPOS.GETCONTENTXMLTYPE (  
    abspath      IN      VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

### Parameters

**Table 202-19** GETCONTENTXMLTYPE Function Parameters

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

### Return Values

The contents of the resource as an `XMLTYPE`.

## 202.4.18 GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

### Syntax

```
DBMS_XDB_REPOS.GETLOCKTOKEN (  
    path          IN      VARCHAR2,  
    locktoken     OUT     VARCHAR2);
```

### Parameters

**Table 202-20** GETLOCKTOKEN Procedure Parameters

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| path      | Path name to the resource                    |
| locktoken | Logged-in user's lock token for the resource |

### Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

## 202.4.19 GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

### Syntax

```
DBMS_XDB_REPOS.GETPRIVILEGES (  
    res_path      IN      VARCHAR2)  
RETURN sys.xmltype;
```

## Parameters

**Table 202-21** GETPRIVILEGES Function Parameters

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| res_path  | Absolute path in the hierarchy of the resource |

## Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

## 202.4.20 GETRESOID Function

The GETRESOID function returns the object ID of the resource from its absolute path.

### Syntax

```
DBMS_XDB_REPOS.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

## Parameters

**Table 202-22** GETRESOID Function Parameters

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## Return Values

NULL if the resource is not present.

## 202.4.21 GETXDB\_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

### Syntax

```
DBMS_XDB_REPOS.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

## 202.4.22 HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

### Syntax

```
DBMS_XDB_REPOS.HASBLOBCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

## Parameters

**Table 202-23 HASBLOBCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has BOB content.

## 202.4.23 HASCHARCONTENT Function

This function returns `TRUE` if the resource has character content.

### Syntax

```
DBMS_XDB_REPOS.HASCHARCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

## Parameters

**Table 202-24 HASCHARCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has character content.

## 202.4.24 HASXMLCONTENT Function

This function returns `TRUE` if the resource has XML content.

### Syntax

```
DBMS_XDB_REPOS.HASXMLCONTENT  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

## Parameters

**Table 202-25 HASXMLCONTENT Function Parameters**

| Parameter                 | Description                   |
|---------------------------|-------------------------------|
| <code>abspath_path</code> | Absolute path of the resource |

## Return Values

`TRUE` if the resource has XML content.

## 202.4.25 HASXMLREFERENCE Function

This function returns `TRUE` if the resource has a `REF` to XML content.

### Syntax

```
DBMS_XDB_REPOS.HASXMLREFERENCE  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-26 HASXMLREFERENCE Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

### Return Values

`TRUE` resource has a `REF` to XML content.

## 202.4.26 ISFOLDER Function

This function returns `TRUE` if the resource is a folder or container.

### Syntax

```
DBMS_XDB_REPOS.ISFOLDER  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-27 ISFOLDER Function Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

### Return Values

`TRUE` if the resource is a folder or container.

## 202.4.27 LINK Procedures

This procedure creates from a specified folder to a specified resource.

### Syntax

```
DBMS_XDB_REPOS.LINK(  
    srcpath IN VARCHAR2,  
    linkfolder IN VARCHAR2,  
    linkname IN VARCHAR2);
```

```
DBMS_XDB_REPOS.LINK(  
    srcpath      IN   VARCHAR2,  
    linkfolder   IN   VARCHAR2,  
    linkname     IN   VARCHAR2,  
    linktype     IN   PLS_INTEGER := DBMS_XDB_REPOS.LINK_TYPE_HARD);
```

### Parameters

**Table 202-28 LINK Procedure Parameters**

| Parameter  | Description                                                                                                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| srcpath    | Path name of the resource to which a link is created                                                                                                                                    |
| linkfolder | Folder in which the new link is placed                                                                                                                                                  |
| linkname   | Name of the new link                                                                                                                                                                    |
| linktype   | Type of link to be created: <ul style="list-style-type: none"><li>• DBMS_XDB.LINK_TYPE_HARD (default)</li><li>• DBMS_XDB.LINK_TYPE_WEAK</li><li>• DBMS_XDB.LINK_TYPE_SYMBOLIC</li></ul> |

## 202.4.28 LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

### Syntax

```
DBMS_XDB_REPOS.LOCKRESOURCE(  
    path      IN   VARCHAR2,  
    depthzero IN   BOOLEAN,  
    shared    IN   boolean)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-29 LOCKRESOURCE Function Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| path      | Path name of the resource to lock.       |
| depthzero | Currently not supported                  |
| shared    | Passing TRUE obtains a shared write lock |

### Return Values

TRUE if successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

## 202.4.29 PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

### Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (  
  abspath IN VARCHAR2,  
  recurse IN BOOLEAN := FALSE);
```

### Parameters

**Table 202-30 PROCESSLINKS Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| abspath   | Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.                                                                                                                                                        |
| recurse   | Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only. |

## 202.4.30 PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

### Syntax

```
DBMS_XDB_REPOS.PURGERESOURCEMETADATA (  
  abspath IN VARCHAR2);
```

### Parameters

**Table 202-31 PURGERESOURCEMETADATA Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| abspath   | Absolute path of the resource |

## 202.4.31 RENAMERESOURCE Procedure

This procedure renames the XDB resource.

### Syntax

```
DBMS_XDB_REPOS.RENAMERESOURCE (  
  srcpath IN VARCHAR2,  
  destfolder IN CARCHAR2,  
  newname IN VARCHAR2);
```

## Parameters

**Table 202-32 RENAMERESOURCE Procedure Parameters**

| Parameter  | Description                                                               |
|------------|---------------------------------------------------------------------------|
| srcpath    | Absolute path in the Hierarchy for the source resource destination folder |
| destfolder | Absolute path in the Hierarchy for the destination folder                 |
| newname    | Name of the child in the destination folder                               |

## 202.4.32 SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

### Syntax

```
DBMS_XDB_REPOS.SETACL(  
    res_path  IN  VARCHAR2,  
    acl_path  IN  VARCHAR2);
```

## Parameters

**Table 202-33 SETACL Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| res_path  | Absolute path in the Hierarchy for resource |
| acl_path  | Absolute path in the Hierarchy for ACL      |

### Usage Notes

The user must have <write-acl> privileges on the resource.

## 202.4.33 SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

### Syntax

```
DBMS_XDB_REPOS.SPLITPATH(  
    abspath      IN  VARCHAR2,  
    parentpath   OUT VARCHAR2,  
    childpath    OUT VARCHAR2);
```

## Parameters

**Table 202-34 SPLITPATH Procedure Parameters**

| Parameter  | Description               |
|------------|---------------------------|
| abspath    | Absolute path to be split |
| parentpath | Parentpath                |
| childpath  | Childpath                 |

## 202.4.34 TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

### Syntax

```
DBMS_XDB_REPOS.TOUCHRESOURCE  
    abspath    IN    VARCHAR2);
```

### Parameters

**Table 202-35 TOUCHRESOURCE Procedure Parameters**

| Parameter    | Description                   |
|--------------|-------------------------------|
| abspath_path | Absolute path of the resource |

## 202.4.35 UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

### Syntax

```
DBMS_XDB_REPOS.UNLOCKRESOURCE(  
    path      IN  VARCHAR2,  
    deltoken  IN  VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 202-36 UNLOCKRESOURCE Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| path      | Path name to the resource |
| deltoken  | Lock token to be removed  |

### Return Values

TRUE if operation successful.

### Usage Notes

The user must have UPDATE privileges on the resource.

## 202.4.36 UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource.

The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

## Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldmetadata IN REF SYS.XMLTYPE,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB_REPOS.UPDATERESOURCEMETADATA (
    abspath IN VARCHAR2,
    oldns IN VARCHAR2,
    oldname IN VARCHAR,
    newmetadata IN REF SYS.XMLTYPE);
```

## Parameters

**Table 202-37 UPDATERESOURCEMETADATA Procedure Parameters**

| Parameter   | Description                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------|
| abspath     | Absolute path of the resource                                                                                  |
| oldmetadata | REF to the old of metadata                                                                                     |
| newmetadata | REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload) |
| oldns       | Namespace identifying old metadata                                                                             |
| oldname     | Local name identifying old metadata                                                                            |

## Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

## DBMS\_XDB\_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS\\_XDB\\_VERSION Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide*

## 203.1 DBMS\_XDB\_VERSION Security Model

Owned by `XDB`, the `DBMS_XDB_VERSION` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 203.2 Summary of DBMS\_XDB\_VERSION Subprograms

This table lists the `DBMS_XDB_VERSION` subprograms and briefly describes them.

**Table 203-1** *DBMS\_XDB\_VERSION Package Subprograms*

| Method                                         | Description                                                                          |
|------------------------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">CHECKIN Function</a>               | Checks in a checked-out VCR and returns the resource id of the newly-created version |
| <a href="#">CHECKOUT Procedure</a>             | Checks out a VCR before updating or deleting it                                      |
| <a href="#">GETCONTENTSBOBBYRESID Function</a> | Obtain contents as a <code>BLOB</code>                                               |
| <a href="#">GETCONTENTSCLBBYRESID Function</a> | Obtain contents as a <code>CLOB</code>                                               |
| <a href="#">GETCONTENTSXMLBYRESID Function</a> | Obtain contents as an <code>XMLType</code>                                           |
| <a href="#">GETPREDECESSORS Function</a>       | Retrieves the list of predecessors by path name                                      |
| <a href="#">GETPREDSBYRESID Function</a>       | Retrieves the list of predecessors by resource id                                    |
| <a href="#">GETRESOURCEBYRESID Function</a>    | Obtains the resource as an <code>XMLType</code> , given the resource object ID       |
| <a href="#">GETSUCCESSORS Function</a>         | Retrieves the list of successors by path name                                        |
| <a href="#">GETSUCCSBYRESID Function</a>       | Retrieves the list of successors by resource id                                      |

**Table 203-1 (Cont.) DBMS\_XDB\_VERSION Package Subprograms**

| Method                                 | Description                                                                                                 |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <a href="#">MAKEVERSIONED Function</a> | Turns a regular resource whose path name is given into a version-controlled resource                        |
| <a href="#">UNCHECKOUT Function</a>    | Checks in a checked-out resource, returns the resource id of the version before the resource is checked out |

## 203.2.1 CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

### Syntax

```
DBMS_XDB_VERSION.CHECKIN(  
    pathname VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 203-2 CHECKIN Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| pathname  | The path name of the checked-out resource. |

### Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

## 203.2.2 CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

### Syntax

```
DBMS_XDB_VERSION.Checkout(  
    pathname    VARCHAR2);
```

### Parameters

**Table 203-3 CHECKOUT Procedure Parameters**

| Parameter | Description                                 |
|-----------|---------------------------------------------|
| pathname  | The path name of the VCR to be checked out. |

### Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

## 203.2.3 GETCONTENTSbloobyresid Function

This function obtain contents as a BLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTSbloobyresid(  
    resid      DBMS_XDB.resid_type)  
RETURN BLOB;
```

### Parameters

**Table 203-4** GETCONTENTSbloobyresid Function Parameters

| Parameter | Description      |
|-----------|------------------|
| resid     | The resource id. |

## 203.2.4 GETCONTENTScloobyresid Function

This function obtains contents as a CLOB.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTScloobyresid(  
    resid      DBMS_XDB.resid_type)  
RETURN CLOB;
```

### Parameters

**Table 203-5** GETCONTENTScloobyresid Function Parameters

| Parameter | Description      |
|-----------|------------------|
| resid     | The resource id. |

## 203.2.5 GETCONTENTStxmlbyresid Function

This function obtains contents as an XMLType.

### Syntax

```
DBMS_XDB_VERSION.GETCONTENTStxmlbyresid(  
    resid      DBMS_XDB.resid_type)  
RETURN XMLType;
```

## Parameters

**Table 203-6 GETCONTENTSXMLBYRESID Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| resid     | The resource id. |

## Return Values

If the contents are not valid XML, returns `NULL`.

## 203.2.6 GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(  
    pathname      VARCHAR2)  
RETURN resid_list_type;
```

## Parameters

**Table 203-7 GETPREDECESSORS Function Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| pathname  | The path name of the resource. |

## Return Values

An exception is raised if `pathname` is illegal.

## 203.2.7 GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

### Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(  
    resid      resid_type)  
RETURN resid_list_type;
```

## Parameters

**Table 203-8 GETPREDSBYRESID Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| resid     | The resource id. |

## Usage Notes

Getting predecessors by `RESID` is more efficient than by `pathname`.

### Exceptions

An exception is raised if the `RESID` is illegal.

## 203.2.8 GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

### Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(  
    resid      resid_type)  
RETURN XMLType;
```

### Parameters

**Table 203-9** GETRESOURCEBYRESID Function Parameters

| Parameter          | Description      |
|--------------------|------------------|
| <code>resid</code> | The resource id. |

## 203.2.9 GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

### Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(  
    pathname VARCHAR2)  
RETURN resid_list_type;
```

### Parameters

**Table 203-10** GETSUCCESSORS Function Parameters

| Parameter             | Description                    |
|-----------------------|--------------------------------|
| <code>pathname</code> | The path name of the resource. |

### Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

### Exceptions

An exception is raised if the `pathname` is illegal.

## 203.2.10 GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

### Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(  
    resid    resid_type)  
RETURN resid_list_type;
```

### Parameters

**Table 203-11** GETSUCCSBYRESID Function Parameters

| Parameter | Description      |
|-----------|------------------|
| resid     | The resource id. |

### Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

### Exceptions

An exception is raised if the `pathname` is illegal.

## 203.2.11 MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

### Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(  
    pathname  VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 203-12** MAKEVERSIONED Function Parameters

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| pathname  | The path name of the resource to be put under version control. |

### Return Values

This function returns the resource ID of the first version, or root, of the VCR.

### Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

## 203.2.12 UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

### Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(  
    pathname    VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

### Parameters

**Table 203-13 UNCHECKOUT Function Parameters**

| Parameter | Description                                |
|-----------|--------------------------------------------|
| pathname  | The path name of the checked-out resource. |

### Usage Notes

This is not an auto-commit SQL operation. The [UNCHECKOUT Function](#) does not have to take the same path name that was passed to the operation by the [CHECKOUT Procedure](#). However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

### Exceptions

An exception is raised if the path name doesn't exist.

# DBMS\_XDBRESOURCE

The `DBMS_XDBRESOURCE` package provides the interface to operate on the resource's metadata and contents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XDBRESOURCE Subprograms](#)

 **See Also:**

Oracle XML DB Developer's Guide for examples of "Using `DBMS_XDBRESOURCE`"

## 204.1 DBMS\_XDBRESOURCE Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

## 204.2 DBMS\_XDBRESOURCE Security Model

Owned by `XDB`, the `DBMS_XDBRESOURCE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 204.3 Summary of DBMS\_XDBRESOURCE Subprograms

This table lists the `DBMS_XDBRESOURCE` subprograms and briefly describes them.

**Table 204-1** *DBMS\_XDBRESOURCE Package Subprograms*

| Subprogram                                | Description                                                             |
|-------------------------------------------|-------------------------------------------------------------------------|
| <a href="#">FREERESOURCE Procedure</a>    | Frees any memory associated with an <code>XDBResource</code>            |
| <a href="#">GETACL Function</a>           | Given an <code>XDBResource</code> , returns its ACL as string           |
| <a href="#">GETACLDOCFROMRES Function</a> | Returns the ACL Document for the given resource as <code>XMLType</code> |
| <a href="#">GETAUTHOR Function</a>        | Given an <code>XDBResource</code> , returns its author                  |
| <a href="#">GETCHARACTERSET Function</a>  | Given an <code>XDBResource</code> , returns its character set           |
| <a href="#">GETCOMMENT Function</a>       | Given an <code>XDBResource</code> , returns its comment                 |

**Table 204-1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

| Subprogram                                        | Description                                                                                          |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <a href="#">GETCONTENTBLOB Function</a>           | Returns the contents of the resource as a BLOB                                                       |
| <a href="#">GETCONTENTCLOB Function</a>           | Returns the contents of the resource as a CLOB                                                       |
| <a href="#">GETCONTENTREF Function</a>            | Returns the contents of the resource as an XMLTypeRef                                                |
| <a href="#">GETCONTENTTYPE Function</a>           | Given an XDBResource, returns its content-type                                                       |
| <a href="#">GETCONTENTXML Function</a>            | Returns the contents of the resource as XML                                                          |
| <a href="#">GETCONTENTVARCHA2 Function</a>        | Returns the contents of the resource as a string                                                     |
| <a href="#">GETCREATIONDATE Function</a>          | Given an XDBResource, returns its creation date                                                      |
| <a href="#">GETCREATOR Function</a>               | Given an XDBResource, returns its creator                                                            |
| <a href="#">GETCUSTOMMETADATA Function</a>        | Returns the requested custom metadata given the xpath and namespace to the metadata                  |
| <a href="#">GETDISPLAYNAME Function</a>           | Given an XDBResource, returns its display name                                                       |
| <a href="#">GETLANGUAGE Function</a>              | Given an XDBResource, returns its language                                                           |
| <a href="#">GETLASTMODIFIER Function</a>          | Given an XDBResource, returns its last modifier                                                      |
| <a href="#">GETMODIFICATIONDATE Function</a>      | Given an XDBResource, returns its modification date                                                  |
| <a href="#">GETOWNER Function</a>                 | Given an XDBResource, returns its owner.                                                             |
| <a href="#">GETREFCOUNT Function</a>              | Given an XDBResource, returns its reference count                                                    |
| <a href="#">GETVERSIONID Function</a>             | Given an XDBResource, returns its version ID.                                                        |
| <a href="#">HASACLCHANGED Function</a>            | Returns TRUE if the ACL of the given resource has changed, FALSE otherwise                           |
| <a href="#">HASAUTHORCHANGED Function</a>         | Returns TRUE if the ACL of the given resource has changed FALSE otherwise                            |
| <a href="#">HASCHANGED Function</a>               | Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise |
| <a href="#">HASCHARACTERSETCHANGED Function</a>   | Returns TRUE if the character set of the given resource has changed, FALSE otherwise                 |
| <a href="#">HASCOMMENTCHANGED Function</a>        | Returns TRUE if the comment of the given resource has changed, FALSE otherwise                       |
| <a href="#">HASCONTENTCHANGED Function</a>        | Returns TRUE if the contents of the given resource has changed, FALSE otherwise                      |
| <a href="#">HASCONTENTTYPECHANGED Function</a>    | Returns TRUE if the content-type of the given resource has changed, FALSE otherwise                  |
| <a href="#">HASCREATIONDATECHANGED Function</a>   | Returns TRUE if the creation date of the given resource has changed, FALSE otherwise                 |
| <a href="#">HASCREATORCHANGED Function</a>        | Returns TRUE if the creator of the given resource has changed, FALSE otherwise                       |
| <a href="#">HASCUSTOMMETADATACHANGED Function</a> | Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise                          |
| <a href="#">HASDISPLAYNAMECHANGED Function</a>    | Returns TRUE if the display name of the given resource has changed, FALSE otherwise                  |
| <a href="#">HASLANGUAGECHANGED Function</a>       | Returns TRUE if the language of the given resource has changed, FALSE otherwise                      |

**Table 204-1 (Cont.) DBMS\_XDBRESOURCE Package Subprograms**

| Subprogram                                          | Description                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">HASLASTMODIFIERCHANGED Function</a>     | Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise          |
| <a href="#">HASMODIFICATIONDATECHANGED Function</a> | Returns TRUE if the modification date of the given resource has changed, FALSE otherwise      |
| <a href="#">HASOWNERCHANGED Function</a>            | Returns TRUE if the owner of the given resource has changed, FALSE otherwise                  |
| <a href="#">HASREFCOUNTCHANGED Function</a>         | Returns TRUE if the reference count of the given resource has changed, FALSE otherwise        |
| <a href="#">HASVERSIONIDCHANGED Function</a>        | Returns TRUE if the version ID of the given resource has changed, FALSE otherwise             |
| <a href="#">ISFOLDER Function</a>                   | Returns TRUE if the given resource is a folder, FALSE otherwise                               |
| <a href="#">ISNULL Function</a>                     | Returns TRUE if input resource is NULL, FALSE otherwise                                       |
| <a href="#">MAKEDOCUMENT Function</a>               | Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface |
| <a href="#">SAVE Procedure</a>                      | Updates the resource with any modifications                                                   |
| <a href="#">SETACL Procedure</a>                    | Sets the ACL of the given XDBResource to the path specified                                   |
| <a href="#">SETAUTHOR Procedure</a>                 | Sets the author of the given XDBResource to the specified string                              |
| <a href="#">SETCHARACTERSET Procedure</a>           | Sets the character set of the given XDBResource to a specified character set                  |
| <a href="#">SETCOMMENT Procedure</a>                | Sets a comment associated with the given XDBResource                                          |
| <a href="#">SETCONTENT Procedures</a>               | Replaces the contents of the given resource with the given CLOB                               |
| <a href="#">SETCONTENTTYPE Procedure</a>            | Sets the content-type of the given XDBResource                                                |
| <a href="#">SETCUSTOMMETADATA Procedure</a>         | Sets the custom metadata specified by the XPath and namespace to new data                     |
| <a href="#">SETDISPLAYNAME Procedure</a>            | Sets the display name of the given XDBResource                                                |
| <a href="#">SETLANGUAGE Procedure</a>               | Sets the language of the given XDBResource                                                    |
| <a href="#">SETOWNER Procedure</a>                  | Sets the owner of the given XDBResource                                                       |

## 204.3.1 FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.FREERESOURCE (
    res    IN    XDBResource)
RETURN VARCHAR2;
```

## Parameters

**Table 204-2 FREERESOURCE Procedure Parameters**

| Parameter | Description         |
|-----------|---------------------|
| res       | XDBResource to free |

## 204.3.2 GETACL Function

Given an XDBResource, this function returns its ACL as string.

### Syntax

```
DBMS_XDBRESOURCE.GETACL (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-3 GETACL Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.3 GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

### Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (  
    res IN XDBResource)  
RETURN SYS.XMLTYPE;
```

## Parameters

**Table 204-4 GETACLDOCFROMRES Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.4 GETAUTHOR Function

Given an XDBResource, this function returns its author.

### Syntax

```
DBMS_XDBRESOURCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-5 GETAUTHOR Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.5 GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

### Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-6 GETCHARACTERSET Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.6 GETCOMMENT Function

Given an XDBResource, this function returns its comment.

### Syntax

```
DBMS_XDBRESOURCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-7 GETCOMMENT Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.7 GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTBLOB (  
    res IN XDBResource,  
    csid OUT PLS_INTEGER)  
RETURN BLOB;
```

## Parameters

**Table 204-8 GETCONTENTBLOB Function Parameters**

| Parameter | Description                           |
|-----------|---------------------------------------|
| res       | XDBResource                           |
| csid      | Character set ID of the BLOB returned |

## 204.3.8 GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTCLOB (  
    res IN XDBResource)  
RETURN CLOB;
```

## Parameters

**Table 204-9 GETCONTENTCLOB Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.9 GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTREF (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-10 GETCONTENTREF Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.10 GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTTYPE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-11** GETCONTENTTYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.11 GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTXML (  
    res    IN    XDBResource)  
RETURN XMLType;
```

## Parameters

**Table 204-12** GETCONTENTXML Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.12 GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

### Syntax

```
DBMS_XDBRESOURCE.GETCONTENTVARCHAR2 (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-13** GETCONTENTVARCHAR2 Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.13 GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

### Syntax

```
DBMS_XDBRESOURCE.GETCREATIONDATE (  
    res    IN    XDBResource)  
RETURN TIMESTAMP;
```

## Parameters

**Table 204-14** GETCREATIONDATE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.14 GETCREATOR Function

Given an XDBResource, this function returns its creator.

### Syntax

```
DBMS_XDBRESOURCE.GETCREATOR (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

## Parameters

**Table 204-15** GETCREATOR Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.15 GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

### Syntax

```
DBMS_XDBRESOURCE.GETCUSTOMMETADATA (  
    res        IN    XDBResource,  
    xpath      IN    VARCHAR2,    namespace IN    VARCHAR2)  
RETURN XMLType;
```

## Parameters

**Table 204-16** GETCUSTOMMETADATA Function Parameters

| Parameter | Description               |
|-----------|---------------------------|
| res       | XDBResource               |
| xpath     | XPath for custom metadata |
| namespace | Namespace                 |

### Usage Notes

The first component of the XPath expression must be "Resource".

## 204.3.16 GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

### Syntax

```
DBMS_XDBRESOURCE.GETDISPLAYNAME (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 204-17** GETDISPLAYNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.17 GETLANGUAGE Function

Given an XDBResource, this function returns its language.

### Syntax

```
DBMS_XDBRESOURCE.GETLANGUAGE (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 204-18** GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.18 GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

### Syntax

```
DBMS_XDBRESOURCE.GETLASTMODIFIER (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 204-19** GETLASTMODIFIER Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.19 GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

### Syntax

```
DBMS_XDBRESOURCE.GETMODIFICATIONDATE (  
    res    IN    XDBResource)  
RETURN TIMESTAMP;
```

### Parameters

**Table 204-20** GETMODIFICATIONDATE Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.20 GETOWNER Function

Given an XDBResource, this function returns its owner.

### Syntax

```
DBMS_XDBRESOURCE.GETOWNER (  
    res    IN    XDBResource)  
RETURN VARCHAR2;
```

### Parameters

**Table 204-21** GETOWNER Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.21 GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

### Syntax

```
DBMS_XDBRESOURCE.GETREFCOUNT (  
    res    IN    XDBResource)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 204-22** GETREFCOUNT Function Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.22 GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

### Syntax

```
DBMS_XDBRESOURCE.GETVERSIONID (
    res    IN    XDBResource)
RETURN PLS_INTEGER;
```

### Parameters

**Table 204-23 GETVERSIONID Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.23 HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASACLCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 204-24 HASACLCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.24 HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASAUTHORCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 204-25 HASAUTHORCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.25 HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

### Syntax

```
DBMS_XDBRESOURCE.HASCHANGED (
    res          IN    XDBResource,
    xpath        IN    VARCHAR2,
    namespace    IN    VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 204-26 HASCHANGED Function Parameters**

| Parameter  | Description      |
|------------|------------------|
| res        | XDBResource      |
| xpath      | XPath to check   |
| bnamespace | Namespace to use |

## 204.3.26 HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCHARACTERSETCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 204-27 HASCHARACTERSETCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.27 HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCOMMENTCHANGED (
    res IN XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-28 HASCOMMENTCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.28 HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASCONTENTCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-29 HASCONTENTCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.29 HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCONTENTTYPECHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-30 HASCONTENTTYPECHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.30 HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCREATIONDATECHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 204-31 HASCREATIONDATECHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.31 HASCREATORCHANGED Function

This function returns `TRUE` if the creator of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASCREATORCHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 204-32 HASCREATORCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.32 HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

### Syntax

```
DBMS_XDBRESOURCE.HASCUSTOMMETADATACHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 204-33 HASCUSTOMMETADATACHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.33 HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASDISPLAYNAMECHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 204-34 HASDISPLAYNAMECHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.34 HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASLANGUAGECHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

### Parameters

**Table 204-35 HASLANGUAGECHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.35 HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASLASTMODIFIERCHANGED (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

## Parameters

**Table 204-36 HASLASTMODIFIERCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.36 HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise

### Syntax

```
DBMS_XDBRESOURCE.HASMODIFICATIONDATECHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-37 HASMODIFICATIONDATECHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.37 HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASOWNERCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-38 HASOWNERCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.38 HASREFCOUNTCHANGED Function

This function returns **TRUE** if the reference count of the given resource has changed, **FALSE** otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASREFCOUNTCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 204-39 HASREFCOUNTCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.39 HASVERSIONIDCHANGED Function

This function returns **TRUE** if the version ID of the given resource has changed, **FALSE** otherwise.

### Syntax

```
DBMS_XDBRESOURCE.HASVERSIONIDCHANGED (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

### Parameters

**Table 204-40 HASVERSIONIDCHANGED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.40 ISFOLDER Function

This function returns **TRUE** if the given resource is a folder, **FALSE** otherwise.

### Syntax

```
DBMS_XDBRESOURCE.ISFOLDER (
    res    IN    XDBResource)
RETURN BOOLEAN;
```

## Parameters

**Table 204-41 ISFOLDER Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.41 ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

### Syntax

```
DBMS_XDBRESOURCE.ISNULL (  
    res    IN    XDBResource)  
RETURN BOOLEAN;
```

## Parameters

**Table 204-42 ISNULL Function Parameters**

| Parameter | Description    |
|-----------|----------------|
| res       | Input resource |

## 204.3.42 MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

### See Also:

The [DBMS\\_XMLDOM](#) package

### Syntax

```
DBMS_XDBRESOURCE.MAKEDOCUMENT (  
    res    IN    XDBResource)  
RETURN DBMS_XMLDOM.DOMDocument;
```

## Parameters

**Table 204-43 MAKEDOCUMENT Function Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.43 SAVE Procedure

This procedure updates the resource with any modifications.

### Syntax

```
DBMS_XDBRESOURCE.SAVE (  
    res    IN    XDBResource);
```

### Parameters

**Table 204-44** SAVE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

## 204.3.44 SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

### Syntax

```
DBMS_XDBRESOURCE.SETACL (  
    res        IN OUT  XDBResource,  
    ACLPath    IN      VARCHAR2);
```

### Parameters

**Table 204-45** SETACL Procedure Parameters

| Parameter | Description                  |
|-----------|------------------------------|
| res       | XDBResource                  |
| ACLPath   | Absolute path of the new ACL |

## 204.3.45 SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

### Syntax

```
DBMS_XDBRESOURCE.SETAUTHOR (  
    res        IN OUT  XDBResource,  
    author     IN      VARCHAR2);
```

### Parameters

**Table 204-46** SETAUTHOR Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |
| author    | Author      |

## 204.3.46 SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

### Syntax

```
DBMS_XDBRESOURCE.SETCHARACTERSET (  
    res      IN OUT  XDBResource,  
    charSet  IN      VARCHAR2);
```

### Parameters

**Table 204-47 SETCHARACTERSET Procedure Parameters**

| Parameter | Description       |
|-----------|-------------------|
| res       | XDBResource       |
| charset   | New character set |

## 204.3.47 SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (  
    res      IN OUT  XDBResource,  
    comment  IN      VARCHAR2);
```

### Parameters

**Table 204-48 SETCOMMENT Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |
| comment   | New comment |

## 204.3.48 SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

### Syntax

```
DBMS_XDBRESOURCE.SETCONTENT (  
    res      IN OUT  XDBResource,  
    data     IN      BFILE,  
    csid     IN      NUMBER);  
  
DBMS_XDBRESOURCE.SETCONTENT (  
    res      IN OUT  XDBResource,  
    data     IN      BLOB,  
    csid     IN      PLS_INTEGER);  
  
DBMS_XDBRESOURCE.SETCONTENT (  
    res      IN OUT  XDBResource,  
    data     IN      CLOB,  
    csid     IN      PLS_INTEGER);
```

```

        res      IN OUT  XDBResource,
        data     IN      CLOB);

DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT  XDBResource,
    data     IN      REF SYS.XMLType,
    sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT  XDBResource,
    data     IN      VARCHAR2);

DBMS_XDBRESOURCE.SETCONTENT (
    res      IN OUT  XDBResource,
    data     IN      SYS.XMLType);

```

### Parameters

**Table 204-49 SETCONTENT Procedure Parameters**

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| res       | XDBResource                                        |
| data      | Data input as BFILE, BLOB, CLOB, string, XMLType   |
| csid      | Character set ID of the BFILE, BLOB                |
| sticky    | If TRUE creates a sticky REF, otherwise non-sticky |

## 204.3.49 SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

### Syntax

```

DBMS_XDBRESOURCE.SETCONTENTTYPE (
    res      IN OUT  XDBResource,
    conttype IN      VARCHAR2);

```

### Parameters

**Table 204-50 SETCONTENTTYPE Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| res       | XDBResource      |
| conttype  | New content-type |

## 204.3.50 SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

### Syntax

```

DBMS_XDBRESOURCE.SETCUSTOMMETADATA (
    res      IN OUT  XDBResource,
    xpath    IN      VARCHAR2,

```

```
namespace    IN      VARCHAR2,  
newMetadata  IN      XMLType);
```

### Parameters

**Table 204-51 SETCUSTOMMETADATA Procedure Parameters**

| Parameter   | Description                                                  |
|-------------|--------------------------------------------------------------|
| res         | XDBResource                                                  |
| xpath       | XPath to change                                              |
| namespace   | Namespace to use                                             |
| newMetadata | New data that should replace the metadata at the given XPath |

### Usage Notes

The first component of the XPath expression must be "Resource".

## 204.3.51 SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (  
    res      IN OUT  XDBResource,  
    name     IN      VARCHAR2);
```

### Parameters

**Table 204-52 SETDISPLAYNAME Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| res       | XDBResource      |
| name      | New display name |

## 204.3.52 SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETLANGUAGE (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

### Parameters

**Table 204-53 SETLANGUAGE Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |

**Table 204-53 (Cont.) SETLANGUAGE Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ACLPath   | New path    |

## 204.3.53 SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

### Syntax

```
DBMS_XDBRESOURCE.SETOWNER (  
    res      IN OUT  XDBResource,  
    owner    IN      VARCHAR2);
```

### Parameters

**Table 204-54 SETOWNER Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| res       | XDBResource |
| owner     | New owner   |

### Usage Notes

The user must have the `XDBADMIN` privilege to call this subprogram.

## DBMS\_XDBT

The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy.

The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XDBT Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide*

## 205.1 DBMS\_XDBT Overview

The `DBMS_XDBT` package contains a set of package variables that describe the configuration settings for the index.

The `DBMS_XDBT` package can be used in the following ways:

- Customize the package to set up the appropriate configuration.
- Use the [DROPPREFERENCES Procedure](#) to drop any existing index preferences
- Create new index preferences using the [CREATEPREFERENCES Procedure](#) procedure
- Create the `CONTEXT` index using the [CREATEINDEX Procedure](#) procedure
- Set up automatic synchronization of the index using the [CONFIGUREAUTOSYNC Procedure](#)

## 205.2 DBMS\_XDBT Security Model

Owned by `XDB`, the `DBMS_XDBT` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB`. Subprograms in this package are executed using the privileges of the current user.

## 205.3 DBMS\_XDBT Operational Notes

Configuration settings, or package variables, are available to customize the DBMS\_XDBT package.

The DBMS\_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER\_JOBS catalog views.

**Table 205-1 General Indexing Settings for Customizing DBMS\_XDBT**

| Parameter       | Default Value | Description                                                                                                                        |
|-----------------|---------------|------------------------------------------------------------------------------------------------------------------------------------|
| IndexName       | XDB\$CI       | Name of the CONTEXT index.                                                                                                         |
| IndexTablespace | XDB\$RESINFO  | Tablespace used by tables and indexes comprising the CONTEXT index.                                                                |
| IndexMemory     | 128M          | Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).   |
| LogFile         | 'XdbCtxLog'   | The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging. |

**Table 205-2 Filtering Settings for Customizing DBMS\_XDBT**

| Parameter        | Default Value                      | Description                                                                                    |
|------------------|------------------------------------|------------------------------------------------------------------------------------------------|
| SkipFilter_Types | image/%, audio/%, video/%, model/% | List of mime types that should not be indexed.                                                 |
| NullFilter_Types | text/plain, text/html, text/xml    | List of mime types that do not need to use the INSO filter. Use this for text-based documents. |
| FilterPref       | XDB\$CI_FILTER                     | Name of the filter preference.                                                                 |

**Table 205-3 Stoplist Settings for Customizing DBMS\_XDBT**

| Parameter    | Default Value            | Description                                              |
|--------------|--------------------------|----------------------------------------------------------|
| StoplistPref | XDB\$CI_STOPLIST         | Name of the stoplist.                                    |
| StopWords    | 0..9; 'a'..'z'; 'A'..'Z' | List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST. |

**Table 205-4 Sectioning and Section Group Settings for Customizing DBMS\_XDBT**

| Parameter        | Default Value        | Description                                                                                                  |
|------------------|----------------------|--------------------------------------------------------------------------------------------------------------|
| SectionGroup     | HTML_SECTION_GROUP   | Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents. |
| SectiongroupPref | XDB\$CI_SECTIONGROUP | Name of the section group.                                                                                   |

**Table 205-5 Other Index Preference Settings for Customizing DBMS\_XDBT**

| Parameter        | Default Value         | Description                           |
|------------------|-----------------------|---------------------------------------|
| DatastorePref    | XDB\$CI_DATASTORE     | Name of the datastore preference      |
| StoragePref      | XDB\$CI_STORAGE       | Name of the storage preference.       |
| WordlistPref     | XDB\$CI_WORDLIST      | Name of the wordlist preference.      |
| DefaultLexerPref | XDB\$CI_DEFAULT_LEXER | Name of the default lexer preference. |

**Table 205-6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS\_XDBT**

| Parameter                 | Default Value         | Description                                                                                                                                                                         |
|---------------------------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AutoSyncPolicy            | SYNC_BY_PENDING_COUNT | Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.                                                           |
| MaxPendingCount           | 2                     | Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME. |
| CheckPendingCountInterval | 10 minutes            | How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.                                  |
| SyncInterval              | 60 minutes            | Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME                                           |

## 205.4 Summary of DBMS\_XDBT Subprograms

This table lists the DBMS\_XDBT subprograms in alphabetical order and briefly describes them.

**Table 205-7 DBMS\_XDBT Package Subprograms**

| Subprogram                                       | Description                                                                |
|--------------------------------------------------|----------------------------------------------------------------------------|
| <a href="#">CONFIGUREAUTOSYNC Procedure</a>      | Configures the CONTEXT index for automatic maintenance, SYNC               |
| <a href="#">CREATEDATASTOREPREF Procedure</a>    | Creates a USER datastore preference for the CONTEXT index                  |
| <a href="#">CREATEFILTERPREF Procedure</a>       | Creates a filter preference for the CONTEXT index                          |
| <a href="#">CREATEINDEX Procedure</a>            | Creates the CONTEXT index on the XML DB hierarchy                          |
| <a href="#">CREATELEXERPREF Procedure</a>        | Creates a lexer preference for the CONTEXT index                           |
| <a href="#">CREATEPREFERENCES Procedure</a>      | Creates preferences required for the CONTEXT index on the XML DB hierarchy |
| <a href="#">CREATESECTIONGROUPPREF Procedure</a> | Creates a storage preference for the CONTEXT index                         |
| <a href="#">CREATESTOPLISTPREF Procedure</a>     | Creates a section group for the CONTEXT index                              |
| <a href="#">CREATESTORAGEPREF Procedure</a>      | Creates a wordlist preference for the CONTEXT index                        |
| <a href="#">CREATEWORLDPREF Procedure</a>        | Creates a stoplist for the CONTEXT index                                   |

Table 205-7 (Cont.) *DBMS\_XDBT Package Subprograms*

| Subprogram                                | Description                    |
|-------------------------------------------|--------------------------------|
| <a href="#">DROPPREFERENCES Procedure</a> | Drops any existing preferences |

## 205.4.1 CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the `CONTEXT` index.

### Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

### Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the `USER_JOBS` catalog views
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

| Sync Basis                                  | Description                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SYNC_BY_PENDING_COUNT</code>          | The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the <a href="#">MaxPendingCount</a> configuration setting). The pending queue is polled at regular intervals (See the <a href="#">CheckPendingCountInterval</a> configuration parameter) to determine if the number of documents exceeds the threshold. |
| <code>SYNC_BY_TIME</code>                   | The SYNC is triggered at regular intervals. (See the <a href="#">SyncInterval</a> configuration parameter).                                                                                                                                                                                                                                                      |
| <code>SYNC_BY_PENDING_COUNT_AND_TIME</code> | A combination of both of the preceding options.                                                                                                                                                                                                                                                                                                                  |

## 205.4.2 CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

### Usage Notes

- The name of the datastore preference can be modified; see the `DatastorePref` configuration setting.
- The default `USER` datastore procedure also filters the incoming document. The `DBMS_XDBT` package provides a set of configuration settings that control the filtering process.
- The `SkipFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.

- The `NullFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
- All other documents use the INSO filter through the IFILTER API.

## 205.4.3 CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

### Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see [CREATEDATASTOREPREF Procedure](#) for more details.

## 205.4.4 CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEINDEX;
```

### Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.

## 205.4.5 CREATELEXERPREF Procedure

This procedure creates a `BASIC` `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

### Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

## 205.4.6 CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

### Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

## 205.4.7 CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

### Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

## 205.4.8 CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

### Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

## 205.4.9 CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

### Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.

- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

## 205.4.10 CREATEWORDLISTPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

### Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

## 205.4.11 DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

### Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

## DBMS\_XDBZ

The DBMS\_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Summary of DBMS\\_XDBZ Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide*

## 206.1 DBMS\_XDBZ Security Model

Owned by XDB, the DBMS\_XDBZ package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 206.2 DBMS\_XDBZ Constants

The DBMS\_XDBZ package defines several constants that can be used for specifying parameter values.

The package uses the constants shown in following tables.

**Table 206-1 DBMS\_XDBZ Constants - Name Format**

| Constant                  | Type        | Value | Description                   |
|---------------------------|-------------|-------|-------------------------------|
| NAME_FORMAT_SHORT         | PLS_INTEGER | 1     | DB user name or LDAP nickname |
| NAME_FORMAT_DISTINGUISHED | PLS_INTEGER | 2     | LDAP distinguished name       |

**Table 206-2 DBMS\_XDBZ Constants - Enable Option**

| Constant        | Type        | Value | Description                                                                                                     |
|-----------------|-------------|-------|-----------------------------------------------------------------------------------------------------------------|
| ENABLE_CONTENTS | PLS_INTEGER | 1     | Enables hierarchy for contents and is used by users when calling the <a href="#">ENABLE_HIERARCHY Procedure</a> |

**Table 206-2 (Cont.) DBMS\_XDBZ Constants - Enable Option**

| Constant           | Type        | Value | Description                                                                                                        |
|--------------------|-------------|-------|--------------------------------------------------------------------------------------------------------------------|
| ENABLE_RESMETADATA | PLS_INTEGER | 2     | Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources |

**Table 206-3 DBMS\_XDBZ Constants - Enable Option Exercised**

| Constant               | Type        | Value | Description                                                                                                                                                  |
|------------------------|-------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_ENABLED_CONTENTS    | PLS_INTEGER | 1     | If hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with hierarchy_type as ENABLE_CONTENTS             |
| IS_ENABLED_RESMETADATA | PLS_INTEGER | 2     | If hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with hierarchy_type as ENABLE_RESMETADATA |

## 206.3 Summary of DBMS\_XDBZ Subprograms

This table lists the DBMS\_XDBZ subprograms and briefly describes them.

**Table 206-4 DBMS\_XDBZ Package Subprograms**

| Method                                        | Description                                                                         |
|-----------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">DISABLE_HIERARCHY Procedure</a>   | Disables repository support for the specified XMLType table or view                 |
| <a href="#">ENABLE_HIERARCHY Procedure</a>    | Enables repository support for the specified XMLType table or view                  |
| <a href="#">GET_ACLOID Function</a>           | Retrieves the ACL Object ID for the specified resource                              |
| <a href="#">GET_USERID Function</a>           | Retrieves the user ID for the specified user                                        |
| <a href="#">IS_HIERARCHY_ENABLED Function</a> | Determines if repository support for the specified XMLType table or view is enabled |
| <a href="#">PURGELDAPCACHE Function</a>       | Purges the LDAP nickname cache                                                      |

### 206.3.1 CREATENONCEKEY Procedure

This procedure generates a nonce value for use in digest authentication.

#### Syntax

```
DBMS_XDBZ.CREATENONCEKEY;
```

## 206.3.2 DISABLE\_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

### Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2);
```

### Parameters

**Table 206-5** DISABLE\_HIERARCHY Procedure Parameters

| Parameter     | Description                              |
|---------------|------------------------------------------|
| object_schema | Schema name of the XMLType table or view |
| object_name   | Name of the XMLType table or view        |

## 206.3.3 ENABLE\_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

### See Also:

*Oracle XML DB Developer's Guide* for more information about

### Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2,  
    hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

### Parameters

**Table 206-6** ENABLE\_HIERARCHY Procedure Parameters

| Parameter     | Description                              |
|---------------|------------------------------------------|
| object_schema | Schema name of the XMLType table or view |
| object_name   | Name of the XMLType table or view        |

**Table 206-6 (Cont.) ENABLE\_HIERARCHY Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hierarchy_type | <p>How to enable the hierarchy.</p> <ul style="list-style-type: none"><li>• <code>ENABLE_CONTENTS</code> - enable hierarchy for contents, that is, this table will store contents of resources in the repository</li><li>• <code>ENABLE_RESMETADATA</code> - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources</li></ul> <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p> |

## 206.3.4 GET\_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

### Syntax

```
DBMS_XDBZ.GET_ACLOID(  
    aclpath IN VARCHAR2,  
    acloid OUT RAW)  
RETURN BOOLEAN;
```

### Parameters

**Table 206-7 GET\_ACLOID Function Parameters**

| Parameter | Description                          |
|-----------|--------------------------------------|
| aclpath   | ACL resource path for the repository |
| acloid    | Returned Object ID                   |

### Return Values

Returns `TRUE` if successful.

## 206.3.5 GET\_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

### Syntax

```
DBMS_XDBZ.GET_USERID(  
    username IN VARCHAR2,  
    userid OUT RAW,  
    format IN BINARY_INTEGER := NAME_FORMAT_SHORT)  
RETURN BOOLEAN;
```

## Parameters

**Table 206-8 GET\_USERID Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| username  | Name of the database or LDAP user.                                                                                                                                                                                                                   |
| userid    | Return parameter for the matching user id.                                                                                                                                                                                                           |
| format    | Format of the specified user name; valid options are: <ul style="list-style-type: none"><li>DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname</li><li>DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.</li></ul> |

## Return Values

Returns `TRUE` if successful.

## 206.3.6 IS\_HIERARCHY\_ENABLED Function

This function determines if repository support for the specified `XMLType` table or view is enabled.

## Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(  
    object_schema IN VARCHAR2,  
    object_name   IN VARCHAR2,  
    hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)  
RETURN BOOLEAN;
```

## Parameters

**Table 206-9 IS\_HIERARCHY\_ENABLED Function Parameters**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| object_schema  | Schema name of the <code>XMLType</code> table or view                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| object_name    | Name of the <code>XMLType</code> table or view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| hierarchy_type | Type of hierarchy to check for: <ul style="list-style-type: none"><li><code>IS_ENABLED_CONTENTS</code> - if hierarchy was enabled for contents, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code></li><li><code>IS_ENABLED_RESMETADATA</code> - if hierarchy was enabled for resource metadata, that is, the <a href="#">ENABLE_HIERARCHY Procedure</a> was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code></li></ul> |

## Return Values

Returns `TRUE` if the given `XMLTYPE` table or view has the XDB Hierarchy enabled with the specified type.

## 206.3.7 PURGELDAPCACHE Function

This function purges the LDAP nickname cache.

It returns `TRUE` if successful.

### Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

## DBMS\_XEVENT

The DBMS\_XEVENT package provides event-related types and supporting subprograms.

This chapter contains the following topics:

- [Security Model](#)
- [Constants](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_XEVENT Subprograms](#)

### See Also:

*Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

## 207.1 DBMS\_XEVENT Security Model

Owned by XDB, the DBMS\_XEVENT package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 207.2 DBMS\_XEVENT Constants

The DBMS\_XEVENT package defines several constants that can be used for specifying parameter values.

The constants are defined in the following table.

**Table 207-1 DBMS\_XEVENT Constants**

| Name              | Type        | Value | Description |
|-------------------|-------------|-------|-------------|
| RENDER_EVENT      | PLS_INTEGER | 1     |             |
| PRE_CREATE_EVENT  | PLS_INTEGER | 2     |             |
| POST_CREATE_EVENT | PLS_INTEGER | 3     |             |
| PRE_DELETE_EVENT  | PLS_INTEGER | 4     |             |
| POST_DELETE_EVENT | PLS_INTEGER | 5     |             |
| PRE_UPDATE_EVENT  | PLS_INTEGER | 6     |             |
| POST_UPDATE_EVENT | PLS_INTEGER | 7     |             |
| PRE_LOCK_EVENT    | PLS_INTEGER | 8     |             |
| POST_LOCK_EVENT   | PLS_INTEGER | 9     |             |

**Table 207-1 (Cont.) DBMS\_XEVENT Constants**

| Name                           | Type        | Value | Description |
|--------------------------------|-------------|-------|-------------|
| PRE_UNLOCK_EVENT               | PLS_INTEGER | 10    |             |
| POST_UNLOCK_EVENT              | PLS_INTEGER | 11    |             |
| PRE_LINKIN_EVENT               | PLS_INTEGER | 12    |             |
| POST_LINKIN_EVENT              | PLS_INTEGER | 13    |             |
| PRE_LINKTO_EVENT               | PLS_INTEGER | 14    |             |
| POST_LINKTO_EVENT              | PLS_INTEGER | 15    |             |
| PRE_UNLINKIN_EVENT             | PLS_INTEGER | 16    |             |
| POST_UNLINKIN_EVENT            | PLS_INTEGER | 17    |             |
| PRE_UNLINKFROM_EVENT           | PLS_INTEGER | 18    |             |
| POST_UNLINKFROM_EVENT          | PLS_INTEGER | 19    |             |
| PRE_CHECKIN_EVENT              | PLS_INTEGER | 20    |             |
| POST_CHECKIN_EVENT             | PLS_INTEGER | 21    |             |
| PRE_CHECKOUT_EVENT             | PLS_INTEGER | 22    |             |
| POST_CHECKOUT_EVENT            | PLS_INTEGER | 23    |             |
| PRE_UNCHECKOUT_EVENT           | PLS_INTEGER | 24    |             |
| POST_UNCHECKOUT_EVENT          | PLS_INTEGER | 25    |             |
| PRE_VERSIONCONTROL_EVENT       | PLS_INTEGER | 26    |             |
| POST_VERSIONCONTROL_EVENT      | PLS_INTEGER | 27    |             |
| PRE_OPEN_EVENT                 | PLS_INTEGER | 28    |             |
| POST_OPEN_EVENT                | PLS_INTEGER | 29    |             |
| PRE_INCONSISTENT_UPDATE_EVENT  | PLS_INTEGER | 30    |             |
| POST_INCONSISTENT_UPDATE_EVENT | PLS_INTEGER | 21    |             |
| POST_CHECKIN_EVENT             | PLS_INTEGER | 21    |             |

## 207.3 Subprogram Groups

The subprograms in the `DBMS_XEVENT` package can be divided in groups.

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

### 207.3.1 DBMS\_XEVENT XDBEvent Type Subprograms

This subprogram group provides an interface for use with the XDBEvent type.

**Table 207-2 XDBEvent Subprograms**

| Subprogram                              | Description                                                                  |
|-----------------------------------------|------------------------------------------------------------------------------|
| <a href="#">GETCURRENTUSER Function</a> | Returns the name of the user executing the operation that triggers the event |
| <a href="#">GETEVENT Function</a>       | Returns a value identifying the triggering event                             |
| <a href="#">ISNULL Functions</a>        | Returns <code>TRUE</code> if input argument is <code>NULL</code>             |

The [Summary of DBMS\\_XEVT Subprograms](#) contains a complete listing of all subprograms in the package.

## 207.3.2 DBMS\_XEVT XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBRepositoryEvent` type.

**Table 207-3 XDBRepositoryEvent Subprograms**

| Subprogram                                   | Description                                                                                                                               |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GETAPPLICATIONDATA Function</a>  | Returns the <code>&lt;applicationData&gt;</code> element extracted from the resource configuration that defines the invoking handler      |
| <a href="#">GETHANDLERLIST Function</a>      | Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler |
| <a href="#">GETINTERFACE Function</a>        | Returns the top-level interface used to initiate the operation that triggered the event                                                   |
| <a href="#">GETLINK Function</a>             | Returns an <code>XDBLink</code> object for the target resource                                                                            |
| <a href="#">GETLOCK Function</a>             | Returns the lock object corresponding to the current operation                                                                            |
| <a href="#">GETOLDRESOURCE Function</a>      | Returns the original <code>XDBResource</code> object before the operation was executed                                                    |
| <a href="#">GETOPENACCESSMODE Function</a>   | Returns the access mode for the open operation                                                                                            |
| <a href="#">GETOPENDENYMODE Function</a>     | Returns the deny mode for the open operation                                                                                              |
| <a href="#">GETOUTPUTSTREAM Function</a>     | Returns the output BLOB in which the handler can write the rendered data                                                                  |
| <a href="#">GETPARAMETER Function</a>        | Returns the value of a request or session-specific parameter                                                                              |
| <a href="#">GETPARENT Function</a>           | Returns the resource object corresponding to a parent folder of the target resource                                                       |
| <a href="#">GETPATH Function</a>             | Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired                               |
| <a href="#">GETRESOURCE Function</a>         | Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource    |
| <a href="#">GETUPDATEBYTECOUNT Function</a>  | If the current operation is a byte-range write, returns the byte count                                                                    |
| <a href="#">GETUPDATEBYTEOFFSET Function</a> | If the current operation is a byte-range write, function returns the byte offset at which the range begins                                |

**Table 207-3 (Cont.) XDBRepositoryEvent Subprograms**

| Subprogram                                | Description                                                                         |
|-------------------------------------------|-------------------------------------------------------------------------------------|
| <a href="#">GETXDBEVENT Function</a>      | Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type |
| <a href="#">ISNULL Functions</a>          | Returns <code>TRUE</code> if input argument is <code>NULL</code>                    |
| <a href="#">SETRENDERPATH Procedure</a>   | Specifies the path of the resource that contains the rendered contents              |
| <a href="#">SETRENDERSTREAM Procedure</a> | sets the <code>BLOB</code> from which the rendered contents can be read             |

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 207.3.3 DBMS\_XEVENT XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandlerList` type.

**Table 207-4 XDBHandlerList Subprograms**

| Subprogram                        | Description                                                      |
|-----------------------------------|------------------------------------------------------------------|
| <a href="#">CLEAR Procedure</a>   | Clears the handler list                                          |
| <a href="#">GETFIRST Function</a> | Returns the first handler in the list                            |
| <a href="#">GETNAME Function</a>  | Returns the next handler in the list                             |
| <a href="#">ISNULL Functions</a>  | Returns <code>TRUE</code> if input argument is <code>NULL</code> |
| <a href="#">REMOVE Procedure</a>  | Removes the specified handler from the handler list              |

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

### 207.3.4 DBMS\_XEVENT XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the `XDBHandler` type.

**Table 207-5 XDBHandler Type Subprograms**

| Subprogram                           | Description                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------|
| <a href="#">GETLANGUAGE Function</a> | Returns the implementation language of the handler                                         |
| <a href="#">GETSCHEMA Function</a>   | Returns the schema of the handler's source                                                 |
| <a href="#">GETSOURCE Function</a>   | Returns the name of the Java class, PL/SQL package or object type implementing the handler |
| <a href="#">ISNULL Functions</a>     | Returns <code>TRUE</code> if input argument is <code>NULL</code>                           |

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## 207.3.5 DBMS\_XEVENT XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

**Table 207-6 XDBPath Type Subprograms**

| Subprogram                             | Description                                                      |
|----------------------------------------|------------------------------------------------------------------|
| <a href="#">GETNAME Function</a>       | Returns the string representation of the path                    |
| <a href="#">GETPARENTPATH Function</a> | Returns the parent's path                                        |
| <a href="#">ISNULL Functions</a>       | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## 207.3.6 DBMS\_XEVENT XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

**Table 207-7 XDBLink Type Subprograms**

| Subprogram                             | Description                                                      |
|----------------------------------------|------------------------------------------------------------------|
| <a href="#">GETCHILDOID Function</a>   | Returns the OID of the resource to which the link is pointing    |
| <a href="#">GETPARENTNAME Function</a> | Returns the link's parent folder's name                          |
| <a href="#">GETPARENTOID Function</a>  | Returns the link's parent folder's OID                           |
| <a href="#">ISNULL Functions</a>       | Returns <code>TRUE</code> if input argument is <code>NULL</code> |

The [Summary of DBMS\\_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

## 207.4 Summary of DBMS\_XEVENT Subprograms

This table lists the DBMS\_XEVENT subprograms and briefly describes them.

**Table 207-8 DBMS\_XEVENT Package Subprograms**

| Subprogram                                  | Description                                                                                                       | Group                                               |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <a href="#">CLEAR Procedure</a>             | Clears the handler list                                                                                           | <a href="#">XDBHandlerList Type Subprograms</a>     |
| <a href="#">GETAPPLICATIONDATA Function</a> | Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETCHILDOID Function</a>        | Returns the OID of the resource to which the link is pointing                                                     | <a href="#">XDBLink Type Subprograms</a>            |
| <a href="#">GETCURRENTUSER Function</a>     | Returns the name of the user executing the operation that triggers the event                                      | <a href="#">XDBEvent Type Subprograms</a>           |
| <a href="#">GETEVENT Function</a>           | Returns a value identifying the triggering event                                                                  | <a href="#">XDBEvent Type Subprograms</a>           |

**Table 207-8 (Cont.) DBMS\_XEVENT Package Subprograms**

| Subprogram                                 | Description                                                                                                                               | Group                                               |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <a href="#">GETFIRST Function</a>          | Returns the first handler in the list                                                                                                     | <a href="#">XDBHandlerList Type Subprograms</a>     |
| <a href="#">GETHANDLERLIST Function</a>    | Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETINTERFACE Function</a>      | Returns the top-level interface used to initiate the operation that triggered the event                                                   | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETLANGUAGE Function</a>       | Returns the implementation language of the handler                                                                                        | <a href="#">XDBHandler Type Subprograms</a>         |
| <a href="#">GETLINK Function</a>           | Returns an <code>XDBLink</code> object for the target resource                                                                            | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETLOCK Function</a>           | Returns the lock object corresponding to the current operation                                                                            | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETNAME Function</a>           | Returns the string representation of the path                                                                                             | <a href="#">XDBPath Type Subprograms</a>            |
| <a href="#">GETNAME Function</a>           | Returns the next handler in the list                                                                                                      | <a href="#">XDBHandlerList Type Subprograms</a>     |
| <a href="#">GETOLDRESOURCE Function</a>    | Returns the original <code>XDBResource</code> object before the operation was executed                                                    | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETOPENACCESSMODE Function</a> | Returns the access mode for the open operation                                                                                            | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETOPENDENYMODE Function</a>   | Returns the deny mode for the open operation                                                                                              | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETOUTPUTSTREAM Function</a>   | Returns the output BLOB in which the handler can write the rendered data                                                                  | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETPARAMETER Function</a>      | Returns the value of a request or session-specific parameter                                                                              | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETPARENT Function</a>         | Returns the resource object corresponding to a parent folder of the target resource                                                       | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETPARENTNAME Function</a>     | Returns the link's parent folder's name                                                                                                   | <a href="#">XDBLink Type Subprograms</a>            |
| <a href="#">GETPARENTOID Function</a>      | Returns the link's parent folder's OID                                                                                                    | <a href="#">XDBLink Type Subprograms</a>            |
| <a href="#">GETPARENTNAME Function</a>     | Returns the parent's path                                                                                                                 | <a href="#">XDBPath Type Subprograms</a>            |
| <a href="#">GETPATH Function</a>           | Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired                               | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETRESOURCE Function</a>       | Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource    | <a href="#">XDBRepositoryEvent Type Subprograms</a> |
| <a href="#">GETSCHEMA Function</a>         | Returns the schema of the handler's source                                                                                                | <a href="#">XDBHandler Type Subprograms</a>         |

Table 207-8 (Cont.) DBMS\_XEVENT Package Subprograms

| Subprogram                                   | Description                                                                                                | Group                                                                                                                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GETSOURCE Function</a>           | Returns the name of the Java class, PL/SQL package or object type implementing the handler                 | <a href="#">XDBHandler Type Subprograms</a>                                                                                                                                                                                                    |
| <a href="#">GETUPDATEBYTECOUNT Function</a>  | If the current operation is a byte-range write, returns the byte count                                     | <a href="#">XDBRepositoryEvent Type Subprograms</a>                                                                                                                                                                                            |
| <a href="#">GETUPDATEBYTEOFFSET Function</a> | If the current operation is a byte-range write, function returns the byte offset at which the range begins | <a href="#">XDBRepositoryEvent Type Subprograms</a>                                                                                                                                                                                            |
| <a href="#">GETXDBEVENT Function</a>         | Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type                        | <a href="#">XDBRepositoryEvent Type Subprograms</a>                                                                                                                                                                                            |
| <a href="#">ISNULL Functions</a>             | Returns <code>TRUE</code> if input argument is <code>NULL</code>                                           | <a href="#">XDBEvent Type Subprograms</a><br><a href="#">XDBRepositoryEvent Type Subprograms</a><br><a href="#">XDBHandlerList Type Subprograms</a><br><a href="#">XDBHandler Type Subprograms</a><br><a href="#">XDBPath Type Subprograms</a> |
| <a href="#">REMOVE Procedure</a>             | Removes the specified handler from the handler list                                                        | <a href="#">XDBHandlerList Type Subprograms</a>                                                                                                                                                                                                |
| <a href="#">SETRENDERPATH Procedure</a>      | Specifies the path of the resource that contains the rendered contents                                     | <a href="#">XDBRepositoryEvent Type Subprograms</a>                                                                                                                                                                                            |
| <a href="#">SETRENDERSTREAM Procedure</a>    | sets the <code>BLOB</code> from which the rendered contents can be read                                    | <a href="#">XDBRepositoryEvent Type Subprograms</a>                                                                                                                                                                                            |

## 207.4.1 CLEAR Procedure

This procedure clears the handler list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.CLEAR (
    hl          IN OUT  XDBHandlerList);
```

### Parameters

Table 207-9 CLEAR Procedure Parameters

| Parameter | Description  |
|-----------|--------------|
| hl        | Handler list |

## 207.4.2 GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (  
    ev    IN    XDBRepositoryEvent)  
RETURN XMLType;
```

### Parameters

**Table 207-10** GETAPPLICATIONDATA Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.3 GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETCHILDOID (  
    link  IN    XDBLink)  
RETURN RAW;
```

### Parameters

**Table 207-11** GETCHILDOID Function Parameters

| Parameter | Description |
|-----------|-------------|
| link      | Link        |

## 207.4.4 GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

### See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVT.GETCURRENTUSER (  
    ev    IN    XDBEvent)  
RETURN VARCHAR2;
```

### Parameters

**Table 207-12** GETCURRENTUSER Function Parameters

| Parameter | Description            |
|-----------|------------------------|
| ev        | Event of XDBEvent type |

## 207.4.5 GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

### See Also:

[XDBEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVT.GETEVENT (  
    ev    IN    XDBEvent)  
RETURN XDBEventID;
```

### Parameters

**Table 207-13** GETEVENT Function Parameters

| Parameter | Description            |
|-----------|------------------------|
| ev        | Event of XDBEvent type |

## 207.4.6 GETFIRST Function

This function returns the first handler in the list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETFIRST (  
    hl    IN    XDBHandlerList)  
RETURN XDBHandler;
```

### Parameters

**Table 207-14** GETFIRST Function Parameters

| Parameter | Description  |
|-----------|--------------|
| hl        | Handler list |

## 207.4.7 GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler.

The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBHandlerList;
```

### Parameters

**Table 207-15** GETHANDLERLIST Function Parameters

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| ev        | Event of <code>XDBRepositoryEvent</code> type |

## 207.4.8 GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETINTERFACE (  
    ev    IN    XDBRepositoryEvent)  
    RETURN VARCHAR2;
```

### Parameters

**Table 207-16** GETINTERFACE Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.9 GETLANGUAGE Function

This function returns the implementation language of the handler.

### See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN    XDBHandler)  
    RETURN VARCHAR2;
```

### Parameters

**Table 207-17** GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler   | Handler     |

## 207.4.10 GETLINK Function

This function returns an `XDBLink` object for the target resource.

For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLINK (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBLink;
```

### Parameters

**Table 207-18 GETLINK Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.11 GETLINKNAME Function

This function returns the name of the link.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLINKNAME (  
    link  IN    XDBLink)  
RETURN VARCHAR2;
```

### Parameters

**Table 207-19 GETLINKNAME Function Parameters**

| Parameter | Description |
|-----------|-------------|
| link      | Link        |

## 207.4.12 GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLOCK (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBLock;
```

### Parameters

**Table 207-20** GETLOCK Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.13 GETLANGUAGE Function

This function returns the implementation language of the handler.

### See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN    XDBHandler)  
RETURN VARCHAR2;
```

### Parameters

**Table 207-21** GETLANGUAGE Function Parameters

| Parameter | Description |
|-----------|-------------|
| handler   | Handler     |

## 207.4.14 GETNAME Function

This function returns the string representation of the path.

### See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETNAME (
    path IN XDBPath)
RETURN VARCHAR2;
```

### Parameters

**Table 207-22 GETNAME Function Parameters**

| Parameter | Description |
|-----------|-------------|
| path      | Path        |

## 207.4.15 GETNEXT Function

This function returns the next handler in the list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETNEXT (
    hl IN XDBHandlerList)
RETURN XDBHandler;
```

### Parameters

**Table 207-23 GETNEXT Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| hl        | Handler list |

## 207.4.16 GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed.

This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBResource;
```

### Parameters

**Table 207-24** GETOLDRESOURCE Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.17 GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (  
    ev    IN    XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 207-25** GETOPENACCESSMODE Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

### Return Values

- `XDBRepositoryEvent.OPEN_ACCESS_READ` (value 1)

- XDBRepositoryEvent.OPEN\_ACCESS\_WRITE (value 2)
- XDBRepositoryEvent.OPEN\_ACCESS\_READ\_WRITE (value 3)

## 207.4.18 GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (  
    ev    IN    XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 207-26** GETOPENDENYMODE Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

### Return Values

- XDBRepositoryEvent.OPEN\_DENY\_NONE (value 0)
- XDBRepositoryEvent.OPEN\_DENY\_READ (value 1)
- XDBRepositoryEvent.OPEN\_DENY\_READ\_WRITE (value 2)

## 207.4.19 GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (  
    ev    IN    XDBRepositoryEvent)  
RETURN BLOB;
```

## Parameters

**Table 207-27 GETOUTPUTSTREAM Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.20 GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETPARAMETER (  
    ev    IN    XDBRepositoryEvent,  
    key   IN    VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 207-28 GETPARAMETER Function Parameters**

| Parameter | Description                                                                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ev        | Event of XDBRepositoryEvent type                                                                                                                            |
| key       | Supported parameters: <ul style="list-style-type: none"><li>• ACCEPT</li><li>• ACCEPT-LANGUAGE</li><li>• ACCEPT-CHARSET</li><li>• ACCEPT_ENCODING</li></ul> |

## 207.4.21 GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a `link*` or `unlink*` event, this method returns the link's parent folder.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENT (
    ev    IN    XDBRepositoryEvent)
RETURN XDBResource;
```

### Parameters

**Table 207-29** GETPARENT Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.22 GETPARENTNAME Function

This function returns the link's parent folder's name.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link IN    XDBLink)
RETURN VARCHAR2;
```

### Parameters

**Table 207-30** GETPARENTNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| link      | Link        |

## 207.4.23 GETPARENTOID Function

This function returns the link's parent folder's OID.

### See Also:

[XDBLink Type Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link IN    XDBLink)
RETURN RAW;
```

## Parameters

**Table 207-31** GETPARENTOID Function Parameters

| Parameter | Description |
|-----------|-------------|
| link      | Link        |

## 207.4.24 GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a `NULL` is returned.

### See Also:

[XDBPath Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETPARENTPATH (  
    path    IN    XDBPath,  
    level   IN    INTEGER)  
RETURN XDBPath;
```

## Parameters

**Table 207-32** GETPARENTPATH Function Parameters

| Parameter | Description                       |
|-----------|-----------------------------------|
| path      | Path                              |
| level     | Number of levels up the hierarchy |

## 207.4.25 GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETPATH (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBPath;
```

## Parameters

**Table 207-33 GETPATH Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.26 GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a `create` event, this method returns the resource that is being created.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETRESOURCE (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBResource;
```

## Parameters

**Table 207-34 GETRESOURCE Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.27 GETSCHEMA Function

This function returns the schema of the handler's source.

### See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETSCHEMA (  
    handler    IN    XDBHandler)  
RETURN VARCHAR2;
```

## Parameters

**Table 207-35 GETSCHEMA Function Parameters**

| Parameter | Description |
|-----------|-------------|
| handler   | Handler     |

## 207.4.28 GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

### See Also:

[XDBHandler Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETSOURCE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

## Parameters

**Table 207-36 GETSOURCE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| handler   | Handler     |

## 207.4.29 GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the `GETUPDATEBYTECOUNT` function returns the byte count. It is only valid for the inconsistent-update event.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (  
    ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

## Parameters

**Table 207-37 GETUPDATEBYTECOUNT Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.30 GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, the `GETUPDATEBYTEOFFSET` function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (  
    ev    IN    XDBRepositoryEvent)  
RETURN NUMBER;
```

## Parameters

**Table 207-38 GETUPDATEBYTEOFFSET Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

## 207.4.31 GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

### See Also:

[XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.GETXDBEVENT (  
    ev    IN    XDBRepositoryEvent)  
RETURN XDBEvent;
```

Parameters

Table 207-39 GETXDBEVENT Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| ev        | Event of XDBRepositoryEvent type |

207.4.32 ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

See Also:

- [XDBEvent Type Subprograms](#) for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) for other subprograms in this group
- [XDBHandlerList Type Subprograms](#) for other subprograms in this group
- [XDBHandler Type Subprograms](#) for other subprograms in this group
- [XDBPath Type Subprograms](#) for other subprograms in this group
- [XDBLink Type Subprograms](#) for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN    XDBEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN    XDBRepositoryEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN    XDBHandlerList)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN    XDBHandler)
RETURN BOOLEAN;
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN    XDBPath)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN    XDBLink)
RETURN BOOLEAN;
```

## Parameters

**Table 207-40 ISNULL Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| ev        | Event of specified type |
| hl        | Handler list            |
| handler   | Handler                 |
| path      | Path                    |

## 207.4.33 REMOVE Procedure

This procedure removes the specified handler from the handler list.

### See Also:

[XDBHandlerList Type Subprograms](#) for other subprograms in this group

## Syntax

```
DBMS_XEVENT.REMOVE (
    hl          IN OUT  XDBHandlerList,
    handler     IN      XDBHandler);
```

## Parameters

**Table 207-41 REMOVE Procedure Parameters**

| Parameter | Description  |
|-----------|--------------|
| hl        | Handler list |
| handler   | Handler      |

## 207.4.34 SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents.

This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

## Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN  XDBRepositoryEvent,
    path   IN  VARCHAR2);
```

## Parameters

**Table 207-42 SETRENDERPATH Procedure Parameters**

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| ev        | XDB Repository Event object                           |
| path      | Path of the resource containing the rendered contents |

## 207.4.35 SETRENDERSTREAM Procedure

This procedure sets the `BLOB` from which the rendered contents can be read.

This should not be called after the stream returned by `GETOUTPUTSTREAM` is written to or after `SETRENDERPATH` is called; doing so will result in an error. This is only valid for the render event.

### Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (  
    ev      IN    XDBRepositoryEvent,  
    istr    IN    BLOB);
```

## Parameters

**Table 207-43 SETRENDERSTREAM Procedure Parameters**

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| ev        | XDBRepositoryEvent object                            |
| istr      | Input stream from which to get the rendered contents |

## DBMS\_XMLDOM

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)
- [Subprogram Groups](#)
- [Summary of DBMS\\_XMLDOM Subprograms](#)

### See Also:

*Oracle XML Developer's Kit Programmer's Guide*

## 208.1 DBMS\_XMLDOM Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated.

In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

### Note:

Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and

applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode` `n`, the [APPENDCHILD Function](#) PL/SQL function is provided.
- To perform `setAttribute` on a `DOMElement` `elem` [SETATTRIBUTE Procedures](#), use PL/SQL procedure .

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 208-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

**Figure 208-1 Inheritance Diagram for DOM Types**

The implementation of this interface follows the REC-DOM-Level-1-19981001.

## 208.2 DBMS\_XMLDOM Security Model

Owned by `XDB`, the `DBMS_XMLDOM` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

## 208.3 DBMS\_XMLDOM Constants

The `DBMS_XMLDOM` package defines several constants that can be used for specifying parameter values.

These constants are listed in the following table.

**Table 208-1** Defined Constants for `DBMS_XMLDOM`

| Constant                                 | Type                     | Value | Description                             |
|------------------------------------------|--------------------------|-------|-----------------------------------------|
| <code>ELEMENT_NODE</code>                | <code>PLS_INTEGER</code> | 1     | The Node is an Element.                 |
| <code>ATTRIBUTE_NODE</code>              | <code>PLS_INTEGER</code> | 2     | The Node is an Attribute.               |
| <code>TEXT_NODE</code>                   | <code>PLS_INTEGER</code> | 3     | The Node is a Text node.                |
| <code>CDATA_SECTION_NODE</code>          | <code>PLS_INTEGER</code> | 4     | The Node is a CDATASection.             |
| <code>ENTITY_REFERENCE_NODE</code>       | <code>PLS_INTEGER</code> | 5     | The Node is an Entity Reference.        |
| <code>ENTITY_NODE</code>                 | <code>PLS_INTEGER</code> | 6     | The Node is an Entity.                  |
| <code>PROCESSING_INSTRUCTION_NODE</code> | <code>PLS_INTEGER</code> | 7     | The Node is a Processing Instruction.   |
| <code>COMMENT_NODE</code>                | <code>PLS_INTEGER</code> | 8     | The Node is a Comment.                  |
| <code>DOCUMENT_NODE</code>               | <code>PLS_INTEGER</code> | 9     | The Node is a Document.                 |
| <code>DOCUMENT_TYPE_NODE</code>          | <code>PLS_INTEGER</code> | 10    | The Node is a Document Type Definition. |
| <code>DOCUMENT_FRAGMENT_NODE</code>      | <code>PLS_INTEGER</code> | 11    | The Node is a Document fragment.        |
| <code>NOTATION_NODE</code>               | <code>PLS_INTEGER</code> | 12    | The Node is a Notation.                 |

## 208.4 DBMS\_XMLDOM Types

This table lists and briefly describes the types for the `DBMS_XMLDOM.DOMTYPE` package.

**Table 208-2** `XDB_XMLDOM` Types

| Type                             | Description                                    |
|----------------------------------|------------------------------------------------|
| <code>DOMATTR</code>             | Implements the DOM Attribute interface.        |
| <code>DOMCDATASECTION</code>     | Implements the DOM CDATASection interface.     |
| <code>DOMCHARACTERDATA</code>    | Implements the DOM Character Data interface.   |
| <code>DOMCOMMENT</code>          | Implements the DOM Comment interface.          |
| <code>DOMDOCUMENT</code>         | Implements the DOM Document interface.         |
| <code>DOMDOCUMENTFRAGMENT</code> | Implements the DOM DocumentFragment interface. |
| <code>DOMDOCUMENTTYPE</code>     | Implements the DOM Document Type interface.    |
| <code>DOMELEMENT</code>          | Implements the DOM Element interface.          |
| <code>DOMENTITY</code>           | Implements the DOM Entity interface.           |
| <code>DOMENTITYREFERENCE</code>  | Implements the DOM EntityReference interface.  |

**Table 208-2 (Cont.) XDB\_XMLDOM Types**

| Type                     | Description                                          |
|--------------------------|------------------------------------------------------|
| DOMIMPLEMENTATION        | Implements the DOM Implementation interface.         |
| DOMNAMEDNODEMAP          | Implements the DOM Named Node Map interface.         |
| DOMNODE                  | Implements the DOM Node interface.                   |
| DOMNODELIST              | Implements the DOM NodeList interface.               |
| DOMNOTATION              | Implements the DOM Notation interface.               |
| DOMPROCESSINGINSTRUCTION | Implements the DOM Processing instruction interface. |
| DOMTEXT                  | Implements the DOM Text interface.                   |

## 208.5 DBMS\_XMLDOM Exceptions

DBMS\_XMLDOM generates an exception when it encounters an issue.

This table lists the exceptions defined for DBMS\_XMLDOM:

**Table 208-3 Exceptions for DBMS\_XMLDOM**

| Exception                   | Description                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOMSTRING_SIZE_ERR          | If the specified range of text does not fit into a DOMString.                                                                                                                                                         |
| HIERARCHY_REQUEST_ERR       | If any node is inserted somewhere it doesn't belong.                                                                                                                                                                  |
| INDEX_SIZE_ERR              | If index or size is negative, or greater than the allowed value.                                                                                                                                                      |
| INUSE_ATTRIBUTE_ERR         | If an attempt is made to add an attribute that is already in use elsewhere.                                                                                                                                           |
| INVALID_CHARACTER_ERR       | If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character. |
| NO_DATA_ALLOWED_ERROR       | If data is specified for a node that does not support data.                                                                                                                                                           |
| NOT_FOUND_ERR               | If an attempt is made to reference a node in a context where it does not exist.                                                                                                                                       |
| NO_MODIFICATION_ALLOWED_ERR | If an attempt is made to modify an object where modifications are not allowed.                                                                                                                                        |
| NOT_SUPPORTED_ERR           | If the implementation does not support the requested type of object or operation.                                                                                                                                     |
| WRONG_DOCUMENT_ERR          | If a node is used in a different document than the one that created it (that doesn't support it).                                                                                                                     |

## 208.6 DBMS\_XMLDOM Subprogram Groups

DBMS\_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#)
- [DOMAttr Subprograms](#)
- [DOMCDataSection Subprograms](#)

- [DOMCharacterData Subprograms](#)
- [DOMComment Subprograms](#)
- [DOMDocument Subprograms](#)
- [DOMDocumentFragment Subprograms](#)
- [DOMDocumentType Subprograms](#)
- [DOMElement Subprograms](#)
- [DOMEntity Subprograms](#)
- [DOMEntityReference Subprograms](#)
- [DOMImplementation Subprograms](#)
- [DOMNamedNodeMap Subprograms](#)
- [DOMNodeList Subprograms](#)
- [DOMNotation Subprograms](#)
- [DOMProcessingInstruction Subprograms](#)
- [DOMText Subprograms](#)

## 208.6.1 DBMS\_XMLDOM DOMNode Subprograms

This table lists and briefly describes the `DOMNode` subprograms of `DBMS_XMLDOM`.

**Table 208-4 Summary of DOMNode Subprograms; DBMS\_XMLDOM**

| Subprogram                                                             | Description                                    |
|------------------------------------------------------------------------|------------------------------------------------|
| <a href="#">ADOPTNODE Function</a>                                     | Adopts a node from another document            |
| <a href="#">APPENDCHILD Function</a>                                   | Appends a new child to the node                |
| <a href="#">CLONENODE Function</a>                                     | Clones the node                                |
| <a href="#">FREENODE Procedure</a>                                     | Frees all resources associated with the node   |
| <a href="#">GETATTRIBUTES Function</a>                                 | Retrieves the attributes of the node           |
| <a href="#">GETCHILDNODES Function</a>                                 | Retrieves the children of the node             |
| <a href="#">GETEXPANDEDNAME Procedure and Functions</a>                | Retrieves the expanded name of the node        |
| <a href="#">GETFIRSTCHILD Function</a>                                 | Retrieves the first child of the node          |
| <a href="#">GETLASTCHILD Function</a>                                  | Retrieves the last child of the node           |
| <a href="#">GETLOCALNAME Procedure and Functions</a>                   | Retrieves the local part of the qualified name |
| <a href="#">GETNAMESPACE Procedure and Functions</a>                   | Retrieves the node's namespace URI             |
| <a href="#">GETNEXTSIBLING Function</a>                                | Retrieves the next sibling of the node         |
| <a href="#">GETNODENAME Function</a>                                   | Retrieves the Name of the Node                 |
| <a href="#">GETNODETYPE Function</a>                                   | Retrieves the Type of the node                 |
| <a href="#">GETNODEVALUE Function</a>                                  | Retrieves the Value of the Node                |
| <a href="#">GETNODEVALUEASBINARYSTREAM Function &amp; Procedure</a>    | Retrieves Node Value as binary stream          |
| <a href="#">GETNODEVALUEASCHARACTERSTREAM Function &amp; Procedure</a> | Retrieves Node Value as character stream       |
| <a href="#">GETOWNERDOCUMENT Function</a>                              | Retrieves the owner document of the node       |

**Table 208-4 (Cont.) Summary of DOMNode Subprograms; DBMS\_XMLDOM**

| Subprogram                                         | Description                                    |
|----------------------------------------------------|------------------------------------------------|
| GETPARENTNODE Function                             | Retrieves the parent of this node              |
| GETPREFIX Function                                 | Retrieves the namespace prefix                 |
| GETPREVIOUSIBLING Function                         | Retrieves the previous sibling of the node     |
| GETSCHEMANODE Function                             | Retrieves the associated schema URI            |
| HASATTRIBUTES Function                             | Tests if the node has attributes               |
| HASCHILDNODES Function                             | Tests if the node has child nodes              |
| IMPORTNODE Function                                | Imports a node from another document           |
| INSERTBEFORE Function                              | Inserts a child before the reference child     |
| ISNULL Functions                                   | Tests if the node is NULL                      |
| MAKEATTR Function                                  | Casts the node to an Attribute                 |
| MAKECDATASECTION Function                          | Casts the node to a CData Section              |
| MAKECHARACTERDATA Function                         | Casts the node to Character Data               |
| MAKECOMMENT Function                               | Casts the node to a Comment                    |
| MAKEDOCUMENT Function                              | Casts the node to a DOM Document               |
| MAKEDOCUMENTFRAGMENT Function                      | Casts the node to a DOM Document Fragment      |
| MAKEDOCUMENTTYPE Function                          | Casts the node to a DOM Document Type          |
| MAKEELEMENT Function                               | Casts the node to a DOM Element                |
| MAKEENTITY Function                                | Casts the node to a DOM Entity                 |
| MAKEENTITYREFERENCE Function                       | Casts the node to a DOM Entity Reference       |
| MAKENOTATION Function                              | Casts the node to a DOM Notation               |
| MAKEPROCESSINGINSTRUCTION Function                 | Casts the node to a DOM Processing Instruction |
| MAKETEXT Function                                  | Casts the node to a DOM Text                   |
| REMOVECHILD Function                               | Removes a specified child from a node          |
| REPLACECHILD Function                              | Replaces the old child with a new child        |
| SETNODEVALUE Procedure                             | Sets the Value of the node                     |
| SETNODEVALUEASBINARYSTREAM Function & Procedure    | Sets the Node Value as binary stream           |
| SETNODEVALUEASCHARACTERSTREAM Function & Procedure | Sets the Node Value as a character stream      |
| SETPREFIX Procedure                                | Sets the namespace prefix                      |
| USEBINARYSTREAM Function                           | Establishes that the stream is valid           |
| WRITETOBUFFER Procedures                           | Writes the contents of the node to a buffer    |
| WRITETOCLOB Procedures                             | Writes the contents of the node to a CLOB      |
| WRITETOFILE Procedures                             | Writes the contents of the node to a file      |

## 208.6.2 DBMS\_XMLDOM DOMAttr Subprograms

This table lists the DOMAttr subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-5 Summary of DOMAttr Subprograms; DBMS\_XMLDOM**

| Method                                                  | Description                                         |
|---------------------------------------------------------|-----------------------------------------------------|
| <a href="#">GETEXPANDEDNAME Procedure and Functions</a> | Retrieves the expanded name of the attribute        |
| <a href="#">GETLOCALNAME Procedure and Functions</a>    | Retrieves the local name of the attribute           |
| <a href="#">GETNAME Functions</a>                       | Retrieves the name of the attribute                 |
| <a href="#">GETNAMESPACE Procedure and Functions</a>    | Retrieves the NS URI of the attribute               |
| <a href="#">GETOWNERELEMENT Function</a>                | Retrieves the Element node, parent of the attribute |
| <a href="#">GETQUALIFIEDNAME Functions</a>              | Retrieves the Qualified Name of the attribute       |
| <a href="#">GETSPECIFIED Function</a>                   | Tests if attribute was specified in the element     |
| <a href="#">GETVALUE Function</a>                       | Retrieves the value of the attribute                |
| <a href="#">ISNULL Functions</a>                        | Tests if the Attribute node is NULL                 |
| <a href="#">MAKENODE Functions</a>                      | Casts the Attribute to a node                       |
| <a href="#">SETVALUE Procedure</a>                      | Sets the value of the attribute                     |

### 208.6.3 DBMS\_XMLDOM DOMCDataSection Subprograms

This table lists the DOMCdata subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-6 Summary of DOMCdata Subprograms; DBMS\_XMLDOM**

| Method                             | Description                       |
|------------------------------------|-----------------------------------|
| <a href="#">ISNULL Functions</a>   | Tests if the CDataSection is NULL |
| <a href="#">MAKENODE Functions</a> | Casts the CDataSection to a node  |

### 208.6.4 DBMS\_XMLDOM DOMCharacterData Subprograms

This table lists the DOMCharacterData subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-7 Summary of DOMCharacterData Subprograms; DBMS\_XMLDOM**

| Method                                | Description                                           |
|---------------------------------------|-------------------------------------------------------|
| <a href="#">APPENDDATA Procedure</a>  | Appends the specified data to the node data           |
| <a href="#">DELETEDATA Procedure</a>  | Deletes the data from the specified offSets           |
| <a href="#">GETDATA Functions</a>     | Retrieves the data of the node                        |
| <a href="#">GETLENGTH Functions</a>   | Retrieves the length of the data                      |
| <a href="#">INSERTDATA Procedure</a>  | Inserts the data in the node at the specified offSets |
| <a href="#">ISNULL Functions</a>      | Tests if the CharacterData is NULL                    |
| <a href="#">MAKENODE Functions</a>    | Casts the CharacterData to a node                     |
| <a href="#">REPLACEDATA Procedure</a> | Changes a range of characters in the node             |

**Table 208-7 (Cont.) Summary of DOMCharacterData Subprograms; DBMS\_XMLDOM**

| Method                                 | Description                         |
|----------------------------------------|-------------------------------------|
| <a href="#">SETDATA Procedures</a>     | Sets the data to the node           |
| <a href="#">SUBSTRINGDATA Function</a> | Retrieves the substring of the data |

## 208.6.5 DBMS\_XMLDOM DOMComment Subprograms

The table lists the DOMComment subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-8 Summary of DOMComment Subprograms; DBMS\_XMLDOM**

| Method                             | Description                  |
|------------------------------------|------------------------------|
| <a href="#">ISNULL Functions</a>   | Tests if the comment is NULL |
| <a href="#">MAKENODE Functions</a> | Casts the Comment to a node  |

## 208.6.6 DBMS\_XMLDOM DOMDocument Subprograms

This table lists the DOMDocument subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-9 Summary of DOMDocument Subprograms; DBMS\_XMLDOM**

| Method                                               | Description                                                                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATEATTRIBUTE Functions</a>            | Creates an Attribute                                                                                                                                                 |
| <a href="#">CREATECDATASECTION Function</a>          | Creates a <code>CDataSection</code> node                                                                                                                             |
| <a href="#">CREATECOMMENT Function</a>               | Creates a Comment node                                                                                                                                               |
| <a href="#">CREATEDOCUMENT Function</a>              | Creates a new Document                                                                                                                                               |
| <a href="#">CREATEDOCUMENTFRAGMENT Function</a>      | Creates a new Document Fragment                                                                                                                                      |
| <a href="#">CREATEELEMENT Functions</a>              | Creates a new Element                                                                                                                                                |
| <a href="#">CREATEENTITYREFERENCE Function</a>       | Creates an Entity reference                                                                                                                                          |
| <a href="#">CREATEPROCESSINGINSTRUCTION Function</a> | Creates a Processing Instruction                                                                                                                                     |
| <a href="#">CREATETEXTNODE Function</a>              | Creates a Text node                                                                                                                                                  |
| <a href="#">FREEDOCFRAG Procedure</a>                | Frees the document fragment                                                                                                                                          |
| <a href="#">FREEDOCUMENT Procedure</a>               | Frees the document                                                                                                                                                   |
| <a href="#">GETCHARSET Function</a>                  | Retrieves the character set of the DOM document                                                                                                                      |
| <a href="#">GETDOCTYPE Function</a>                  | Retrieves the DTD of the document                                                                                                                                    |
| <a href="#">GETDOCUMENTELEMENT Function</a>          | Retrieves the root element of the document                                                                                                                           |
| <a href="#">GETELEMENTSBYTAGNAME Functions</a>       | Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNodelist by tag name</li> <li>elements in the subtree of a DOMNodelist by tagname</li> </ul> |
| <a href="#">GETIMPLEMENTATION Function</a>           | Retrieves the DOM implementation                                                                                                                                     |

**Table 208-9 (Cont.) Summary of DOMDocument Subprograms; DBMS\_XMLDOM**

| Method                                   | Description                                                         |
|------------------------------------------|---------------------------------------------------------------------|
| <a href="#">GETSTANDALONE Function</a>   | Retrieves the standalone property of the document                   |
| <a href="#">GETVERSION Function</a>      | Retrieves the version of the document                               |
| <a href="#">GETXMLTYPE Function</a>      | Retrieves the <code>XMLType</code> associated with the DOM Document |
| <a href="#">ISNULL Functions</a>         | Tests if the document is <code>NULL</code>                          |
| <a href="#">MAKENODE Functions</a>       | Casts the document to a node                                        |
| <a href="#">NEWDOMDOCUMENT Functions</a> | Creates a new document                                              |
| <a href="#">SETCHARSET Procedure</a>     | Sets the character set of the DOM document                          |
| <a href="#">SETDOCTYPE Procedure</a>     | Sets the DTD of the document                                        |
| <a href="#">SETSTANDALONE Procedure</a>  | Sets the standalone property of the document                        |
| <a href="#">SETVERSION Procedure</a>     | Sets the version of the document                                    |
| <a href="#">WRITETOBUFFER Procedures</a> | Writes the document to a buffer                                     |
| <a href="#">WRITETOCLOB Procedures</a>   | Writes the document to a <code>CLOB</code>                          |
| <a href="#">WRITETOFILE Procedures</a>   | Writes the document to a file                                       |

## 208.6.7 DBMS\_XMLDOM DOMDocumentFragment Subprograms

This table lists the DOMDocumentFragment subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-10 Summary of DOMDocumentFragment Subprograms; DBMS\_XMLDOM**

| Method                                   | Description                                              |
|------------------------------------------|----------------------------------------------------------|
| <a href="#">FREEDOCFRAG Procedure</a>    | Frees the specified document fragment                    |
| <a href="#">ISNULL Functions</a>         | Tests if the DocumentFragment is <code>NULL</code>       |
| <a href="#">MAKENODE Functions</a>       | Casts the Document Fragment to a node                    |
| <a href="#">WRITETOBUFFER Procedures</a> | Writes the contents of a document fragment into a buffer |

## 208.6.8 DBMS\_XMLDOM DOMDocumentType Subprograms

This table lists the DOMDocumentType subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-11 Summary of DOMDocumentType Subprograms; DBMS\_XMLDOM**

| Method                                | Description                                            |
|---------------------------------------|--------------------------------------------------------|
| <a href="#">FINDENTITY Function</a>   | Finds the specified entity in the document type        |
| <a href="#">FINDNOTATION Function</a> | Finds the specified notation in the document type      |
| <a href="#">GETENTITIES Function</a>  | Retrieves the nodemap of entities in the Document type |
| <a href="#">GETNAME Functions</a>     | Retrieves the name of the Document type                |

**Table 208-11 (Cont.) Summary of DOMDocumentType Subprograms; DBMS\_XMLDOM**

| Method                                | Description                                                 |
|---------------------------------------|-------------------------------------------------------------|
| <a href="#">GETNOTATIONS Function</a> | Retrieves the nodemap of the notations in the Document type |
| <a href="#">GETPUBLICID Functions</a> | Retrieves the public ID of the document type                |
| <a href="#">GETSYSTEMID Functions</a> | Retrieves the system ID of the document type                |
| <a href="#">ISNULL Functions</a>      | Tests if the Document Type is <code>NULL</code>             |
| <a href="#">MAKENODE Functions</a>    | Casts the document type to a node                           |

## 208.6.9 DBMS\_XMLDOM DOMELEMENT Subprograms

This table lists the DOMELEMENT subprograms of DBMS\_XMLDOM in alphabetical order and briefly describes them.

**Table 208-12 Summary of DOMELEMENT Subprograms; DBMS\_XMLDOM**

| Method                                                  | Description                                                                                                                                                          |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">FREEELEMENT Procedure</a>                   | Frees memory allocated to a DOMELEMENT handle                                                                                                                        |
| <a href="#">GETATTRIBUTE Functions</a>                  | Retrieves the attribute node by name                                                                                                                                 |
| <a href="#">GETATTRIBUTENODE Functions</a>              | Retrieves the attribute node by name                                                                                                                                 |
| <a href="#">GETCHILDRENBYTAGNAME Functions</a>          | Retrieves children of the element by tag name                                                                                                                        |
| <a href="#">GETELEMENTSBYTAGNAME Functions</a>          | Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNODELIST by tag name</li> <li>elements in the subtree of a DOMNODELIST by tagname</li> </ul> |
| <a href="#">GETEXPANDEDNAME Procedure and Functions</a> | Retrieves the expanded name of the element                                                                                                                           |
| <a href="#">GETLOCALNAME Procedure and Functions</a>    | Retrieves the local name of the element                                                                                                                              |
| <a href="#">GETNAMESPACE Procedure and Functions</a>    | Retrieves the NS URI of the element                                                                                                                                  |
| <a href="#">GETQUALIFIEDNAME Functions</a>              | Retrieves the qualified name of the element                                                                                                                          |
| <a href="#">GETTAGNAME Function</a>                     | Retrieves the Tag name of the element                                                                                                                                |
| <a href="#">HASATTRIBUTE Functions</a>                  | Tests if an attribute exists                                                                                                                                         |
| <a href="#">ISNULL Functions</a>                        | Tests if the Element is <code>NULL</code>                                                                                                                            |
| <a href="#">MAKENODE Functions</a>                      | Casts the Element to a node                                                                                                                                          |
| <a href="#">NORMALIZE Procedure</a>                     | Normalizes the text children of the element                                                                                                                          |
| <a href="#">REMOVEATTRIBUTE Procedures</a>              | Removes the attribute specified by the name                                                                                                                          |
| <a href="#">REMOVEATTRIBUTENODE Function</a>            | Removes the attribute node in the element                                                                                                                            |
| <a href="#">RESOLVENAMESPACEPREFIX Function</a>         | Resolve the prefix to a namespace URI                                                                                                                                |
| <a href="#">SETATTRIBUTE Procedures</a>                 | Sets the attribute specified by the name                                                                                                                             |
| <a href="#">SETATTRIBUTENODE Functions</a>              | Sets the attribute node in the element                                                                                                                               |

## 208.6.10 DBMS\_XMLDOM DOMENTITY Subprograms

This table lists and briefly describes the DOMENTITY subprograms of DBMS\_XMLDOM.

**Table 208-13 Summary of DOMEntity Subprograms; DBMS\_XMLDOM**

| Method                                   | Description                               |
|------------------------------------------|-------------------------------------------|
| <a href="#">GETNOTATIONNAME Function</a> | Retrieves the notation name of the entity |
| <a href="#">GETPUBLICID Functions</a>    | Retrieves the public Id of the entity     |
| <a href="#">GETSYSTEMID Functions</a>    | Retrieves the system Id of the entity     |
| <a href="#">ISNULL Functions</a>         | Tests if the Entity is NULL               |
| <a href="#">MAKENODE Functions</a>       | Casts the Entity to a node                |

## 208.6.11 DBMS\_XMLDOM DOMEntityReference Subprograms

This table lists and briefly describes the `DOMEntityReference` subprograms of `DBMS_XMLDOM`.

**Table 208-14 Summary of DOMEntityReference Subprograms; DBMS\_XMLDOM**

| Method                             | Description                                          |
|------------------------------------|------------------------------------------------------|
| <a href="#">ISNULL Functions</a>   | Tests if the <code>DOMEntityReference</code> is NULL |
| <a href="#">MAKENODE Functions</a> | Casts the <code>DOMEntityReference</code> to NULL    |

## 208.6.12 DBMS\_XMLDOM DOMImplementation Subprograms

This table lists and briefly describes the `DOMImplementation` subprograms of `DBMS_XMLDOM`.

**Table 208-15 Summary of DOMImplementation Subprograms; DBMS\_XMLDOM**

| Method                              | Description                                                      |
|-------------------------------------|------------------------------------------------------------------|
| <a href="#">ISNULL Functions</a>    | Tests if the <code>DOMImplementation</code> node is NULL         |
| <a href="#">HASFEATURE Function</a> | Tests if the <code>DOMImplementation</code> implements a feature |

## 208.6.13 DBMS\_XMLDOM DOMNamedNodeMap Subprograms

This table lists and briefly describes the `DOMNamedNodeMap` subprograms of `DBMS_XMLDOM`.

**Table 208-16 Summary of DOMNamedNodeMap Subprograms; DBMS\_XMLDOM**

| Method                                   | Description                                    |
|------------------------------------------|------------------------------------------------|
| <a href="#">GETLENGTH Functions</a>      | Retrieves the number of items in the map       |
| <a href="#">GETNAMEDITEM Function</a>    | Retrieves the item specified by the name       |
| <a href="#">ISNULL Functions</a>         | Tests if the <code>NamedNodeMap</code> is NULL |
| <a href="#">ITEM Functions</a>           | Retrieves the item given the index in the map  |
| <a href="#">REMOVENAMEDITEM Function</a> | Removes the item specified by name             |
| <a href="#">SETNAMEDITEM Function</a>    | Sets the item in the map specified by the name |

## 208.6.14 DBMS\_XMLDOM DOMNodeList Subprograms

This table lists and briefly describes the `DOMNodeList` subprograms of `DBMS_XMLDOM`.

**Table 208-17 Summary of DOMNodeList Subprograms; DBMS\_XMLDOM**

| Method                                 | Description                                             |
|----------------------------------------|---------------------------------------------------------|
| <a href="#">FREENODELIST Procedure</a> | Frees all resources associated with a nodelist          |
| <a href="#">GETLENGTH Functions</a>    | Retrieves the number of items in the list               |
| <a href="#">ISNULL Functions</a>       | Tests if the <code>NodeList</code> is <code>NULL</code> |
| <a href="#">ITEM Functions</a>         | Retrieves the item given the index in the list          |

## 208.6.15 DBMS\_XMLDOM DOMNotation Subprograms

This table lists and briefly describes the `DOMNotation` subprograms of `DBMS_XMLDOM`.

**Table 208-18 Summary of DOMNotation Subprograms; DBMS\_XMLDOM**

| Method                                | Description                                |
|---------------------------------------|--------------------------------------------|
| <a href="#">GETPUBLICID Functions</a> | Retrieves the public Id of the notation    |
| <a href="#">GETSYSTEMID Functions</a> | Retrieves the system Id of the notation    |
| <a href="#">ISNULL Functions</a>      | Tests if the Notation is <code>NULL</code> |
| <a href="#">MAKENODE Functions</a>    | Casts the notation to a node               |

## 208.6.16 DBMS\_XMLDOM DOMProcessingInstruction Subprograms

This table lists and briefly describes the `DOMProcessingInstruction` subprograms of `DBMS_XMLDOM`.

**Table 208-19 Summary of DOMProcessingInstruction Subprograms; DBMS\_XMLDOM**

| Method                             | Description                                              |
|------------------------------------|----------------------------------------------------------|
| <a href="#">GETDATA Functions</a>  | Retrieves the data of the processing instruction         |
| <a href="#">GETTARGET Function</a> | Retrieves the target of the processing instruction       |
| <a href="#">ISNULL Functions</a>   | Tests if the Processing Instruction is <code>NULL</code> |
| <a href="#">MAKENODE Functions</a> | Casts the Processing Instruction to a node               |
| <a href="#">SETDATA Procedures</a> | Sets the data of the processing instruction              |

## 208.6.17 DBMS\_XMLDOM DOMText Subprograms

This table lists and briefly describes the `DOMText` subprograms of `DBMS_XMLDOM`.

**Table 208-20 Summary of DOMText Subprograms; DBMS\_XMLDOM**

| Method                             | Description                                            |
|------------------------------------|--------------------------------------------------------|
| <a href="#">ISNULL Functions</a>   | Tests if the text is NULL                              |
| <a href="#">MAKENODE Functions</a> | Casts the text to a node                               |
| <a href="#">SPLITTEXT Function</a> | Splits the contents of the text node into 2 text nodes |

## 208.7 Summary of DBMS\_XMLDOM Subprograms

This table lists the DBMS\_XMLDOM subprograms and briefly describes them.

**Table 208-21 Summary of DBMS\_XMLDOM Package Subprogram**

| Subprogram                                           | Description                                       | Group                                                                       |
|------------------------------------------------------|---------------------------------------------------|-----------------------------------------------------------------------------|
| <a href="#">ADOPTNODE Function</a>                   | Adopts a node from another document               | <a href="#">DOMNode Subprograms</a>                                         |
| <a href="#">APPENDCHILD Function</a>                 | Appends a new child to the node                   | <a href="#">DOMNode Subprograms</a>                                         |
| <a href="#">APPENDDATA Procedure</a>                 | Appends the specified data to the node data       | <a href="#">DOMCharacterData Subprograms</a>                                |
| <a href="#">CLONENODE Function</a>                   | Clones the node                                   | <a href="#">DOMNode Subprograms</a>                                         |
| <a href="#">CREATEATTRIBUTE Functions</a>            | Creates an Attribute                              | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATECDATASECTION Function</a>          | Creates a CDataSection node                       | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATECOMMENT Function</a>               | Creates a Comment node                            | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATEDOCUMENT Function</a>              | Creates a new Document                            | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATEDOCUMENTFRAGMENT Function</a>      | Creates a new Document Fragment                   | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATEELEMENT Functions</a>              | Creates a new Element                             | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATEENTITYREFERENCE Function</a>       | Creates an Entity reference                       | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATEPROCESSINGINSTRUCTION Function</a> | Creates a Processing Instruction                  | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">CREATETEXTNODE Function</a>              | Creates a Text node                               | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">DELETEDATA Procedure</a>                 | Deletes the data from the specified offSets       | <a href="#">DOMCharacterData Subprograms</a>                                |
| <a href="#">FINDENTITY Function</a>                  | Finds the specified entity in the document type   | <a href="#">DOMDocumentType Subprograms</a>                                 |
| <a href="#">FINDNOTATION Function</a>                | Finds the specified notation in the document type | <a href="#">DOMDocumentType Subprograms</a>                                 |
| <a href="#">FREEDOCFRAG Procedure</a>                | Frees the document fragment                       | <a href="#">DOMDocument Subprograms and DOMDocumentFragment Subprograms</a> |
| <a href="#">FREEDOCUMENT Procedure</a>               | Frees the document                                | <a href="#">DOMDocument Subprograms</a>                                     |
| <a href="#">FREEELEMENT Procedure</a>                | Frees memory allocated to a DOMELEMENT handle     | <a href="#">DOMELEMENT Subprograms</a>                                      |
| <a href="#">FREENODE Procedure</a>                   | Frees all resources associated with the node      | <a href="#">DOMNode Subprograms</a>                                         |

**Table 208-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

| Subprogram                                              | Description                                                                                                                                                                      | Group                                                                                                                                                                                                |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">FREENODELIST Procedure</a>                  | Frees all resources associated with a nodelist                                                                                                                                   | <a href="#">DOMNodeList Subprograms</a>                                                                                                                                                              |
| <a href="#">GETATTRIBUTE Functions</a>                  | Retrieves the attribute node by name                                                                                                                                             | <a href="#">DOMElement Subprograms</a>                                                                                                                                                               |
| <a href="#">GETATTRIBUTENODE Functions</a>              | Retrieves the attribute node by name                                                                                                                                             | <a href="#">DOMElement Subprograms</a>                                                                                                                                                               |
| <a href="#">GETATTRIBUTES Function</a>                  | Retrieves the attributes of the node                                                                                                                                             | <a href="#">DOMNode Subprograms</a>                                                                                                                                                                  |
| <a href="#">GETCHARSET Function</a>                     | Retrieves the character set of the DOM document                                                                                                                                  | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                              |
| <a href="#">GETCHILDNODES Function</a>                  | Retrieves the children of the node                                                                                                                                               | <a href="#">DOMNode Subprograms</a>                                                                                                                                                                  |
| <a href="#">GETCHILDRENBYTAGNAME Functions</a>          | Retrieves children of the element by tag name                                                                                                                                    | <a href="#">DOMCharacterData Subprograms</a>                                                                                                                                                         |
| <a href="#">GETDATA Functions</a>                       | Retrieves <ul style="list-style-type: none"> <li>the data of the node</li> <li>the data of the processing instruction</li> </ul>                                                 | <ul style="list-style-type: none"> <li><a href="#">DOMCharacterData Subprograms</a></li> <li><a href="#">DOMProcessingInstruction Subprograms</a></li> </ul>                                         |
| <a href="#">GETDOCTYPE Function</a>                     | Retrieves the DTD of the document                                                                                                                                                | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                              |
| <a href="#">GETDOCUMENTELEMENT Function</a>             | Retrieves the root element of the document                                                                                                                                       | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                              |
| <a href="#">GETELEMENTSBYTAGNAME Functions</a>          | Retrieves <ul style="list-style-type: none"> <li>the elements in the DOMNODELIST by tag name</li> <li>elements in the subtree of a DOMNODELIST by tagname</li> </ul>             | <ul style="list-style-type: none"> <li><a href="#">DOMDocument Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>                                                            |
| <a href="#">GETENTITIES Function</a>                    | Retrieves the nodemap of entities in the Document type                                                                                                                           | <a href="#">DOMDocumentType Subprograms</a>                                                                                                                                                          |
| <a href="#">GETEXPANDEDNAME Procedure and Functions</a> | Retrieves <ul style="list-style-type: none"> <li>the expanded name of the node</li> <li>the expanded name of the attribute</li> <li>the expanded name of the element</li> </ul>  | <ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>                   |
| <a href="#">GETFIRSTCHILD Function</a>                  | Retrieves the first child of the node                                                                                                                                            | <a href="#">DOMNode Subprograms</a>                                                                                                                                                                  |
| <a href="#">GETIMPLEMENTATION Function</a>              | Retrieves the DOM implementation                                                                                                                                                 | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                              |
| <a href="#">GETLASTCHILD Function</a>                   | Retrieves the last child of the node                                                                                                                                             | <a href="#">DOMNode Subprograms</a>                                                                                                                                                                  |

| <a href="#">GETLOCALNAME Procedure and Functions</a>    | Retrieves <ul style="list-style-type: none"> <li>the local part of the qualified name</li> <li>the local name of the attribute</li> <li>the local name of the element</li> </ul> | <ul style="list-style-type: none"> <li><a href="#">DOMNode Subprograms</a></li> <li><a href="#">DOMAttr Subprograms</a></li> <li><a href="#">DOMElement Subprograms</a></li> </ul>                   |

**Table 208-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

| Subprogram                                         | Description                                                                                                                                                                | Group                                                                                                                                         |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| GETNAME Functions                                  | Retrieves <ul style="list-style-type: none"> <li>the name of the attribute</li> <li>the name of the Document type</li> </ul>                                               | <ul style="list-style-type: none"> <li>DOMAttr Subprograms</li> <li>DOMDocumentType Subprograms</li> </ul>                                    |
| GETNAMEDITEM Function                              | Retrieves <ul style="list-style-type: none"> <li>an item specified by name</li> <li>and namespace URI )</li> </ul>                                                         | <ul style="list-style-type: none"> <li>DOMNamedNodeMap Subprograms</li> <li>DOMNamedNodeMap Subprograms</li> </ul>                            |
| GETNAMESPACE Procedure and Functions               | Retrieves <ul style="list-style-type: none"> <li>the node's namespace URI</li> <li>the NS URI of the attribute</li> <li>the NS URI of the element</li> </ul>               | <ul style="list-style-type: none"> <li>DOMNode Subprograms</li> <li>DOMAttr Subprograms</li> <li>DOMElement Subprograms</li> </ul>            |
| GETNEXTSIBLING Function                            | Retrieves the next sibling of the node                                                                                                                                     | DOMNode Subprograms                                                                                                                           |
| GETNODENAME Function                               | Retrieves the Name of the Node                                                                                                                                             | DOMNode Subprograms                                                                                                                           |
| GETNODETYPE Function                               | Retrieves the Type of the node                                                                                                                                             | DOMNode Subprograms                                                                                                                           |
| GETNODEVALUE Function                              | Retrieves the Value of the Node                                                                                                                                            | DOMNode Subprograms                                                                                                                           |
| GETNODEVALUEASBINARYSTREAM Function & Procedure    | Retrieves the Node Value as binary stream                                                                                                                                  | DOMNode Subprograms                                                                                                                           |
| GETNODEVALUEASCHARACTERSTREAM Function & Procedure | Retrieves the Node Value as character stream                                                                                                                               | DOMNode Subprograms                                                                                                                           |
| GETNOTATIONNAME Function                           | Retrieves the notation name of the entity                                                                                                                                  | DOMEntity Subprograms                                                                                                                         |
| GETNOTATIONS Function                              | Retrieves the nodemap of the notations in the Document type                                                                                                                | DOMDocumentType Subprograms                                                                                                                   |
| GETTARGET Function                                 | Retrieves the target of the processing instruction                                                                                                                         | DOMProcessingInstruction Subprograms                                                                                                          |
| GETOWNERDOCUMENT Function                          | Retrieves the owner document of the node                                                                                                                                   | DOMNode Subprograms                                                                                                                           |
| GETOWNERELEMENT Function                           | Retrieves the Element node, parent of the attribute                                                                                                                        | DOMAttr Subprograms                                                                                                                           |
| GETPARENTNODE Function                             | Retrieves the parent of this node                                                                                                                                          | DOMNode Subprograms                                                                                                                           |
| GETPREFIX Function                                 | Retrieves the namespace prefix )                                                                                                                                           | DOMNode Subprograms                                                                                                                           |
| GETPREVIOUSIBLING Function                         | Retrieves the previous sibling of the node                                                                                                                                 | DOMNode Subprograms                                                                                                                           |
| GETPUBLICID Functions                              | Retrieves <ul style="list-style-type: none"> <li>the public ID of the document type</li> <li>the public Id of the entity</li> <li>the public Id of the notation</li> </ul> | <ul style="list-style-type: none"> <li>DOMDocumentType Subprograms</li> <li>DOMEntity Subprograms</li> <li>DOMNotation Subprograms</li> </ul> |
| GETQUALIFIEDNAME Functions                         | Retrieves <ul style="list-style-type: none"> <li>the Qualified Name of the attribute</li> <li>the qualified name of the element</li> </ul>                                 | <ul style="list-style-type: none"> <li>DOMAttr Subprograms</li> <li>DOMElement Subprograms</li> </ul>                                         |
| GETSCHEMANODE Function                             | Retrieves the associated schema URI                                                                                                                                        | DOMNode Subprograms                                                                                                                           |

**Table 208-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

| Subprogram                             | Description                                                                                                                                                                | Group                                                                                                                                                                                         |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GETSPECIFIED Function</a>  | Tests if attribute was specified in the element.                                                                                                                           | <a href="#">DOMAttr Subprograms</a>                                                                                                                                                           |
| <a href="#">GETSTANDALONE Function</a> | Retrieves the standalone property of the document                                                                                                                          | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                       |
| <a href="#">GETSYSTEMID Functions</a>  | Retrieves <ul style="list-style-type: none"> <li>the system ID of the document type</li> <li>the system Id of the entity</li> <li>the system Id of the notation</li> </ul> | <ul style="list-style-type: none"> <li><a href="#">DOMDocumentType Subprograms</a></li> <li><a href="#">DOMEntity Subprograms</a></li> <li><a href="#">DOMNotation Subprograms</a></li> </ul> |
| <a href="#">GETTAGNAME Function</a>    | Retrieves the Tag name of the element                                                                                                                                      | <a href="#">DOMELEMENT Subprograms</a>                                                                                                                                                        |
| <a href="#">GETVALUE Function</a>      | Retrieves the value of the attribute                                                                                                                                       | <a href="#">DOMAttr Subprograms</a>                                                                                                                                                           |
| <a href="#">GETVERSION Function</a>    | Retrieves the version of the document                                                                                                                                      | <a href="#">DOMDocument Subprograms)</a>                                                                                                                                                      |
| <a href="#">GETXMLTYPE Function</a>    | Retrieves the <code>XMLType</code> associated with the DOM Document                                                                                                        | <a href="#">DOMDocument Subprograms</a>                                                                                                                                                       |
| <a href="#">HASATTRIBUTES Function</a> | Tests if the node has attributes                                                                                                                                           | <a href="#">DOMNode Subprograms</a>                                                                                                                                                           |
| <a href="#">HASATTRIBUTE Functions</a> | Tests if an attribute exists                                                                                                                                               | <a href="#">DOMELEMENT Subprograms</a>                                                                                                                                                        |
| <a href="#">HASCHILDNODES Function</a> | Tests if the node has child nodes                                                                                                                                          | <a href="#">DOMNode Subprograms</a>                                                                                                                                                           |
| <a href="#">HASFEATURE Function</a>    | Tests if the <code>DOMImplementation</code> implements a feature                                                                                                           | <a href="#">DOMImplementation Subprograms</a>                                                                                                                                                 |
| <a href="#">IMPORTNODE Function</a>    | Imports a node from another document                                                                                                                                       | <a href="#">DOMNode Subprograms</a>                                                                                                                                                           |
| <a href="#">INSERTBEFORE Function</a>  | Inserts a child before the reference child                                                                                                                                 | <a href="#">DOMNode Subprograms</a>                                                                                                                                                           |
| <a href="#">INSERTDATA Procedure</a>   | Inserts the data in the node at the specified offSets                                                                                                                      | <a href="#">DOMCharacterData Subprograms</a>                                                                                                                                                  |

**Table 208-21 (Cont.) Summary of DBMS\_XMLDOM Package Subprogram**

| Subprogram                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 208.7.1 ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

### See Also:

[DOMNode Subprograms](#) for other subprograms in this group

### Syntax

```
DBMS_XMLDOM.ADOPTNODE (  
    doc             IN   DOMDocument,  
    importedNode    IN   DOMNode)  
RETURN DOMNODE;
```

### Parameters

**Table 208-22 ADOPTNODE Function Parameters**

| Parameter    | Description                        |
|--------------|------------------------------------|
| doc          | Document that is adopting the node |
| importedNode | Node to adopt                      |

### Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## 208.7.2 APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.APPENDCHILD (  
    n             IN   DOMNode,  
    newchild      IN   DOMNode)  
RETURN DOMNODE;
```

## Parameters

**Table 208-23 APPENDCHILD Function Parameters**

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| n         | DOMNode                                                    |
| newchild  | The child to be appended to the list of children of node n |

## 208.7.3 APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

### See Also:

[DOMCharacterData Subprograms](#)

## Syntax

```
DBMS_XMLDOM.APPENDDATA (  
    cd          IN    DOMCHARACTERDATA,  
    arg         IN    VARCHAR2);
```

## Parameters

**Table 208-24 APPENDDATA Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| cd        | DOMCHARACTERDATA                        |
| arg       | The data to append to the existing data |

## 208.7.4 CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is `NULL`.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.CLONENODE (  
    n          IN    DOMNODE,  
    deep       IN    BOOLEAN)  
RETURN DOMNODE;
```

## Parameters

**Table 208-25 CLONENODE Function Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| n         | DOMNODE                                 |
| deep      | Determines if children are to be cloned |

## Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is `TRUE`).
- Cloning any other type of node simply returns a copy of this node.

## 208.7.5 CREATEATTRIBUTE Functions

This function creates a `DOMATTR` node.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

Creates a `DOMATTR` with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (  
    doc      IN      DOMDOCUMENT,  
    name     IN      VARCHAR2)  
RETURN DOMATTR;
```

Creates a `DOMATTR` with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (  
    doc      IN      DOMDOCUMENT,  
    qname    IN      VARCHAR2,  
    ns       IN      VARCHAR2)  
RETURN DOMATTR;
```

## Parameters

**Table 208-26 CREATEATTRIBUTE Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| doc       | DOMDOCUMENT                  |
| qname     | New attribute qualified name |

**Table 208-26 (Cont.) CREATEATTRIBUTE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| ns        | Namespace   |

## 208.7.6 CREATECDATASECTION Function

This function creates a `DOMCDATASECTION` node.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATECDATASECTION (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCDATASECTION;
```

### Parameters

**Table 208-27 CREATECDATASECTION Function Parameters**

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| doc       | DOMDOCUMENT                                      |
| data      | Content of the <code>DOMCDATASECTION</code> node |

## 208.7.7 CREATECOMMENT Function

This function creates a `DOMCOMMENT` node.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATECOMMENT (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

## Parameters

**Table 208-28 CREATECOMMENT Function Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| doc       | DOMDOCUMENT                    |
| data      | Content of the DOMComment node |

## 208.7.8 CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT (  
    namespaceURI      IN      VARCHAR2,  
    qualifiedName      IN      VARCHAR2,  
    doctype            IN      DOMTYPE := NULL)  
RETURN DOMDOCUMENT;
```

## Parameters

**Table 208-29 CREATEDOCUMENT Function Parameters**

| Parameter     | Description       |
|---------------|-------------------|
| namespaceURI  | Namespace URI     |
| qualifiedName | Root element name |
| doctype       | Document type     |

## 208.7.9 CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTFRAGMENT;
```

## Parameters

**Table 208-30** CREATEDOCUMENTFRAGMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDocument |

## 208.7.10 CREELEMENT Functions

This function creates a `DOMElement`.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

Creates a `DOMElement` with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(  
    doc          IN      DOMDOCUMENT,  
    tagName      IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Creates a `DOMElement` with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(  
    doc          IN      DOMDOCUMENT,  
    tagName      IN      VARCHAR2,  
    ns           IN      VARCHAR2)  
RETURN DOMELEMENT;
```

## Parameters

**Table 208-31** CREELEMENT Function Parameters

| Parameter | Description                             |
|-----------|-----------------------------------------|
| doc       | DOMDOCUMENT                             |
| tagName   | Tagname for new <code>DOMELEMENT</code> |
| ns        | Namespace                               |

## 208.7.11 CREATEENTITYREFERENCE Function

This function creates a `DOMENTITYREFERENCE` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE (  
    doc          IN      DOMDOCUMENT,  
    name         IN      VARCHAR2)  
RETURN DOMENTITYREFERENCE;
```

### Parameters

**Table 208-32 CREATEENTITYREFERENCE Function Parameters**

| Parameter | Description               |
|-----------|---------------------------|
| doc       | DOMDOCUMENT               |
| name      | New entity reference name |

## 208.7.12 CREATEPROCESSINGINSTRUCTION Function

This function creates a `DOMPROCESSINGINSTRUCTION` node.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION (  
    doc          IN      DOMDocument,  
    target       IN      VARCHAR2,  
    data         IN      VARCHAR2)  
RETURN DOMPROCESSINGINSTRUCTION;
```

### Parameters

**Table 208-33 CREATEPROCESSINGINSTRUCTION Function Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| doc       | DOMDOCUMENT                              |
| target    | Target of the new processing instruction |

**Table 208-33 (Cont.) CREATEPROCESSINGINSTRUCTION Function Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| data      | Content data of the new processing instruction |

## 208.7.13 CREATETEXTNODE Function

This function creates a `DOMTEXT` node.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(  
    doc      IN      DOMDocument,  
    data     IN      VARCHAR2)  
RETURN DOMTEXT;
```

### Parameters

**Table 208-34 CREATETEXTNODE Function Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| doc       | DOMDOCUMENT                              |
| data      | Content of the <code>DOMText</code> node |

## 208.7.14 DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

### See Also:

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.DELETEDATA(  
    cd      IN      DOMCHARACTERDATA,  
    offset  IN      NUMBER,  
    cnt     IN      NUMBER);
```

## Parameters

**Table 208-35 DELETEDATA PROCEDURE Parameters**

| Parameter | Description                                               |
|-----------|-----------------------------------------------------------|
| cd        | DOMCHARACTERDATA                                          |
| offset    | The offset from which to delete the data                  |
| cnt       | The number of characters (starting from offset) to delete |

## 208.7.15 FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

**See Also:**

[DOMDocumentType Subprograms](#)

## Syntax

```
DBMS_XMLDOM.FINDENTITY (  
    dt      IN      DOMDOCUMENTTYPE,  
    name    IN      VARCHAR2,  
    par     IN      BOOLEAN)  
RETURN DUMENTITY;
```

## Parameters

**Table 208-36 FINDENTITY Function Parameters**

| Parameter | Description                                                                            |
|-----------|----------------------------------------------------------------------------------------|
| dt        | The DTD                                                                                |
| name      | Entity to find                                                                         |
| par       | Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity |

## 208.7.16 FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

**See Also:**

[DOMDocumentType Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FINDNOTATION(  
    dt          IN      DOMDocumentType,  
    name        IN      VARCHAR2)  
RETURN DOMNOTATION;
```

### Parameters

**Table 208-37 FINDNOTATION Function Parameters**

| Parameter | Description          |
|-----------|----------------------|
| dt        | The DTD              |
| name      | The notation to find |

## 208.7.17 FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

### See Also:

[DOMDocument Subprograms](#) and [DOMDocumentFragment Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(  
    df          IN      DOMDOCUMENTFRAGMENT);
```

### Parameters

**Table 208-38 FREEDOCFRAG Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| df        | DOM document fragment |

## 208.7.18 FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

### See Also:

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(  
    doc         IN      DOMDOCUMENT);
```

## Parameters

**Table 208-39 FREEDOCUMENT Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.19 FREEELEMENT Procedure

This procedure frees memory allocated to a DOMELEMENT handle.

### See Also:

[DBMS\\_XMLDOM DOMELEMENT Subprograms](#)

## Syntax

```
DBMS_XMLDOM.FREEELEMENT(  
    elem IN DOMELEMENT);
```

## Parameters

**Table 208-40 FREEELEMENT Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| elem      | Of type DOMELEMENT |

## 208.7.20 FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.FREENODE(  
    n      IN      DOMNODE);
```

## Parameters

**Table 208-41** FREENODE Procedure Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.21 FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

### See Also:

[DBMS\\_XMLDOM DOMNodeList Subprograms](#)

## Syntax

```
DBMS_XMLDOM.FREENODELIST(  
    nl IN DOMNodeList);
```

## Parameters

**Table 208-42** FREENODELIST Procedure Parameters

| Parameter | Description         |
|-----------|---------------------|
| nl        | Of type DOMNODELIST |

## 208.7.22 GETATTRIBUTE Functions

This function returns the value of an attribute of an DOMELEMENT by name.

### See Also:

[DOMELEMENT Subprograms](#)

## Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 208-43** GETATTRIBUTE Function Parameters

| Parameter | Description    |
|-----------|----------------|
| elem      | The DOMELEMENT |
| name      | Attribute name |
| ns        | Namespace      |

## 208.7.23 GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### See Also:

[DOMELEMENT Subprograms](#)

### Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2)  
RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN DOMATTR;
```

### Parameters

**Table 208-44** GETATTRIBUTENODE Function Parameters

| Parameter | Description                             |
|-----------|-----------------------------------------|
| elem      | The DOMELEMENT                          |
| name      | Attribute name; * matches any attribute |
| ns        | Namespace                               |

## 208.7.24 GETATTRIBUTES Function

This function retrieves a `NAMEDNODEMAP` containing the attributes of this node (if it is an Element) or `NULL` otherwise.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETATTRIBUTES (
    n          IN      DOMNode)
RETURN DOMNAMEDNODEMAP;
```

### Parameters

**Table 208-45 GETATTRIBUTES Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNode     |

## 208.7.25 GETCHARSET Function

This function retrieves the charset of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETCHARSET (
    doc IN      DOMDocument)
RETURN VARCHAR2;
```

### Parameters

**Table 208-46 GETCHARSET Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| doc       | DOM document |

### Usage Notes

For a newly parsed document, we return the database charset. Once the `SETCHARSET` Procedure is called with a non-`NULL` value for `charset`, that `charset` is returned.

# 208.7.26 GETCHILDNODES Function

This function retrieves a `DOMNODELIST` that contains all children of this node. If there are no children, this is a `DOMNODELIST` containing no nodes.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETCHILDNODES (  
    n          IN      DOMNode)  
RETURN DOMNodeList;
```

## Parameters

**Table 208-47 GETCHILDNODES Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNode     |

# 208.7.27 GETCHILDRENBYTAGNAME Functions

This function returns the children of the `DOMELEMENT`.

**See Also:**

[DOMElement Subprograms](#)

## Syntax

Returns children of the `DOMELEMENT` given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (  
    elem      IN      DOMElement,  
    name      IN      VARCHAR2)  
RETURN DOMNODELIST;
```

Returns children of the `DOMELEMENT` given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (  
    elem      IN      DOMElement,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN DOMNODELIST;
```

## Parameters

**Table 208-48 GETCHILDRENBYTAGNAME Function Parameters**

| Parameter | Description |
|-----------|-------------|
| elem      | DOMELEMENT  |
| name      | Tag name    |
| ns        | Namespace   |

## 208.7.28 GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETDATA(  
    cd      IN      DOMCHARACTERDATA)  
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.GETDATA(  
    pi      IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

## Parameters

**Table 208-49 GETDATA Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| cd        | DOMCHARACTERDATA             |
| pi        | The DOMPROCESSINGINSTRUCTION |

## 208.7.29 GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETDOCTYPE (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 208-50 GETDOCTYPE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.30 GETDOCUMENTELEMENT Function

This function returns the root element of the `DOMDOCUMENT`.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMELEMENT;
```

### Parameters

**Table 208-51 GETDOCUMENTELEMENT Function Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.31 GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns a `DOMNODELIST` of all the elements with a specified tagname (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (  
    doc      IN      DOMDOCUMENT,  
    tagname  IN      VARCHAR2)  
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2)  
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN DOMNODELIST;
```

**Parameters**

**Table 208-52    GETELEMENTSBYTAGNAME Function Parameters**

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| doc       | DOMDOCUMENT                                       |
| tagname   | Name of the tag to match on                       |
| elem      | The DOMELEMENT                                    |
| name      | Tag name; using a wildcard(*) would match any tag |
| ns        | Namespace                                         |

208.7.32 GETENTITIES Function

This function retrieves a `DOMNAMEDNODEMAP` containing the general entities, both external and internal, declared in the DTD.

**See Also:**

[DOMDocumentType Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.GETENTITIES (  
    dt      IN      DOMDocumentType)  
RETURN DOMNAMEDNODEMAP;
```

**Parameters**

**Table 208-53    GETENTITIES Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| dt        | DOMDOCUMENTTYPE |

## 208.7.33 GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#))

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    n          IN      DOMNODE
    data       OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    a          IN      DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    elem       IN      DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 208-54** GETEXPANDEDNAME Procedure and Function Parameters

| Parameter | Description                        |
|-----------|------------------------------------|
| n         | DOMNODE                            |
| data      | Returned expanded name of the Node |
| a         | DOMATTR                            |
| elem      | DOMELEMENT                         |

## 208.7.34 GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns `NULL`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD (
    n          IN      DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 208-55 GETFIRSTCHILD Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.35 GETIMPLEMENTATION Function

This function returns the `DOMIMPLEMENTATION` object that handles this `DOMDOCUMENT`.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(  
    doc      IN      DOMDOCUMENT)  
RETURN DOMIMPLEMENTATION;
```

## Parameters

**Table 208-56 GETIMPLEMENTATION Function Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.36 GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns `NULL`.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETLASTCHILD(  
    n      IN      DOMNODE)  
RETURN DOMNODE;
```

## Parameters

**Table 208-57 GETLASTCHILD Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.37 GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    cd      IN      DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nnm      IN      DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to length-1, inclusive (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.GETLENGTH (
    nl      IN      DOMNODELIST)
RETURN NUMBER;
```

## Parameters

**Table 208-58 GETLENGTH Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| cd        | DOMCHARACTERDATA |
| nnm       | DOMNAMEDNODEMAP  |
| nl        | DOMNODELIST      |

## 208.7.38 GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

### Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    n          IN      DOMNODE,
    data       OUT     VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETLOCALNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#))

```
DBMS_XMLDOM.GETLOCALNAME (
    elem       IN      DOMELEMENT)
RETURN VARCHAR2;
```

### Parameters

**Table 208-59 GETLOCALNAME Procedure and Function Parameters**

| Parameter | Description          |
|-----------|----------------------|
| n         | DOMNode              |
| data      | Returned local name. |
| a         | DOMAttr.             |
| elem      | DOMELEMENT.          |

## 208.7.39 GETNAME Functions

This function is overloaded. The specific forms of functionality are described with the syntax declarations.

### Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    a          IN      DOMATTR)
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETNAME (
    dt         IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

### Parameters

**Table 208-60 GETNAME Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| a         | DOMATTR         |
| dt        | DOMDOCUMENTTYPE |

# 208.7.40 GETNAMEDITEM Function

GETNAMEDITEM retrieves a node specified by name.

**See Also:**

[DOMNamedNodeMap Subprograms](#)

## Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(  
    nnm      IN  DOMNAMEDNODEMAP,  
    name     IN  VARCHAR2)  
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(  
    nnm      IN  DOMNAMEDNODEMAP,  
    name     IN  VARCHAR2,  
    ns       IN  VARCHAR2)  
RETURN DOMNODE;
```

## Parameters

**Table 208-61** GETNAMEDITEM Function Parameters

| Parameter | Description                      |
|-----------|----------------------------------|
| nnm       | DOMNAMEDNODEMAP                  |
| name      | Name of the item to be retrieved |
| ns        | Namespace                        |

# 208.7.41 GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

## Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(  
    n      IN  DOMNODE,  
    data   OUT VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(  
    a      IN  DOMATTR)  
RETURN VARCHAR2;
```

Retrieves the namespace of the `DOMELEMENT` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETNAMESPACE(  
    elem      IN      DOMELEMENT)  
RETURN VARCHAR2;
```

Parameters

Table 208-62 GETNAMESPACE Procedure and Function Parameters

| Parameter | Description            |
|-----------|------------------------|
| n         | DOMNODE                |
| data      | Returned namespace URI |
| a         | DOMATTR                |
| elem      | DOMELEMENT             |

208.7.42 GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

 **See Also:**  
[DOMNode Subprograms](#)

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(  
    n      IN      DOMNODE)  
RETURN DOMNode;
```

Parameters

Table 208-63 GETNEXTSIBLING Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

208.7.43 GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

 **See Also:**  
[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNODETYPE (  
    n          IN      DOMNODE)  
RETURN NUMBER;
```

### Parameters

**Table 208-64** GETNODETYPE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.44 GETNODENAME Function

This function gets the name of the node depending on its type.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNODENAME (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

### Parameters

**Table 208-65** GETNODENAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.45 GETNODEVALUE Function

This function gets the value of this node, depending on its type.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNODEVALUE (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;*
```

## Parameters

**Table 208-66 GETNODEVALUE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.46 GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

### See Also:

[DOMNode Subprograms](#)

## Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node datatype must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (  
    n          IN      DOMNODE)  
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The datatype of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (  
    n          in      DOMNODE,  
    value      in      SYS.UTL_BINARYOUTPUTSTREAM);
```

## Parameters

**Table 208-67 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters**

| Parameter | Description        |
|-----------|--------------------|
| n         | DOMNODE            |
| value     | BINARYOUTPUTSTREAM |

## 208.7.47 GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTEROUTPUTSTREAM);
```

### Parameters

**Table 208-68 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| n         | DOMNODE               |
| value     | CHARACTEROUTPUTSTREAM |

## 208.7.48 GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

**See Also:**

[DOMEntity Subprograms](#)

### Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME (
    ent      IN      DOMENTITY)
RETURN VARCHAR2;
```

## Parameters

**Table 208-69** GETNOTATIONNAME Function Parameters

| Parameter | Description |
|-----------|-------------|
| ent       | DOMENTITY   |

## 208.7.49 GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

### See Also:

[DOMDocumentType Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETNOTATIONS(  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN DOMNAMEDNODEMAP;
```

## Parameters

**Table 208-70** GETNOTATIONS Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| dt        | DOMDOCUMENTTYPE |

## 208.7.50 GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

### See Also:

[DOMProcessingInstruction Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETTARGET(  
    pi          IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

## Parameters

**Table 208-71** GETTARGET Function Parameters

| Parameter | Description              |
|-----------|--------------------------|
| pi        | DOMPROCESSINGINSTRUCTION |

## 208.7.51 GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is `NULL`.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENT;
```

## Parameters

**Table 208-72** GETOWNERDOCUMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.52 GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

### See Also:

[DOMAttr Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT (  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

## Parameters

**Table 208-73** GETOWNERELEMENT Function Parameters

| Parameter | Description |
|-----------|-------------|
| a         | Attribute   |

## 208.7.53 GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETPARENTNODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

## Parameters

**Table 208-74** GETPARENTNODE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.54 GETPREFIX Function

This function retrieves the namespace prefix of the node.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETPREFIX (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

## Parameters

**Table 208-75 GETPREFIX Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.55 GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING(  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

## Parameters

**Table 208-76 GETPREVIOUSIBLING Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.56 GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

## Syntax

Returns the public identifier of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(  
    ent         IN      DOMENTITY)  
RETURN VARCHAR2;
```

Returns the public identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETPUBLICID(  
    n          IN      DOMNOTATION)  
RETURN VARCHAR2;
```

### Parameters

**Table 208-77** GETPUBLICID Function Parameters

| Parameter | Description |
|-----------|-------------|
| dt        | The DTD     |
| ent       | DOMENTITY   |
| n         | DOMNOTATION |

## 208.7.57 GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the qualified name of the `DOMATTR` (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Returns the qualified name of the `DOMElement` (See Also: [DOMElement Subprograms](#)):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(  
    elem       IN      DOMELEMENT)  
RETURN VARCHAR2;
```

### Parameters

**Table 208-78** GETQUALIFIEDNAME Functions Parameters

| Parameter | Description |
|-----------|-------------|
| a         | DOMATTR     |
| elem      | DOMELEMENT  |

## 208.7.58 GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETSCHEMANODE (
    n          IN      DOMNODE)
RETURN DOMNODE;
```

## Parameters

**Table 208-79 GETSCHEMANODE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.59 GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

### See Also:

[DOMAttr Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETSPECIFIED (
    a          IN      DOMATTR)
RETURN BOOLEAN;
```

## Parameters

**Table 208-80 GETSPECIFIED Function Parameters**

| Parameter | Description |
|-----------|-------------|
| a         | DOMATTR     |

## 208.7.60 GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETSTANDALONE (
    doc        IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

## Parameters

**Table 208-81 GETSTANDALONE Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| doc       | DOMDOCUMENT. |

## 208.7.61 GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the system id of the specified DTD (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMENTITY` (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(  
    ent        IN      DOMENTITY)  
RETURN VARCHAR2;
```

Returns the system identifier of the `DOMNOTATION` (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.GETSYSTEMID(  
    n          IN      DOMNOTATION)  
RETURN VARCHAR2;
```

## Parameters

**Table 208-82 GETSYSTEMID Function Parameters**

| Parameter | Description  |
|-----------|--------------|
| dt        | The DTD.     |
| ent       | DOMEntity.   |
| n         | DOMNotation. |

## 208.7.62 GETTAGNAME Function

This function returns the name of the `DOMELEMENT`.

**See Also:**

[DOMElement Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETTAGNAME (
    elem      IN      DOMELEMENT)
RETURN VARCHAR2;
```

## Parameters

**Table 208-83 GETTAGNAME Function Parameters**

| Parameter | Description    |
|-----------|----------------|
| elem      | The DOMELEMENT |

## 208.7.63 GETVALUE Function

This function retrieves the value of the attribute.

**See Also:**

[DOMAttr Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETVALUE (
    a      IN      DOMATTR)
RETURN VARCHAR2;
```

## Parameters

**Table 208-84 GETVALUE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| a         | DOMATTR     |

## 208.7.64 GETVERSION Function

This function returns the version of the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETVERSION (
    doc      IN      DOMDOCUMENT)
RETURN VARCHAR2;
```

## Parameters

**Table 208-85 GETVERSION Function Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.65 GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.GETXMLTYPE (  
    doc      IN      DOMDOCUMENT)  
RETURN SYS.XMLTYPE;
```

## Parameters

**Table 208-86 GETXMLTYPE Function Parameters**

| Parameter | Description |
|-----------|-------------|
| doc       | DOMDOCUMENT |

## 208.7.66 HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

### See Also:

[DOMElement Subprograms](#)

## Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE (  
    elem      IN  DOMELEMENT,  
    name      IN  VARCHAR2)  
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(  
    elem    IN  DOMELEMENT,  
    name    IN  VARCHAR2,  
    ns      IN  VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 208-87 HASATTRIBUTE Function Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| elem      | The DOMELEMENT                          |
| name      | Attribute name; * matches any attribute |
| ns        | Namespace                               |

## 208.7.67 HASATTRIBUTES Function

This function returns whether this node has any attributes.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(  
    n      IN  DOMNODE)  
RETURN BOOLEAN;
```

### Parameters

**Table 208-88 HASATTRIBUTES Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNode     |

## 208.7.68 HASCHILDNODES Function

This function determines whether this node has any children.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASCHILDNODES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

### Parameters

**Table 208-89 HASCHILDNODES Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.69 HASFEATURE Function

This function tests if the `DOMIMPLEMENTATION` implements a specific feature.

**See Also:**

[DOMImplementation Subprograms](#)

### Syntax

```
DBMS_XMLDOM.HASFEATURE (  
    di          IN      DOMIMPLEMENTATION,  
    feature     IN      VARCHAR2,  
    version     IN      VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 208-90 HASFEATURE Function Parameters**

| Parameter | Description                        |
|-----------|------------------------------------|
| di        | DOMIMPLEMENTATION                  |
| feature   | The feature to check for           |
| version   | The version of the DOM to check in |

## 208.7.70 IMPORTNODE Function

This function imports a node from an external document and returns this new node.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.IMPORTNODE (  
    doc          IN  DOMDOCUMENT,  
    importedNode IN  DOMNODE,  
    deep         IN  BOOLEAN)  
RETURN DOMNODE;
```

## Parameters

**Table 208-91** IMPORTNODE Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| doc          | Document from which the node is imported                                                                                                                                                                                                                 |
| importedNode | Node to import                                                                                                                                                                                                                                           |
| deep         | Setting for recursive import. <ul style="list-style-type: none"><li>If this value is <b>TRUE</b>, the entire subtree of the node will be imported with the node.</li><li>If this value is <b>FALSE</b>, only the node itself will be imported.</li></ul> |

## Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

## 208.7.71 INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.INSERTBEFORE (  
    n          IN  DOMNODE,  
    newchild   IN  DOMNODE,  
    refchild   IN  DOMNODE)  
RETURN DOMNode;
```

## Parameters

**Table 208-92** INSERTBEFORE Function Parameters

| Parameter | Description |
|-----------|-------------|
| n         | DOMNode     |

**Table 208-92 (Cont.) INSERTBEFORE Function Parameters**

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| newChild  | The child to be inserted in the DOMNODE                        |
| refChild  | The reference node before which the newchild is to be inserted |

## 208.7.72 INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

### See Also:

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.INSERTDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset      IN      NUMBER,  
    arg         IN      VARCHAR2);
```

### Parameters

**Table 208-93 INSERTDATA Procedure Parameters**

| Parameter | Description                            |
|-----------|----------------------------------------|
| cd        | DOMCHARACTERDATA                       |
| offset    | The offset at which to insert the data |
| arg       | The value to be inserted               |

## 208.7.73 ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMAttr Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (  
    a          IN      DOMATTR)  
RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCDATASection Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    cds      IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    cd       IN      DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    com      IN      DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    doc      IN      DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    df       IN      DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    dt       IN      DOMDOCUMENTTYPE)
RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMELEMENT Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    elem     IN      DOMELEMENT)
RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    ent      IN      DOMENTITY)
RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    EREF     IN      DOMENTITYREFERENCE)
RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    di          IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nnm         IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    nl          IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    n           IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    pi          IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.ISNULL (
    t           IN      DOMTEXT)
RETURN BOOLEAN;
```

## Parameters

**Table 208-94 ISNULL Function Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| n         | DOMNODE to check             |
| a         | DOMATTR to check             |
| cds       | DOMCDATASECTION to check     |
| cd        | DOMCHARACTERDATA to check    |
| com       | DOMCOMMENT to check          |
| doc       | DOMDOCUMENT to check         |
| dF        | DOMDOCUMENTFRAGMENT to check |
| dt        | DOMDOCUMENTTYPE to check     |
| elem      | DOMELEMENT to check          |

**Table 208-94 (Cont.) ISNULL Function Parameters**

| Parameter | Description                       |
|-----------|-----------------------------------|
| ent       | DOMENTITY to check                |
| eref      | DOMENTITYREFERENCE to check       |
| di        | DOMIMPLEMENTATION to check        |
| nnm       | DOMNAMENODEMAP to check           |
| nl        | DOMNODELIST to check              |
| n         | DOMNOTATION to check              |
| pi        | DOMPROCESSINGINSTRUCTION to check |
| t         | DOMTEXT to check                  |

## 208.7.74 ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: [DOMNamedNodeMap Subprograms](#)):

```
DBMS_XMLDOM.ITEM(  
    nnm      IN      DOMNAMEDNODEMAP,  
    index    IN      NUMBER)  
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: [DOMNodeList Subprograms](#)):

```
DBMS_XMLDOM.ITEM(  
    nl      IN      DOMNODELIST,  
    index   IN      NUMBER)  
RETURN DOMNODE;
```

### Parameters

**Table 208-95 ITEM Function Parameters**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| nnm       | DOMNAMEDNODEMAP                                                  |
| index     | The index in the node map at which the item is to be retrieved   |
| nl        | DOMNODELIST                                                      |
| index     | The index in the <code>NodeList</code> used to retrieve the item |

## 208.7.75 MAKEATTR Function

This function casts a specified `DOMNODE` to a `DOMATTR`, and returns the `DOMATTR`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEATTR (  
    n          IN      DOMNODE)  
RETURN DOMATTR;
```

### Parameters

**Table 208-96** MAKEATTR Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.76 MAKECDATASECTION Function

This function casts a specified `DOMNODE` to a `DOMCDATASECTION`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKECDATASECTION (  
    n          IN      DOMNODE)  
RETURN DOMCDATASECTION;
```

### Parameters

**Table 208-97** MAKECDATASECTION Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.77 MAKECHARACTERDATA Function

This function casts a specified `DOMNODE` to a `DOMCHARACTERDATA`, and returns the `DOMCHARACTERDATA`.

**See Also:**

[DOMNode Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.MAKECHARACTERDATA (  
    n          IN      DOMNode)  
RETURN DOMCharacterData;
```

**Parameters**

**Table 208-98    MAKECHARACTERDATA Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.78 MAKECOMMENT Function

This function casts a specified `DOMNODE` to a `DOMCOMMENT`, and returns the `DOMCOMMENT`.

**See Also:**

[DOMNode Subprograms](#)

**Syntax**

```
DBMS_XMLDOM.MAKECOMMENT (  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

**Parameters**

**Table 208-99    MAKECOMMENT Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

# 208.7.79 MAKEDOCUMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENT`, and returns the `DOMDOCUMENT`.

 **See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDocument;
```

## Parameters

Table 208-100 MAKEDOCUMENT Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

# 208.7.80 MAKEDOCUMENTFRAGMENT Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTFRAGMENT`, and returns the `DOMDOCUMENTFRAGMENT`.

 **See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;
```

## Parameters

Table 208-101 MAKEDOCUMENTFRAGMENT Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.81 MAKEDOCUMENTTYPE Function

This function casts a specified `DOMNODE` to a `DOMDOCUMENTTYPE` and returns the `DOMDOCUMENTTYPE`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

### Parameters

**Table 208-102 MAKEDOCUMENTTYPE Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| n         | DOMNODE to cast. |

## 208.7.82 MAKEELEMENT Function

This function casts a specified `DOMNODE` to a `DOMELEMENT`, and returns the `DOMELEMENT`.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEELEMENT (  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

### Parameters

**Table 208-103 MAKEELEMENT Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.83 MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEENTITY (  
    n          IN      DOMNODE)  
RETURN DOMENTITY;
```

### Parameters

**Table 208-104** MAKEENTITY Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.84 MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE (  
    n          IN      DOMNODE)  
RETURN DOMENTITYREFERENCE;
```

### Parameters

**Table 208-105** MAKEENTITYREFERENCE Function Parameters

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.85 MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

**Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: [DOMAttr Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    a          IN      DOMATTR)
RETURN DOMNODE;
```

**Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: [DOMCDATASection Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    cds        IN      DOMCDATASECTION)
RETURN DOMNODE;
```

**Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: [DOMCharacterData Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    cd         IN      DOMCHARACTERDATA)
RETURN DOMNODE;
```

**Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMComment Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    com        IN      DOMCOMMENT)
RETURN DOMNODE;
```

**Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocument Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    doc        IN      DOMDOCUMENT)
RETURN DOMNODE;
```

**Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentFragment Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    df         IN      DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

**Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: [DOMDocumentType Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    dt         IN      DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

**Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: [DOMELEMENT Subprograms](#)):**

```
DBMS_XMLDOM.MAKENODE (
    elem      IN      DOMELEMENT)
RETURN DOMNODE;
```

**Cast**s specified **DOMENTITY** to a **DOMNODE**, and returns that **DOMNODE** (See Also: [DOMEntity Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

**Cast**s the **DOMENTITYREFERENCE** to a **DOMNODE**, and returns that **DOMNODE** (See Also: [DOMEntityReference Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

**Cast**s the **DOMNOTATION** to a **DOMNODE**, and returns that **DOMNODE** (See Also: [DOMNotation Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    n        IN      DOMNOTATION)
RETURN DOMNODE;
```

**Cast**s the **DOMPROCESSINGINSTRUCTION** to a **DOMNODE**, and returns the **DOMNODE** (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    pi       IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

**Cast**s the **DOMTEXT** to a **DOMNODE**, and returns that **DOMNODE** (See Also: [DOMText Subprograms](#)):

```
DBMS_XMLDOM.MAKENODE (
    t        IN      DOMTEXT)
RETURN DOMNODE;
```

## Parameters

**Table 208-106**    **MAKENODE Function Parameters**

| Parameter | Description                 |
|-----------|-----------------------------|
| a         | DOMATTR to cast             |
| cds       | DOMCDATASECTION to cast     |
| cd        | DOMCHARACTERDATA to cast    |
| com       | DOMCOMMENT to cast          |
| doc       | DOMDOCUMENT to cast         |
| df        | DOMDOCUMENTFRAGMENT to cast |
| dt        | DOMDOCUMENTTYPE to cast     |
| elem      | DOMELEMENT to cast          |
| ent       | DOMENTITY to cast           |
| eref      | DOMENTITYREFERENCE to cast  |
| n         | DOMNOTATION to cast         |

**Table 208-106 (Cont.) MAKENODE Function Parameters**

| Parameter | Description                      |
|-----------|----------------------------------|
| pi        | DOMPROCESSINGINSTRUCTION to cast |
| t         | DOMTEXT to cast                  |

## 208.7.86 MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKENOTATION (
    n          IN      DOMNODE)
RETURN DOMNOTATION;
```

### Parameters

**Table 208-107 MAKENOTATION Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.87 MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION (
    n          IN      DOMNODE)
RETURN DOMPROCESSINGINSTRUCTION;
```

## Parameters

**Table 208-108 MAKEPROCESSINGINSTRUCTION Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.88 MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.MAKETEXT (  
    n          IN      DOMNODE)  
RETURN DOMTEXT;
```

## Parameters

**Table 208-109 MAKETEXT Function Parameters**

| Parameter | Description     |
|-----------|-----------------|
| n         | DOMNODE to cast |

## 208.7.89 NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

### See Also:

[DOMDocument Subprograms](#)

## Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT  
RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (  
    xmldoc      IN SYS.XMLTYPE)  
RETURN DOMDOCUMENT;
```

Returns a new `DOMDOCUMENT` instance created from the specified `CLOB`:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (  
    cl          IN    CLOB)  
RETURN DOMDOCUMENT;
```

#### Parameters

**Table 208-110** NEWDOMDOCUMENT Function Parameters

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| xmlDoc    | XMLType source for the <code>DOMDOCUMENT</code> |
| cl        | CLOB source for the <code>DOMDOCUMENT</code>    |

## 208.7.90 NORMALIZE Procedure

This procedure normalizes the text children of the `DOMELEMENT`.

#### See Also:

[DOMElement Subprograms](#)

#### Syntax

```
DBMS_XMLDOM.NORMALIZE (  
    elem          IN    DOMELEMENT);
```

#### Parameters

**Table 208-111** NORMALIZE Procedure Parameters

| Parameter | Description                 |
|-----------|-----------------------------|
| elem      | The <code>DOMELEMENT</code> |

## 208.7.91 REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the `DOMELEMENT` by name.

#### See Also:

[DOMElement Subprograms](#)

#### Syntax

Removes the value of a `DOMELEMENT`'s attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE (  
    elem          IN    DOMELEMENT,  
    name          IN    VARCHAR2);
```

Removes the value of a `DOMELEMENT`'s attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2) ;
```

### Parameters

**Table 208-112 REMOVEATTRIBUTE Procedure Parameters**

| Parameter | Description                 |
|-----------|-----------------------------|
| elem      | The <code>DOMELEMENT</code> |
| name      | Attribute name              |
| ns        | Namespace                   |

## 208.7.92 REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the `DOMELEMENT`. The method returns the removed node.

### See Also:

[DOMElement Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE (  
    elem      IN      DOMELEMENT,  
    oldAttr   IN      DOMATTR)  
RETURN DOMAttr;
```

### Parameters

**Table 208-113 REMOVEATTRIBUTENODE Function Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| elem      | The <code>DOMELEMENT</code> .  |
| oldAttr   | The old <code>DOMATTR</code> . |

## 208.7.93 REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

**See Also:**

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REMOVECHILD(  
    n            IN      DOMNode,  
    oldchild    IN      DOMNode)  
RETURN DOMNode;
```

### Parameters

**Table 208-114 REMOVECHILD Function Parameters**

| Parameter             | Description                                        |
|-----------------------|----------------------------------------------------|
| <code>n</code>        | DOMNode                                            |
| <code>oldChild</code> | The child of the node <code>n</code> to be removed |

## 208.7.94 REMOVENAMEDITEM Function

This function removes a node, specified by name, from the map and returns this node.

When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

**See Also:**

[DOMNamedNodeMap Subprograms](#)

### Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(  
    nnm        IN      DOMNamedNodeMap,  
    name       IN      VARCHAR2)  
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(  
    nnm        IN      DOMNamedNodeMap,  
    name       IN      VARCHAR2,
```

```
    ns          IN      VARCHAR2)  
RETURN DOMNode;
```

### Parameters

**Table 208-115** REMOVENAMEDITEM Function Parameters

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| nnm       | DOMNamedNodeMap                                 |
| name      | The name of the item to be removed from the map |
| ns        | Namespace                                       |

## 208.7.95 REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node.

If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REPLACECHILD(  
    n          IN      DOMNode,  
    newchild   IN      DOMNode,  
    oldchild   IN      DOMNode)  
RETURN DOMNode;
```

### Parameters

**Table 208-116** REPLACECHILD Function Parameters

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| n         | DOMNode                                         |
| newchild  | The new child which is to replace the old child |
| oldchild  | The child of the node n which is to be replaced |

## 208.7.96 REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

**See Also:**

[DOMCharacterData Subprograms](#)

### Syntax

```
DBMS_XMLDOM.REPLACEDATA (  
    cd          IN      DOMCHARACTERDATA,  
    offset      IN      NUMBER,  
    cnt         IN      NUMBER,  
    arg         IN      VARCHAR2);
```

### Parameters

**Table 208-117 REPLACEDATA Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| cd        | DOMCHARACTERDATA                    |
| offset    | The offset at which to replace      |
| cnt       | The number of characters to replace |
| arg       | The value to replace with           |

## 208.7.97 RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

**See Also:**

[DOMElement Subprograms](#)

### Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX (  
    elem      IN      DOMELEMENT,  
    prefix    IN      VARCHAR2)  
RETURN VARCHAR2;
```

## Parameters

**Table 208-118 RESOLVENAMESPACEPREFIX Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| elem      | The DOMELEMENT   |
| prefix    | Namespace prefix |

## 208.7.98 SETATTRIBUTE Procedures

This procedure sets the value of a DOMELEMENT's attribute by name.

**See Also:**

[DOMELEMENT Subprograms](#)

### Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(  
    elem      IN  DOMELEMENT,  
    name      IN  VARCHAR2,  
    newvalue  IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(  
    elem      IN  DOMELEMENT,  
    name      IN  VARCHAR2,  
    newvalue  IN  VARCHAR2,  
    ns        IN  VARCHAR2);
```

## Parameters

**Table 208-119 SETATTRIBUTE Procedure Parameters**

| Parameter | Description     |
|-----------|-----------------|
| elem      | The DOMELEMENT  |
| name      | Attribute name  |
| newvalue  | Attribute value |
| ns        | Namespace       |

## 208.7.99 SETATTRIBUTENODE Functions

This function adds a new attribute node to the `DOMELEMENT`.

**See Also:**

[DOMElement Subprograms](#)

### Syntax

Adds a new attribute node to the `DOMELEMENT`:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the `DOMElement`; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
    elem      IN  DOMELEMENT,
    newAttr   IN  DOMATTR,
    ns        IN  VARCHAR2)
RETURN DOMATTR;
```

### Parameters

**Table 208-120 SETATTRIBUTENODE Function Parameters**

| Parameter            | Description                  |
|----------------------|------------------------------|
| <code>elem</code>    | The <code>DOMELEMENT</code>  |
| <code>newAttr</code> | The new <code>DOMATTR</code> |
| <code>ns</code>      | The namespace                |

## 208.7.100 SETCHARSET Procedure

This function sets the character set of the DOM document.

**See Also:**

[DOMDocument Subprograms](#)

### Syntax

```
DBMS_XMLDOM.SETCHARSET (
    doc      IN  DOMDocument,
    charset  IN  VARCHAR2);
```

## Parameters

**Table 208-121 SETCHARSET Procedure Parameters**

| Parameter | Description   |
|-----------|---------------|
| doc       | DOM document  |
| charset   | Character set |

## Usage Notes

This is used for [WRITETOFILE Procedures](#) if not explicitly specified at that time.

## 208.7.101 SETDATA Procedures

This overloaded procedure sets character data or `DOMPROCESSINGINSTRUCTION` content data. The specific functionality is described in the syntax declarations.

### Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (  
    cd          IN      DOMCHARACTERDATA,  
    data        IN      VARCHAR2);
```

Sets the content data of the `DOMPROCESSINGINSTRUCTION` (See Also: [DOMProcessingInstruction Subprograms](#)):

```
DBMS_XMLDOM.SETDATA (  
    pi          IN      DOMPROCESSINGINSTRUCTION,  
    data        IN      VARCHAR2);
```

## Parameters

**Table 208-122 SETDATA Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| cd        | DOMCHARACTERDATA                        |
| data      | The data to which the node is set       |
| pi        | DOMPROCESSINGINSTRUCTION                |
| data      | New processing instruction content data |

## 208.7.102 SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document.

This DTD can later be retrieved using the [GETDOCTYPE Function](#).

## Syntax

```
DBMS_XMLDOM.SETDOCTYPE (  
    doc      IN    DOMDocument,  
    name     IN    VARCHAR2,  
    sysid    IN    VARCHAR2,  
    pubid    IN    VARCHAR2);
```

## Parameters

**Table 208-123 SETDOCTYPE Procedure Parameters**

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| doc       | The document whose DTD has to be set                        |
| name      | The name that the doctype needs to be initialized with      |
| sysid     | The system ID that the doctype needs to be initialized with |
| pubid     | The public ID that the doctype needs to be initialized with |

## 208.7.103 SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute.

If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

### See Also:

[DOMNamedNodeMap Subprograms](#)

## Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(  
    nnm      IN    DOMNAMEDNODEMAP,  
    arg      IN    DOMNODE)  
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(  
    nnm      IN    DOMNAMEDNODEMAP,  
    arg      IN    DOMNODE,  
    ns       IN    VARCHAR2)  
RETURN DOMNode;
```

## Parameters

**Table 208-124 SETNAMEDITEM Function Parameters**

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| nnm       | DOMNAMEDNODEMAP                                   |
| arg       | The Node to be added using its nodeName attribute |
| ns        | Namespace                                         |

## 208.7.104 SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

### See Also:

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SETNODEVALUE (  
    n          IN      DOMNODE,  
    nodeValue IN      VARCHAR2);
```

## Parameters

**Table 208-125 SETNODEVALUE Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| n         | DOMNode                        |
| nodeValue | The value to which node is set |

## 208.7.105 SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

### See Also:

[DOMNode Subprograms](#)

## Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The datatype of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The datatype of the node must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n          in      DOMNODE,
    value      in      SYS.UTL_BINARYINPUTSTREAM);
```

### Parameters

**Table 208-126 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters**

| Parameter | Description       |
|-----------|-------------------|
| n         | DOMNODE           |
| value     | BINARYINPUTSTREAM |

## 208.7.106 SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described in the syntax section.

### See Also:

[DOMNode Subprograms](#)

### Syntax

This function returns an instance of the PL/SQL `XMLCHARACTEROUTPUTSTREAM` type into which the caller can write the node value. The datatype of the node can be any valid XDB datatype. If the type is not character or `CLOB`, the character data written to the stream is converted to the node datatype. If the datatype of the node is character or `CLOB`, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `SYS.UTL_CHARACTERINPUTSTREAM` from which XDB reads to populate the node. The datatype of the node may be any valid type supported by XDB. If a non-character datatype, the character data read from the stream is converted to the datatype of the node. If the datatype of the node is either character or `CLOB`, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTERINPUTSTREAM);
```

## Parameters

**Table 208-127 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters**

| Parameter | Description          |
|-----------|----------------------|
| n         | DOMNODE              |
| value     | CHARACTERINPUTSTREAM |

## 208.7.107 SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

**See Also:**

[DOMNode Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SETPREFIX(  
    n          IN      DOMNODE,  
    prefix     IN      VARCHAR2);
```

## Parameters

**Table 208-128 SETPREFIX Procedure Parameters**

| Parameter | Description                                    |
|-----------|------------------------------------------------|
| n         | DOMNODE                                        |
| prefix    | The value for the namespace prefix of the node |

## 208.7.108 SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SETSTANDALONE(  
    doc          IN      DOMDOCUMENT,  
    newvalue     IN      VARCHAR2);
```

## Parameters

**Table 208-129 SETSTANDALONE Procedure Parameters**

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| doc       | DOMDOCUMENT                                      |
| newvalue  | Value of the standalone property of the document |

## 208.7.109 SETVALUE Procedure

This procedure sets the value of the attribute.

**See Also:**

[DOMAttr Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SETVALUE (
    a          IN      DOMATTR,
    value      IN      VARCHAR2);
```

## Parameters

**Table 208-130 SETVALUE Procedure Parameters**

| Parameter | Description                             |
|-----------|-----------------------------------------|
| a         | DOMATTR                                 |
| value     | The value to which to set the attribute |

## 208.7.110 SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

**See Also:**

[DOMDocument Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SETVERSION (
    doc        IN      DOMDOCUMENT,
    version    IN      VARCHAR2);
```

## Parameters

**Table 208-131 SETVERSION Procedure Parameters**

| Parameter | Description                 |
|-----------|-----------------------------|
| doc       | DOMDOCUMENT                 |
| version   | The version of the document |

## 208.7.111 SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

**See Also:**

[DBMS\\_XMLDOM DOMText Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SPLITTEXT(  
    t          IN      DOMTEXT,  
    offset     IN      NUMBER)  
RETURN DOMText;
```

## Parameters

**Table 208-132 SPLITTEXT Function Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| t         | DOMTEXT                  |
| offset    | Offset at which to split |

## 208.7.112 SUBSTRINGDATA Function

This function extracts a range of data from the node.

**See Also:**

[DOMCharacterData Subprograms](#)

## Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(  
    cd          IN      DOMCHARACTERDATA,  
    offset      IN      NUMBER,
```

```
    cnt      IN      NUMBER)
RETURN VARCHAR2;
```

### Parameters

**Table 208-133 SUBSTRINGDATA Function Parameters**

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| cd        | DOMCHARACTERDATA                                              |
| offset    | The starting offset of the data from which to get the data    |
| cnt       | The number of characters (from the offset) of the data to get |

## 208.7.113 USEBINARYSTREAM Function

This function returns `TRUE` if the datatype of the node is `RAW` or `BLOB`, so that the node value may be read or written using an `UTL_BINARYINPUTSTREAM` or `UTL_BINARYOUTPUTSTREAM`.

If a value of `FALSE` is returned, the node value may only be accessed through an `UTL_CHARACTERINPUTSTREAM` or `UTL_CHARACTEROUTPUTSTREAM`.

### See Also:

[DOMNode Subprograms](#)

### Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM  (
    n      IN      DOMNODE)
RETURN BOOLEAN;
```

### Parameters

**Table 208-134 USEBINARYSTREAM Function Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

## 208.7.114 WRITETOBUFFER Procedures

`WRITETOBUFFER` is an overloaded procedure that writes an XML node, XML document, or a document fragment to a specified buffer.

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER(  
    n          IN          DOMNODE,  
    buffer     IN OUT     VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER(  
    doc        IN          DOMDOCUMENT,  
    buffer     IN OUT     VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#)):

```
DBMS_XMLDOM.WRITETOBUFFER(  
    df         IN          DOMDOCUMENTFRAGMENT,  
    buffer     IN OUT     VARCHAR2);
```

**Parameters**

**Table 208-135 WRITETOBUFFER Procedure Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| n         | DOMNODE                  |
| buffer    | Buffer to which to write |
| doc       | DOMDOCUMENT              |
| df        | DOM document fragment    |

## 208.7.115 WRITETOCLOB Procedures

WRITETOCLOB is an overloaded procedure that writes an XML node or document to a specified CLOB.

The specific forms of functionality are described along with the syntax declarations.

**Syntax**

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB(  
    n          IN          DOMNODE,  
    cl         IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOCLOB(  
    doc        IN          DOMDOCUMENT,  
    cl         IN OUT     CLOB);
```

## Parameters

**Table 208-136 WRITETOCLOB Procedure Parameters**

| Parameter | Description            |
|-----------|------------------------|
| n         | DOMNODE                |
| cl        | CLOB to which to write |
| doc       | DOMDOCUMENT            |

## 208.7.116 WRITETOFILE Procedures

This overloaded procedure writes an XML node or XML document to a specified node.

The specific forms of functionality are described along with the syntax declarations.

### Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (  
    n            IN      DOMNODE,  
    fileName     IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (  
    n            IN      DOMNODE,  
    fileName     IN      VARCHAR2,  
    charset      IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (  
    doc          IN      DOMDOCUMENT,  
    filename     IN      VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (  
    doc          IN      DOMDOCUMENT,  
    fileName     IN      VARCHAR2,  
    charset      IN      VARCHAR2);
```

## Parameters

**Table 208-137 WRITETOFILE Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| n         | DOMNODE     |

**Table 208-137 (Cont.) WRITETOFILE Procedure Parameters**

| Parameter | Description                                                                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fileName  | File to which to write. The filename should be in the format of database_directory_object_name/filename, for example mydir/filename (on windows, use \ instead of /). |
| charset   | specified character set                                                                                                                                               |
| doc       | DOMDOCUMENT                                                                                                                                                           |
| charset   | Character set                                                                                                                                                         |

# DBMS\_XMLGEN

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format.

The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Security Model](#)
- [Summary of DBMS\\_XMLGEN Subprograms](#)

**See Also:**

*Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`

## 209.1 DBMS\_XMLGEN Security Model

Owned by `XDB`, the `DBMS_XMLGEN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 209.2 Summary of DBMS\_XMLGEN Subprograms

This table lists the `DBMS_XMLGEN` subprograms and briefly describes them.

**Table 209-1 Summary of DBMS\_XMLGEN Package Subprograms**

| Subprogram                                       | Description                                                                                                                                           |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLOSECONTEXT Procedure</a>           | Closes the context and releases all resources                                                                                                         |
| <a href="#">CONVERT Functions</a>                | Converts the XML into the escaped or unescaped XML equivalent                                                                                         |
| <a href="#">GETNUMROWSPROCESSED Function</a>     | Gets the number of SQL rows that were processed in the last call to <a href="#">GETXML Functions</a>                                                  |
| <a href="#">GETXML Functions</a>                 | Gets the XML document                                                                                                                                 |
| <a href="#">GETXMLTYPE Functions</a>             | Gets the XML document and returns it as <code>XMLType</code>                                                                                          |
| <a href="#">NEWCONTEXT Functions</a>             | Creates a new context handle                                                                                                                          |
| <a href="#">NEWCONTEXTFROMHIERARCHY Function</a> | Obtains a handle to use in the <a href="#">GETXML Functions</a> and other functions to get a hierarchical XML with recursive elements from the result |
| <a href="#">RESTARTQUERY Procedure</a>           | Restarts the query to start fetching from the beginning                                                                                               |

**Table 209-1 (Cont.) Summary of DBMS\_XMLGEN Package Subprograms**

| Subprogram                                          | Description                                                                                                                                         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SETCONVERTSPECIALCHARS Procedure</a>    | Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation                |
| <a href="#">SETMAXROWS Procedure</a>                | Sets the maximum number of rows to be fetched each time                                                                                             |
| <a href="#">SETNULLHANDLING Procedure</a>           | Sets NULL handling options                                                                                                                          |
| <a href="#">SETROWSETTAG Procedure</a>              | Sets the name of the element enclosing the entire result                                                                                            |
| <a href="#">SETROWTAG Procedure</a>                 | Sets the name of the element enclosing each row of the result                                                                                       |
| <a href="#">SETSKIPROWS Procedure</a>               | Sets the number of rows to skip every time before generating the XML.                                                                               |
| <a href="#">USEITEMTAGSFORCOLL Procedure</a>        | Forces the use of the collection column name appended with the tag _ITEM for collection elements                                                    |
| <a href="#">USENULLATTRIBUTEINDICATOR Procedure</a> | Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. |

## 209.2.1 CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

### Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (  
    ctx IN ctxHandle);
```

### Parameters

**Table 209-2 CLOSECONTEXT Procedure Parameters**

| Parameter | Description                  |
|-----------|------------------------------|
| ctx       | The context handle to close. |

## 209.2.2 CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

### Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (  
    xmlData IN VARCHAR2,  
    flag IN NUMBER := ENTITY_ENCODE)  
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

### Parameters

**Table 209-3 CONVERT Function Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| xmlData   | The XML CLOB data to be encoded or decoded.                                         |
| flag      | The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode. |

### Usage Notes

This function escapes the XML data if the ENTITY\_ENCODE is specified. For example, the escaped form of the character < is &lt;. Unescaping is the reverse transformation.

## 209.2.3 GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML.

Note that GETXML Functions always generates an XML document, even if there are no rows present.

### Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
    ctx    IN    ctxHandle)
RETURN NUMBER;
```

### Parameters

**Table 209-4 GETNUMROWSPROCESSED Function Parameters**

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| ctx       | The context handle obtained from the NEWCONTEXT Functions call. |

### Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

### Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

# 209.2.4 GETXML Functions

This function gets the XML document. The function is overloaded.

## Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    tmpclob      IN OUT NCOPY CLOB,
    dtdOrSchema  IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

## Parameters

**Table 209-5** GETXML Function Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| ctx         | The context handle obtained from the <code>newContext</code> call. |
| tmpclob     | The CLOB to which the XML document is appended.                    |
| sqlQuery    | The SQL query string.                                              |
| dtdOrSchema | Generate a DTD or a schema? Only <code>NONE</code> is supported.   |

## Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

## 209.2.5 GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results. This function is overloaded.

### Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (  
    ctx             IN ctxhandle,  
    dtdOrSchema     IN number := NONE)  
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (  
    sqlQuery        IN VARCHAR2,  
    dtdOrSchema     IN number := NONE)  
RETURN sys.XMLType
```

### Parameters

**Table 209-6** GETXMLTYPE Function Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| ctx         | The context handle obtained from the <code>newContext</code> call. |
| sqlQuery    | The SQL query string.                                              |
| dtdOrSchema | Generate a DTD or a schema? Only <code>NONE</code> is supported.   |

## 209.2.6 NEWCONTEXT Functions

This function generates and returns a new context handle.

This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

### Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query           IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString     IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

## Parameters

**Table 209-7 NEWCONTEXT Function Parameters**

| Parameter   | Description                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------|
| query       | The query, in the form of a VARCHAR, the result of which must be converted to XML.                 |
| queryString | The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML. |

## 209.2.7 NEWCONTEXTFROMHIERARCHY Function

This function obtains a handle to use in the GETXML Functions and other functions to get a hierarchical XML with recursive elements from the result.

### Syntax

```
DBMS_XMLGEN.NEWCONTEXTFROMHIERARCHY (  
    queryString IN VARCHAR2)  
RETURN ctxHandle;
```

## Parameters

**Table 209-8 NEWCONTEXTFROMHIERARCHY Function Parameters**

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queryString | The query string, the result of which must be converted to XML. The query is a hierarchical query typically formed using a CONNECT BY clause, and the result must have the same property as the result set generated by a CONNECT BY query. The result set must have only two columns, the level number and an XML value. The level number is used to determine the hierarchical position of the XML value within the result XML document. |

### Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 209.2.8 RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row.

It can be used to start executing the query again, without having to create a new context.

### Syntax

```
DBMS_XMLGEN.RESTARTQUERY (  
    ctx IN ctxHandle);
```

## Parameters

**Table 209-9 RESTARTQUERY Procedure Parameters**

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| ctx       | The context handle corresponding to the current query. |

## 209.2.9 SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to &lt;.

The default is to perform conversions.

This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, ", ', which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

### Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (  
  ctx      IN ctxHandle,  
  conv     IN BOOLEAN);
```

## Parameters

**Table 209-10 SETCONVERTSPECIALCHARS Procedure Parameters**

| Parameter | Description                                                                            |
|-----------|----------------------------------------------------------------------------------------|
| ctx       | The context handle obtained from one of the <a href="#">NEWCONTEXT Functions</a> call. |
| conv      | TRUE indicates that conversion is needed.                                              |

## 209.2.10 SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the GETXML Functions call.

It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

### Syntax

```
DBMS_XMLGEN.SETMAXROWS (  
  ctx      IN ctxHandle,  
  maxRows  IN NUMBER);
```

## Parameters

**Table 209-11 SETMAXROWS Procedure Parameters**

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| ctx       | The context handle corresponding to the query executed.                             |
| maxRows   | The maximum number of rows to get for each call to <a href="#">GETXML Functions</a> |

## Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 209.2.11 SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

### Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(  
  ctx    IN ctx,  
  flag   IN NUMBER);
```

## Parameters

**Table 209-12 SETNULLHANDLING Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ctx       | The context handle corresponding to the query executed.                                                                                                                                                                                                                                                                                                                  |
| flag      | The NULL handling option set. <ul style="list-style-type: none"><li>• <code>DROP_NULLS</code> CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements.</li><li>• <code>NULL_ATTR</code> CONSTANT NUMBER:= 1; Sets <code>xsi:nil="true"</code>.</li><li>• <code>EMPTY_TAG</code> CONSTANT NUMBER:= 2; Sets, for example, <code>&lt;foo/&gt;</code>.</li></ul> |

## 209.2.12 SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

### Syntax

```
DBMS_XMLGEN.SETROWSETTAG (  
  ctx                IN ctxHandle,  
  rowSetTagName      IN VARCHAR2);
```

## Parameters

**Table 209-13 SETROWSETTAG Procedure Parameters**

| Parameter     | Description                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------|
| ctx           | The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call.                           |
| rowSetTagName | The name of the document element. Passing NULL indicates that you do not want the ROWSET element present. |

## Usage Notes

The user can set the `rowSetTag` to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## 209.2.13 SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

## Syntax

```
DBMS_XMLGEN.SETROWTAG (  
  ctx          IN ctxHandle,  
  rowTagName   IN VARCHAR2);
```

## Parameters

**Table 209-14 SETROWTAG Procedure Parameters**

| Parameter  | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
| ctx        | The context handle obtained from the <a href="#">NEWCONTEXT Functions</a> call.                   |
| rowTagName | The name of the ROW element. Passing NULL indicates that you do not want the ROW element present. |

## Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

## 209.2.14 SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility.

For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#).

### Syntax

```
DBMS_XMLGEN.SETSKIPROWS (  
  ctx          IN ctxHandle,  
  skipRows     IN NUMBER);
```

### Parameters

**Table 209-15 SETSKIPROWS Procedure Parameters**

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| ctx       | The context handle corresponding to the query executed.           |
| skipRows  | The number of rows to skip for each call to <code>getXML</code> . |

### Related Topics

- [GETXML Functions](#)  
This function gets the XML document. The function is overloaded.

## 209.2.15 USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

### Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (  
  ctx IN ctxHandle);
```

### Parameters

**Table 209-16 USEITEMTAGSFORCOLL Procedure Parameters**

| Parameter | Description         |
|-----------|---------------------|
| ctx       | The context handle. |

### Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

## 209.2.16 USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate `NULL`, or to do it by omitting the inclusion of the particular entity in the XML document.

It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

### Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR (  
  ctx          IN ctxType,  
  attrind      IN BOOLEAN := TRUE);
```

## Parameters

**Table 209-17 USENULLATTRIBUTEINDICATOR Procedure Parameters**

| Parameter | Description                     |
|-----------|---------------------------------|
| ctx       | Context handle.                 |
| attrind   | Use attribute to indicate NULL? |

# DBMS\_XMLINDEX

The `DBMS_XMLINDEX` package provides an interface to implement asynchronous indexing.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLINDEX Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide* for more information about "XMLIndex"

## 210.1 DBMS\_XMLINDEX Overview

`DBMS_XMLINDEX` provides a mechanism for asynchronous index maintenance.

### Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a more convenient time, for example when the load on the database is low. `DBMS_XMLINDEX` provides this mechanism.

## 210.2 DBMS\_XMLINDEX Security Model

Owned by `XDB`, the `DBMS_XMLINDEX` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

## 210.3 Summary of DBMS\_XMLINDEX Subprograms

This table lists the `DBMS_XMLINDEX` subprograms and briefly describes them.

**Table 210-1 DBMS\_XMLINDEX Package Subprograms**

| Subprogram                                  | Description                                                                                                                                         |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CREATEDATEINDEX Procedure</a>   | Creates a secondary index for date values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an XMLIndex   |
| <a href="#">CREATENUMBERINDEX Procedure</a> | Creates a secondary index for number values in the <code>VALUE</code> column of a <code>PATH TABLE</code> which is the storage table of an XMLIndex |

**Table 210-1 (Cont.) DBMS\_XMLINDEX Package Subprograms**

| Subprogram                                  | Description                                                                               |
|---------------------------------------------|-------------------------------------------------------------------------------------------|
| <a href="#">DROPPARAMETER Procedure</a>     | Drops the XMLIndex parameter string that is associated with a given parameter identifier. |
| <a href="#">MODIFYPARAMETER Procedure</a>   | Modifies the XMLIndex parameter string that is associated with a given parameter name     |
| <a href="#">PROCESS_PENDING Procedure</a>   | Processes pending rows for a NONBLOCKING ALTER INDEX OPERATION on an XMLIndex             |
| <a href="#">REGISTERPARAMETER Procedure</a> | Registers a parameter string and XMLIndex parameter string pair in XDB                    |
| <a href="#">SYNCINDEX Procedure</a>         | Synchronizes the index manually                                                           |

## 210.3.1 CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an XMLIndex. The second form of the procedure allows for the `date_index_clause` to be set to an empty string.

### Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
    xml_index_schema IN VARCHAR2,
    xml_index_name   IN VARCHAR2,
    date_index_name  IN VARCHAR2,
    xmltypename      IN VARCHAR2,
    date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
    xml_index_schema IN VARCHAR2,
    xml_index_name   IN VARCHAR2,
    date_index_name  IN VARCHAR2,
    xmltypename      IN VARCHAR2);
```

### Parameters

**Table 210-2 CREATEDATEINDEX Procedure Parameters**

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>xml_index_schema</code>  | Name of the owner of the XMLIndex                                                                                                                                                                                                                                                                                          |
| <code>xml_index_name</code>    | Name of the XMLIndex                                                                                                                                                                                                                                                                                                       |
| <code>date_index_name</code>   | Name of the secondary index to be created for date values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of XMLIndex named <code>xml_index_name</code> and owned by <code>xml_index_schema</code>                                                                                                         |
| <code>xmltypename</code>       | The type to which values in the <code>VALUE</code> column of the path table are to be cast. Acceptable values are the following strings: <code>DATETIME</code> , <code>TIME</code> , <code>DATE</code> , <code>GDAY</code> , <code>GMONTH</code> , <code>GYEAR</code> , <code>GYEARMONTH</code> , <code>GMONTHDAY</code> . |
| <code>date_index_clause</code> | Storage clause to be applied to the date index during its creation. This is a string argument appended to the <code>CREATE INDEX</code> statement for creating the date index                                                                                                                                              |

## 210.3.2 CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`.

### Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (  
    xml_index_schema    IN    VARCHAR2,  
    xml_index_name      IN    VARCHAR2,  
    num_index_name      IN    VARCHAR2,  
    num_index_clause    IN    VARCHAR2,  
    xmltypename         IN    VARCHAR2);
```

### Parameters

**Table 210-3    CREATENUMBERINDEX Procedure Parameters**

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>xml_index_schema</code> | Name of the owner of the <code>XMLIndex</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>xml_index_name</code>   | Name of the <code>XMLIndex</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>num_index_name</code>   | Name of the secondary index to be created for number values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of <code>XMLIndex</code> named <code>xml_index_name</code> and owned by <code>xml_index_schema</code>                                                                                                                                                                                                                                                                                                                                   |
| <code>num_index_clause</code> | Storage clause to be applied to the number index during its creation. This is a string argument appended to the <code>CREATE INDEX</code> statement for creating the number index.                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>xmltypename</code>      | The type to which values in the <code>VALUE</code> column of the path table are to be cast. Acceptable values are the following strings: <code>FLOAT</code> , <code>DOUBLE</code> , <code>DECIMAL</code> , <code>INTEGER</code> , <code>NONPOSITIVEINTEGER</code> , <code>NEGATIVEINTEGER</code> , <code>LONG</code> , <code>INT</code> , <code>SHORT</code> , <code>BYTE</code> , <code>NONNEGATIVEINTEGER</code> , <code>UNSIGNEDLONG</code> , <code>UNSIGNEDINT</code> , <code>UNSIGNEDSHORT</code> , <code>UNSIGNEDBYTE</code> , <code>POSITIVEINTEGER</code> . |

## 210.3.3 DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (  
    name      IN    VARCHAR2);
```

### Parameters

**Table 210-4    DROPPARAMETER Procedure Parameters**

| Parameter         | Description                     |
|-------------------|---------------------------------|
| <code>name</code> | Identifier for parameter string |

## Examples

```
DBMS_XMLINDEX.DROPPARAMETER (  
    'myIndexParam');
```

## 210.3.4 MODIFYPARAMETER Procedure

This procedure modifies the `XMLIndex` parameter string that is associated with a given parameter identifier.

### Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (  
    name          IN          VARCHAR2,  
    parameter     IN          CLOB);
```

### Parameters

**Table 210-5** MODIFYPARAMETER Procedure Parameters

| Parameter | Description                                                                             |
|-----------|-----------------------------------------------------------------------------------------|
| name      | Identifier for parameter string                                                         |
| parameter | XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement |

### Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (  
    'myIndexParam',  
    'PATH TABLE po_ptab  
    PATH ID INDEX po_pidx  
    ORDER KEY INDEX po_oidx  
    VALUE INDEX po_vidx');
```

## 210.3.5 PROCESS\_PENDING Procedure

This procedure processes executes DMLs required to complete a NONBLOCKING ALTER INDEX ADD\_GROUP/ADD\_COLUMN operation on an XMLIndex.

### Syntax

```
DBMS_XMLINDEX.PROCESS_PENDING (  
    xml_index_schema IN VARCHAR2,  
    xml_index_name   IN VARCHAR2,  
    pending_row_count OUT BINARY_INTEGER,  
    error_row_count  OUT BINARY_INTEGER);
```

### Parameters

**Table 210-6** PROCESS\_PENDING Procedure Parameters

| Parameter        | Description                       |
|------------------|-----------------------------------|
| xml_index_schema | Name of the owner of the XMLIndex |

**Table 210-6 (Cont.) PROCESS\_PENDING Procedure Parameters**

| Parameter         | Description                                                                |
|-------------------|----------------------------------------------------------------------------|
| xml_index_name    | Name of the XMLIndex to be altered using NONBLOCKING ALTER INDEX OPERATION |
| pending_row_count | Number of pending rows to be processed                                     |
| error_row_count   | Number of rows for which indexing may have failed because of an error      |

**Usage Notes**

- This procedure will iteratively attempt to index all necessary rows in small batches while skipping rows that are locked and rows for which index maintenance fails with an error. Therefore, it may have to be executed multiple times for an XMLIndex until all pending rows are processed. Once all pending rows are processed, user can complete the NONBLOCKING ALTER INDEX OPERATION.
- If it is not possible process all the pending rows after multiple trials, the user will have to manually triage the locking or error issues by examining unprocessed rows in SYS\_AIXSXI\_#####\_PENDINGTAB and errors in SYS\_AIXSXI\_#####\_ERRORTAB.. Keeping track of rows and the errors is useful in triaging issues.

**Examples**

```
EXEC DBMS_XMLINDEX.PROCESS_PENDING(  
    'SCOTT', 'PO_XMLINDEX_IX', out_param1, out_param2);
```

## 210.3.6 REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

**Syntax**

```
DBMS_XMLINDEX.REGISTERPARAMETER (  
    name          IN      VARCHAR2,  
    parameter     IN      CLOB);
```

**Parameters****Table 210-7 REGISTERPARAMETER Procedure Parameters**

| Parameter | Description                                                                             |
|-----------|-----------------------------------------------------------------------------------------|
| name      | Identifier for parameter string                                                         |
| parameter | XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement |

**Examples**

```
DBMS_XMLINDEX.REGISTERPARAMETER (  
    'myIndexParam',  
    'PATH TABLE po_ptab  
    PATH ID INDEX po_pidx  
    ORDER KEY INDEX po_oidx  
    VALUE INDEX po_vidx
```

```
PATHS (NAMESPACE MAPPING (xmlns:p="http://www.example.com/IPO"))
GROUP MASTERGROUP XMLTABLE PO_TAB
(''/p:PurchaseOrder''
  COLUMNS
    REFERENCE VARCHAR2(30) PATH ''p:Reference'',
    REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )
GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
(''/p:PurchaseOrder/p:LineItems/p:LineItem''
  COLUMNS
    LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',
    QUANTITY NUMBER(38) PATH ''@p:Quantity'',
    DESCRIPTION VARCHAR2(256) PATH ''p:Description''));
```

## 210.3.7 SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex.

It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

### Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
  xml_index_schema      IN VARCHAR2,
  xml_index_name        IN VARCHAR2,
  partition_name        IN VARCHAR2 DEFAULT NULL,
  reindex               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

Table 210-8 SYNCINDEX Procedure Parameters

| Parameter        | Description                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------|
| xml_index_schema | Name of the owner of the XMLIndex                                                                                            |
| xml_schema_name  | Name of the XMLIndex                                                                                                         |
| partition_name   | [Currently not supported]                                                                                                    |
| reindex          | Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulk-loaded. |

### Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

## DBMS\_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- [Security Model](#)
- [Summary of DBMS\\_XMLPARSER Subprograms](#)

## 211.1 DBMS\_XMLPARSER Security Model

Owned by `XDB`, the `DBMS_XMLPARSER` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

## 211.2 Summary of DBMS\_XMLPARSER Subprograms

This table lists the `DBMS_XMLPARSER` subprograms and briefly describes them.

**Table 211-1 DBMS\_XMLPARSER Package Subprograms**

| Method                                | Description                                                  |
|---------------------------------------|--------------------------------------------------------------|
| <a href="#">FREEPARSER</a>            | Frees a parser object.                                       |
| <a href="#">GETDOCTYPE</a>            | Gets parsed DTD.                                             |
| <a href="#">GETDOCUMENT</a>           | Gets DOM document.                                           |
| <a href="#">GETRELEASEVERSION</a>     | Returns the release version of Oracle XML Parser for PL/SQL. |
| <a href="#">GETVALIDATIONMODE</a>     | Returns validation mode.                                     |
| <a href="#">NEWPARSER</a>             | Returns a new parser instance                                |
| <a href="#">PARSE</a>                 | Parses XML stored in the given url/file.                     |
| <a href="#">PARSEBUFFER</a>           | Parses XML stored in the given buffer                        |
| <a href="#">PARSECLOB</a>             | Parses XML stored in the given clob                          |
| <a href="#">PARSEDTD</a>              | Parses DTD stored in the given url/file                      |
| <a href="#">PARSEDTCBUFFER</a>        | Parses DTD stored in the given buffer                        |
| <a href="#">PARSEDTCLOB</a>           | Parses DTD stored in the given clob                          |
| <a href="#">SETBASEDIR</a>            | Sets base directory used to resolve relative URLs.           |
| <a href="#">SETDOCTYPE</a>            | Sets DTD.                                                    |
| <a href="#">SETERRORLOG</a>           | Sets errors to be sent to the specified file                 |
| <a href="#">SETPRESERVEWHITESPACE</a> | Sets white space preserve mode                               |
| <a href="#">SETVALIDATIONMODE</a>     | Sets validation mode.                                        |
| <a href="#">SHOWWARNINGS</a>          | Turns warnings on or off.                                    |

## 211.2.1 FREEPARSER

This procedure frees a parser object.

### Syntax

```
PROCEDURE freeParser(  
    p Parser);
```

### Parameters

**Table 211-2 FREEPARSER Procedure Parameters**

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

## 211.2.2 GETDOCTYPE

The `GETDOCTYPE` function returns the parsed DTD. This function must be called only after a DTD is parsed.

### Syntax

```
FUNCTION getDoctype(  
    p Parser)  
RETURN DOMDocumentType;
```

### Parameters

**Table 211-3** GETDOCTYPE Function Parameters

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

## 211.2.3 GETDOCUMENT

`GETDOCUMENT` returns the document node of a DOM tree document built by the parser. This function must be called only after a document is parsed.

### Syntax

```
FUNCTION GETDOCUMENT(  
    p Parser)  
RETURN DOMDocument;
```

### Parameters

**Table 211-4** GETDOCUMENT Function Parameters

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

## 211.2.4 GETRELEASEVERSION

`GETRELEASEVERSION` returns the release version of the Oracle XML parser for PL/SQL.

### Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

## 211.2.5 GETVALIDATIONMODE

The `GETVALIDATIONMODE` function retrieves the validation mode: `TRUE` for validating, `FALSE` otherwise.

### Syntax

```
FUNCTION GETVALIDATIONMODE (  
    p Parser)  
RETURN BOOLEAN;
```

### Parameters

**Table 211-5** `GETVALIDATIONMODE` Function Parameters

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

## 211.2.6 NEWPARSER

This function returns a new parser instance.

This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

### Syntax

```
FUNCTION newParser  
RETURN Parser;
```

## 211.2.7 PARSE

`PARSE` parses XML stored in the given URL or file. An application error is raised if parsing fails.

There are several versions of this method.

### Syntax

Function. Use this when the default parser behavior is acceptable, and only a URL or file needs to be parsed. Returns the built DOM document.

```
FUNCTION parse(url VARCHAR2)  
RETURN DOMDocument;
```

Procedure. Any changes to the default parser behavior should be effected before calling this procedure.

```
PROCEDURE parse(  
    p Parser,  
    url VARCHAR2);
```

## Parameters

**Table 211-6 PARSE Subprogram Parameters**

| Parameter | IN / OUT | Description                                 |
|-----------|----------|---------------------------------------------|
| url       | (IN)     | Complete path of the url/file to be parsed. |
| p         | (IN)     | Parser instance.                            |

## 211.2.8 PARSEBUFFER

`PARSEBUFFER` parses XML stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEBUFFER(  
    p    Parser,  
    doc VARCHAR2);
```

## Parameters

**Table 211-7 PARSEBUFFER Procedure Parameters**

| Parameter | IN / OUT | Description                   |
|-----------|----------|-------------------------------|
| p         | (IN)     | Parser instance.              |
| doc       | (IN)     | XML document buffer to parse. |

## 211.2.9 PARSECLOB

`PARSECLOB` parses XML stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSECLOB(  
    p    Parser,  
    doc CLOB);
```

## Parameters

**Table 211-8 PARSECLOB Procedure Parameters**

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

**Table 211-8 (Cont.) PARSECLOB Procedure Parameters**

| Parameter | IN / OUT | Description                   |
|-----------|----------|-------------------------------|
| doc       | (IN)     | XML document buffer to parse. |

## 211.2.10 PARSEDTD

`PARSEDTD` parses the DTD stored in the given URL or file.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTD(  
    p      Parser,  
    url    VARCHAR2,  
    root   VARCHAR2);
```

### Parameters

**Table 211-9 PARSEDTD Procedure Parameters**

| Parameter | IN / OUT | Description                                    |
|-----------|----------|------------------------------------------------|
| p         | (IN)     | Parser instance.                               |
| url       | (IN)     | Complete path of the URL or file to be parsed. |
| root      | (IN)     | Name of the root element.                      |

## 211.2.11 PARSEDTDBUFFER

`PARSEDTDBUFFER` parses the DTD stored in the given buffer.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTDBUFFER(  
    p      Parser,  
    dtd    VARCHAR2,  
    root   VARCHAR2);
```

### Parameters

**Table 211-10 PARSEDTDBUFFER Procedure Parameters**

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |

**Table 211-10 (Cont.) PARSEDTDBUFFER Procedure Parameters**

| Parameter | IN / OUT | Description               |
|-----------|----------|---------------------------|
| dtd       | (IN)     | DTD buffer to parse.      |
| root      | (IN)     | Name of the root element. |

## 211.2.12 PARSEDTDCLOB

`PARSEDTDCLOB` parses the DTD stored in the given clob.

Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE PARSEDTDCLOB(  
    p    Parser,  
    dtd  CLOB,  
    root VARCHAR2);
```

### Parameters

**Table 211-11 PARSEDTDCLOB Procedure Parameters**

| Parameter | IN / OUT | Description               |
|-----------|----------|---------------------------|
| p         | (IN)     | Parser instance.          |
| dtd       | (IN)     | DTD Clob to parse.        |
| root      | (IN)     | Name of the root element. |

## 211.2.13 SETBASEDIR

This procedure sets the base directory used to resolve relative URLs. An application error is raised if parsing fails.

### Syntax

```
PROCEDURE setBaseDir(  
    p    Parser,  
    dir  VARCHAR2);
```

### Parameters

**Table 211-12 SETBASEDIR Procedure Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| p         | (IN)     | Parser instance.                    |
| dir       | (IN)     | Directory used as a base directory. |

## 211.2.14 SETDOCTYPE Procedure

This procedure sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

### Syntax

```
PROCEDURE setDoctype(  
    p    Parser,  
    dtd DOMDocumentType);
```

### Parameters

**Table 211-13 SETDOCTYPE Procedure Parameters**

| Parameter | IN / OUT | Description      |
|-----------|----------|------------------|
| p         | (IN)     | Parser instance. |
| dtd       | (IN)     | DTD to set.      |

## 211.2.15 SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

### Syntax

```
PROCEDURE setErrorLog(  
    p          Parser,  
    fileName VARCHAR2);
```

### Parameters

**Table 211-14 SETERRORLOG Procedure Parameters**

| Parameter | IN / OUT | Description                                        |
|-----------|----------|----------------------------------------------------|
| p         | (IN)     | Parser instance.                                   |
| fileName  | (IN)     | Complete path of the file to use as the error log. |

## 211.2.16 SETPRESERVEWHITESPACE

This procedure sets whitespace preserving mode.

### Syntax

```
PROCEDURE setPreserveWhitespace(  
    p    Parser,  
    yes BOOLEAN);
```

## Parameters

**Table 211-15   SETPRESERVEWHITESPACE Procedure Parameters**

| Parameter | IN / OUT | Description                                           |
|-----------|----------|-------------------------------------------------------|
| p         | (IN)     | Parser instance.                                      |
| yes       | (IN)     | Mode to set: TRUE - preserve, FALSE - don't preserve. |

## 211.2.17 SETVALIDATIONMODE

This procedure sets the validation mode.

### Syntax

```
PROCEDURE setValidationMode(  
    p    Parser,  
    yes BOOLEAN);
```

## Parameters

**Table 211-16   SETVALIDATIONMODE Procedure Parameters**

| Parameter | IN / OUT | Description                                           |
|-----------|----------|-------------------------------------------------------|
| p         | (IN)     | Parser instance.                                      |
| yes       | (IN)     | Mode to set: TRUE - validate, FALSE - don't validate. |

## 211.2.18 SHOWWARNINGS

This procedure turns warnings on or off.

### Syntax

```
PROCEDURE showWarnings(  
    p    Parser,  
    yes BOOLEAN);
```

## Parameters

**Table 211-17   SHOWWARNINGS Procedure Parameters**

| Parameter | IN / OUT | Description                                                     |
|-----------|----------|-----------------------------------------------------------------|
| p         | (IN)     | Parser instance.                                                |
| yes       | (IN)     | Mode to set: TRUE - show warnings, FALSE - don't show warnings. |

# DBMS\_XMLQUERY

DBMS\_XMLQUERY provides database-to-XMLType functionality.

**Note:**

With Oracle Database 18.1 Release, the DBMS\_XMLQUERY package is deprecated. Use DBMS\_XMLGEN instead.

The DBMS\_XMLQUERY package has been replaced with improved technology. While Oracle recommends you not to begin development using DBMS\_XMLQUERY, Oracle continues to support DBMS\_XMLQUERY for reasons of backward compatibility. Your existing applications using DBMS\_XMLQUERY will continue to work.

**See Also:**

For more information, see [DBMS\\_XMLGEN](#).

This chapter contains the following topics:

- [DBMS\\_XMLQUERY Security Model](#)
- [DBMS\\_XMLQUERY Constants](#)
- [Types](#)
- [Summary of DBMS\\_XMLQUERY Subprograms](#)

## 212.1 DBMS\_XMLQUERY Security Model

Owned by XDB, the DBMS\_XMLQUERY package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 212.2 DBMS\_XMLQUERY Constants

The DBMS\_XMLQUERY package includes several constants to use when specifying parameter values.

These constants are defined in the following table.

**Table 212-1 Constants of DBMS\_XMLQUERY**

| Constant            | Description                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| DB_ENCODING         | Used to signal that the DB character encoding is to be used.                                                                             |
| DEFAULT_ROWSETTAG   | The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET. |
| DEFAULT_ERRORTAG    | The default tag to enclose raised errors -- ERROR.                                                                                       |
| DEFAULT_ROWIDATTR   | The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM                                        |
| DEFAULT_ROWTAG      | The default tag name for the element corresponding to db.records -- ROW                                                                  |
| DEFAULT_DATE_FORMAT | Default date mask -- 'MM/dd/yyyy HH:mm:ss'                                                                                               |
| ALL_ROWS            | Indicates that all rows are needed in the output.                                                                                        |
| NONE                | Used to specifies that the output should not contain any XML metadata (for example, no DTD).                                             |
| DTD                 | Used to specify that the generation of the DTD is desired.                                                                               |
| SCHEMA              | Used to specify that the generation of the XML Schema is desired.                                                                        |
| LOWER_CASE          | Use lower case tag names.                                                                                                                |
| UPPER_CASE          | Use upper case tag names.                                                                                                                |

## 212.3 Types

The DBMS\_XMLQUERY subprograms use the `ctxType` type.

**Table 212-2 Types of DBMS\_XMLQUERY**

| Type                 | Description                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------|
| <code>ctxType</code> | The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a> |

## 212.4 Summary of DBMS\_XMLQUERY Subprograms

This table lists the DBMS\_XMLQUERY subprograms and briefly describes them.

**Table 212-3 DBMS\_XMLQUERY Package Subprograms**

| Method                              | Description                                                  |
|-------------------------------------|--------------------------------------------------------------|
| <a href="#">CLOSECONTEXT</a>        | Closes or deallocates a particular query context.            |
| <a href="#">GETDTD</a>              | Generates the DTD.                                           |
| <a href="#">GETEXCEPTIONCONTENT</a> | Returns the thrown exception's error code and error message. |
| <a href="#">GETNUMROWSPROCESSED</a> | Returns the number of rows processed for the query.          |
| <a href="#">GETVERSION</a>          | Prints the version of the XSU in use.                        |
| <a href="#">GETXML</a>              | Generates the XML document.                                  |
| <a href="#">NEWCONTEXT</a>          | Creates a query context and it returns the context handle.   |

**Table 212-3 (Cont.) DBMS\_XMLQUERY Package Subprograms**

| Method                                     | Description                                                                                                                                                                              |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">PROPAGATEORIGINALEXCEPTION</a> | Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> . |
| <a href="#">REMOVEXSLTPARAM</a>            | Removes a particular top-level stylesheet parameter.                                                                                                                                     |
| <a href="#">SETBINDVALUE</a>               | Sets a value for a particular bind name.                                                                                                                                                 |
| <a href="#">SETCOLLIDATTRNAME</a>          | Sets the name of the id attribute of the collection element's separator tag.                                                                                                             |
| <a href="#">SETDATAHEADER</a>              | Sets the XML data header.                                                                                                                                                                |
| <a href="#">SETDATEFORMAT</a>              | Sets the format of the generated dates in the XML document.                                                                                                                              |
| <a href="#">SETENCODINGTAG</a>             | Sets the encoding processing instruction in the XML document.                                                                                                                            |
| <a href="#">SETERRORTAG</a>                | Sets the tag to be used to enclose the XML error documents.                                                                                                                              |
| <a href="#">SETMAXROWS</a>                 | Sets the maximum number of rows to be converted to XML.                                                                                                                                  |
| <a href="#">SETMETAHEADER</a>              | Sets the XML meta header.                                                                                                                                                                |
| <a href="#">SETRAISEEXCEPTION</a>          | Tells the XSU to throw the raised exceptions.                                                                                                                                            |
| <a href="#">SETRAISENOROWSEXCEPTION</a>    | Tells the XSU to throw or not to throw an <code>OracleXMLNoRowsException</code> in the case when for one reason or another, the XML document generated is empty.                         |
| <a href="#">SETROWIDATTRNAME</a>           | Sets the name of the id attribute of the row enclosing tag.                                                                                                                              |
| <a href="#">SETROWIDATTRVALUE</a>          | Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.                                                                                  |
| <a href="#">SETROWSETTAG</a>               | Sets the tag to be used to enclose the XML dataset.                                                                                                                                      |
| <a href="#">SETROWTAG</a>                  | Sets the tag to be used to enclose the XML element.                                                                                                                                      |
| <a href="#">SETSKIPROWS</a>                | Sets the number of rows to skip.                                                                                                                                                         |
| <a href="#">SETSQLTOXMLNAMEESCAPING</a>    | This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.                                      |
| <a href="#">SETSTYLESHEETHEADER</a>        | Sets the stylesheet header.                                                                                                                                                              |
| <a href="#">SETTAGCASE</a>                 | Specified the case of the generated XML tags.                                                                                                                                            |
| <a href="#">SETXSLT</a>                    | Registers a stylesheet to be applied to generated XML.                                                                                                                                   |
| <a href="#">SETXSLTPARAM</a>               | Sets the value of a top-level stylesheet parameter.                                                                                                                                      |
| <a href="#">USENULLATTRIBUTEINDICATOR</a>  | Specifies weather to use an XML attribute to indicate NULLness.                                                                                                                          |
| <a href="#">USETYPEFORCOLLELEMTAG</a>      | Tells the XSU to use the collection element's type name as the collection element tag name.                                                                                              |

## 212.4.1 CLOSECONTEXT

This procedure closes or deallocates a particular query context

### Syntax

```
PROCEDURE CLOSECONTEXT(  
  ctxHdl IN ctxType);
```

**Table 212-4 CLOSECONTEXT Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 212.4.2 GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

### Syntax

Function that generates the DTD based on the SQL query that is used to initialize the context.

```
FUNCTION GETDTD(  
  ctxHdl IN ctxType,  
  withVer IN BOOLEAN := false)  
RETURN CLOB;
```

Procedure that generates the DTD based on the SQL query that is used to initialize the context. Specifies the output CLOB for XML document result.

```
PROCEDURE GETDTD(  
  ctxHdl IN ctxType,  
  xDoc IN CLOB,  
  withVer IN BOOLEAN := false);
```

### Parameters

**Table 212-5 GETDTD Subprogram Parameters**

| Parameter | IN / OUT | Description                                          |
|-----------|----------|------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                      |
| withVer   | (IN)     | Generate the version information? TRUE for yes.      |
| xDoc      | (IN)     | CLOB into which to write the generated XML document. |

## 212.4.3 GETEXCEPTIONCONTENT

`GETEXCEPTIONCONTENT` returns the thrown exception's SQL error code and error message through the procedure's `OUT` parameters.

This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

### Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(  
    ctxHdl IN ctxType,  
    errNo OUT NUMBER,  
    errMsg OUT VARCHAR2);
```

### Parameters

**Table 212-6** GETEXCEPTIONCONTENT Procedure Parameters

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| errNo     | (OUT)    | Error number.   |
| errMsg    | (OUT)    | Error message.  |

## 212.4.4 GETNUMROWSPROCESSED

Return the number of rows processed for the query.

### Syntax

```
FUNCTION GETNUMROWSPROCESSED(  
    ctxHdl IN ctxType)  
RETURN NUMBER;
```

**Table 212-7** GETNUMROWSPROCESSED Function Parameters

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 212.4.5 GETVERSION

The `GETVERSION` procedure prints the version of the XSU in use.

### Syntax

```
PROCEDURE GETVERSION();
```

## 212.4.6 GETXML

**GETXML** creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context does not need to be explicitly opened or closed.

### Syntax

This function uses a SQL query in string form.

```
FUNCTION GETXML(  
    sqlQuery IN VARCHAR2,  
    metaType IN NUMBER := NONE)  
RETURN CLOB;
```

This function uses a SQL query in CLOB form.

```
FUNCTION GETXML(  
    sqlQuery IN CLOB,  
    metaType IN NUMBER := NONE)  
RETURN CLOB;
```

This function generates the XML document based on a SQL query used to initialize the context.

```
FUNCTION GETXML(  
    ctxHdl IN ctxType,  
    metaType IN NUMBER := NONE)  
RETURN CLOB;
```

This procedure generates the XML document based on the SQL query used to initialize the context.

```
PROCEDURE GETXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB,  
    metaType IN NUMBER := NONE);
```

### Parameters

**Table 212-8 GETXML Procedure Parameters**

| Parameter | IN / OUT | Description                                          |
|-----------|----------|------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                      |
| metaType  | (IN)     | XML metadatatype (NONE, DTD, or SCHEMA).             |
| sqlQuery  | (IN)     | SQL query.                                           |
| xDoc      | (IN)     | CLOB into which to write the generated XML document. |

## 212.4.7 NEWCONTEXT

NEWCONTEXT creates a save context and returns the context handle.

### Syntax

```
FUNCTION NEWCONTEXT(  
    sqlQuery IN VARCHAR2)  
RETURN ctxType;
```

```
FUNCTION NEWCONTEXT(  
    sqlQuery IN CLOB)  
RETURN ctxType;
```

### Parameters

**Table 212-9 NEWCONTEXT Function Parameters**

| Parameter | IN / OUT | Description                                        |
|-----------|----------|----------------------------------------------------|
| sqlQuery  | (IN)     | SQL query, the results of which to convert to XML. |

## 212.4.8 PROPAGATEORIGINALEXCEPTION

The PROPAGATEORIGINALEXCEPTION procedure specifies whether to throw every original exception raised or to wrap it in an OracleXMLSQLException.

### Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN);
```

### Parameters

**Table 212-10 PROPAGATEORIGINALEXCEPTION Procedure Parameters**

| Parameter | IN / OUT | Description                                                                        |
|-----------|----------|------------------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                                    |
| flag      | (IN)     | TRUE if want to propagate original exception, FALSE to wrap in OracleXMLException. |

## 212.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

### Syntax

```
PROCEDURE REMOVEXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2);
```

**Table 212-11 REMOVEXSLTPARAM Procedure Parameters**

| Parameter | IN / OUT | Description                                 |
|-----------|----------|---------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                             |
| name      | (IN)     | Name of the top level stylesheet parameter. |

## 212.4.10 SETBINDVALUE

This procedure sets a value for a particular bind name.

### Syntax

```
PROCEDURE SETBINDVALUE(  
  ctxHdl IN ctxType,  
  bindName IN VARCHAR2,  
  bindValue IN VARCHAR2);
```

**Table 212-12 SETBINDVALUE Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| bindName  | (IN)     | Bind name.      |
| bindValue | (IN)     | Bind value.     |

## 212.4.11 SETCOLLIDATTRNAME

This procedure sets the name of the id attribute of the collection element's separator tag.

Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETCOLLIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

**Table 212-13 SETCOLLIDATTRNAME Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

**Table 212-13 (Cont.) SETCOLLIDATTRNAME Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| attrName  | (IN)     | Attribute name. |

## 212.4.12 SETDATAHEADER

This procedure sets the XML data header.

The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

### Syntax

```
PROCEDURE SETDATAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null,  
  tag IN VARCHAR2 := null);
```

**Table 212-14 SETDATAHEADER Procedure Parameters**

| Parameter | IN / OUT | Description                                         |
|-----------|----------|-----------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                     |
| header    | (IN)     | Header.                                             |
| tag       | (IN)     | Tag used to enclose the data header and the rowset. |

## 212.4.13 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

### Syntax

```
PROCEDURE SETDATEFORMAT(  
  ctxHdl IN ctxType,  
  mask IN VARCHAR2);
```

**Table 212-15 SETDATEFORMAT Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| mask      | (IN)     | The date mask.  |

## 212.4.14 SETENCODINGTAG Procedure

This procedure sets the encoding processing instruction in the XML document.

### Syntax

```
PROCEDURE SETENCODINGTAG(  
  ctxHdl IN ctxType,  
  enc IN VARCHAR2 := DB_ENCODING);
```

**Table 212-16 SETENCODINGTAG Procedure Parameters**

| Parameter | IN / OUT | Description          |
|-----------|----------|----------------------|
| ctxHdl    | (IN)     | Context handle.      |
| enc       | (IN)     | The encoding to use. |

## 212.4.15 SETERRORTAG Procedure

This procedure sets the tag to be used to enclose the XML error documents.

### Syntax

```
PROCEDURE SETERRORTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

**Table 212-17 SETERRORTAG Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| tag       | (IN)     | Tag name.       |

## 212.4.16 SETMAXROWS Procedure

This procedure sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

### Syntax

```
PROCEDURE SETMAXROWS (  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

**Table 212-18 SETMAXROWS Procedure Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| rows      | (IN)     | Maximum number of rows to generate. |

## 212.4.17 SETMETAHEADER Procedure

This procedure sets the XML meta header.

When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

### Syntax

```
PROCEDURE SETMETAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null);
```

**Table 212-19** SETMETAHEADER Procedure Parameters

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| Header    | (IN)     | Header.         |

## 212.4.18 SETRAISEEXCEPTION

This procedure specifies whether to throw raised exceptions.

If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

### Syntax

```
PROCEDURE SETRAISEEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=true);
```

**Table 212-20** SETRAISEEXCEPTION Procedure Parameters

| Parameter | IN / OUT | Description                                                                        |
|-----------|----------|------------------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                                    |
| flag      | (IN)     | Throw raised exceptions? <code>TRUE</code> for yes, otherwise <code>FALSE</code> . |

## 212.4.19 SETRAISENOROWSEXCEPTION

This procedure specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

### Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=false);
```

**Table 212-21 SETRAISENOROWSEXCEPTION Procedure Parameters**

| Parameter | IN / OUT | Description                                                                   |
|-----------|----------|-------------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                               |
| flag      | (IN)     | Throws an <code>OracleXMLNoRowsException</code> if set to <code>TRUE</code> . |

## 212.4.20 SETROWIDATTRNAME

This procedure sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

### Syntax

```
PROCEDURE SETROWIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

**Table 212-22 SETROWIDATTRNAME Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| attrName  | (IN)     | Attribute name. |

## 212.4.21 SETROWIDATTRVALUE

This procedure specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.

Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

### Syntax

```
PROCEDURE SETROWIDATTRVALUE(  
  ctxHdl IN ctxType,  
  colName IN VARCHAR2);
```

**Table 212-23 SETROWIDATTRVALUE Procedure Parameters**

| Parameter | IN / OUT | Description                                                   |
|-----------|----------|---------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                               |
| colName   | (IN)     | Column whose value is to be assigned to the row id attribute. |

## 212.4.22 SETROWSETTAG

This procedure sets the tag to be used to enclose the XML dataset.

### Syntax

```
PROCEDURE SETROWSETTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

**Table 212-24 SETROWSETTAG Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| tag       | (IN)     | Tag name.       |

## 212.4.23 SETROWTAG

This procedure sets the tag to be used to enclose the XML element corresponding to a `db.record`.

### Syntax

```
PROCEDURE SETROWTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

**Table 212-25 SETROWTAG Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| tag       | (IN)     | Tag name.       |

## 212.4.24 SETSKIPROWS

`SETSKIPROWS` sets the number of rows to skip. By default, 0 rows are skipped.

### Syntax

```
PROCEDURE SETSKIPROWS(  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

**Table 212-26 SETSKIPROWS Procedure Parameters**

| Parameter | IN / OUT | Description                     |
|-----------|----------|---------------------------------|
| ctxHdl    | (IN)     | Context handle.                 |
| rows      | (IN)     | Maximum number of rows to skip. |

## 212.4.25 SETSQLTOXMLNAMEESCAPING

This procedure turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

**Table 212-27 SETSQLTOXMLNAMEESCAPING Procedure Parameters**

| Parameter | IN / OUT | Description                                      |
|-----------|----------|--------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                  |
| flag      | (IN)     | Turn on escaping? TRUE for yes, otherwise FALSE. |

## 212.4.26 SETSTYLESHEETHEADER

SETSTYLESHEETHEADER sets the stylesheet header (the stylesheet processing instructions) in the generated XML document.

Passing NULL for the uri argument will unset the stylesheet header and the stylesheet type.

### Syntax

```
PROCEDURE SETSTYLESHEETHEADER(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  type IN VARCHAR2 := 'text/xml');
```

**Table 212-28 SETSTYLESHEETHEADER Procedure Parameters**

| Parameter | IN / OUT | Description                              |
|-----------|----------|------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                          |
| uri       | (IN)     | Stylesheet URI.                          |
| type      | (IN)     | Stylesheet type; defaults to "text/xml". |

## 212.4.27 SETTAGCASE

SETTAGCASE specifies the case of the generated XML tags.

### Syntax

```
PROCEDURE SETTAGCASE(  
  ctxHdl IN ctxType,  
  tCase IN NUMBER);
```

**Table 212-29 SETTAGCASE Procedure Parameters**

| Parameter | IN / OUT | Description                                                                                                                          |
|-----------|----------|--------------------------------------------------------------------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                                                                                      |
| tCase     | (IN)     | The tag's case: <ul style="list-style-type: none"><li>• 0 for as are</li><li>• 1 for lower case</li><li>• 2 for upper case</li></ul> |

## 212.4.28 SETXSLT

SETXSLT registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. Passing NULL for the uri argument, or NULL or an empty string for the stylesheet argument, *unsets* the stylesheet header and type.

### Syntax

To unregister the stylesheet, pass in NULL for the URI.

```
PROCEDURE SETXSLT(  
    ctxHdl IN ctxType,  
    uri IN VARCHAR2,  
    ref IN VARCHAR2 := null);
```

To unregister the stylesheet pass in NULL or an empty string for the stylesheet.

```
PROCEDURE SETXSLT(  
    ctxHdl IN ctxType,  
    stylesheet CLOB,  
    ref IN VARCHAR2 := null);
```

### Parameters

**Table 212-30 SETXSLT Procedure Parameters**

| Parameter  | IN / OUT | Description                                     |
|------------|----------|-------------------------------------------------|
| ctxHdl     | (IN)     | Context handle.                                 |
| uri        | (IN)     | Stylesheet URI.                                 |
| stylesheet | (IN)     | Stylesheet.                                     |
| ref        | (IN)     | URL to include, imported and external entities. |

## 212.4.29 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

### Syntax

```
PROCEDURE SETXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2,  
  value IN VARCHAR2);
```

**Table 212-31 SETXSLTPARAM Procedure Parameters**

| Parameter | IN / OUT | Description                                       |
|-----------|----------|---------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                   |
| name      | (IN)     | Name of the top level stylesheet parameter.       |
| value     | (IN)     | Value to be assigned to the stylesheet parameter. |

## 212.4.30 USENULLATTRIBUTEINDICATOR

This procedure specifies whether to use an XML attribute to indicate `NULL`ness, or to do this by omitting the particular entity in the XML document.

### Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN);
```

**Table 212-32 USENULLATTRIBUTEINDICATOR Procedure Parameters**

| Parameter | IN / OUT | Description                                                                                                |
|-----------|----------|------------------------------------------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                                                            |
| flag      | (IN)     | Sets attribute to <code>NULL</code> if <code>TRUE</code> , omits from XML document if <code>FALSE</code> . |

## 212.4.31 USETYPEFORCOLLELEMTAG

This procedure specifies whether to use the collection element's type name as its element tag name.

By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

### Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

**Table 212-33 USETYPEFORCOLLELEMTAG Procedure Parameters**

| Parameter | IN / OUT | Description                   |
|-----------|----------|-------------------------------|
| ctxHdl    | (IN)     | Context handle.               |
| flag      | (IN)     | Turn on use of the type name? |

# DBMS\_XMLSAVE

DBMS\_XMLSAVE provides XML to database-type functionality.

**Note:**

With Oracle Database 18.1 Release, the DBMS\_XMLSAVE package is deprecated. Use DBMS\_XMLSTORE instead.

The DBMS\_XMLSAVE package has been replaced with improved technology. While Oracle recommends you not to begin development using DBMS\_XMLSAVE, Oracle continues to support this package for reasons of backward compatibility. Your existing applications using DBMS\_XMLSAVE will continue to work.

This chapter contains the following topics:

- [DBMS\\_XMLSAVE Security Model](#)
- [DBMS\\_XMLSAVE Constants](#)
- [Types](#)
- [Summary of DBMS\\_XMLSAVE Subprograms](#)

**See Also:**

- For more information on DBMS\_XMLSTORE, see [DBMS\\_XMLSTORE](#)
- *Oracle XML DB Developer's Guide*

## 213.1 DBMS\_XMLSAVE Security Model

Owned by XDB, the DBMS\_XMLSAVE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC.

Subprograms in this package are executed using the privileges of the current user.

## 213.2 DBMS\_XMLSAVE Constants

The DBMS\_XMLSAVE includes constants to use when specifying parameter values.

These constants are defined in the following table.

**Table 213-1 Constants of DBMS\_XMLSAVE**

| Constant            | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| DEFAULT_ROWTAG      | The default tag name for the element corresponding to database records -- ROW                            |
| DEFAULT_DATE_FORMAT | Default date mask: 'MM/dd/yyyy HH:mm:ss'                                                                 |
| MATCH_CASE          | Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.   |
| IGNORE_CASE         | Used to specify that when mapping XML elements to database. entities the XSU should be case insensitive. |

## 213.3 Types

The DBMS\_XMLSAVE subprograms use the `ctxType` Type.

**Table 213-2 Types of DBMS\_XMLSAVE**

| Type                 | Description                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <code>ctxType</code> | The type of the query context handle. The type of the query context handle. This the return type of <a href="#">NEWCONTEXT</a> . |

## 213.4 Summary of DBMS\_XMLSAVE Subprograms

This table lists the DBMS\_XMLSAVE subprograms and briefly describes them.

**Table 213-3 DBMS\_XMLSAVE Package Subprograms**

| Method                                     | Description                                                                                                                                                                              |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">CLEARKEYCOLUMNLIST</a>         | Clears the key column list.                                                                                                                                                              |
| <a href="#">CLEARUPDATECOLUMNLIST</a>      | Clears the update column list.                                                                                                                                                           |
| <a href="#">CLOSECONTEXT</a>               | It closes/deallocates a particular save context.                                                                                                                                         |
| <a href="#">DELETEXML</a>                  | Deletes records specified by data from the XML document, from the table specified at the context creation time.                                                                          |
| <a href="#">GETEXCEPTIONCONTENT</a>        | Returns the thrown exception's error code and error message.                                                                                                                             |
| <a href="#">INSERTXML</a>                  | Inserts the XML document into the table specified at the context creation time.                                                                                                          |
| <a href="#">NEWCONTEXT</a>                 | Creates a save context, and returns the context handle.                                                                                                                                  |
| <a href="#">PROPAGATEORIGINALEXCEPTION</a> | Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an <code>OracleXMLSQLException</code> . |
| <a href="#">REMOVEXSLTPARAM</a>            | Removes the value of a top-level stylesheet parameter                                                                                                                                    |
| <a href="#">SETBATCHSIZE</a>               | Changes the batch size used during DML operations.                                                                                                                                       |
| <a href="#">SETCOMMITBATCH</a>             | Sets the commit batch size.                                                                                                                                                              |
| <a href="#">SETDATEFORMAT</a>              | Sets the format of the generated dates in the XML document.                                                                                                                              |
| <a href="#">SETIGNORECASE</a>              | The XSU does mapping of XML elements to database.                                                                                                                                        |

**Table 213-3 (Cont.) DBMS\_XMLSAVE Package Subprograms**

| Method                                  | Description                                                                                                                                         |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SETKEYCOLUMN</a>            | This methods adds a column to the key column list.                                                                                                  |
| <a href="#">SETPRESERVEWHITESPACE</a>   | Tells the XSU whether to preserve whitespace or not.                                                                                                |
| <a href="#">SETROWTAG</a>               | Names the tag used in the XML document to enclose the XML elements corresponding to database.                                                       |
| <a href="#">SETSQLTOXMLNAMEESCAPING</a> | This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier. |
| <a href="#">SETUPDATECOLUMN</a>         | Adds a column to the update column list.                                                                                                            |
| <a href="#">SETXSLT</a>                 | Registers a XSL transform to be applied to the XML to be saved.                                                                                     |
| <a href="#">SETXSLTPARAM</a>            | Sets the value of a top-level stylesheet parameter.                                                                                                 |
| <a href="#">UPDATEXML</a>               | Updates the table given the XML document.                                                                                                           |

## 213.4.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

### Parameters

**Table 213-4 CLEARKEYCOLUMNLIST Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 213.4.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

### Parameters

**Table 213-5 CLEARUPDATECOLUMNLIST Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 213.4.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

### Syntax

```
PROCEDURE closeContext(  
    ctxHdl IN ctxType);
```

### Parameters

**Table 213-6 CLOSECONTEXT Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 213.4.4 DELETEXML

The `DELETEXML` function deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

The options are described in the following table.

### Syntax

```
FUNCTION deleteXML(  
    ctxHdl IN ctxPType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

### Parameters

**Table 213-7 DELETEXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

## 213.4.5 GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code.

This is to get around the fact that the JVM throws an exception on top of whatever exception was raised, rendering PL/SQL unable to access the original exception.

### Syntax

```
PROCEDURE getExceptionContent(  
    ctxHdl IN ctxType,  
    errNo OUT NUMBER,  
    errMsg OUT VARCHAR2);
```

### Parameters

**Table 213-8 GETEXCEPTIONCONTENT Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| errNo     | (IN)     | Error number.   |
| errMsg    | (IN)     | Error message.  |

## 213.4.6 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

### Syntax

**Table 213-9 INSERTXML Function Syntax**

| Syntax                                                                                                 | Description                                 |
|--------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <pre>FUNCTION insertXML(<br/>    ctxHdl IN ctxType,<br/>    xDoc IN VARCHAR2)<br/>RETURN NUMBER;</pre> | Passes in the xDoc parameter as a VARCHAR2. |
| <pre>FUNCTION insertXML(<br/>    ctxHdl IN ctxType,<br/>    xDoc IN CLOB)<br/>RETURN NUMBER;</pre>     | Passes in the xDoc parameter as a CLOB.     |

## Parameters

**Table 213-10 INSERTXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

## 213.4.7 NEWCONTEXT

**NEWCONTEXT** creates a save context and returns the context handle.

### Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

## Parameters

**Table 213-11 NEWCONTEXT Function Parameters**

| Parameter   | IN / OUT | Description                                           |
|-------------|----------|-------------------------------------------------------|
| targetTable | (IN)     | The target table into which to load the XML document. |

## 213.4.8 PROPAGATEORIGINALEXCEPTION

The **PROPAGATEORIGINALEXCEPTION** procedure tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an `OracleXMLSQLException`.

### Syntax

```
PROCEDURE propagateOriginalException(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN);
```

## Parameters

**Table 213-12 PROPAGATEORIGINALEXCEPTION Procedure Parameters**

| Parameter | IN / OUT | Description                                        |
|-----------|----------|----------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                    |
| flag      | (IN)     | Propagate the original exception? 0=FALSE, 1=TRUE. |

## 213.4.9 REMOVEXSLTPARAM

This procedure removes the value of a top-level stylesheet parameter.

### Syntax

```
PROCEDURE removeXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2);
```

### Parameters

**Table 213-13 REMOVEXSLTPARAM Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| name      | (IN)     | Parameter name. |

## 213.4.10 SETBATCHSIZE

This procedure changes the batch size used during DML operations.

When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

### Syntax

```
PROCEDURE setBatchSize(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

### Parameters

**Table 213-14 SETBATCHSIZE Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| batchSize | (IN)     | Batch size.     |

## 213.4.11 SETCOMMITBATCH

This procedure sets the commit batch size.

The commit batch size refers to the number of records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

### Syntax

```
PROCEDURE setCommitBatch(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

### Parameters

**Table 213-15 SETCOMMITBATCH Procedure Parameters**

| Parameter              | IN / OUT | Description        |
|------------------------|----------|--------------------|
| <code>ctxHdl</code>    | (IN)     | Context handle.    |
| <code>batchSize</code> | (IN)     | Commit batch size. |

## 213.4.12 SETDATEFORMAT

This procedure sets the format of the generated dates in the XML document.

The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

### Syntax

```
PROCEDURE setDateFormat(  
    ctxHdl IN ctxType,  
    mask IN VARCHAR2);
```

### Parameters

**Table 213-16 SETDATEFORMAT Procedure Parameters**

| Parameter           | IN / OUT | Description                        |
|---------------------|----------|------------------------------------|
| <code>ctxHdl</code> | (IN)     | Context handle.                    |
| <code>mask</code>   | (IN)     | Syntax of the date format pattern. |

## 213.4.13 SETIGNORECASE

This function tells the XSU whether to ignore case when the XSU maps XML elements to database columns/attributes. This matching is based on the element names (XML tags).

### Syntax

```
PROCEDURE setIgnoreCase(  
    ctxHdl IN ctxType,  
    flag IN NUMBER);
```

### Parameters

**Table 213-17 SETIGNORECASE Procedure Parameters**

| Parameter | IN / OUT | Description                                      |
|-----------|----------|--------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                  |
| flag      | (IN)     | Ignore tag case in the XML doc? 0=FALSE, 1=TRUE. |

## 213.4.14 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be `NULL`. In case of update or delete, the columns in the key column list make up the `WHERE` clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

### Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

### Parameters

**Table 213-18 SETKEYCOLUMN Procedure Parameters**

| Parameter | IN / OUT | Description                                                              |
|-----------|----------|--------------------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                                          |
| colName   | (IN)     | Column to be added to the key column list; cannot be <code>NULL</code> . |

## 213.4.15 SETPRESERVEWHITESPACE

This procedure tells the XSU whether or not to preserve whitespace.

### Syntax

```
PROCEDURE setPreserveWhitespace(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

## Parameters

**Table 213-19 SETPRESERVEWHITESPACE Procedure Parameters**

| Parameter | IN / OUT | Description                     |
|-----------|----------|---------------------------------|
| ctxHdl    | (IN)     | Context handle.                 |
| flag      | (IN)     | Should XSU preserve whitespace? |

## 213.4.16 SETROWTAG

This procedure names the tag used in the XML document to enclose the XML elements corresponding to db. records.

### Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

## Parameters

**Table 213-20 SETROWTAG Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| tag       | (IN)     | Tag name.       |

## 213.4.17 SETSQLTOXMLNAMEESCAPING

SETSQLTOXMLNAMEESCAPING turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

### Syntax

```
PROCEDURE setSQLToXMLNameEscaping(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

## Parameters

**Table 213-21 SETSQLTOXMLNAMEESCAPING Procedure Parameters**

| Parameter | IN / OUT | Description       |
|-----------|----------|-------------------|
| ctxHdl    | (IN)     | Context handle.   |
| flag      | (IN)     | Turn on escaping? |

## 213.4.18 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

### Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

### Parameters

**Table 213-22** SETUPDATECOLUMN Procedure Parameters

| Parameter | IN / OUT | Description                                   |
|-----------|----------|-----------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                               |
| colName   | (IN)     | Column to be added to the update column list. |

## 213.4.19 SETXSLT

SETXSLT registers an XSL transform to be applied to the XML to be saved.

If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

### Syntax

**Table 213-23** SETXSLT Procedure Syntax

| Syntax                                                                                                                 | Description                              |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <pre>PROCEDURE setXSLT(<br/>    ctxHdl IN ctxType,<br/>    uri IN VARCHAR2,<br/>    ref IN VARCHAR2 := null);</pre>    | Passes in the stylesheet through a URI.  |
| <pre>PROCEDURE setXSLT(<br/>    ctxHdl IN ctxType,<br/>    stylesheet IN CLOB,<br/>    ref IN VARCHAR2 := null);</pre> | Passes in the stylesheet through a CLOB. |

## Parameters

**Table 213-24 SETXSLT Procedure Parameters**

| Parameter  | IN / OUT | Description                                     |
|------------|----------|-------------------------------------------------|
| ctxHdl     | (IN)     | Context handle.                                 |
| uri        | (IN)     | URI to the stylesheet to register.              |
| ref        | (IN)     | URL for include, import, and external entities. |
| stylesheet | (IN)     | CLOB containing the stylesheet to register.     |

## 213.4.20 SETXSLTPARAM

SETXSLTPARAM sets the value of a top-level stylesheet parameter.

The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

### Syntax

```
PROCEDURE setXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2,  
    value IN VARCHAR2);
```

## Parameters

**Table 213-25 SETXSLTPARAM Procedure Parameters**

| Parameter | IN / OUT | Description                            |
|-----------|----------|----------------------------------------|
| ctxHdl    | (IN)     | Context handle.                        |
| name      | (IN)     | Parameter name.                        |
| value     | (IN)     | Parameter value as an XPath expression |

## 213.4.21 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

### Syntax

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,
```

```
xDoc IN VARCHAR2)
RETURN NUMBER;
```

```
FUNCTION updateXML(
  ctxHdl IN ctxType,
  xDoc IN CLOB)
RETURN NUMBER;
```

## Parameters

**Table 213-26 UPDATEXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

# DBMS\_XMLSCHEMA

DBMS\_XMLSCHEMA package provides procedures to manage XML schemas.

It is created by script `dbmsxsch.sql` during Oracle database installation.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XMLSCHEMA Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 214.1 DBMS\_XMLSCHEMA Overview

The DBMS\_XMLSCHEMA package uses subprograms to manage XML schemas.

These subprograms provide the following XML schema management::

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

## 214.2 DBMS\_XMLSCHEMA Security Model

Owned by XDB, the DBMS\_XMLSCHEMA package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 214.3 DBMS\_XMLSCHEMA Constants

The DBMS\_XMLSCHEMA package defines several constants to use when specifying parameter values.

These constants are shown in following tables.

- [Table 214-1](#)
- [Table 214-2](#)
- [Table 214-3](#)

**Table 214-1 DBMS\_XMLSCHEMA Constants - Delete Option**

| Constant             | Type   | Value | Description                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|--------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELETE_RESTRICT      | NUMBER | 1     | Deletion of an XML schema fails if there are any tables or XML schemas that depend on it                                                                                                                                                                                                                                                                        |
| DELETE_INVALIDATE    | NUMBER | 2     | Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.                                                                                                                                                                                                                 |
| DELETE_CASCADE       | NUMBER | 3     | Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas. |
| DELETE_CASCADE_FORCE | NUMBER | 4     | This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.                                                                                                                                                       |

**Table 214-2 DBMS\_XMLSCHEMA Constants - Enable Hierarchy**

| Constant                  | Type        | Value | Description                                                                                                                                                                                                                   |
|---------------------------|-------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENABLE_HIERARCHY_NONE     | PLS_INTEGER | 1     | The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema                                                                      |
| ENABLE_HIERARCHY_CONTENTS | PLS_INTEGER | 2     | The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code> |

**Table 214-2 (Cont.) DBMS\_XMLSCHEMA Constants - Enable Hierarchy**

| Constant                     | Type        | Value | Description                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENABLE_HIERARCHY_RESMETADATA | PLS_INTEGER | 3     | The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables. |

**Table 214-3 DBMS\_XMLSCHEMA Constants - Register CSID**

| Constant           | Type   | Value | Description                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|--------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REGISTER_NODOCID   | NUMBER | 1     | If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage. |
| REGISTER_CSID_NULL | NUMBER | -1    | If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter.                                                                                                                                                                                                                     |

## 214.4 Views

This table lists the views used by the DBMS\_XMLSCHEMA package.

The columns of these views are described in detail in the *Oracle Database Reference*.

**Table 214-4 Summary of Views used by DBMS\_XMLSCHEMA**

| Schema           | Description                                           |
|------------------|-------------------------------------------------------|
| USER_XML_SCHEMAS | All registered XML Schemas owned by the user          |
| ALL_XML_SCHEMAS  | All registered XML Schemas usable by the current user |
| DBA_XML_SCHEMAS  | All registered XML Schemas in the database            |
| DBA_XML_TABLES   | All XMLType tables in the system                      |

**Table 214-4 (Cont.) Summary of Views used by DBMS\_XMLSCHEMA**

| Schema             | Description                                                    |
|--------------------|----------------------------------------------------------------|
| USER_XML_TABLES    | All XMLType tables owned by the current user                   |
| ALL_XML_TABLES     | All XMLType tables usable by the current user                  |
| DBA_XML_TAB_COLS   | All XMLType table columns in the system                        |
| USER_XML_TAB_COLS  | All XMLType table columns in tables owned by the current user  |
| ALL_XML_TAB_COLS   | All XMLType table columns in tables usable by the current user |
| DBA_XML_VIEWS      | All XMLType views in the system                                |
| USER_XML_VIEWS     | All XMLType views owned by the current user                    |
| ALL_XML_VIEWS      | All XMLType views usable by the current user                   |
| DBA_XML_VIEW_COLS  | All XMLType view columns in the system                         |
| USER_XML_VIEW_COLS | All XMLType view columns in views owned by the current user    |
| ALL_XML_VIEW_COLS  | All XMLType view columns in views usable by the current user   |

## 214.5 DBMS\_XMLSCHEMA Operational Notes

There are guidelines for using in-place XML schema evolution.

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

## 214.6 Summary of DBMS\_XMLSCHEMA Subprograms

This table lists the `DBMS_XMLSCHEMA` subprograms and briefly describes them.

**Table 214-5 DBMS\_XMLSCHEMA Package Subprograms**

| Method                                    | Description                                                                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">COMPILESCHEMA Procedure</a>   | Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. |
| <a href="#">COPYEVOLVE Procedure</a>      | Evolves registered schemas so that existing XML instances remain valid                                                          |
| <a href="#">DELETESCHEMA Procedure</a>    | Removes the schema from the database                                                                                            |
| <a href="#">INPLACEEVOLVE Procedure</a>   | Evolves registered schemas by propagating schema changes to object types and tables                                             |
| <a href="#">PURGESCHEMA Procedure</a>     | Removes the XML schema                                                                                                          |
| <a href="#">REGISTERSCHEMA Procedures</a> | Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.           |

**Table 214-5 (Cont.) DBMS\_XMLSCHEMA Package Subprograms**

| Method                                | Description                                     |
|---------------------------------------|-------------------------------------------------|
| <a href="#">REGISTERURI Procedure</a> | Registers an XML schema specified by a URI name |

## 214.6.1 COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

### Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(  
    schemaurl IN VARCHAR2);
```

### Parameters

**Table 214-6 COMPILESCHEMA Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| schemaurl | URL identifying the schema |

## 214.6.2 COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

### See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

## Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE (
    schemaurls      IN  XDB$STRUG_LIST_T,
    newschemas      IN  XMLSequenceType,
    transforms      IN  XMLSequenceType :=NULL,
    preserveolddocs IN  BOOLEAN :=FALSE,
    maptablename    IN  VARCHAR2 :=NULL,
    generatetables  IN  BOOLEAN :=TRUE,
    force           IN  BOOLEAN :=FALSE,
    schemaowners    IN  XDB$STRING_LIST_T :=NULL,
    parallelDegree  IN  PLS_INTEGER := 0,
    options         IN  PLS_INTEGER := 0);
```

## Parameters

**Table 214-7 COPYEVOLVE Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemaurls      | VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the <code>FORCE</code> parameter is <code>TRUE</code> , URLs should be in the order of dependency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| newschemas      | VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| transforms      | VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| preserveolddocs | Default is <code>FALSE</code> , and temporary tables with old data are dropped. If <code>TRUE</code> , these table are still available after schema evolution is complete.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| maptabname      | Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: <ul style="list-style-type: none"> <li><code>SCHEMA_URL</code> - <code>VARCHAR2(700)</code> - URL of schema to which this table conforms</li> <li><code>SCHEMA_OWNER</code> - <code>VARCHAR2(30)</code> - Owner of the schema</li> <li><code>ELEMENT_NAME</code> - <code>VARCHAR2(256)</code> - Element to which this table conforms</li> <li><code>TAB_NAME</code> - <code>VARCHAR2(65)</code> - Qualified table name: <code>&lt;owner_name&gt;.&lt;table_name&gt;</code></li> <li><code>COL_NAME</code> - <code>VARCHAR2(4000)</code> - Name of the column (<code>NULL</code> for <code>XMLType</code> tables)</li> <li><code>TEMP_TABNAME</code> - <code>VARCHAR2(30)</code> - Name of temporary tables which holds data for this table.</li> </ul> |
| generatetables  | Default is <code>TRUE</code> , and new tables will be generated.<br>If <code>FALSE</code> : <ul style="list-style-type: none"> <li>new tables will not be generated after registration of new schemas</li> <li><code>preserveolddocs</code> must be <code>TRUE</code></li> <li><code>maptablename</code> must be non-<code>NULL</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| force           | Default is <code>FALSE</code> .<br>If <code>TRUE</code> , ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 214-7 (Cont.) COPYEVOLVE Procedure Parameters**

| Parameter      | Description                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemaowners   | VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.                                                          |
| paralleldegree | Specifies the degree of parallelism to be used in a <code>PARALLEL</code> hint during the data copy stage of the evolution. If this is 0 (default), the <code>PARALLEL</code> hint will not be given in the data copy statements. |
| options        | Currently, the only supported option is <code>COPYEVOLVE_BINARY_XML</code> which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.                          |

### Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

## 214.6.3 DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

### Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(  
    schemaur1      IN  VARCHAR2,  
    delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

#### See Also:

### Parameters

**Table 214-8 DELETESCHEMA Procedure Parameters**

| Parameter | Description                              |
|-----------|------------------------------------------|
| schemaur1 | URL identifying the schema to be deleted |

**Table 214-8 (Cont.) DELETESchema Procedure Parameters**

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| delete_option | Delete options: <ul style="list-style-type: none"><li>• <code>DELETE_RESTRICT</code> - Schema deletion fails if there are any tables or schemas that depend on this schema</li><li>• <code>DELETE_INVALIDATE</code> - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects.</li><li>• <code>DELETE_CASCADE</code> - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema.</li><li>• <code>DELETE_CASCADE_FORCE</code> - Similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.</li></ul> |

### Exceptions

**Table 214-9 DELETESchema Procedure Exceptions**

| Exception | Description                          |
|-----------|--------------------------------------|
| ORA-31001 | Invalid resource handle or path name |

## 214.6.4 INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

### Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(  
    schemaURL    IN    VARCHAR2,  
    diffXML      IN    XMLType,  
    flags        IN    NUMBER);
```

### Parameters

**Table 214-10 INPLACEEVOLVE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemaurL | URL of the schema to evolve                                                                                                                                                                                                          |
| diffXML   | Changes to be applied to the schema. This is an XML document conforming to the <code>XDIFF</code> schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied. |

**Table 214-10 (Cont.) INPLACEEVOLVE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flags     | <p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> <li>• <code>INPLACE_EVOLVE</code> (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new.</li> <li>• <code>INPLACE_TRACE</code> (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file.</li> </ul> <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> <li>• Bit <code>INPLACE_EVOLVE</code> carries out those evolution steps and replaces the old XML schema with the new.</li> <li>• Bit <code>INPLACE_TRACE</code> saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)</li> </ul> |

### Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid `XPATH` expressions and for `XDIFF` documents that do not conform to the `xdiff` schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.
- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

### Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSCHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

## 214.6.5 PURGESCHEMA Procedure

This procedure removes the XML schema.

### See Also:

"XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

### Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(  
    schemaid IN RAW);
```

### Parameters

**Table 214-11 PURGESCHEMA Procedure Parameters**

| Parameter | Description                   |
|-----------|-------------------------------|
| schemaid  | ID of the schema to be purged |

### Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

## 214.6.6 REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

### Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

### See Also:

"XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

## Syntax

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl      IN  VARCHAR2,
    schemadoc      IN  VARCHAR2,
    local          IN  BOOLEAN := TRUE,
    gentypes       IN  BOOLEAN := TRUE,
    genbean        IN  BOOLEAN := FALSE,
    gentables      IN  BOOLEAN := TRUE,
    force          IN  BOOLEAN := FALSE,
    owner          IN  VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl      IN  VARCHAR2,
    schemadoc      IN  BFILE,
    local          IN  BOOLEAN := TRUE,
    gentypes       IN  BOOLEAN := TRUE,
    genbean        IN  BOOLEAN := FALSE,
    force          IN  BOOLEAN := FALSE,
    owner          IN  VARCHAR2 := NULL,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl      IN  VARCHAR2,
    schemadoc      IN  BFILE,
    local          IN  BOOLEAN := TRUE,
    gentypes       IN  BOOLEAN := TRUE,
    genbean        IN  BOOLEAN := TRUE,
    gentables      IN  BOOLEAN := TRUE,
    force          IN  BOOLEAN := TRUE,
    owner          IN  VARCHAR2 := '',
    csid           IN  NUMBER,
    enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl      IN  VARCHAR2,
```

```

schemadoc      IN  BLOB,
local          IN  BOOLEAN := TRUE,
genTypes       IN  BOOLEAN := TRUE,
genBean        IN  BOOLEAN := FALSE,
force          IN  BOOLEAN := FALSE,
owner          IN  VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options        IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl     IN  VARCHAR2,
  schemadoc     IN  BLOB,
  local         IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := TRUE,
  gentables     IN  BOOLEAN := TRUE,
  force        IN  BOOLEAN := TRUE,
  owner         IN  VARCHAR2 := '',
  csid          IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options       IN  PLS_INTEGER := 0);

```

Registers the schema specified as a CLOB

```

DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl     IN  VARCHAR2,
  schemadoc     IN  CLOB,
  local         IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := FALSE,
  force        IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  options       IN  PLS_INTEGER := 0);

```

Registers the schema specified as an XMLTYPE.

```

DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl     IN  VARCHAR2,
  schemadoc     IN  SYS.XMLTYPE,
  local         IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,
  genbean       IN  BOOLEAN := FALSE,
  force        IN  BOOLEAN := FALSE,
  owner         IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options       IN  PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA(
  schemaurl     IN  VARCHAR2,
  schemadoc     IN  SYS.UTITYPE,
  local         IN  BOOLEAN := TRUE,
  gentypes      IN  BOOLEAN := TRUE,

```

```

genbean      IN  BOOLEAN := FALSE,
force        IN  BOOLEAN := FALSE,
owner        IN  VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options      IN  PLS_INTEGER := 0);

```

## Parameters

**Table 214-12 REGSITERSchema Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemauri       | URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| schemadoc       | A valid XML schema document                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| local           | Is this a local or global schema? <ul style="list-style-type: none"> <li>By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code></li> <li>If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code></li> </ul> You need write privileges on the directory to be able to register a schema as global.                                                                                                                                                                                                                                                                                                                                                                             |
| gentypes        | Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| genbean         | Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> . Oracle recommends that this parameter always be set to <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| gentables       | Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| force           | If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| owner           | This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| csid            | Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| enablehierarchy | <ul style="list-style-type: none"> <li><code>ENABLE_HIERARCHY_NONE</code> - enable hierarchy will not be called on any tables created while registering that schema</li> <li><code>ENABLE_HIERARCHY_CONTENTS</code> - enable hierarchy will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code>. This is the default.</li> <li><code>ENABLE_HIERARCHY_RESMETADATA</code> - enable hierarchy will be called on all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.</li> </ul> |

**Table 214-12 (Cont.) REGSITERSchema Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| options   | <p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits. Possible bits:</p> <ul style="list-style-type: none"> <li>• <code>REGISTER_NODOCID</code> - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)</li> <li>• <code>REGISTER_BINARYXML</code> - Register the schema for Binary XML</li> <li>• <code>REGISTER_NT_AS_IOT</code> - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables</li> </ul> |

## 214.6.7 REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

### Note:

As of Oracle Database 11g Release 2 (11.2) the `genbean` parameter is deprecated. Oracle recommends that you do not use this parameter in new applications. Support for this feature is for backward compatibility only.

### Syntax

```
DBMS_XMLSCHEMA.REGISTERURI (
  schemaurl      IN  VARCHAR2,
  schemadocuri   IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);
```

### Parameters

**Table 214-13 REGISTERURI Procedure Parameters**

| Parameter | Description                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------|
| schemaurl | Uniquely identifies the schema document. Can be used inside <code>schemaLocation</code> attribute of XML Schema import element. |

**Table 214-13 (Cont.) REGISTERURI Procedure Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| schemadocuri | Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a <code>URIType</code> instance using the <code>urifactory</code> , and invokes the <a href="#">REGISTERSchema Procedures</a> .                                                                                                                                                                                                                                                                                                                                                                    |
| local        | Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under <code>/sys/schemas/&lt;username&gt;/...</code> . If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> . The user needs write privileges on the directory to register a global schema.                                                                                                                                                                                                                                                                                                                                   |
| gentypes     | Determines whether the compiler generate object types. By default, <code>TRUE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| genbean      | Determines whether the compiler generate Java beans. By default, <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| gentables    | Determines whether the compiler generate default tables. <code>TRUE</code> by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| force        | <code>TRUE</code> : schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| owner        | This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| options      | Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a <code>BITOR</code> of the desired bits.<br>Possible bits: <ul style="list-style-type: none"> <li><code>REGISTER_NODOCID</code> - this will suppress the creation of the <code>DOCID</code> column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the <code>DOCID</code> column)</li> </ul> |

# DBMS\_XMLSCHEMA\_ANNOTATE

The `DBMS_XMLSCHEMA_ANNOTATE` package provides an interface to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLSCHEMA\\_ANNOTATE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 215.1 DBMS\_XMLSCHEMA\_ANNOTATE Overview

The `DBMS_XMLSCHEMA_ANNOTATE` package contains procedures to manage and configure the structured storage model, mainly through the use of pre-registration schema annotations.

Schema annotations influence the way the XML data is stored. For example, the default table annotation assigns a user-provided name to an XML element instead of allowing the database to generate a system name. Consequently, query plans are more readable and it is easier to create constraints on that table.

## 215.2 DBMS\_XMLSCHEMA\_ANNOTATE Security Model

Owned by XDB, the `DBMS_XMLSCHEMA_ANNOTATE` package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 215.3 Summary of DBMS\_XMLSCHEMA\_ANNOTATE Subprograms

This table lists and describes the `DBMS_XMLSCHEMA_ANNOTATE` package subprograms.

**Table 215-1 DBMS\_XMLSCHEMA\_ANNOTATE Package Subprograms**

| Subprogram                                            | Description                                                                                                                       |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADDXDBNAMESPACE Procedure</a>             | Adds the XDB namespace required for XDB annotation                                                                                |
| <a href="#">DISABLEDEFAULTTABLECREATION Procedure</a> | Prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element |

Table 215-1 (Cont.) DBMS\_XMLSCHEMA\_ANNOTATE Package Subprograms

| Subprogram                                            | Description                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DISABLEMAINTAINDOM Procedure</a>          | Sets the DOM fidelity attribute to <code>FALSE</code>                                                                                                                                                                                                                   |
| <a href="#">ENABLEDEFAULTTABLECREATION Procedure</a>  | Enables the creation of <code>ALL</code> top level tables by removing the empty default table name annotation                                                                                                                                                           |
| <a href="#">ENABLEMAINTAINDOM Procedure</a>           | Sets the DOM fidelity attribute to <code>TRUE</code>                                                                                                                                                                                                                    |
| <a href="#">GETSCHEMAANNOTATIONS Function</a>         | Creates a document containing the differences between the annotated XML schema and the original XML schema                                                                                                                                                              |
| <a href="#">GETSIDXDEFFFROMVIEW Function</a>          | Takes a <code>XMLTABLE</code> view definition on a <code>xmltype</code> column or table and it returns a <code>CLOB</code> which can be used as parameter to create a structured <code>xmlindex</code> that backs up the <code>XMLTABLE</code> view as relational table |
| <a href="#">PRINTWARNINGS Procedure</a>               | Lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema                                                                                                                                                                           |
| <a href="#">REMOVEANYSTORAGE Procedure</a>            | Removes the setting of the SQL type from the <code>ANY</code> child of the complex type with the given name                                                                                                                                                             |
| <a href="#">REMOVEDEFAULTTABLE Procedure</a>          | Removes any default table attribute given for the element. After calling this procedure, the system generates table names                                                                                                                                               |
| <a href="#">REMOVEMAINTAINDOM Procedure</a>           | Removes all annotations used to maintain DOM from the given schema                                                                                                                                                                                                      |
| <a href="#">REMOVEOUTOFFLINE Procedure</a>            | Removes any existing <code>SQLInline</code> attributes to prevent out-of-line storage                                                                                                                                                                                   |
| <a href="#">REMOVESQLCOLLTYPE Procedure</a>           | Removes a SQL collection type.                                                                                                                                                                                                                                          |
| <a href="#">REMOVESQLNAME Procedure</a>               | Removes a <code>SQLNAME</code> from a global element                                                                                                                                                                                                                    |
| <a href="#">REMOVESQLTYPE Procedure</a>               | Removes a SQL type                                                                                                                                                                                                                                                      |
| <a href="#">REMOVESQLTYPE MAPPING Procedure</a>       | Removes the SQL type mapping for the given schema type.                                                                                                                                                                                                                 |
| <a href="#">REMOVETABLEPROPS Procedure</a>            | Removes the table storage properties from the <code>CREATE TABLE</code> statement                                                                                                                                                                                       |
| <a href="#">REMOVETIMESTAMPWITHTIMEZONE Procedure</a> | Removes the setting of the <code>TimeStampWithTimeZone</code> datatype from all <code>dateTime</code> typed elements in the XML schema                                                                                                                                  |
| <a href="#">SETANYSTORAGE Procedure</a>               | Assigns a SQL datatype to the <code>ANY</code> child of the complex type with the given name                                                                                                                                                                            |
| <a href="#">SETDEFAULTTABLE Procedure</a>             | Sets the name of the table for the specified global element                                                                                                                                                                                                             |
| <a href="#">SETOUTOFFLINE Procedure</a>               | Sets the <code>SQLInline</code> attribute to <code>FALSE</code>                                                                                                                                                                                                         |
| <a href="#">SETSCHEMAANNOTATIONS Procedure</a>        | Takes the annotated differences resulting from a call to <code>DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS</code> and patches them into the provided XML schema                                                                                                        |
| <a href="#">SETSQLCOLLTYPE Procedure</a>              | Assigns a SQL type name for a collection                                                                                                                                                                                                                                |
| <a href="#">SETSQLNAME Procedure</a>                  | Assigns a name to the SQL attribute that corresponds to an element defined in the XML schema                                                                                                                                                                            |
| <a href="#">SETSQLTYPE Procedure</a>                  | Assigns a SQL type to a global object                                                                                                                                                                                                                                   |
| <a href="#">SETSQLTYPE MAPPING Procedure</a>          | Defines a mapping of schema type and SQL type                                                                                                                                                                                                                           |
| <a href="#">SETTABLEPROPS Procedure</a>               | Specifies properties in the <code>TABLE</code> storage clause that is appended to the default <code>CREATE TABLE</code> statement                                                                                                                                       |

**Table 215-1 (Cont.) DBMS\_XMLSCHEMA\_ANNOTATE Package Subprograms**

| Subprogram                                         | Description                                                                                                        |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <a href="#">SETTIMESTAMPWITHTIMEZONE Procedure</a> | Sets the <code>TIMESTAMPWITHTIMEZONE</code> datatype to all <code>dateTime</code> typed elements in the XML schema |

## 215.3.1 ADDXDBNAMESPACE Procedure

This procedure adds the XDB namespace required for XDB annotation.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ADDXDBNAMESPACE (  
    xmlschema      IN OUT XMLTYPE);
```

### Parameters

**Table 215-2 ADDXDBNAMESPACE Procedure Parameters**

| Parameter              | Description                                                                         |
|------------------------|-------------------------------------------------------------------------------------|
| <code>xmlschema</code> | Gets an XML Schema as <code>XMLTYPE</code> , performs the annotation and returns it |

### Usage Notes

This procedure is called implicitly by any other procedure that adds a schema annotation. Since there is no reason to add an XDB namespace without other annotations, this procedure is most likely called by other annotations procedures and not by the user directly.

## 215.3.2 DISABLEDEFAULTTABLECREATION Procedure

This procedure prevents the creation of a table for the top-level element by adding a default table attribute with an empty value to the element. The first overload applies to a specified top-level element and the second applies to all top-level elements. The procedure always overwrites. This is equivalent to using the schema annotation `xdb:defaultTable=""` for the top-level element or elements.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (  
    xmlschema      IN OUT XMLType,  
    globalElementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION (  
    xmlschema      IN OUT XMLType);
```

## Parameters

**Table 215-3 DISABLEDEFAULTTABLECREATION Procedure Parameters**

| Parameter         | Description                              |
|-------------------|------------------------------------------|
| xmlschema         | XML schema to be annotated               |
| globalElementName | Name of the global element in the schema |

## Example

The `purchaseOrder` element will have an annotation similar to `xdb:defaultTable=""`.

```
DECLARE
    xml_schema    XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.DISABLEDEFAULTTABLECREATION(xml_schema,
                                                         'purchaseOrder');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

## 215.3.3 DISABLEMAINTAINDOM Procedure

This procedure sets the DOM fidelity attribute to `FALSE`.

There are two overloads. The first sets DOM fidelity attribute to `FALSE` for all complex types, and the second sets it to `FALSE` for the named complex type. This is equivalent to adding `xdb:maintainDOM="false"` on all or specified complex types respectively.

## Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema      IN OUT XMLType,
    overwrite      IN BOOLEAN default TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.DISABLEMAINTAINDOM (
    xmlschema      IN OUT XMLType,
    complexTypeName IN VARCHAR2,
    overwrite      IN BOOLEAN default TRUE);
```

## Parameters

**Table 215-4 DISABLEMAINTAINDOM Procedure Parameters**

| Parameter       | Description                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| xmlschema       | The XML schema to be annotated                                                                                        |
| complexTypeName | The name of the complex type                                                                                          |
| overwrite       | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> |

## 215.3.4 ENABLEDEFAULTTABLECREATION Procedure

This procedure enables the creation of ALL top level tables by removing the empty default table name annotation.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (  
    xmlschema          IN OUT  XMLTYPE);  
  
DBMS_XMLSCHEMA_ANNOTATE.ENABLEDEFAULTTABLECREATION (  
    xmlschema          IN OUT  XMLTYPE,  
    globalElementName  IN      VARCHAR2);;
```

### Parameters

**Table 215-5** ENABLEDEFAULTTABLECREATION Procedure Parameters

| Parameter          | Description                              |
|--------------------|------------------------------------------|
| xmlschema          | The XML schema to be annotated           |
| gloableElementName | Name of the global element in the schema |

### Usage Notes

This procedure does not affect elements that have a default table name.

## 215.3.5 ENABLEMAINTAINDOM Procedure

This overloaded procedure sets the DOM fidelity attribute to `TRUE`.

There are two overloads. The first sets DOM fidelity attribute to `TRUE` for all complex types, and the second sets it to `TRUE` for the named complex type.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (  
    xmlschema          IN OUT XMLType,  
    overwrite          IN BOOLEAN default TRUE);  
  
DBMS_XMLSCHEMA_ANNOTATE.ENABLEMAINTAINDOM (  
    xmlschema          IN OUT XMLType,  
    complexTypeName    IN VARCHAR2,  
    overwrite          IN BOOLEAN default TRUE);
```

### Parameters

**Table 215-6** ENABLEMAINTAINDOM Procedure Parameters

| Parameter       | Description                    |
|-----------------|--------------------------------|
| xmlschema       | The XML schema to be annotated |
| complexTypeName | The name of the complex type   |

**Table 215-6 (Cont.) ENABLEMAINTAINDOM Procedure Parameters**

| Parameter | Description                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------|
| overwrite | A boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE |

## 215.3.6 GETSCHEMAANNOTATIONS Function

This function creates a document containing the differences between the annotated XML schema and the original XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS (  
    xmlschema IN xmlType)  
RETURN xmlType;
```

### Parameters

**Table 215-7 GETSCHEMAANNOTATIONS Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| xmlschema | The original XML schema |

### Return Values

This function returns the document `annotations.xml` as an `xmlType`.

### Usage Notes

This function saves all annotations in one document, named `annotations`, and returns it. With this document, you can apply all annotations to a non-annotated schema, using

```
DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS.
```

`DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS` is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

#### See Also:

[SETSCHEMAANNOTATIONS Procedure](#)

### Example

For an example of `DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS`, see the example in [SETSCHEMAANNOTATIONS Procedure](#).

## 215.3.7 GETSIDXDEFFROMVIEW Function

This function takes a XMLTABLE view definition on a xmltype column or table and it returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.GETSIDXDEFFROMVIEW (  
    viewName    IN xmlType)  
RETURN CLOB;
```

### Parameters

**Table 215-8 GETSIDXDEFFROMVIEW Function Parameters**

| Parameter | Description             |
|-----------|-------------------------|
| viewName  | The original XML schema |

### Return Values

This function returns a CLOB which can be used as parameter to create a structured xmlindex that backs up the XMLTABLE view as relational table.

## 215.3.8 PRINTWARNINGS Procedure

This procedure lets a user raise or suppress a warning if an annotation maps to zero nodes in the XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.PRINTWARNINGS (  
    value        IN    BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 215-9 PRINTWARNINGS Procedure Parameters**

| Parameter | Description                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| val       | For the NO MATCHING ELEMENTS FOUND error message to be raised val must be set to TRUE. In cases in which user wishes to suppress this warning, set to FALSE. |

### Usage Notes

If an annotation maps to more than one node in the XML schema, this raise the error ANNOTATION MAPS TO MULTIPLE ELEMENTS. In this case no annotation is performed, and the user must correct the parameters to the procedure call to refer to a unique node in the XML schema.

## 215.3.9 REMOVEANYSTORAGE Procedure

This procedure removes the setting of the SQL type from the `ANY` child of the complex type with the given name.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEANYSTORAGE (  
    xmlschema          IN OUT XMLType,  
    complexTypeName IN VARCHAR2);
```

### Parameters

**Table 215-10 REMOVEANYSTORAGE Procedure Parameters**

| Parameter       | Description                     |
|-----------------|---------------------------------|
| xmlschema       | The XML schema to be annotated. |
| complexTypeName | The name of the complex type.   |

### Usage Notes

This procedure reverses the [SETANYSTORAGE Procedure](#).

## 215.3.10 REMOVEDEFAULTTABLE Procedure

This procedure removes any default table attribute given for the element.

After calling this procedure, the system generates table names. This procedure always overwrites.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE (  
    xmlschema          IN OUT XMLTYPE,  
    globalElementName IN VARCHAR2);
```

### Parameters

**Table 215-11 REMOVEDEFAULTTABLE Procedure Parameters**

| Parameter         | Description                              |
|-------------------|------------------------------------------|
| xmlschema         | XML schema to be annotated               |
| globalElementName | Name of the global element in the schema |

### Example

Annotations can be verified anytime using "select out from annotation\_tab".

```
--The purchaseOrder element will have no annotation for defaultTable.  
DECLARE  
    xml_schema XMLTYPE;  
BEGIN
```

```

SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.REMOVEDEFAULTTABLE(xml_schema,
                                           'purchaseOrder');
UPDATE annotation_tab SET out = xml_schema;
END;
/

```

## 215.3.11 REMOVEMAINTAINDOM Procedure

This procedure removes all annotations used to maintain DOM from the given schema.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEMAINTAINDOM (
    xmlschema    IN OUT XMLType);

```

### Parameters

**Table 215-12 REMOVEMAINTAINDOM Procedure Parameters**

| Parameter | Description                    |
|-----------|--------------------------------|
| xmlschema | The XML schema to be annotated |

## 215.3.12 REMOVEOUTOFLINE Procedure

This procedure removes any existing `SQLInline` attributes to prevent out-of-line storage.

There are three overloads.

### Syntax

Removes the `SQLInline` attribute for the named element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema    IN OUT XMLType,
    elementName  IN      VARCHAR2,
    elementType  IN      VARCHAR2,
    overwrite    IN      BOOLEAN default TRUE);

```

Removes the `SQLInline` attribute for the object specified by its global object and local element names.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema    IN OUT XMLType,
    globalObject  IN      VARCHAR2,
    globalObjectName IN    VARCHAR2,
    localElementName IN    VARCHAR2);

```

Removes the `SQLInline` attribute for the referenced global element.

```

DBMS_XMLSCHEMA_ANNOTATE.REMOVEOUTOFLINE (
    xmlschema    IN OUT XMLType,
    reference     IN      VARCHAR2);

```

## Parameters

**Table 215-13 REMOVEOUTOFLINE Procedure Parameters**

| Parameter        | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| xmlschema        | The XML schema to be annotated                                                                                          |
| elementName      | The element name                                                                                                        |
| elementType      | The element type                                                                                                        |
| globalObject     | The global object (global complex type or global element)                                                               |
| globalObjectName | The name of the global object                                                                                           |
| localElementName | The name of a local element that descends from the global element                                                       |
| reference        | A reference to a global element                                                                                         |
| overwrite        | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

## Usage Notes

This procedure reverses [SETOUTOFLINE Procedure](#).

## 215.3.13 REMOVESQLCOLLTYPE Procedure

This procedure removes a SQL collection type.

The first overload removes the SQL collection type corresponding to the named element and the second overload removes the type from the XML element inside the complex type.

## Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (  
    xmlschema IN OUT XMLType,  
    elementName IN VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLCOLLTYPE (  
    xmlschema IN OUT XMLType,  
    globalObject IN VARCHAR2,  
    globalName IN VARCHAR2,  
    localElementName IN VARCHAR2);
```

## Parameters

**Table 215-14 REMOVESQLCOLLTYPE Procedure Parameters**

| Parameter        | Description                                                       |
|------------------|-------------------------------------------------------------------|
| xmlschema        | The XML schema to be annotated                                    |
| elementName      | The element name                                                  |
| globalObject     | The global object (global complex type or global element)         |
| globalName       | The name of the global object                                     |
| localElementName | The name of a local element that descends from the global element |

## Usage Notes

This procedure reverses the [SETSQLCOLLTYPE Procedure](#).

## 215.3.14 REMOVESQLNAME Procedure

This procedure removes a `SQLNAME` from a global element.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLNAME (
    xmlschema          IN OUT  XMLType,
    globalObject        IN      VARCHAR2,
    globalObjectName    IN      VARCHAR2,
    localObject         IN      VARCHAR2,
    localObjectName     IN      VARCHAR2,
    sqlName             IN      VARCHAR2,
    overwrite           IN      BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 215-15 REMOVESQLNAME Procedure Parameters**

| Parameter                     | Description                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>xmlschema</code>        | XML schema to be annotated                                                                                            |
| <code>globalObject</code>     | Global object (global complex type or global element)                                                                 |
| <code>globalObjectName</code> | Name of the global object                                                                                             |
| <code>localObject</code>      | Object descended from the global object                                                                               |
| <code>localObjectName</code>  | Name of the local object                                                                                              |
| <code>sqlName</code>          | Name of the SQL attribute that corresponds to the element defined in the XML schema                                   |
| <code>overwrite</code>        | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

### Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```
DECLARE
    xml_schema  XMLTYPE;
BEGIN
    SELECT out INTO xml_schema FROM annotation_tab;
    DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                         'element', 'purchaseOrder',
                                         'element', 'shipTo',
                                         'SHIPTO_SQLNAME');
    UPDATE annotation_tab SET out = xml_schema;
END;
/
```

## 215.3.15 REMOVESQLTYPE Procedure

This procedure removes a SQL type.

The first overload removes a SQL type from a global element and the second overload removes the type from a global element inside the complex type.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (  
    xmlschema in out XMLType,  
    globalElementName IN      VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE (  
    xmlschema          IN OUT XMLTYPE,  
    globalObject        IN      VARCHAR2,  
    globalObjectName    IN      VARCHAR2,  
    localObject         IN      VARCHAR2,  
    localObjectName     IN      VARCHAR2);
```

### Parameters

**Table 215-16 REMOVESQLTYPE Procedure Parameters**

| Parameter         | Description                                           |
|-------------------|-------------------------------------------------------|
| xmlschema         | XML schema to be annotated.                           |
| globalObject      | Global object (global complex type or global element) |
| globalElementName | Name of the global element.                           |
| globalObjectName  | Name of the global object                             |
| localObject       | Object descended from the global object               |
| localObjectName   | Name of the local object                              |

### Usage Notes

This procedure reverses the [SETSQLTYPE Procedure](#).

## 215.3.16 REMOVESQLTYPE\_MAPPING Procedure

This procedure removes the SQL type mapping for the given schema type.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVESQLTYPE_MAPPING (  
    xmlschema          IN OUT XMLTYPE,  
    schemaTypeName     IN      VARCHAR2);
```

### Parameters

**Table 215-17 REMOVESQLTYPE\_MAPPING Procedure Parameters**

| Parameter | Description                |
|-----------|----------------------------|
| xmlschema | XML schema to be annotated |

**Table 215-17 (Cont.) REMOVESQLTYPE\_MAPPING Procedure Parameters**

| Parameter      | Description             |
|----------------|-------------------------|
| schemaTypeName | Name of the schema type |

**Usage Notes**

This procedure reverses the [SETSQLTYPE\\_MAPPING Procedure](#).

## 215.3.17 REMOVETABLEPROPS Procedure

This procedure removes the table storage properties from the `CREATE TABLE` statement.

This procedure is overloaded. Each overload has different parameter requirements as indicated.

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (  
    xmlschema          IN OUT  XMLTYPE,  
    globalElementName  IN      VARCHAR2);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETABLEPROPS (  
    xmlschema          IN OUT  XMLTYPE,  
    globalObject       IN      VARCHAR2,  
    globalObjectName   IN      VARCHAR2,  
    localElementName   IN      VARCHAR2);
```

**Parameters****Table 215-18 REMOVETABLEPROPS Procedure Parameters**

| Parameter         | Description                                                   |
|-------------------|---------------------------------------------------------------|
| xmlschema         | XML schema to be annotated                                    |
| globalElementName | Name of the global element in the schema                      |
| globalObject      | Global object (global complex type or global element)         |
| globalObjectName  | Name of the global object                                     |
| localElementName  | Name of a local element that descends from the global element |

**Usage Notes**

This procedure reverses the [SETTABLEPROPS Procedure](#).

## 215.3.18 REMOVETIMESTAMPWITHTIMEZONE Procedure

This procedure removes the setting of the `TimeStampWithTimeZone` datatype from all `dateTime` typed elements in the XML schema.

**Syntax**

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (  
    xmlschema          IN OUT  XMLTYPE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.REMOVETIMESTAMPWITHTIMEZONE (
    xmlschema          IN OUT  XMLTYPE,
    schemaTypeName     IN      VARCHAR2);
```

### Parameters

**Table 215-19 REMOVETIMESTAMPWITHTIMEZONE Procedure Parameters**

| Parameter      | Description                |
|----------------|----------------------------|
| xmlschema      | XML schema to be annotated |
| schemaTypeName | Name of the schema type    |

### Usage Notes

This procedure reverses the [SETTIMESTAMPWITHTIMEZONE Procedure](#).

## 215.3.19 SETANYSTORAGE Procedure

This procedure assigns a SQL datatype to the `ANY` child of the complex type with the given name.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETANYSTORAGE )
    xmlschema          IN OUT  XMLType,
    complexTypeName    IN      VARCHAR2,
    sqlTypeName        IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 215-20 SETANYSTORAGE Procedure Parameters**

| Parameter       | Description                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| xmlschema       | XML schema to be annotated                                                                                            |
| complexTypeName | Name of the complex type                                                                                              |
| sqlTypeName     | Name of the SQL type                                                                                                  |
| overwrite       | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

### Example

The `xsd:any` child of complex type `Items` is assigned an annotation similar to `xdb:SQLType="VARCHAR"`.

```
DECLARE  xml_schema XMLTYPE;BEGIN  SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setAnyStorage
(xml_schema,
'Items',                                     'VARCHAR');  UPDATE annotation_tab SET
out = xml_schema;END;
/
```

## 215.3.20 SETDEFAULTTABLE Procedure

This procedure sets the name of the table for the specified global element. This is equivalent to using the schema annotation `xdb:defaultTable=<default_table_name>` for the top-level element.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETDEFAULTTABLE (
  xmlschema          IN OUT XMLTYPE,
  globalElementName  IN      VARCHAR2,
  tableName          IN      VARCHAR2,
  overwrite          IN      BOOLEAN   DEFAULT TRUE);
```

### Parameters

**Table 215-21 SETDEFAULTTABLE Procedure Parameters**

| Parameter                      | Description                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>xmlschema</code>         | XML schema to be annotated                                                                                            |
| <code>globalElementName</code> | Name of the global element in the schema                                                                              |
| <code>tableName</code>         | Name being assigned to the table                                                                                      |
| <code>overwrite</code>         | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

## 215.3.21 SETOUTOFFLINE Procedure

This procedure sets the `SQLInline` attribute to `FALSE`, that is, it sets `xdb:SQLInline=FALSE`.

This forces XDB to store the corresponding elements in the XML document out-of-line as rows in a separate `XMLType` table. XDB stores references to each row of the `XMLType` table in a link table that is maintained by the main table

This procedure can improve performance in some situations if the out-of-line table acts as the driver for the query. Storing elements in an out-of-line table also reduces the numbers of columns in the base table, thus avoiding '1000 column limit' errors during XML schema registration, when some elements have complex types with many elements.

### Also See:

*Oracle XML DB Developer's Guide*

There are three overloads.

### Syntax

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the named element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFFLINE (
  xmlschema          IN OUT XMLType,
  elementName        IN      VARCHAR2,
```

```
elementType      IN      VARCHAR2,
defaultTableName  IN      VARCHAR2,
overwrite         IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE`, forcing out-of-line storage for the element specified by its local and global name.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
  xmlschema      IN OUT XMLType,
  globalObject    IN      VARCHAR2,
  globalObjectName IN    VARCHAR2,
  localElementName IN    VARCHAR2,
  defaultTableName IN    VARCHAR2,
  overwrite       IN      BOOLEAN DEFAULT TRUE);
```

Sets the `SQLInline` attribute to `FALSE` to force out-of-line storage and sets the default table name for all references to a particular global element.

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (
  xmlschema      IN OUT XMLType,
  reference       IN      VARCHAR2,
  defaultTableName IN    VARCHAR2,
  overwrite       IN      BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 215-22 SETOUTOFLINE Procedure Parameters**

| Parameter                     | Description                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>xmlschema</code>        | The XML schema to be annotated.                                                                                         |
| <code>elementName</code>      | The element name                                                                                                        |
| <code>elementType</code>      | The element type                                                                                                        |
| <code>defaultTableName</code> | The name of the default table.                                                                                          |
| <code>globalObject</code>     | The global object (global complex type or global element)                                                               |
| <code>globalObjectName</code> | The name of the global object                                                                                           |
| <code>localElementName</code> | The name of a local element that descends from the global element.                                                      |
| <code>reference</code>        | A reference to a global element                                                                                         |
| <code>overwrite</code>        | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

## Usage Notes

After XML schema registration and before loading XML instance data, use `DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES()` to make these references scope to the out-of-line table only. This ensures better query performance later on.

## Example

The following example illustrates the third overloaded method. The element comment will have an annotation similar to `xdb:defaultTable="CMMNT_DEFAULT_TABLE"`

```
DECLARE
  xml_schema xmltype;
BEGIN
  SELECT OUT INTO xml_schema FROM annotation_tab;
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETOUTOFLINE (xml_schema,
                                     'ipo:comment',
                                     'CMMNT_DEFAULT_TABLE');
UPDATE annotation_tab SET OUT = xml_schema;
END;
/
```

## 215.3.22 SETSCHEMAANNOTATIONS Procedure

This procedure takes the annotated differences resulting from a call to DBMS\_XMLSCHEMA\_ANNOTATE.GETSCHEMAANNOTATIONS and patches them into the provided XML schema.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSCHEMAANNOTATIONS (
    xmlschema      IN OUT xmlType,
    annotations    IN VARCHAR2);
```

### Parameters

**Table 215-23 SETSCHEMAANNOTATIONS Procedure Parameters**

| Parameter   | Description                                                                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| xmlschema   | An XML schema to be patched.                                                                                                                      |
| annotations | The differences document produced by calling DBMS_XMLSCHEMA_ANNOTATE.GETSCHEMAANNOTATIONS on the original XML schema and an annotated XML schema. |

### Usage Notes

DBMS\_XMLSCHEMA\_ANNOTATE.SETSCHEMAANNOTATIONS is not available on Oracle Database release 10.2 (only Oracle Database release 11.x).

**See Also:**

[GETSCHEMAANNOTATIONS Function](#)

### Example

The following example illustrates DBMS\_XMLSCHEMA\_ANNOTATE.SETSCHEMAANNOTATIONS shown here and [GETSCHEMAANNOTATIONS Function](#).

```
-- test getannotations and apply them
declare
    xml_schema xmltype;
    xml_schema2 xmltype;
    annotations xmltype;
begin
    select out into xml_schema from annotation_tab;

    -- get the annotations from the schema
    annotations := DBMS_XMLSCHEMA_ANNOTATE.getSchemaAnnotations (xml_schema);
```

```

-- apply the annotations to the schema
select inp into xml_schema2 from annotation_tab;

DBMS_XMLSCHEMA_ANNOTATE.setSchemaAnnotations(xml_schema2, annotations);

update annotation_tab t set t.out = xml_schema2;
end;
/

```

## 215.3.23 SETSQLCOLLTYPE Procedure

This procedure assigns a SQL type name for a collection. A collection is a global or local element with `maxOccurs>1`.

Using this procedure, XDB creates `SQLTypes` with the user-defined names provided.

There are two overloads. The first sets the name of the SQL collection type corresponding to an XML element and the second to an XML element inside the specified complex type.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
    xmlschema          IN OUT  XMLTYPE,
    elementName        IN     VARCHAR2,
    sqlCollType        IN     VARCHAR2,
    overwrite          IN     BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLCOLLTYPE (
    xmlschema          IN OUT XMLType,
    globalObject       IN  VARCHAR2,
    globalObjectName   IN  VARCHAR2,
    localElementName   IN  VARCHAR2,
    sqlCollType        IN  VARCHAR2,
    overwrite          IN  BOOLEAN default TRUE );

```

### Parameters

**Table 215-24 SETSQLCOLLTYPE Procedure Parameters**

| Parameter                     | Description                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>xmlschema</code>        | The XML schema to be annotated                                                                                          |
| <code>elementName</code>      | The element name                                                                                                        |
| <code>sqlCollType</code>      | The SQL collection type                                                                                                 |
| <code>globalObject</code>     | The global object (global complex type or global element)                                                               |
| <code>globalObjectName</code> | The name of the global object                                                                                           |
| <code>localElementName</code> | The name of a local element that descends from the global element                                                       |
| <code>overwrite</code>        | A boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

### Example

The `item` element will have an annotation similar to `xdb:SQLCollType="ITEM_SQL_COL_TYPE"`.

```

declare
    xml_schema xmltype;
begin

```

```

SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLCollType (xml_schema,
                                         'item',
                                         'ITEM_SQL_COL_TYPE',TRUE);
UPDATE annotation_tab SET out = xml_schema;
end;

```

## 215.3.24 SETSQLNAME Procedure

This procedure assigns a name to the SQL attribute that corresponds to an element defined in the XML schema.

### Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (
  xmlschema          IN OUT XMLType,
  globalObject       IN      VARCHAR2,
  globalObjectName   IN      VARCHAR2,
  localObject        IN      VARCHAR2,
  localObjectName    IN      VARCHAR2,
  sqlName            IN      VARCHAR2,
  overwrite          IN      BOOLEAN DEFAULT TRUE);

```

### Parameters

**Table 215-25 SETSQLNAME Procedure Parameters**

| Parameter        | Description                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------|
| xmlschema        | XML schema to be annotated                                                                              |
| globalObject     | Global object (global complex type or global element)                                                   |
| globalObjectName | Name of the global object                                                                               |
| localObject      | Object descended from the global object                                                                 |
| localObjectName  | Name of the local object                                                                                |
| sqlName          | Name of the SQL attribute that corresponds to the element defined in the XML schema                     |
| overwrite        | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

### Example

The `shipTo` element will have an annotation similar to `xdb:SQLName="SHIPTO_SQLNAME"`.

```

DECLARE
  xml_schema  XMLTYPE;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.SETSQLNAME (xml_schema,
                                       'element', 'purchaseOrder',
                                       'element', 'shipTo',
                                       'SHIPTO_SQLNAME');
  UPDATE annotation_tab SET out = xml_schema;
END;
/

```

## 215.3.25 SETSQLTYPE Procedure

This procedure assigns a SQL type to a global object.

There are two overloads. The first overload assigns a SQL Type to a global object, such as a global element or global complex type and the second to a local object.

### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
  xmlschema           IN OUT  XMLTYPE,
  globalElementName   IN      VARCHAR2,
  sqlType             IN      VARCHAR2,
  overwrite            IN      BOOLEAN DEFAULT TRUE);
```

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE (
  xmlschema           IN OUT  XMLTYPE,
  globalObject        IN      VARCHAR2,
  globalObjectName    IN      VARCHAR2,
  localObject          IN      VARCHAR2,
  localObjectName      IN      VARCHAR2,
  sqlType             IN      VARCHAR2,
  overwrite            IN      BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 215-26 SETSQLTYPE Procedure Parameters**

| Parameter         | Description                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------|
| xmlschema         | XML schema to be annotated                                                                              |
| globalObject      | Global object (global complex type or global element)                                                   |
| globalObjectName  | Name of the global object                                                                               |
| globalElementName | Name of the global element                                                                              |
| localObject       | Object descended from the global object                                                                 |
| localObjectName   | Name of the local object                                                                                |
| sqlType           | SQL type assigned to the named global element                                                           |
| overwrite         | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

### Example

The purchaseOrder element will have an annotation similar to xdb:SQLType="PO\_SQLTYPE" and the shipTo element has one similar to xdb:SQLType="VARCHAR".

```
DECLARE
  xml_schema  xmltype;
BEGIN
  SELECT out INTO xml_schema FROM annotation_tab;
  DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
                                     'purchaseOrder',
                                     'PO_SQLTYPE');
  UPDATE annotation_tab SET out = xml_schema;
END;
/
```

```
DECLARE    xml_schema    xmltype;BEGIN  SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.setSQLType (xml_schema,
'element','purchaseOrder',
'element','shipTo',
'VARCHAR');  UPDATE
annotation_tab SET out = xml_schema;END;
/
```

### 215.3.26 SETSQLTYPE\_MAPPING Procedure

This procedure defines a mapping of schema type and SQL type.

If you use this procedure, you do not need to call the `SETSQLTYPE` procedure on all instances of the schema type; instead the procedure traverses the schema and assigns the SQL type automatically.

#### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETSQLTYPE_MAPPING (
    xmlschema          IN OUT  XMLType,
    schemaTypeName     IN      VARCHAR2,
    sqlTypeName        IN      VARCHAR2,
    overwrite          IN      BOOLEAN DEFAULT TRUE);
```

#### Parameters

**Table 215-27** SETSQLTYPE\_MAPPING Procedure Parameters

| Parameter      | Description                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------|
| xmlschema      | XML schema to be annotated                                                                             |
| schemaTypeName | Schema type                                                                                            |
| sqlTypeName    | Name of the SQL type                                                                                   |
| overwrite      | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE |

#### Example

The attribute `orderDate` will have an annotation similar to `xdb:SQLType="DATE"`.

```
declare    xml_schema xmltype;beginSELECT out INTO xml_schema FROM
annotation_tab;DBMS_XMLSCHEMA_ANNOTATE.setSQLTypeMapping
(xml_schema,
'date',
'DATE');UPDATE annotation_tab SET out =
xml_schema;end;
/
```

### 215.3.27 SETTABLEPROPS Procedure

This procedure specifies properties in the `TABLE` storage clause that is appended to the default `CREATE TABLE` statement.

There are two overloads with different parameter requirements, as indicated:

#### Syntax

```
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
    xmlschema          IN OUT  XMLType,
```

```

globalElementName  IN      VARCHAR2,
tableProps         IN      VARCHAR2,
overwrite          IN      BOOLEAN DEFAULT TRUE);

```

```

DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS (
  xmlschema         IN OUT  XMLTYPE,
  globalObject      IN      VARCHAR2,
  globalObjectName  IN      VARCHAR2,
  localElementName  IN      VARCHAR2,
  tableProps        IN      VARCHAR2,
  overwrite         IN      BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 215-28 SETTABLEPROPS Procedure Parameters**

| Parameter         | Description                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------|
| xmlschema         | XML schema to be annotated                                                                              |
| globalElementName | Name of the global element in the schema                                                                |
| tableProps        | Table properties                                                                                        |
| globalObject      | Global object (global complex type or global element)                                                   |
| globalObjectName  | Name of the global object                                                                               |
| localElementName  | Name of a local element that descends from the global element                                           |
| overwrite         | Boolean that indicates whether or not the procedure overwrites element attributes. The default is TRUE. |

## Example

The `purchaseOrder` element will have an annotation similar to `xdb:tableProps="CACHE"`.

```

DECLARE  xml_schema XMLTYPE; BEGIN  SELECT out INTO xml_schema FROM annotation_tab;
DBMS_XMLSCHEMA_ANNOTATE.SETTABLEPROPS(xml_schema,
'purchaseOrder' , 'CACHE');  UPDATE annotation_tab SET out = xml_schema;END;
/

```

## 215.3.28 SETTIMESTAMPWITHTIMEZONE Procedure

This procedure sets the `TIMESTAMPWITHTIMEZONE` datatype to all `dateTime` typed elements in the XML schema.

This is equivalent to adding `xdb:SQLType="TIMESTAMP WITH TIME ZONE"` to all `dateTime` objects.

## Syntax

```

DBMS_XMLSCHEMA_ANNOTATE.SETTIMESTAMPWITHTIMEZONE (
  xmlschema         IN OUT  XMLTYPE,
  overwrite         IN      BOOLEAN DEFAULT TRUE);

```

## Parameters

**Table 215-29 SETTIMESTAMPWITHTIMEZONE Procedure Parameters**

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| xmlschema | XML schema to be annotated                                                                                            |
| overwrite | Boolean that indicates whether or not the procedure overwrites element attributes. The default is <code>TRUE</code> . |

# DBMS\_XMLSCHEMA\_UTIL

The `DBMS_XMLSCHEMA_UTIL` package provides an interface for XML schema validation.

This chapter contains the following topics:

- [DBMS\\_XMLSCHEMA\\_UTIL Security Model](#)
- [Summary of DBMS\\_XMLSCHEMA\\_UTIL Subprograms](#)

 **See Also:**

- *Oracle XML DB Developer's Guide*

## 216.1 DBMS\_XMLSCHEMA\_UTIL Security Model

Applications must have the `EXECUTE` privilege on the `DBMS_XMLSCHEMA_UTIL` package

## 216.2 Summary of DBMS\_XMLSCHEMA\_UTIL Subprograms

This topic lists the `DBMS_XMLSCHEMA_UTIL` subprograms in alphabetical order and briefly describes them.

**Table 216-1** *DBMS\_XMLSCHEMA\_UTIL Package Subprograms*

| Subprogram                          | Description                                |
|-------------------------------------|--------------------------------------------|
| <a href="#">CONFORMING Function</a> | Validates an XML document against a schema |
| <a href="#">VALIDATE Procedure</a>  | Validates an XML document against a schema |

### 216.2.1 CONFORMING Function

This function is used to validate an XML document against a schema.

**Syntax**

```
DBMS_XMLSCHEMA_UTIL.CONFORMING (  
    doc          IN XMLTYPE,  
    sch          IN XMLTYPE)  
RETURN NUMBER;
```

## Parameters

**Table 216-2 CONFORMING Function Parameters**

| Parameter | Description      |
|-----------|------------------|
| doc       | The XML instance |
| sch       | The XML schema   |

## Function Exceptions

The exceptions of DBMS\_XMLSCHEMA\_UTIL.CONFORMING function are as follows:

- The function returns zero if the schema is legal and the document conforms to the schema; otherwise it returns an LSX error code from the schema validation.

### Note:

The function takes an xml data instance and xml schema instance. The user does not have to register the schema.

## Example: The document conforms to the schema

```
SELECT DBMS_XMLSCHEMA_UTIL.CONFORMING (
  XMLType('<A/>'),
  XMLType (
    '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
      <xs:element name="A" type="xs:string"/>
    </xs:schema>')) "LSX CODE"
FROM DUAL;
```

## 216.2.2 VALIDATE Procedure

This procedure is used to validate an XML document against a schema.

## Syntax

```
DBMS_XMLSCHEMA_UTIL.VALIDATE (
  doc          IN XMLTYPE,
  sch          IN XMLTYPE);
```

## Parameters

**Table 216-3 VALIDATE Procedure Parameters**

| Parameter | Description      |
|-----------|------------------|
| doc       | The XML instance |
| sch       | The XML schema   |

## Procedure Exceptions

The exceptions of DBMS\_XMLSCHEMA\_UTIL.VALIDATE procedure are as follows:

- The procedure raises ORA-31154 if either the schema is not legal, or the document does not conform to the schema.

**Note:**

The procedure takes an xml data instance and xml schema instance. The user does not have to register the schema.

**Example: The document conforms to the schema**

```
BEGIN
  DBMS_XMLSCHEMA_UTIL.VALIDATE(
    XMLType('<A/>'),
    XMLType(
      '<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
        <xs:element name="A" type="xs:string"/>
      </xs:schema>')
  );
END;
/
```

# DBMS\_XMLSTORAGE\_MANAGE

The `DBMS_XMLSTORAGE_MANAGE` package provides an interface to manage and modify XML storage after schema registration has been completed.

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Summary of DBMS\\_XMLSTORAGE\\_MANAGE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 217.1 DBMS\_XMLSTORAGE\_MANAGE Overview

`DBMS_XMLSTORAGE_MANAGE` contains procedures to manage and modify XML storage after schema registration has been completed.

Use subprograms from this package to improve the performance of bulk load operations. You can disable indexes and constraints before doing a bulk load process and to enable them afterwards.

## 217.2 DBMS\_XMLSTORAGE\_MANAGE Security Model

Owned by XDB, the `DBMS_XMLSTORAGE_MANAGE` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`.

Subprograms in this package are executed using the privileges of the current user.

## 217.3 Summary of DBMS\_XMLSTORAGE\_MANAGE Subprograms

This table lists and describes the `DBMS_XML_STORAGE` package subprograms.

**Table 217-1 DBMS\_XMLSTORAGE\_MANAGE Package Subprograms**

| Subprogram                                             | Description                                                                                                                         |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DISABLEINDEXESANDCONSTRAINTS Procedure</a> | Disables the indexes and constraints for <code>XMLType</code> tables and <code>XMLType</code> columns                               |
| <a href="#">ENABLEINDEXESANDCONSTRAINTS Procedure</a>  | Rebuilds all indexes and enables the constraints on an <code>XMLType</code> table including its child tables and out-of-line tables |

**Table 217-1 (Cont.) DBMS\_XMLSTORAGE\_MANAGE Package Subprograms**

| Subprogram                                        | Description                                                                                                                                                                                                               |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EXCHANGEPOSTPROC Procedure</a>        | Enable constraints after exchange partition                                                                                                                                                                               |
| <a href="#">EXCHANGEPREPROC Procedure</a>         | Disable constraints before exchange partition                                                                                                                                                                             |
| <a href="#">INDEXXMLREFERENCES Procedure</a>      | Creates unique indexes on the REF columns of the given XML type table or the XML type column of a given table                                                                                                             |
| <a href="#">REFPARTITIONEXCHANGEIN Procedure</a>  | This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided the child table has an xmltype column with a local xmlindex. |
| <a href="#">REFPARTITIONEXCHANGEOUT Procedure</a> | Auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.     |
| <a href="#">RENAMECOLLECTIONTABLE Procedure</a>   | Renames a collection table to the given table name                                                                                                                                                                        |
| <a href="#">SCOPEXMLREFERENCES Procedure</a>      | Scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types                                                                                            |
| <a href="#">XPATHT2TABCOLMAPPING Function</a>     | Maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name                                                                                                               |

## 217.3.1 DISABLEINDEXESANDCONSTRAINTS Procedure

This procedure disables the indexes and constraints for XMLType tables and XMLType columns.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS (
    owner_name    IN  VARCHAR2 DEFAULT USER,
    table_name    IN  VARCHAR2,
    column_name   IN  VARCHAR2 DEFAULT NULL,
    clear         IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 217-2 DISABLEINDEXESANDCONSTRAINTS Procedure Parameters**

| Parameter   | Description                                                                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner_name  | Owner's name                                                                                                                                                            |
| table_name  | Name of the XMLType table that the procedure is being performed on                                                                                                      |
| column_name | XMLType column name                                                                                                                                                     |
| clear       | Boolean that when set to TRUE clears all stored index and constraint data for the table before the procedure executes. The default is FALSE, which does not clear them. |

### Usage Notes

Passing XMLTYPE tables

For `XMLType` tables, you must pass the `XMLType` table name on which the bulk load operation is to be performed. For `XMLType` columns, you must pass the relational table name and the corresponding `XMLType` column name.

Using `clear` to Enable and Disable Indexes and Constraints

#### Note:

If the `DISABLEINDEXESANDCONSTRAINTS` procedure is called with `clear` set to `TRUE`, it removes any index or constraint information about the `XMLType` table or column memorized during earlier executions of the procedure.

Therefore, you must ensure that all disabled indexes and constraints are re-enabled on the table or column before you call the `DISABLEINDEXESANDCONSTRAINTS` procedure with `clear` set to `TRUE`.

Ideally, it is recommended that you set `clear` set to `TRUE` for the first execution. For any subsequent executions (due to errors while disabling or enabling indexes) `clear` should be set to `FALSE`, the default value. Once you have successfully re-enabled all the indexes and constraints following the bulk load operation, you can call this procedure again with `clear` set to `TRUE` for the next bulk load operation.

#### Example

The following example illustrates the use of `clear` in the `DISABLEINDEXESANDCONSTRAINTS` procedure and the [ENABLEINDEXESANDCONSTRAINTS Procedure](#).

First, add a not-NULL constraint on `comment` element of the `PURCHASEORDER_TAB` table:

```
ALTER TABLE PURCHASEORDER_TAB ADD CONSTRAINT c1 check          ("XMLDATA"."comment" IS
NOT NULL);
```

Then, disable all the indexes and constraints by passing the `clear` as `TRUE`, by calling the `DISABLEINDEXESANDCONSTRAINTS` procedure:

```
BEGIN
    XDB.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
                                ( USER, 'PURCHASEORDER_TAB', NULL, TRUE );
END;
/
```

Next, perform a bulk load operation (such as `datapump import`) which violates constraint `c1` in the `ALTER` table statement. This does not raise an error because the constraint is disabled:

```
host impdp orexample/orexample directory=dir dumpfile=dmp.txt
tables=OREXAMPLE.PURCHASEORDER_TAB content = DATA_ONLY;
```

**NOTE:** To view the disabled constraints and indexes use:

```
SELECT constraint_name, table_name, status FROM all_constraints
WHERE owner = user;
```

Finally, try to enable the constraint using the `ENABLEINDEXESANDCONSTRAINTS` procedure. It raises an error because `c1`, the not null constraint, is violated by the bulk load operation:

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB');
END;
/
```

To disable all the indexes and constraints, again use `DISABLEINDEXESANDCONSTRAINTS`, but set `clear= FALSE` (because the `ENABLEINDEXESANDCONSTRAINTS` failed to complete successfully).

**Note:** `clear = FALSE` by default, so we do not need to pass it explicitly in the next call.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.DISABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB');
END;
/
```

Then, delete the incorrect rows entered into the table

```
DELETE FROM purchaseorder_tab p
  WHERE p.xmldata."comment" IS NULL;
```

Re-enable the indexes and constraints using `ENABLEINDEXESANDCONSTRAINTS`, which completes successfully.

```
BEGIN
  xdb.DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS
    ( USER, 'PURCHASEORDER_TAB');
END;
/
```

## 217.3.2 ENABLEINDEXESANDCONSTRAINTS Procedure

This procedure rebuilds all indexes and enables the constraints on an `XMLType` table including its child tables and out-of-line tables.

When `column_name` is passed, it does the same for this `XMLType` column.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.ENABLEINDEXESANDCONSTRAINTS (
  owner_name   IN VARCHAR2 DEFAULT USER,
  table_name   IN VARCHAR2,
  column_name  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 217-3** ENABLEINDEXESANDCONSTRAINTS Procedure Parameters

| Parameter                | Description                                                               |
|--------------------------|---------------------------------------------------------------------------|
| <code>owner_user</code>  | Owner's name                                                              |
| <code>table_name</code>  | Name of the table that the indexes and constraints are being removed from |
| <code>column_name</code> | Column name                                                               |

### Usage Notes

This procedure reverses [DISABLEINDEXESANDCONSTRAINTS Procedure](#).

### Example

See [DISABLEINDEXESANDCONSTRAINTS Procedure](#)

## 217.3.3 EXCHANGEPOSTPROC Procedure

This procedure enable constraints after exchange partition.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPOSTPROC (  
    owner_name    IN VARCHAR2 DEFAULT USER,  
    table_name    IN VARCHAR2);
```

### Parameters

**Table 217-4 EXCHANGEPOSTPROC Procedure Parameters**

| Parameter  | Description                                                               |
|------------|---------------------------------------------------------------------------|
| owner_user | Owner's name                                                              |
| table_name | Name of the table that the indexes and constraints are being removed from |

## 217.3.4 EXCHANGEPREPROC Procedure

This procedure disable constraints before exchange partition.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.EXCHANGEPREPROC (  
    owner_name    IN VARCHAR2 DEFAULT USER,  
    table_name    IN VARCHAR2);
```

### Parameters

**Table 217-5 EXCHANGEPREPROC Procedure Parameters**

| Parameter  | Description                                                               |
|------------|---------------------------------------------------------------------------|
| owner_user | Owner's name                                                              |
| table_name | Name of the table that the indexes and constraints are being removed from |

## 217.3.5 INDEXXMLREFERENCES Procedure

This procedure creates unique indexes on the `REF` columns of the given XML type table or the XML type column of a given table.

If the procedure creates multiple `REF` columns, it appends `_1`, `_2`, and so on to their names.

## Syntax

```
DBMS_XMLSTORAGE_MANAGE.INDEXXMLREFERENCES (  
    owner_name      IN VARCHAR2 DEFAULT USER,  
    table_name      IN VARCHAR2,  
    column_name     IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 217-6 INDEXXMLREFERENCES Procedure Parameters**

| Parameter   | Description                                    |
|-------------|------------------------------------------------|
| owner_name  | The owner's name                               |
| table_name  | The table being indexed                        |
| column_name | A column name. Not needed for XML type tables. |
| index_name  | The name of the newly created index            |

## Usage Notes

This procedure is only used if the REFS are scoped. See [SCOPEXMLREFERENCES Procedure](#).

Indexed REFS lead to better performance when joins between the base table and a child table occur in the query plan.

- If the base table has a higher selectivity than the child table, there is no need to index the REFS.
- If the selectivity of the child table is higher than that of the base table and if no indexes are present, then the join of one row in the child table with the base table leads to a full table scan of the base table.

INDEXXMLREFERENCES does not index REFS recursively in child tables of a table it is called on. To do this, Oracle recommends calling the procedure from within a loop over the XML\_OUT\_OF\_LINE\_TABLES or XML\_NESTED\_TABLES view. This creates the index names from the current value of a column in the view.

### Note:

This procedure is limited to the structured storage model.

## 217.3.6 REFPARTITIONEXCHANGEIN Procedure

This is an auxiliary procedure to load data through exchange partition operation into a partitioned table and its reference-partitioned child table provided that the child table has an xmltype column with a local xmlindex.

## Syntax

```
DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEIN (  
    owner_name      IN VARCHAR2,  
    parent_table_name IN VARCHAR2,
```

```

child_table_name          IN VARCHAR2,
parent_exchange_table_name IN VARCHAR2,
child_exchange_table_name IN VARCHAR2,
parent_exchange_stmt      IN CLOB,
child_exchange_stmt       IN CLOB);

```

### Parameters

**Table 217-7 REFPARTITIONEXCHANGEIN Parameters**

| Parameter                  | Description                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| owner_name                 | owner's name                                                                                                                                                             |
| parent_table_name          | the partitioned base table                                                                                                                                               |
| child_table_name           | a partitioned table with reference partitioning based on the table named <code>parent_table_name</code>                                                                  |
| parent_exchange_table_name | an exchange table for the partitioned base table                                                                                                                         |
| child_exchange_table_name  | an exchange table for the table named <code>child_table_name</code>                                                                                                      |
| parent_exchange_stmt       | SQL statement to execute exchange partition operation between the table named <code>parent_table_name</code> and the table named <code>parent_exchange_table_name</code> |
| child_exchange_stmt        | SQL statement to execute exchange partition operation between the table named <code>child_table_name</code> and the table named <code>child_exchange_table_name</code>   |

## 217.3.7 REFPARTITIONEXCHANGEOUT Procedure

This is an auxiliary procedure to load data through exchange partition operation out of a partitioned table and its reference-partitioned child table provided that the child table has an `xmltype` column with a local `xmlindex`.

### Syntax

```

DBMS_XMLSTORAGE_MANAGE.REFPARTITIONEXCHANGEOUT (
  owner_name          IN VARCHAR2,
  parent_table_name   IN VARCHAR2,
  child_table_name     IN VARCHAR2,
  parent_exchange_table_name IN VARCHAR2,
  child_exchange_table_name IN VARCHAR2,
  parent_exchange_stmt IN CLOB,
  child_exchange_stmt  IN CLOB);

```

### Parameters

**Table 217-8 REFPARTITIONEXCHANGEOUT Parameters**

| Parameter  | Description  |
|------------|--------------|
| owner_name | owner's name |

**Table 217-8 (Cont.) REFPARTITIONEXCHANGEOUT Parameters**

| Parameter                  | Description                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parent_table_name          | the partitioned base table                                                                                                                                               |
| child_table_name           | a partitioned table with reference partitioning based on the table named <code>parent_table_name</code>                                                                  |
| parent_exchange_table_name | an exchange table for the partitioned base table                                                                                                                         |
| child_exchange_table_name  | an exchange table for the table named <code>child_table_name</code>                                                                                                      |
| parent_exchange_stmt       | SQL statement to execute exchange partition operation between the table named <code>parent_table_name</code> and the table named <code>parent_exchange_table_name</code> |
| child_exchange_stmt        | SQL statement to execute exchange partition operation between the table named <code>child_table_name</code> and the table named <code>child_exchange_table_name</code>   |

## 217.3.8 RENAMECOLLECTIONTABLE Procedure

This procedure renames a collection table to the given table name.

An XPath expression specifies the collection table, starting from the `XMLType` base table or an `XMLType` column of the base table.

This procedure provides the only way to derive a collection table name from the corresponding collection type name because there is no direct schema annotation for the purpose.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    owner_name          IN VARCHAR2 DEFAULT USER,
    table_name          IN VARCHAR2,
    column_name         IN VARCHAR2 DEFAULT NULL,
    xpath               IN VARCHAR2,
    collection_table_name IN VARCHAR2
    namespaces          IN VARCHAR2 default NULL); // For release 11.2 only
```

### Parameters

**Table 217-9 RENAMECOLLECTIONTABLE Procedure Parameters**

| Parameter             | Description                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------|
| owner_name            | The name of the owner                                                                               |
| table_name            | The name of a base table that can be used as the starting point for specifying the collection table |
| column_name           | An <code>XMLType</code> column that can be the starting point for specifying the collection table   |
| xpath                 | The XPath expression that specifies the collection table                                            |
| collection_table_name | The name of the collection table                                                                    |

**Table 217-9 (Cont.) RENAMECOLLECTIONTABLE Procedure Parameters**

| Parameter  | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| namespaces | For Oracle Database 11g Release 2 (11.2) and higher. The namespaces used in XPath. |

### Usage Notes

Call this procedure after registering the XML schema.

The table name serves as a prefix to the index names.

Oracle recommends using this function because it makes query execution plans more readable.

Report errors that occur while this procedure runs to the user that called the procedure.

#### Note:

This procedure is limited to the structured storage model.

For Oracle Database 11g Release 2 (11.2) and higher, only, this function accepts XPath notation as well as DOT notation. If XPath notation is used, a `namespaces` parameter may also be required.

### Example

The collection table name will be `EMP_TAB_NAMELIST`. You can verify this using `SELECT * FROM user_nested_tables`.

Using DOT Notation:

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '"XMLDATA"."EMPLOYEE"."NAME"',
    'EMP_TAB_NAMELIST');
```

Using XPath Notation:

XPath notation is available with Oracle Database 11g Release 2 (11.2) and higher.

```
call XDB.DBMS_XMLSTORAGE_MANAGE.RENAMECOLLECTIONTABLE (
    USER,
    'EMP_TAB',
    NULL,
    '/e:Employee/Name',
    'EMP_TAB_NAMELIST',
    '"http://www.oracle.com/emp.xsd"' as "e");
```

## 217.3.9 SCOPEXMLREFERENCES Procedure

This procedure scopes all XML references. Scoped REF types require less storage space and allow more efficient access than unscoped REF types.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.SCOPEXMLREFERENCES;
```

### Usage Notes

- If you have used [SETOUTOFFLINE Procedure](#) in the [DBMS\\_XMLSTORAGE\\_MANAGE](#) package to avoid raising '1000 column limit' errors during XML schema registration, you should also use [SCOPEXMLREFERENCES Procedure](#).
- Using SCOPEXMLREFERENCES after XML schema registration and before loading XML instance data, makes these reference scoped to the out-of-line table only.

### Note:

This procedure is limited to the structured storage model.

## 217.3.10 XPATH2TABCOLMAPPING Function

This function maps a path expression (in XPath notation or DOT notations) to the corresponding table name and column name. This is necessary in cases in which the user wants to create an index on this table, or to add a constraint, or to rename a table to make query execution plans more readable.

### Syntax

```
DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
  owner_name   IN  VARCHAR2 DEFAULT USER,
  table_name    IN  VARCHAR2,
  column_name   IN  VARCHAR2 DEFAULT NULL,
  xpath         IN  VARCHAR2,
  namespaces    IN  VARCHAR2 DEFAULT NULL)
RETURN XMLTYPE;
```

### Parameters

**Table 217-10 XPATH2TABCOLMAPPING Procedure Parameters**

| Parameter   | Description                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| owner_user  | Owner's name                                                                                                                                       |
| table_name  | Name of the base table                                                                                                                             |
| column_name | Optional name of the XML type column if table_name is not an XMLtype table. If table_name refers to XMLType table then column_name should be NULL. |
| xpath       | Path expression in DOT notation or XPath notation (see examples below)                                                                             |

**Table 217-10 (Cont.) XPATH2TABCOLMAPPING Procedure Parameters**

| Parameter  | Description                                        |
|------------|----------------------------------------------------|
| namespaces | Optional namespace definitions for path expression |

### Examples

XPath2TabColMapping evaluated on XMLType table with Xpath Notation, namespaces provided

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
    USER, 'XML_TAB', '', '//n1:item/n1:location','xdbXmark' as "n1")
FROM DUAL;
```

This produces a result, for example:

```
<Result>
<Mapping TableName="SYS_NT12345" ColumnName="location"/>
</Result>
```

This allows us to define an index or constraint on table SYS\_NT12345 and column location.

XPath2TabColMapping evaluated on table not of XMLType but with XMLType column by means of DOT notation

```
SELECT XDB.DBMS_XMLSTORAGE_MANAGE.XPATH2TABCOLMAPPING (
    USER, 'PurchaseOrderTab', 'XMLCOL', 'xmldata.LineItems.LineItem', '')
FROM DUAL;
```

# DBMS\_XMLSTORE

DBMS\_XMLSTORE provides the ability to store XML data in relational tables.

This chapter contains the following sections:

- [Security Model](#)
- [Types](#)
- [Summary of DBMS\\_XMLSTORE Subprograms](#)

## See Also:

*Oracle XML DB Developer's Guide*

## 218.1 DBMS\_XMLSTORE Security Model

Owned by XDB, the DBMS\_XMLSTORE package must be created by SYS or XDB. The EXECUTE privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

## 218.2 Types

The DBMS\_XMLSTORE subprograms use the ctxType Type.

**Table 218-1** *Types of DBMS\_XMLSTORE*

| Type    | Description                                                                                   |
|---------|-----------------------------------------------------------------------------------------------|
| ctxType | The type of the query context handle. This is the return type of <a href="#">NEWCONTEXT</a> . |

## 218.3 Summary of DBMS\_XMLSTORE Subprograms

This table lists the DBMS\_XMLSTORE subprograms and briefly describes them.

**Table 218-2** *DBMS\_XMLSTORE Package Subprograms*

| Method                                | Description                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <a href="#">CLEARKEYCOLUMNLIST</a>    | Clears the key column list.                                                                                     |
| <a href="#">CLEARUPDATECOLUMNLIST</a> | Clears the update column list.                                                                                  |
| <a href="#">CLOSECONTEXT</a>          | It closes/deallocates a particular save context.                                                                |
| <a href="#">DELETEXML</a>             | Deletes records specified by data from the XML document, from the table specified at the context creation time. |

**Table 218-2 (Cont.) DBMS\_XMLSTORE Package Subprograms**

| Method                          | Description                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------|
| <a href="#">INSERTXML</a>       | Inserts the XML document into the table specified at the context creation time.                     |
| <a href="#">NEWCONTEXT</a>      | Creates a save context, and returns the context handle.                                             |
| <a href="#">SETKEYCOLUMN</a>    | This method adds a column to the key column list.                                                   |
| <a href="#">SETROWTAG</a>       | Names the tag used in the XML document., to enclose the XML elements corresponding to the database. |
| <a href="#">SETUPDATECOLUMN</a> | Adds a column to the "update column list".                                                          |
| <a href="#">UPDATEXML</a>       | Updates the table given the XML document.                                                           |

## 218.3.1 CLEARKEYCOLUMNLIST

This procedure clears the key column list.

### Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

**Table 218-3 CLEARKEYCOLUMNLIST Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 218.3.2 CLEARUPDATECOLUMNLIST

This procedure clears the update column list.

### Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

**Table 218-4 CLEARUPDATECOLUMNLIST Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 218.3.3 CLOSECONTEXT

This procedure closes/deallocates a particular save context.

### Syntax

```
PROCEDURE closeContext(ctxHdl IN ctxType);
```

**Table 218-5 CLOSECONTEXT Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |

## 218.3.4 DELETXML

**DELETXML** deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

### Syntax

The following syntax uses a `VARCHAR2` type for the `xDoc` parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxPType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

The following syntax uses a `CLOB` type for the `xDoc` parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax uses an `XMLType` type for the `xDoc` parameter.

```
FUNCTION deleteXML(  
    ctxHdl IN ctxType,  
    xDoc IN XMLType)  
RETURN NUMBER;
```

### Parameters

**Table 218-6 DELETXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

## 218.3.5 INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for `insertXML` to `DBMS_XMLSTORE` that contains extra elements (elements that do not match any columns in the table), Oracle tries to insert into

those columns unless **SETUPDATECOLUMN** is used. The use of `setUpdateColumn` is optional only if the elements in the XML file match up to the columns in the table.

### Syntax

```
FUNCTION insertXML(  
    ctxHdl IN ctxType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

```
FUNCTION insertXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

```
FUNCTION insertXML(  
    ctxHdl IN ctxType,  
    xDoc IN XMLType)  
RETURN NUMBER;
```

### Parameters

**Table 218-7 INSERTXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

## 218.3.6 NEWCONTEXT

**NEWCONTEXT** creates a save context and returns the context handle.

### Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

**Table 218-8 NEWCONTEXT Function Parameters**

| Parameter   | IN / OUT | Description                                           |
|-------------|----------|-------------------------------------------------------|
| targetTable | (IN)     | The target table into which to load the XML document. |

## 218.3.7 SETKEYCOLUMN

This method adds a column to the "key column list".

The value for the column cannot be **NULL**. In case of update or delete, the columns in the key column list make up the **WHERE** clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

### Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

**Table 218-9 SETKEYCOLUMN Procedure Parameters**

| Parameter | IN / OUT | Description                                                |
|-----------|----------|------------------------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                                            |
| colName   | (IN)     | Column to be added to the key column list; cannot be NULL. |

## 218.3.8 SETROWTAG

This procedure names the tag used in the XML document, to enclose the XML elements corresponding to database records.

### Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

**Table 218-10 SETROWTAG Procedure Parameters**

| Parameter | IN / OUT | Description     |
|-----------|----------|-----------------|
| ctxHdl    | (IN)     | Context handle. |
| tag       | (IN)     | Tag name.       |

## 218.3.9 SETUPDATECOLUMN

SETUPDATECOLUMN adds a column to the update column list.

In case of insert, the default is to insert values to all the columns in the table. In case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for [INSERTXML](#) to DBMS\_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

### Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

**Table 218-11    SETUPDATECOLUMN Procedure Parameters**

| Parameter | IN / OUT | Description                                   |
|-----------|----------|-----------------------------------------------|
| ctxHdl    | (IN)     | Context handle.                               |
| colName   | (IN)     | Column to be added to the update column list. |

## 218.3.10 UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated.

The options are described in the following table.

### Syntax

The following syntax passes the `xDoc` parameter as a `VARCHAR2`.

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,  
    xDoc IN VARCHAR2)  
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `CLOB`.

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,  
    xDoc IN CLOB)  
RETURN NUMBER;
```

The following syntax passes the `xDoc` parameter as a `XMLType`.

```
FUNCTION updateXML(  
    ctxHdl IN ctxType,  
    xDoc IN XMLType)  
RETURN NUMBER;
```

### Parameters

**Table 218-12    UPDATEXML Function Parameters**

| Parameter | IN / OUT | Description                         |
|-----------|----------|-------------------------------------|
| ctxHdl    | (IN)     | Context handle.                     |
| xDoc      | (IN)     | String containing the XML document. |

## DBMS\_XPLAN

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats.

You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

### See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database SQL Tuning Guide*.
- For more information on the `V$SQL_PLAN` fixed view, see *Oracle Database Reference*
- For more information on the `V$SQL_PLAN_STATISTICS` fixed view, see *Oracle Database Reference*

This chapter contains the following topics:

- [Overview](#)
- [Security Model](#)
- [Examples](#)
- [Summary of DBMS\\_XPLAN Subprograms](#)

## 219.1 DBMS\_XPLAN Overview

The `DBMS_XPLAN` package supplies five table functions.

These functions are listed below:

- `DISPLAY` - to format and display the contents of a plan table.
- `DISPLAY_AWR` - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- `DISPLAY_CURSOR` - to format and display the contents of the execution plan of any loaded cursor.
- `DISPLAY_SQL_PLAN_BASELINE` - to display one or more execution plans for the SQL statement identified by SQL handle
- `DISPLAY_SQLSET` - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

## 219.2 DBMS\_XPLAN Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function `DISPLAY_CURSOR` requires `SELECT` or `READ` privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`. This function also requires `SELECT/READ` permissions on `V$SQL`.

`DISPLAY_AWR` Function requires the user to have `SELECT` or `READ` privileges on `DBA_HIST_SQL_PLAN`, `AWR_ROOT_SQL_PLAN`, `AWR_PDB_SQL_PLAN`, `AWR_ROOT_SQLTEXT`, `DBA_HIST_SQLTEXT`, `AWR_PDB_SQLTEXT`, and `V$DATABASE`.

`DISPLAY_SQLSET` Function requires the user to have the `SELECT` or `READ` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

`DISPLAY_SQL_PLAN_BASELINE` Function requires the user to have the `SELECT` or `READ` privilege on `DBA_SQL_PLAN_BASELINES` as well as the privileges to execute the SQL statement for which the user is trying to get the plan.

The preceding privileges are granted automatically as part of `SELECT_CATALOG_ROLE`.

## 219.3 DBMS\_XPLAN Data Structures

The `DBMS_XPLAN` package defines a `TABLE` type.

### Table Types

- `DBMS_XPLAN PLAN_OBJECT_LIST` Table Type

### 219.3.1 DBMS\_XPLAN PLAN\_OBJECT\_LIST Table Type

This type allows for a list of generic objects as input to the `COMPARE_PLANS` function.

#### Syntax

```
TYPE plan_object_list IS TABLE OF generic_plan_object;
```

The generic object abstracts the common attributes of plans from all plan sources. Every plan source is a subclass of the `plan_object_list` superclass. The following table summarizes the different plan sources. Note that when an optional parameter is null, it can correspond to multiple objects. For example, if you do not specify a child number for `cursor_cache_object`, then it matches all cursor cache statements with the specified SQL ID.

**Table 219-1 Plan Sources for PLAN\_OBJECT\_LIST**

| Plan Source         | Specification                                                                           | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Plan table          | <code>plan_table_object(owner,<br/>plan_table_name, statement_id,<br/>plan_id)</code>   | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>owner</code>—The owner of the plan table</li> <li><code>plan_table_name</code>—The name of the plan table</li> <li><code>statement_id</code>—The ID of the statement (optional)</li> <li><code>plan_id</code>—The ID of the plan (optional)</li> </ul>          |
| Cursor cache        | <code>cursor_cache_object(sql_id,<br/>child_number)</code>                              | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>sql_id</code>—The SQL ID of the plan</li> <li><code>child_number</code>—The child number of the plan in the cursor cache (optional)</li> </ul>                                                                                                                  |
| AWR                 | <code>awr_object(sql_id, dbid,<br/>con_dbid, plan_hash_value)</code>                    | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>sql_id</code>—The SQL ID of the plan</li> <li><code>dbid</code>—The database ID (optional)</li> <li><code>con_dbid</code>—The CDB ID (optional)</li> <li><code>plan_hash_value</code>—The hash value of the plan (optional)</li> </ul>                          |
| SQL tuning set      | <code>sqlset_object (sqlset_owner,<br/>sqlset_name, sql_id,<br/>plan_hash_value)</code> | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>sqlset_owner</code>—The owner of the SQL tuning set</li> <li><code>sqlset_name</code>—The name of the SQL tuning set</li> <li><code>sql_id</code>—The SQL ID of the plan</li> <li><code>plan_hash_value</code>—The hash value of the plan (optional)</li> </ul> |
| SQL plan management | <code>spm_object (sql_handle,<br/>plan_name)</code>                                     | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>sql_handle</code>—The SQL handle of plans protected by SQL plan management</li> <li><code>plan_name</code>—The name of the SQL plan baseline (optional)</li> </ul>                                                                                              |
| SQL profile         | <code>sql_profile_object<br/>(profile_name)</code>                                      | <p>The <code>profile_name</code> parameter specifies the name of the SQL profile.</p>                                                                                                                                                                                                                                                              |
| Advisor             | <code>advisor_object (task_name,<br/>execution_name, sql_id,<br/>plan_id)</code>        | <p>The parameters are as follows:</p> <ul style="list-style-type: none"> <li><code>task_name</code>—The name of the advisor task</li> <li><code>execution_name</code>—The name of the task execution</li> <li><code>sql_id</code>—The SQL ID of the plan</li> <li><code>plan_id</code>—The advisor plan ID (optional)</li> </ul>                   |

## 219.4 Examples

These examples show sample uses of DBMS\_XPLAN.

### Displaying a Plan Table Using DBMS\_XPLAN.DISPLAY

Execute an explain plan command on a `SELECT` statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

| Id  | Operation         | Name | Rows | Bytes | Cost (%CPU) | Time     |
|-----|-------------------|------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT  |      | 1    | 57    | 6 (34)      | 00:00:01 |
| * 1 | HASH JOIN         |      | 1    | 57    | 6 (34)      | 00:00:01 |
| * 2 | TABLE ACCESS FULL | EMP  | 1    | 37    | 3 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4    | 80    | 3 (34)      | 00:00:01 |

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

### Displaying a Cursor Execution Plan Using DBMS\_XPLAN.DISPLAY\_CURSOR

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.empno=7369;
```

```
ENAME
-----
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR();
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
```

AND e.empno=7369

| Id  | Operation         | Name | Rows | Bytes | Cost (%CPU) | Time     |
|-----|-------------------|------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT  |      |      |       |             |          |
| * 1 | HASH JOIN         |      | 1    | 16    | 6 (34)      | 00:00:01 |
| * 2 | TABLE ACCESS FULL | EMP  | 1    | 13    | 3 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4    | 12    | 3 (34)      | 00:00:01 |

Predicate Information (identified by operation id):

- 1 - access("E"."DEPTNO"="D"."DEPTNO")
- 2 - filter("E"."EMPNO"=7369)

21 rows selected.

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

| SQL_ID        | CHILD_NUMBER |
|---------------|--------------|
| gwp663cqh5qbf | 0            |

Display the execution plan for the cursor:

```
SELECT * FROM DBMS_XPLAN.DISPLAY_CURSOR('gwp663cqh5qbf',0);
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

| Id  | Operation         | Name | Rows | Bytes | Cost (%CPU) | Time     |
|-----|-------------------|------|------|-------|-------------|----------|
| 0   | SELECT STATEMENT  |      |      |       | 7 (100)     |          |
| 1   | SORT GROUP BY     |      | 4    | 64    | 7 (43)      | 00:00:01 |
| * 2 | HASH JOIN         |      | 14   | 224   | 6 (34)      | 00:00:01 |
| 3   | TABLE ACCESS FULL | DEPT | 4    | 44    | 3 (34)      | 00:00:01 |
| 4   | TABLE ACCESS FULL | EMP  | 14   | 70    | 3 (34)      | 00:00:01 |

Predicate Information (identified by operation id):

- 2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number) t WHERE sql_text LIKE
'%TOTO%';
```

### Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the `display` and `display_cursor` table functions. In [Displaying a Plan Table Using DBMS\\_XPLAN.DISPLAY](#), the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.ename    ='hermann'
  ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM DBMS_XPLAN.DISPLAY();
Plan hash value: 3693697345
```

| Id   | Operation          | Name     | Rows | Bytes | Cost (%CPU) | Time     | TQ    | INOUT | PQ Distrib |
|------|--------------------|----------|------|-------|-------------|----------|-------|-------|------------|
| 0    | SELECT STATEMENT   |          | 1    | 117   | 6 (50)      | 00:00:01 |       |       |            |
| 1    | PX COORDINATOR     |          |      |       |             |          |       |       |            |
| 2    | PX SEND QC (ORDER) | :TQ10003 | 1    | 117   | 6 (50)      | 00:00:01 | Q1,03 | P->S  | QC (ORDER) |
| 3    | SORT ORDER BY      |          | 1    | 117   | 6 (50)      | 00:00:01 | Q1,03 | PCWP  |            |
| 4    | PX RECEIVE         |          | 1    | 117   | 5 (40)      | 00:00:01 | Q1,03 | PCWP  |            |
| 5    | PX SEND RANGE      | :TQ10002 | 1    | 117   | 5 (40)      | 00:00:01 | Q1,02 | P->P  | RANGE      |
| * 6  | HASH JOIN          |          | 1    | 117   | 5 (40)      | 00:00:01 | Q1,02 | PCWP  |            |
| 7    | PX RECEIVE         |          | 1    | 87    | 2 (50)      | 00:00:01 | Q1,02 | PCWP  |            |
| 8    | PX SEND HASH       | :TQ10001 | 1    | 87    | 2 (50)      | 00:00:01 | Q1,01 | P->P  | HASH       |
| 9    | PX BLOCK ITERATOR  |          | 1    | 87    | 2 (50)      | 00:00:01 | Q1,01 | PCWC  |            |
| * 10 | TABLE ACCESS FULL  | EMP      | 1    | 87    | 2 (50)      | 00:00:01 | Q1,01 | PCWP  |            |
| 11   | BUFFER SORT        |          |      |       |             |          | Q1,02 | PCWC  |            |
| 12   | PX RECEIVE         |          | 4    | 120   | 3 (34)      | 00:00:01 | Q1,02 | PCWP  |            |
| 13   | PX SEND HASH       | :TQ10000 | 4    | 120   | 3 (34)      | 00:00:01 |       | S->P  | HASH       |
| 14   | TABLE ACCESS FULL  | DEPT     | 4    | 120   | 3 (34)      | 00:00:01 |       |       |            |

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the `statement_id` parameter passed to the `display` table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global

temporary table to store any plan information for individual users and preserves its content throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

### Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

## 219.5 Summary of DBMS\_XPLAN Subprograms

This table lists the DBMS\_XPLAN subprograms and briefly describes them.

**Table 219-2** *DBMS\_XPLAN Package Subprograms*

| Subprogram                                         | Description                                                                              |
|----------------------------------------------------|------------------------------------------------------------------------------------------|
| <a href="#">COMPARE_PLANS Function</a>             | Compares each plan in a list with a reference plan and returns the report                |
| <a href="#">DIFF_PLAN Function</a>                 | Compares plans                                                                           |
| <a href="#">DISPLAY Function</a>                   | Displays the contents of the plan table                                                  |
| <a href="#">DISPLAY_AWR Function</a>               | Displays the contents of an execution plan stored in the AWR                             |
| <a href="#">DISPLAY_CURSOR Function</a>            | Displays the execution plan of any cursor in the cursor cache                            |
| <a href="#">DISPLAY_PLAN Function</a>              | Displays the contents of the plan table in a variety of formats with CLOB output type    |
| <a href="#">DISPLAY_SQL_PLAN_BASELINE Function</a> | Displays one or more execution plans for the specified SQL handle of a SQL plan baseline |
| <a href="#">DISPLAY_SQLSET Function</a>            | Displays the execution plan of a given statement stored in a SQL tuning set              |

### 219.5.1 COMPARE\_PLANS Function

This function compares each plan in a list with a reference plan and returns the report.

#### Syntax

```
DBMS_XPLAN.COMPARE_PLANS (
    reference_plan      IN generic_plan_object,
    compare_plan_list   IN plan_object_list,
    type                IN VARCHAR2 := 'TEXT',
    level               IN VARCHAR2 := 'TYPICAL',
    section             IN VARCHAR2 := 'ALL')
RETURN CLOB;
```

## Parameters

**Table 219-3 COMPARE\_PLANS Function Parameters**

| Parameter         | Description                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reference_plan    | The reference plan. This plan should always evaluate to a single plan.                                                                                                                             |
| compare_plan_list | List of plans to compare with reference plan. The compare_plan_list is a list of generic_object and each generic_object could correspond to one or more plans.                                     |
| type              | Type of the report. Possible values are: <ul style="list-style-type: none"> <li>• TEXT</li> <li>• HTML</li> <li>• XML</li> </ul>                                                                   |
| level             | Format of the report. Possible values are: <ul style="list-style-type: none"> <li>• BASIC</li> <li>• TYPICAL</li> <li>• ALL</li> </ul>                                                             |
| section           | A particular section in the report. Possible values are: <ul style="list-style-type: none"> <li>• SUMMARY</li> <li>• FINDINGS</li> <li>• PLANS</li> <li>• INFORMATION</li> <li>• ERRORS</li> </ul> |

### Example 219-1 Examples

The following examples illustrate the usage of COMPARE\_PLANS Function.

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
    - plan_object_list (cursor_cache_object('8mkxm7ur07za0', 4)));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the child cursor number 4 for the same SQL ID. Returns the report in the text format (default).

```
var report clob;
exec :report := dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
    plan_object_list( spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd')));

print report
```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with that of the plan baseline captured by SPM for query whose SQL handle is 'SQL\_024d0f7d21351f5d' and plan name is 'SQL\_PLAN\_sdfjkd'. Returns the report in the text format (default).

```
var report clob;
exec :report = dbms_xplan.compare_plans(cursor_cache_object('8mkxm7ur07za0', 2),
```

```

        plan_object_list( cursor_cache_object('8mkxm7ur07za0'),
sqlset_object('SH', 'SQLT_WORKLOAD', '6vfqvav0rgyad'),
awr_object('6vfqvav0rgyad', 5), spm_object('SQL_024d0f7d21351f5d',
'SQL_PLAN_sdfjkd'), plan_table_object('SH', 'plan_table', NULL, 38),
sql_profile_object('pe3r3ejsfd'), a divisor_object('TASK_1228',
'EXEC_1928', '8mkxm7ur07za0')), type => 'XML',
        level => 'ALL', section => 'SUMMARY');

```

The above example compares the plan of child cursor number 2 for the SQL ID '8mkxm7ur07za0' with each of the plans in the following list:

- `cursor_cache_object('8mkxm7ur07za0')`: All the plans in the cursor cache that are generated for the SQL ID '8mkxm7ur07za0'.
- `sqlset_object('SH', 'SQLT_WORKLOAD', '6vfqvav0rgyad')`: All the plans generated in the SQL tuning set SH. SQLT\_WORKLOAD for the SQL ID '6vfqvav0rgyad'.
- `awr_object('6vfqvav0rgyad', 5)`: All the plans in AWR that are captured for database ID 5 and SQL ID '6vfqvav0rgyad'.
- `spm_object('SQL_024d0f7d21351f5d', 'SQL_PLAN_sdfjkd')`: The plan baseline for the query with SQL handle 'SQL\_024d0f7d21351f5d' with name 'SQL\_PLAN\_sdfjkd'.
- `plan_table_object('SH', 'plan_table', NULL, 38)`: Plan stored in SH.plan\_table identified by plan\_id=38.
- `sql_profile_object('pe3r3ejsfd')`: Plan identified by the SQL profile name 'pe3r3ejsfd'.
- `advisor_object('TASK_1228', 'EXEC_1928', '8mkxm7ur07za0')`: All the plans stored in SQL advisor identified by task name 'TASK\_1228', execution name 'EXEC\_1928' and SQL ID '8mkxm7ur07za0'.

## 219.5.2 DIFF\_PLAN Function

This function compares two sql plans, the reference plan and the target plan. This function returns a `task_id` that can be used to retrieve the report of findings.

### Syntax

```

DBMS_XPLAN.DIFF_PLAN(
    sql_text      IN    CLOB,
    outline       IN    CLOB,
    user_name     IN    VARCHAR2 := 'NULL')
RETURN VARCHAR2;

```

### Parameters

**Table 219-4 DIFF\_PLAN Function Parameters**

| Parameter              | Description                                      |
|------------------------|--------------------------------------------------|
| <code>sql_text</code>  | The text of the SQL statement.                   |
| <code>outline</code>   | Used to generate the target plan.                |
| <code>user_name</code> | The parsing schema name default to current user. |

## 219.5.3 DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

### Syntax

```
DBMS_XPLAN.DISPLAY(  
    table_name      IN  VARCHAR2  DEFAULT 'PLAN_TABLE',  
    statement_id    IN  VARCHAR2  DEFAULT NULL,  
    format          IN  VARCHAR2  DEFAULT 'TYPICAL',  
    filter_preds    IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 219-5** DISPLAY Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .                                                                                                    |
| statement_id | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement. |

**Table 219-5 (Cont.) DISPLAY Function Parameters**

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>format</code>       | <p>Controls the level of details for the plan. It accepts the following values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS, and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li>ROWS - if relevant, shows the number of rows estimated by the optimizer</li> <li>BYTES - if relevant, shows the number of bytes estimated by the optimizer</li> <li>COST - if relevant, shows optimizer cost information</li> <li>PARTITION - if relevant, shows partition pruning information</li> <li>PARALLEL - if relevant, shows PX information (distribution method and table queue information)</li> <li>PREDICATE - if relevant, shows the predicate section</li> <li>PROJECTION -if relevant, shows the projection section</li> <li>ALIAS - if relevant, shows the "Query Block Name / Object Alias" section</li> <li>REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li>NOTE - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see <code>table_name</code> parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view <code>V\$SQL_PLAN_STATISTICS_ALL</code>), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a>. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS, and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> or the <a href="#">DISPLAY_SQLSET Function</a> for a full description of these four keywords).</p> |
| <code>filter_preds</code> | <p>SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example:</p> <pre>filter_preds=&gt;'plan_id = 10'</pre> <p>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

 **WARNING:**

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

### Examples

To display the result of the last `EXPLAIN PLAN` command stored in the plan table:

```
SELECT * FROM TABLE (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my\_plan\_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='sales_query'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'sales_query'));
```

## 219.5.4 DISPLAY\_AWR Function

This table function displays the contents of an execution plan stored in AWR.

 **Note:**

This function is deprecated. Use `DISPLAY_WORKLOAD_REPOSITORY` instead. `DISPLAY_AWR` only works with snapshots for the local DBID, whereas `DISPLAY_WORKLOAD_REPOSITORY` supports all snapshots inside AWR, including remote and imported snapshots.

## Syntax

```
DBMS_XPLAN.DISPLAY_AWR(  
    sql_id          IN      VARCHAR2,  
    plan_hash_value IN      NUMBER DEFAULT NULL,  
    db_id           IN      NUMBER DEFAULT NULL,  
    format          IN      VARCHAR2 DEFAULT TYPICAL);
```

## Parameters

**Table 219-6** DISPLAY\_AWR Table Function Parameters

| Parameter       | Description                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.                                |
| plan_hash_value | Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.                                   |
| db_id           | Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V\$DATABASE. |

**Table 219-6 (Cont.) DISPLAY\_AWR Table Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li><b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li><b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li><b>COST</b> - if relevant, shows optimizer cost information</li> <li><b>PARTITION</b> - if relevant, shows partition pruning information</li> <li><b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li><b>PREDICATE</b> - if relevant, shows the predicate section</li> <li><b>PROJECTION</b> -if relevant, shows the projection section</li> <li><b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li><b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li><b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

### Usage Notes

- To use the DISPLAY\_AWR functionality, the calling user must have SELECT or READ privilege on DBA\_HIST\_SQL\_PLAN, AWR\_ROOT\_SQL\_PLAN, AWR\_PDB\_SQL\_PLAN, DBA\_HIST\_SQLTEXT, AWR\_ROOT\_SQLTEXT, AWR\_PDB\_SQLTEXT, and V\$DATABASE, otherwise it shows an appropriate error message. By default, select privilege for these views is granted to the select\_catalog role.
- The following examples show different ways of using the format parameter:
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.

- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates and the predicate section.

**Examples**

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.*
FROM   DBA_HIST_SQLTEXT ht, table(DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null,
null, 'ALL' )) tf
WHERE  ht.sql_text like '%TOTO%';
```

219.5.5 DISPLAY\_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V\$SQL\_PLAN\_STATISTICS\_ALL VIEWS).

**Syntax**

```
DBMS_XPLAN.DISPLAY_CURSOR(
    sql_id           IN  VARCHAR2  DEFAULT  NULL,
    cursor_child_no  IN  NUMBER     DEFAULT  0,
    format           IN  VARCHAR2  DEFAULT  'TYPICAL');
```

**Parameters**

**Table 219-7    DISPLAY\_CURSOR Function Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed. |
| cursor_child_no | Child number of the cursor to display. If not supplied, the execution plan of the child_number=0 cursor matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.                                                                                                                                                  |

**Table 219-7 (Cont.) DISPLAY\_CURSOR Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li><b>ADAPTIVE:</b> <ul style="list-style-type: none"> <li>Displays the final plan, or the current plan if the execution has not completed. This section includes notes about runtime optimizations that affect the plan, such as switching from a Nested Loops join to a Hash join.</li> <li>Plan lineage. This section shows the plans that were run previously due to automatic reoptimization. It also shows the default plan, if the plan changed due to dynamic plans.</li> <li>Recommended plan. In reporting mode, the plan is chosen based on execution statistics displayed. Note that displaying the recommended plan for automatic reoptimization requires re-compiling the query with the optimizer adjustments collected in the child cursor. Displaying the recommended plan for a dynamic plan does not require this.</li> <li>Dynamic plans. This summarizes the portions of the plan that differ from the default plan chosen by the optimizer.</li> </ul> </li> </ul> <p>For finer control on the display output, you can add the following keywords to the preceding format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p> <p>Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li><b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li><b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li><b>COST</b> - if relevant, shows optimizer cost information</li> <li><b>PARTITION</b> - if relevant, shows partition pruning information</li> <li><b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li><b>PREDICATE</b> - if relevant, shows the predicate section</li> <li><b>PROJECTION</b> -if relevant, shows the projection section</li> <li><b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li><b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li><b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li><b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter</li> </ul> |

**Table 219-7 (Cont.) DISPLAY\_CURSOR Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor.</p> <ul style="list-style-type: none"> <li>MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li>ALLSTATS - A shortcut for 'IOSTATS MEMSTATS'</li> <li>LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.</li> </ul> <p>The following formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li>RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor.</li> <li>RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>You can prefix format keywords with the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |

### Usage Notes

- To use the DISPLAY\_CURSOR functionality, the calling user must have SELECT or READ privilege on the fixed views V\$SQL\_PLAN\_STATISTICS\_ALL, V\$SQL and V\$SQL\_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST'));
```

## 219.5.6 DISPLAY\_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

### Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
  table_name      IN      VARCHAR2      DEFAULT 'PLAN_TABLE',
  statement_id    IN      VARCHAR2      DEFAULT NULL,
  format          IN      VARCHAR2      DEFAULT 'TYPICAL',
  filter_preds    IN      VARCHAR2      DEFAULT NULL,
  type            IN      VARCHAR2      DEFAULT 'TEXT')
RETURN CLOB;
```

### Parameters

**Table 219-8** DISPLAY\_PLAN Function Parameters

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| table_name   | Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .                                                                                                                                                                                                     |
| statement_id | Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a set <code>statement_id</code> clause. If no <code>statement_id</code> is specified, the function shows you the plan of the most recent explained statement.                                                                                                  |
| filter_preds | SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is <code>NULL</code> (the default), the plan displayed corresponds to the last executed explain plan. For example:<br><code>filter_preds=&gt;'plan_id = 10'</code><br>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see <b>WARNING</b> under Usage Notes) |

**Table 219-8 (Cont.) DISPLAY\_PLAN Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts five values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> <li><b>ADAPTIVE:</b> Displays the default plan, and for each dynamic subplan (if stipulated): <ul style="list-style-type: none"> <li>- A list of the rowsources from the original which may be replaced, and the rowsources to replace them</li> <li>- If outline display is specified in the format argument, the hints for each option in the dynamic subplan are displayed</li> </ul> </li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li><b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li><b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li><b>COST</b> - if relevant, shows optimizer cost information</li> <li><b>PARTITION</b> - if relevant, shows partition pruning information</li> <li><b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li><b>PREDICATE</b> - if relevant, shows the predicate section</li> <li><b>PROJECTION</b> -if relevant, shows the projection section</li> <li><b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li><b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li><b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V\$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the <a href="#">DISPLAY Function</a>. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the <a href="#">DISPLAY_CURSOR Function</a> or the <a href="#">DISPLAY_SQLSET Function</a> for a full description of these four keywords).</p> |
| type      | <p>Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Return Values**

Returns the requested report as CLOB

**Usage Notes**

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

**WARNING:**

Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

219.5.7 `DISPLAY_SQL_PLAN_BASELINE` Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

**Syntax**

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    format          IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

**Parameters**

**Table 219-9    `DISPLAY_SQL_PLAN_BASELINE` Function Parameters**

| Parameter               | Description                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>sql_handle</code> | SQL statement handle. It identifies a SQL statement whose plans are to be displayed.                                                                                            |
| <code>plan_name</code>  | Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.                                    |
| <code>format</code>     | Format string determines what information stored in the plan displayed. The following format values are possible, each representing a common use case: BASIC, TYPICAL, and ALL. |

**Return Values**

A PL/SQL type table

### Usage Notes

This function uses plan information stored in the plan baseline to explain and display the plans. The `plan_id` stored in the SQL management base may not match the `plan_id` of the generated plan. A mismatch between the stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

### Examples

Display all plans of a SQL statement identified by the SQL handle `SYS_SQL_b1d49f6074ab95af` using `TYPICAL` format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE('SYS_SQL_b1d49f6074ab95af'))
t;
```

Display all plans of one or more SQL statements containing the string `HR2` using `BASIC` format:

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines WHERE sql_text
LIKE '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
'BASIC')) t;
```

## 219.5.8 DISPLAY\_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

### Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  plan_hash_value  IN  NUMBER := NULL,
  format           IN  VARCHAR2 := 'TYPICAL',
  sqlset_owner     IN  VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

### Parameters

**Table 219-10**    **DISPLAY\_SQLSET Function Parameters**

| Parameter                | Description                |
|--------------------------|----------------------------|
| <code>sqlset_name</code> | Name of the SQL Tuning Set |

**Table 219-10 (Cont.) DISPLAY\_SQLSET Function Parameters**

| Parameter       | Description                                                                                                                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code> |
| plan_hash_value | Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.                                                              |

**Table 219-10 (Cont.) DISPLAY\_SQLSET Function Parameters**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format    | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li><b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li><b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li><b>COST</b> - if relevant, shows optimizer cost information</li> <li><b>PARTITION</b> - if relevant, shows partition pruning information</li> <li><b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li><b>PREDICATE</b> - if relevant, shows the predicate section</li> <li><b>PROJECTION</b> - if relevant, shows the projection section</li> <li><b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li><b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li><b>NOTE</b> - if relevant, shows the note section of the explain plan</li> <li><b>IOSTATS</b> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>STATISTICS_LEVEL</code> to <code>ALL</code>), this format shows IO statistics for <code>ALL</code> (or only for the <code>LAST</code> as shown below) executions of the cursor.</li> <li><b>MEMSTATS</b> - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators.</li> <li><b>ALLSTATS</b> - A shortcut for '<code>IOSTATS MEMSTATS</code>'</li> <li><b>LAST</b> - By default, plan statistics are shown for all executions of the cursor. The keyword <code>LAST</code> can be specified to see only the statistics for the last execution.</li> </ul> <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> <li><b>RUNSTATS_TOT</b> - Same as <code>IOSTATS</code>, that is, displays IO statistics for all executions of the specified cursor.</li> </ul> |

**Table 219-10 (Cont.) DISPLAY\_SQLSET Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <ul style="list-style-type: none"> <li>RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |
| sqlset_owner | The owner of the SQL tuning set. The default is the current user.                                                                                                                                                                                                                                                              |

### Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

### Examples

To display the execution plan for the SQL statement associated with SQL ID 'gwp663cqh5qbf' and PLAN HASH 3693697075 in the SQL Tuning Set called 'OLTP\_optimization\_0405':

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf',
3693697075));
```

To display all execution plans of the SQL ID 'atfwcg8anrykp' stored in the SQL tuning set:

```
SELECT * FROM table
(DBMS_XPLAN.DISPLAY_SQLSET('OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

## 219.5.9 DISPLAY\_WORKLOAD\_REPOSITORY Function

This table function displays the contents of an execution plan stored in AWR.

**Note:**

This function replaces `DISPLAY_AWR`, which is deprecated.

**Syntax**

```
DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY (
  sql_id          IN          VARCHAR2,
  plan_hash_value IN          NUMBER  DEFAULT NULL,
  format          IN          VARCHAR2 DEFAULT 'TYPICAL'
  dbid            IN          NUMBER  DEFAULT NULL,
  con_dbid        IN          NUMBER  DEFAULT NULL,
  awr_location    IN          VARCHAR2 DEFAULT 'AWR_ROOT'
);
```

**Parameters**

**Table 219-11    DISPLAY\_WORKLOAD\_REPOSITORY Table Function Parameters**

| Parameter       | Description                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_id          | Specifies the SQL_ID of the SQL statement.<br><br>You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT. |
| plan_hash_value | Specifies the PLAN_HASH_VALUE of a SQL statement.<br><br>This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.    |

**Table 219-11 (Cont.) DISPLAY\_WORKLOAD\_REPOSITORY Table Function Parameters**

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| format       | <p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> <li><b>BASIC:</b> Displays the minimum information in the plan—the operation ID, the operation name and its option.</li> <li><b>TYPICAL:</b> This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below).</li> <li><b>SERIAL:</b> Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel.</li> <li><b>ALL:</b> Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).</li> </ul> <p>For finer control on the display output, the following keywords can be added to the above four standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> <li><b>ROWS</b> - if relevant, shows the number of rows estimated by the optimizer</li> <li><b>BYTES</b> - if relevant, shows the number of bytes estimated by the optimizer</li> <li><b>COST</b> - if relevant, shows optimizer cost information</li> <li><b>PARTITION</b> - if relevant, shows partition pruning information</li> <li><b>PARALLEL</b> - if relevant, shows PX information (distribution method and table queue information)</li> <li><b>PREDICATE</b> - if relevant, shows the predicate section</li> <li><b>PROJECTION</b> -if relevant, shows the projection section</li> <li><b>ALIAS</b> - if relevant, shows the "Query Block Name / Object Alias" section</li> <li><b>REMOTE</b> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL)</li> <li><b>NOTE</b> - if relevant, shows the note section of the explain plan</li> </ul> <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> |
| dbid         | <p>Identifies the plans for a specific database.</p> <p>If this parameter is omitted, then the value defaults to the DBID of the AWR repository pointed to by the initialization parameter AWR_LOCATION. In a CDB, if AWR_LOCATION is set to AWR_ROOT, then the value is set to the DBID of the CDB root. If it is set to AWR_PDB, then the value is set to the DBID of the container.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| con_dbid     | <p>Identifies the plans for a specific container.</p> <p>If this parameter is omitted, then the value defaults to SYS_CONTEXT('userenv', 'con_id').</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| awr_location | <p>Specifies the location of the AWR repository. Supported values are:</p> <ul style="list-style-type: none"> <li><b>AWR_ROOT</b> when the AWR to be accessed is in the root container. This is the default.</li> <li><b>'AWR_PDB'</b>, if the AWR to be accessed is in the local container.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Example 219-2 Querying an AWR Plan

Assume that you log in as an administrator and issue the following query:

```
select count(*) from sh.sAleS
```

You create an AWR snapshot as follows:

```
EXEC DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT;
```

You query joint DBA\_HIST\_SQLTEST to the function output as follows:

```
SET LINESIZE 150
SET PAGESIZE 5000

SELECT t.*
FROM   DBA_HIST_SQLTEXT ht,
       TABLE(DBMS_XPLAN.DISPLAY_WORKLOAD_REPOSITORY
              (ht.sql_id, null, '-PREDICATE +ALIAS',null,null,'AWR_ROOT')) t
WHERE  ht.SQL_TEXT LIKE '%sAleS%';
```

```
SQL_ID 2f4cx9qjnd70
```

```
select count(*) from sh.sAleS
```

```
Plan hash value: 1123225294
```

```

# DBMS\_XSLPROCESSOR

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [DBMS\\_XSLPROCESSOR Overview](#)
- [DBMS\\_XSLPROCESSOR Deprecated Subprograms](#)
- [DBMS\\_XSLPROCESSOR Security Model](#)
- [Summary of DBMS\\_XSLPROCESSOR Subprograms](#)

## See Also:

## 220.1 DBMS\_XSLPROCESSOR Overview

The `DBMS_XSLPROCESSOR` package provides an interface to manage the contents and structure of XML documents.

### Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

### Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

### Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

## 220.2 DBMS\_XSLPROCESSOR Deprecated Subprograms

These subprograms are deprecated from the `DBMS_XSLPROCESSOR` package in Oracle Database 12c release 12.2.

**Note:**

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Starting in this release, these subprograms are available in the `DBMS_LOB` package.

- [CLOB2FILE Procedure](#)
- [READ2CLOB Function](#)

**See Also:**

[Summary of DBMS\\_LOB Subprograms](#)

## 220.3 DBMS\_XSLPROCESSOR Security Model

Owned by `XDB`, the `DBMS_XSLPROCESSOR` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `PUBLIC`. Subprograms in this package are executed using the privileges of the current user.

## 220.4 Summary of DBMS\_XSLPROCESSOR Subprograms

This table lists the `DBMS_XSLPROCESSOR` subprograms and briefly describes them.

**Table 220-1** *DBMS\_XSLPROCESSOR Package Subprograms*

| Method                                              | Description                                                                                                                                |

| <a href="#">VALUEOF Function and Procedure</a> | Gets the value of the first node that matches a pattern |

## 220.4.1 CLOB2FILE Procedure

This procedure writes content of a CLOB into a file. This procedure has moved to the DBMS\_LOB package, starting in Oracle Database 12c release 12.2.

### Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE (
  cl          IN  CLOB,
  flocation   IN  VARCHAR2,
  fname       IN  VARCHAR2,
  csid        IN  NUMBER := 0);
```

### Parameters

**Table 220-2 CLOB2FILE Procedure Parameters**

| Parameter | Description                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cl        | CLOB                                                                                                                                                                                                                 |
| flocation | File directory                                                                                                                                                                                                       |
| fname     | File name                                                                                                                                                                                                            |
| csid      | Character set id of the file <ul style="list-style-type: none"> <li>Must be a valid Oracle id; otherwise returns an error</li> <li>If 0, content of the output file will be in the database character set</li> </ul> |

## 220.4.2 FREEPROCESSOR Procedure

This procedure frees a Processor object.

### Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR (
  p IN Processor);
```

### Parameters

**Table 220-3 FREEPROCESSOR Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| p         | Processor   |

## 220.4.3 FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

### Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(  
    ss    IN    Stylesheet);
```

### Parameters

**Table 220-4 FREESTYLESHEET Procedure Parameters**

| Parameter | Description |
|-----------|-------------|
| ss        | Stylesheet  |

## 220.4.4 NEWPROCESSOR Function

This function returns a new `Processor` instance.

The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

### Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR  
RETURN Processor;
```

## 220.4.5 NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance.

The options are described in the following table.

### Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    xmldoc IN    DOMDOCUMENT,  
    ref    IN    VARCHAR2)  
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(  
    inp    IN    VARCHAR2,  
    ref    IN    VARCHAR2)  
RETURN Stylesheet;
```

## Parameters

**Table 220-5 NEWSTYLESET Function Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| xmlDoc    | DOMDocument to use for construction |
| inp       | Input URL to use for construction   |
| ref       | Reference URL                       |

## 220.4.6 PROCESSXSL Functions and Procedures

This function transforms input XMLDocument.

Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

### Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN   Processor,
  ss     IN   Stylesheet,
  xmlDoc IN   DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN   Processor,
  ss     IN   Stylesheet,
  url    IN   VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p      IN   Processor,
  ss     IN   Stylesheet,
  clb    IN   CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
  p      IN   Processor,
  ss     IN   Stylesheet,
  xmlDoc IN   DOMDOCUMENT,
  dir     IN   VARCHAR2,
  fileName IN VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  url        IN      VARCHAR2,
  dir        IN      VARCHAR2,
  fileName   IN      VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldoc     IN      DOMDOCUMENT,
  cl         IN OUT   CLOB);
```

Transforms input `XMLDocument` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf      IN      DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocumentFragment` using given `DOMDocumentFragment` and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf      IN      DOMDOCUMENTFRAGMENT,
  dir        IN      VARCHAR2,
  filename   IN      VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf      IN      DOMDOCUMENTFRAGMENT,
  buf        IN OUT   VARCHAR2);
```

Transforms input `XMLDocumentFragment` using given `DOMDOCUMENTFRAGMENT` and the stylesheet, and writes the output to a `CLOB`:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
  p          IN      Processor,
  ss         IN      Stylesheet,
  xmldf      IN      DOMDOCUMENTFRAGMENT,
  cl         IN OUT   CLOB);
```

## Parameters

**Table 220-6 PROCESSXSL Function and Procedure Parameters**

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| p         | Processor instance                              |
| ss        | Stylesheet instance                             |
| xmldoc    | XML document being transformed                  |
| url       | URL for the information being transformed       |
| clb       | CLOB containing information to be transformed   |
| dir       | Directory where processing output file is saved |
| filename  | Processing output file                          |
| cl        | CLOB to which the processing output is saved    |
| xmldf     | XMLDocumentFragment being transformed           |

## 220.4.7 READ2CLOB Function

This function reads content of a file into a CLOB.

### Note:

This procedure has moved to the `DBMS_LOB` package, starting in Oracle Database 12c release 12.2.

## Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB (
    flocation    IN   VARCHAR2,
    fname        IN   VARCHAR2,
    csid         IN   NUMBER:=0)
RETURN CLOB;
```

## Parameters

**Table 220-7 READ2CLOB Function Parameters**

| Parameter | Description                                                                                                                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flocation | File directory                                                                                                                                                                                                |
| fname     | File name                                                                                                                                                                                                     |
| csid      | Character set id of the file <ul style="list-style-type: none"> <li>Must be a valid Oracle id; otherwise returns an error</li> <li>If 0, input file is assumed to be in the database character set</li> </ul> |

## 220.4.8 REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

### Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(  
    ss      IN  Stylesheet,  
    name    IN  VARCHAR2);
```

### Parameters

**Table 220-8 REMOVEPARAM Procedure Parameters**

| Parameter | Description           |
|-----------|-----------------------|
| ss        | Stylesheet instance   |
| name      | Name of the parameter |

## 220.4.9 RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

### Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(  
    ss IN  Stylesheet);
```

### Parameters

**Table 220-9 RESETPARAMS Procedure Parameters**

| Parameter | Description         |
|-----------|---------------------|
| ss        | Stylesheet instance |

## 220.4.10 SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(  
    n          IN  DBMS_XMLDOM.DOMNODE,  
    pattern    IN  VARCHAR2,  
    namespace  IN  VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODELIST;
```

## Parameters

**Table 220-10 SELECTNODES Function Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| n         | Root DOMNode of the tree |
| pattern   | Pattern to use           |
| namespace | Namespace declared       |

## 220.4.11 SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

### Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(  
    n          IN    DBMS_XMLDOM.DOMNODE,  
    pattern    IN    VARCHAR2,  
    namespace  IN    VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODE;
```

## Parameters

**Table 220-11 SELECTSINGLENODE Function Parameters**

| Parameter | Description              |
|-----------|--------------------------|
| n         | Root DOMNode of the tree |
| pattern   | Pattern to use           |
| namespace | Namespace declared       |

## 220.4.12 SETERRORLOG Procedure

This deprecated procedure sets errors to be sent to the specified file.

### Note:

This subprogram has been deprecated, and is included only for reasons of backward compatibility.

### Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(  
    p          IN    Processor,  
    fileName   IN    VARCHAR2);
```

## Parameters

**Table 220-12 SETERRORLOG Procedure Parameters**

| Parameter | Description                                       |
|-----------|---------------------------------------------------|
| p         | Processor instance                                |
| fileName  | Complete path of the file to use as the error log |

## 220.4.13 SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet.

The parameter value must be a valid XPath expression. Literal string values must be quoted.

### Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(  
    ss      IN   Stylesheet,  
    name    IN   VARCHAR2,  
    value   IN   VARCHAR2);
```

## Parameters

**Table 220-13 SETPARAM Procedure Parameters**

| Parameter | Description            |
|-----------|------------------------|
| ss        | Stylesheet instance    |
| name      | Name of the parameter  |
| value     | Value of the parameter |

## 220.4.14 SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

### Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(  
    p      IN   Processor,  
    yes    IN   BOOLEAN);
```

## Parameters

**Table 220-14 SHOWWARNINGS Procedure Parameters**

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| p         | Processor instance                                  |
| yes       | Mode to set: TRUE to show warnings, FALSE otherwise |

## 220.4.15 TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

### Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE (
    n      IN  DOMNODE,
    ss     IN  Stylesheet)
RETURN DOMDocumentFragment;
```

### Parameters

**Table 220-15 TRANSFORMNODE Function Parameters**

| Parameter | Description          |
|-----------|----------------------|
| n         | DOMNode to transform |
| ss        | Stylesheet to use    |

## 220.4.16 VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

### Syntax

```
DBMS_XSLPROCESSOR.VALUEOF (
    n          IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    namespace  IN    VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (
    n          IN    DBMS_XMLDOM.DOMNODE,
    pattern     IN    VARCHAR2,
    val         OUT   VARCHAR2,
    namespace  IN    VARCHAR2 := NULL);
```

### Parameters

**Table 220-16 VALUEOF Function and Procedure Parameters**

| Parameter | Description                         |
|-----------|-------------------------------------|
| n         | Node whose value is being retrieved |
| pattern   | Pattern to use                      |
| val       | Retrieved value                     |
| namespace | Namespace to use                    |

## DBMS\_XSTREAM\_ADM

This `DBMS_XSTREAM_ADM` package provides interfaces for streaming database changes between an Oracle database and other systems. XStream enables applications to stream out or stream in database changes.

This chapter contains the following topic:

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Summary of DBMS\\_XSTREAM\\_ADM Subprograms](#)

### See Also:

- *Oracle Database XStream Guide*
- *Oracle Call Interface Programmer's Guide*
- *Oracle Database XStream Java API Reference*

### 221.1 DBMS\_XSTREAM\_ADM Overview

The package provides interfaces for configuring outbound servers that stream database changes from an Oracle database to other systems. The package also provides interfaces for configuring inbound servers that stream database changes from other systems to an Oracle database.

In both cases, the database changes are encapsulated in logical change records (LCRs). Also, the other systems can be Oracle systems or a non-Oracle systems, such as non-Oracle databases or file systems.

XStream outbound servers can stream out LCRs from an Oracle database programmatically using C or Java. After receiving the LCRs, the other system can process them in any customized way. For example, the other system can save the contents of the LCRs to a file, send the LCRs to an Oracle database through an XStream inbound server, or generate SQL statements and execute them on any Oracle or non-Oracle databases.

XStream inbound servers accept LCRs from another system and either apply them to an Oracle database or process them in a customized way using apply handlers.

XStream can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

 **See Also:**

- *Oracle Database XStream Guide*
- *Oracle Database Concepts* for more information about CDBs and PDBs

## 221.2 DBMS\_XSTREAM\_ADM Security Model

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an XStream administrator and connect as the XStream administrator when using this package.

An administrator must be granted the `DBA` role when the administrator is performing any of the following actions:

- Running the `ADD_OUTBOUND` procedure while connected as a user that is different from the configured connect user for an outbound server
- Running the `ALTER_OUTBOUND` procedure to change the capture user for a capture process or the connect user for an outbound server
- Running the `CREATE_OUTBOUND` procedure, because this procedure creates a capture process
- Running the `ALTER_INBOUND` procedure to change the apply user for an inbound server
- Running the `ADD_INBOUND` procedure while connected as a user that is different from the configured apply user for an inbound server

When the administrator does not need to perform the preceding tasks, the `DBA` role is not required.

 **See Also:**

- [GRANT\\_ADMIN\\_PRIVILEGE Procedure](#)
- *Oracle Database XStream Guide, Chapter 4, "XStream Out and Security"* for more information about XStream and security.

## 221.3 DBMS\_XSTREAM\_ADM Operational Notes

Some subprograms in the `DBMS_APPLY_ADM` package can manage XStream outbound servers, and some subprograms in the `DBMS_APPLY_ADM` package can manage XStream inbound servers.

 **See Also:**

[DBMS\\_APPLY\\_ADM](#) for details about which subprograms can manage outbound servers and inbound servers

## 221.4 Summary of DBMS\_XSTREAM\_ADM Subprograms

This table lists the DBMS\_XSTREAM\_ADM subprograms and briefly describes them.

**Table 221-1 DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                                             | Description                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ADD_COLUMN Procedure</a>                   | Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule                                    |
| <a href="#">ADD_GLOBAL_PROPAGATION_RULES Procedure</a> | Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| <a href="#">ADD_GLOBAL_RULES Procedure</a>             | Adds global rules to either the positive or negative rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist             |
| <a href="#">ADD_OUTBOUND Procedure</a>                 | Creates an XStream outbound server that dequeues LCRs from the specified queue                                                                                                                   |
| <a href="#">ADD_SCHEMA_PROPAGATION_RULES Procedure</a> | Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist |
| <a href="#">ADD_SCHEMA_RULES Procedure</a>             | Adds rules to a rule set of XStream clients.                                                                                                                                                     |
| <a href="#">ADD_SUBSET_OUTBOUND_RULES Procedure</a>    | Adds subset rules to an outbound server configuration                                                                                                                                            |
| <a href="#">ADD_SUBSET_PROPAGATION_RULES Procedure</a> | Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist                                                                         |
| <a href="#">ADD_SUBSET_RULES Procedure</a>             | Adds subset rules to the positive rule set of a capture process or apply process, and creates the specified capture process or apply process if it does not exist                                |
| <a href="#">ADD_TABLE_PROPAGATION_RULES Procedure</a>  | Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist   |
| <a href="#">ADD_TABLE_RULES Procedure</a>              | This procedure adds rules to a rule set of an XStream client.                                                                                                                                    |
| <a href="#">ALTER_INBOUND Procedure</a>                | Modifies an XStream inbound server                                                                                                                                                               |
| <a href="#">ALTER_OUTBOUND Procedure</a>               | Modifies an XStream outbound server                                                                                                                                                              |
| <a href="#">CREATE_INBOUND Procedure</a>               | Creates an XStream inbound server and its queue                                                                                                                                                  |
| <a href="#">CREATE_OUTBOUND Procedure</a>              | Creates an XStream outbound server, queue, and capture process to enable XStream client applications to stream out Oracle database changes encapsulated in LCRs                                  |
| <a href="#">DELETE_COLUMN Procedure</a>                | Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule                                                           |
| <a href="#">DROP_INBOUND Procedure</a>                 | Removes an inbound server configuration                                                                                                                                                          |

**Table 221-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                                              | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">DROP_OUTBOUND Procedure</a>                 | Removes an outbound server configuration                                                                                                                                                                                       |

| <a href="#">IS_GG_XSTREAM_FOR_STREAMS Function</a>      | Returns <b>TRUE</b> if XStream performance optimizations are enabled for Oracle Replication components, or returns <b>FALSE</b> if XStream performance optimizations are disabled for Oracle Replication components            |
| <a href="#">KEEP_COLUMNS Procedure</a>                  | Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule                                                                                    |
| <a href="#">MERGE_STREAMS Procedure</a>                 | Merges a stream flowing from one capture process with a stream flowing from another capture process                                                                                                                            |
| <a href="#">MERGE_STREAMS_JOB Procedure</a>             | Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the <a href="#">MERGE_STREAMS</a> procedure to merge the two streams                    |
| <a href="#">PURGE_SOURCE_CATALOG Procedure</a>          | Removes all Oracle Replication data dictionary information at the local database for the specified object                                                                                                                      |
| <a href="#">RECOVER_OPERATION Procedure</a>             | Provides options for a split and merge operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation. |
| <a href="#">REMOVE_QUEUE Procedure</a>                  | Removes the specified <b>ANYDATA</b> queue                                                                                                                                                                                     |
| <a href="#">REMOVE_RULE Procedure</a>                   | Removes the specified rule or all rules from the rule set associated with the specified capture process, apply process, or propagation.                                                                                        |
| <a href="#">REMOVE_SUBSET_OUTBOUND_RULES Procedure</a>  | Removes subset rules from an outbound server configuration                                                                                                                                                                     |
| <a href="#">REMOVE_XSTREAM_CONFIGURATION Procedure</a>  | Removes the XStream configuration at the local database                                                                                                                                                                        |
| <a href="#">RENAME_COLUMN Procedure</a>                 | Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule                                                                                           |
| <a href="#">RENAME_SCHEMA Procedure</a>                 | Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule                                                                                           |
| <a href="#">RENAME_TABLE Procedure</a>                  | Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule                                                                                            |
| <a href="#">SET_MESSAGE_TRACKING Procedure</a>          | Sets the tracking label for logical change records (LCRs) produced by the current session                                                                                                                                      |
| <a href="#">SET_PARAMETER Procedure</a>                 | Sets a parameter for an outbound server, an inbound server, or an outbound server's capture process                                                                                                                            |

**Table 221-1 (Cont.) DBMS\_XSTREAM\_ADM Package Subprograms**

| Subprogram                               | Description                                                                                                         |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <a href="#">SET_TAG Procedure</a>        | Sets the binary tag for all redo entries subsequently generated by the current session                              |
| <a href="#">SET_UP_QUEUE Procedure</a>   | Creates a queue table and a queue for use with the capture, propagate, and apply functionality of XStream           |
| <a href="#">SPLIT_STREAMS Procedure</a>  | Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process |
| <a href="#">START_OUTBOUND Procedure</a> | Starts an XStream outbound server                                                                                   |
| <a href="#">STOP_OUTBOUND Procedure</a>  | Stops an XStream outbound server                                                                                    |

**Note:**

All subprograms commit unless specified otherwise.

## 221.4.1 ADD\_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an XStream client. XStream clients include capture processes, propagations, and apply processes.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

**Note:**

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REFS`, `varrays`, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. Therefore, a DML rule must be specified when you run this procedure. If a DDL rule is specified, then the procedure raises an error.

**See Also:**

*Oracle Database XStream Guide* for more information about declarative rule-based transformations

## Syntax

```
DBMS_XSTREAM_ADM.ADD_COLUMN (
    rule_name      IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    column_name    IN  VARCHAR2,
    column_value   IN  ANYDATA,
    value_type     IN  VARCHAR2      DEFAULT 'NEW',
    step_number    IN  NUMBER        DEFAULT 0,
    operation      IN  VARCHAR2      DEFAULT 'ADD');

DBMS_XSTREAM_ADM.ADD_COLUMN (
    rule_name      IN  VARCHAR2,
    table_name     IN  VARCHAR2,
    column_name    IN  VARCHAR2,
    column_function IN  VARCHAR2,
    value_type     IN  VARCHAR2      DEFAULT 'NEW',
    step_number    IN  NUMBER        DEFAULT 0,
    operation      IN  VARCHAR2      DEFAULT 'ADD');
```

## Parameters

**Table 221-2 ADD\_COLUMN Procedure Parameters**

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rule_name       | <p>The name of the rule, specified as <code>[schema_name.]rule_name</code>. If NULL, then the procedure raises an error.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code>, enter <code>hr.employees12</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| table_name      | <p>The name of the table to which the column is added in the row LCR, specified as <code>[schema_name.]object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| column_name     | <p>The name of the column added to each row LCR that satisfies the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| column_value    | <p>The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is <code>NUMBER</code> and the value is NULL, then specify the <code>ANYDATA.ConvertNumber(NULL)</code> function.</p> <p>This parameter cannot be specified if the <code>column_function</code> parameter is specified.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| column_function | <p>Either the <code>'SYSDATE'</code> or the <code>'SYSTIMESTAMP'</code> SQL function.</p> <p>The <code>'SYSDATE'</code> SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is <code>DATE</code>, and the format returned depends on the value of the <code>NLS_DATE_FORMAT</code> initialization parameter.</p> <p>The <code>'SYSTIMESTAMP'</code> SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is <code>TIMESTAMP WITH TIME ZONE</code>.</p> <p>The function executes when the rule evaluates to <code>TRUE</code>.</p> <p>This parameter cannot be specified if the <code>column_value</code> parameter is specified.</p> |
| value_type      | <p>Specify <code>'NEW'</code> to add the column to the new values in the row LCR.</p> <p>Specify <code>'OLD'</code> to add the column to the old values in the row LCR.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 221-2 (Cont.) ADD\_COLUMN Procedure Parameters**

| Parameter   | Description                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| step_number | The order of execution of the transformation.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> for more information about transformation ordering |
| operation   | Specify 'ADD' to add the transformation to the rule.<br>Specify 'REMOVE' to remove the transformation from the rule.                                      |

**Usage Notes**

When 'REMOVE' is specified for the `operation` parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `ADD_COLUMN` procedures when one or more of these parameters is NULL:

| table_name | column_name | step_number | Result                                                                                                                                                             |
|------------|-------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NULL       | NULL        | NULL        | Remove all add column transformations for the specified rule.                                                                                                      |
| NULL       | NULL        | non-NULL    | Remove all add column transformations with the specified <code>step_number</code> for the specified rule.                                                          |
| NULL       | non-NULL    | non-NULL    | Remove all add column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.                             |
| non-NULL   | NULL        | non-NULL    | Remove all add column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.                              |
| NULL       | non-NULL    | NULL        | Remove all add column transformations with the specified <code>column_name</code> for the specified rule.                                                          |
| non-NULL   | non-NULL    | NULL        | Remove all add column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.                              |
| non-NULL   | NULL        | NULL        | Remove all add column transformations with the specified <code>table_name</code> for the specified rule.                                                           |
| non-NULL   | non-NULL    | non-NULL    | Remove all add column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule. |

## 221.4.2 ADD\_GLOBAL\_PROPAGATION\_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

## Syntax

```
DBMS_XSTREAM_ADM.ADD_GLOBAL_PROPAGATION_RULES (
